

DFW Pre-Harvest Flora  
Birch Hill WMA, Winchendon, Massachusetts  
Date of survey: 7/15, 7/17, 7/18 2006  
Surveyed by Private Contractor  
Location of lot(s): East of New Boston Road

#### General description and setting

Six lots are marked along a 2.5 km stretch of New Boston Road, south of River Road. Two of the lots are red pine plantations, the remaining lots are primarily white pine stands with varying amounts of mixed hardwoods. Wetlands and small streams are common in and around the marked stands. All have been delineated and buffered from areas marked for harvest. Wetlands and filter strips have been inventoried separately from the marked stands. The northernmost stand (RP-ST-1) was divided into northern and southern portions for inventory.

#### Significant Flora and Habitats

No rare species, priority natural communities, or significant habitats were found. The forests are all post agricultural plantations and white pine dominated types with floras typical of the northern Worcester Plateau. Checkered rattlesnake plantain *Goodyera tessellata* was common in the stand, and some unusual individual plants resembled dwarf or lesser rattlesnake plantain *Goodyera repens* (Endangered) in one portion of the stand. *G. tessellata* can be difficult to distinguish from *G. repens*, so a specimen was collected and sent to an orchid expert for an expert opinion. The specimen was confirmed as the common *G. tessellata*.

#### Invasive Species

Three non-native invasive species are resident in the stands; glossy buckthorn (*Rhamnus frangula*), Morrow's honeysuckle (*Lonicera morrowii*) and Japanese barberry (*Berberis thunbergii*). Seedling stems of these invasive plants occurred within the stands, and some large individuals occur outside the stands. The invasive species occur as scattered individuals or in small, low density patches. None are currently aggressive. These species may respond favorably to increased light and disturbance associated with the planned harvest. *Note: Prior to the harvesting operation, mechanical control efforts were conducted to locate and pull invasive plant seedlings within the harvest area.*
