## **Acknowledgements**

The MDPH would like to thank school nurses in both private and public school systems who contributed to the success of the second year of its pediatric asthma surveillance effort by completing a pediatric asthma surveillance form. We would also like to thank the asthma surveillance advisory committee for its valuable input during both the planning and implementation phases of the project.

# **Pediatric Asthma In Massachusetts 2003-2004**

## **I. Introduction**

Asthma is a common chronic disease among children that appears to have increased in prevalence over the past decades [1]. It affects more than 12% of Americans under the age of 18 [2] , and costs \$11.5 billion in direct health care costs annually [3]. The magnitude of prevalence and cost of this disease have made asthma a priority concern among public health organizations across the country.

Historically the information available regarding asthma prevalence in Massachusetts has been limited to prevalence figures for the state as a whole. Statewide prevalence figures have been collected through the Behavioral Risk Factor Surveillance System (BRFSS), a random telephone survey implemented by state health departments in conjunction with the U.S. Centers for Disease Control and Prevention (CDC). Although BRFSS data are useful for estimating asthma prevalence in the state as a whole, they do not provide information regarding asthma at the community level. Before this environmental public health tracking effort, community level data have been available only for a small number of communities in which specialized surveillance programs or research studies have been implemented.

While statewide prevalence figures are a convenient way to summarize the overall health of Commonwealth residents, there remains a need to better quantify the scope of the problem on the state and local level, particularly as it relates to the pediatric population, the population for which the largest increases in asthma prevalence have been detected over time [4]. A standardized pediatric asthma surveillance or “tracking” system that collects asthma prevalence data at the community level allows public health officials to identify

populations with asthma on the local level, evaluate at risk groups, and evaluate the impact of interventions over time more effectively than state-level data.

Given the need for a comprehensive, systematic approach to pediatric asthma tracking in the Commonwealth, the Massachusetts Department of Public Health (MDPH), Center for Environmental Health (CEH), developed a proposal to track pediatric asthma through school health records. Massachusetts law authorizes the MDPH to access school health records in public health investigations and requires the strict protection of the privacy of the information collected (Massachusetts Student Record Registration Section 23.7 (4) (h) and MGL c111, s 24A). CEH staff sought assistance from school health nurses in the review of records and ascertainment of children diagnosed with pediatric asthma within each school participating.

This project is being implemented as part of a larger effort aimed at tracking several health outcomes thought to be impacted by environmental exposures. The overall tracking project, primarily funded through the U.S. Centers for Disease Control and Prevention (CDC) National Environmental Public Health Tracking Program, aims to track the prevalence of pediatric asthma in Massachusetts school children, lupus in the city of Boston, and developmental disabilities in Berkshire County. A supplemental award is allowing for tracking childhood cancer, reproductive outcomes, and childhood lead poisoning in relation to potential environmental exposures.

This report describes the methods used to implement the pediatric asthma tracking effort and summarizes the asthma prevalence data collected during year two, which encompassed all public and private schools in the Commonwealth serving grades K through 8. Year 1 results were released in May 2004, and consisted of data from a smaller number of schools [5]. Thus, year two represents the first time pediatric asthma data were collected statewide.

## **II. Methods**

### **A. Target Population**

During the 2003-2004 school year the MDPH requested all public and private schools in Massachusetts with any grade kindergarten through 8 (2,128 schools) to report the number of students with asthma enrolled in the school.

### **B. Project Definition of Asthma**

School nurses provided the number of students with asthma in each school by grade and gender on a standardized report form (Appendix II). Specific sources in the health record for the nurses' knowledge of a child's asthma status included emergency cards, parent resource centers, parent communications, student communications, health care provider documentation, or direct observation of an asthma attack. The percentage of cases with a documented provider diagnosis or medication orders was requested in the survey.

### **C. Data Collection**

During March 2004, public school nurse leaders and private school health contacts were asked to distribute to nurses in their district a one-page reporting form asking for aggregate numbers of children with asthma by grade, gender, and school building (Appendix II). The form also contained questions regarding the source of the data reported. The reporting forms were sent to the nurse leader or school health contact via email, whenever possible, to facilitate electronic data submission. If electronic mail was not available, then forms were sent via the U.S. Postal Service. Follow-up telephone calls were placed to nurses who did not respond by April 2004. School enrollment data were collected from the Massachusetts Department of Education (DOE) or from a school's administrative staff. Schools that did not return a complete survey or for which 2003 -

2004 enrollment data could not be obtained by September 2004 were considered non-responders.

## **D. Data Management**

MDPH staff reviewed surveys for completeness and accuracy, and attempted to resolve missing data or inconsistencies. Massachusetts DOE school identifier codes were assigned to each school's survey. In the case of a school that was not listed in the DOE database, or was listed as part of a larger school, the MDPH assigned its own unique identifier code, following the DOE code structure. Complete survey data were manually inputted to the tracking project database upon satisfactory review. Incomplete surveys were not input to the project database.

## **E. Data Analysis**

Data analysis was performed with SAS version 9 and Microsoft Access. The percent participation of the target population was calculated, along with the breakdown of submitted surveys by type of school. The prevalence of asthma with 95% confidence intervals was calculated for each participating school, and for the entire state. Additionally, statewide prevalence was calculated by gender and by grade level.

# **III. Results**

## **A. Participation**

MDPH received asthma data from a total of 1,664 public, private, and charter schools, approximately 78% of the schools serving any of grades K-8 in the Commonwealth during the school year. Of the 1,664 completed report forms, 1,305 were received from public schools (85%), 30 from charter schools (73%), and 329 from private schools (58%). Figures 1a and 1b show the geographic distribution of schools that

participated and those that did not participate. Some asthma report forms were incomplete and so could not be included in all prevalence analyses. The data reported from 20 schools could not be used to estimate prevalence by grade and 19 schools could not be included in gender-specific prevalence estimates. However, the data from all but two reporting schools were used in the estimate of statewide prevalence.

## **B. Reported Asthma Prevalence**

The reported prevalence of asthma among the 638,421 students enrolled in the 1,664 schools participating was 9.5% (95% CI\* 9.4% - 9.6%). Reported prevalence by school ranged from 0 – 39.1%. Prevalence figures for the 1,664 participating schools are listed in Appendix III, and their frequency distribution is presented in Figure 2. By school type, reported asthma prevalence was 10.0 % in charter schools, 9.6% in public schools, and 8.2% in private schools. Reported statewide asthma prevalence by grade ranged from 8.2% (kindergarten) to 10.3 % (5<sup>th</sup> grade) (Table 2). Asthma prevalence for males was 10.9% and for females was 8.0%.

## **C. Other Variables**

Responses to survey questions relating to the nurses' health records are summarized in Table 3. The percent of students with documentation in the health record of a provider diagnosis of asthma ranged from 0 - 100%, and averaged 68.6%. When asked which other components of the health record nurses used to determine asthma status, emergency cards and parent communications were reported most frequently (Table 3.)

---

\* 95% Confidence Interval (CI) of a the prevalence is a statistical range used to indicate the stability of a prevalence estimate

## **IV. Discussion**

### **School-Specific Prevalence**

While there was notable variation in reported asthma prevalence between schools (range of 0 - 39.1%), caution should be used when comparing school prevalence estimates. It is likely that differences in school health record keeping and reporting account for some of the differences observed between schools. In order to better understand this issue, the MDPH hopes to verify school nurse reported asthma data against the reports of other nurses and physician's medical records. A funding request to CDC for this activity is pending.

It is also important to note that a higher prevalence of asthma at one school compared with another does not necessarily indicate the presence of environmental problems within that school. Pediatric respiratory symptoms have been associated with a number of factors including exposures in the outdoor environment [6-8], exposures in the home environment [9-11], genetic factors [12, 13], and lifestyle factors [14, 15]. The MDPH pediatric asthma tracking project is a surveillance effort, not a research study. Therefore the data cannot be used to draw conclusions regarding the causes of reported asthma prevalence in any school. A MDPH companion effort however is tracking indoor environmental data in a number of schools statewide with the ultimate goal of linking the datasets. Similar environmental linkage efforts are underway for each of the health outcomes tracking efforts funded under the CDC award.

### **District Prevalence**

Year one pediatric asthma surveillance data were reported by school district. In this report, year two asthma prevalence data are reported by individual school. A town might be part of both a regional and local school district at the same time, putting some of the schools located within a town boundary in one school district, and other schools located within the town boundary in another school district. Additionally, private and

charter schools are not grouped in public school districts, and were not targeted as part of the year one surveillance effort. Thus, reporting pediatric asthma by school is more informative than reporting by district.

### Comparison with Year One Data

The statewide prevalence of pediatric asthma found in this survey of school nurses was 9.5%, however the prevalence by individual school was as high as 39%. This compares to year one results (from a smaller number of schools) which showed an overall prevalence of 9.2%, with a range as high as 30.8% in participating schools [5]. In addition to the fact that year 2 represents an expansion to statewide surveillance, MDPH also learned that during year one some schools reported only children that had asthma medication orders in the school health record, while other schools included all children known to have asthma, even if they did not have medication orders on file. Hence, some schools underestimated the number of children with asthma during year 1. When any surveillance program is initiated, data generally tends to improve over time as the reporting entity understanding of requested information also improves. As the surveillance program continues, there is an ongoing communication with nurses which results in more standardized reporting procedures.

### Comparison with Other Surveillance Programs

The statewide prevalence observed in year two differs from other state and national childhood asthma surveillance efforts. The 2003 BRFSS reports that 9.2% of Massachusetts children under 18 years old have current asthma. The BRFSS prevalence of current asthma for children aged 5-9 and 10-14, the age groups comparable to our K-8 grade range, are 11.1% and 11.9%, respectively [16]. The 2004 CDC National Health Interview Survey (NHIS) reports that 7.9% of U.S. children 0-14 years old have current asthma [17]. The 2003 National Survey of Children's Health reports that 8.8% of U.S. children, and 10.2% of Massachusetts children have current asthma [3].

BRFSS and NHIS asthma prevalence figures give an idea of the range in which to expect Massachusetts prevalence values to fall within, but different methodologies and target populations between surveys make them less than ideal for comparison with MDPH surveillance figures. The BRFSS and NHIS figures are derived from samples of households and self-reported health information that may affect the precision of the prevalence estimates. A school-based surveillance effort similar to that used in Massachusetts and therefore producing more comparable figures is discussed in a recent report describing nurse-reported asthma in Connecticut students. The report describes a 9.7% asthma prevalence among Connecticut students in grades K-5 [18]. Reported asthma prevalence in Massachusetts K-5 students described in this report was 7.9%. Prevalence data for grade 6-8 students in Connecticut are not available for comparison.

### The Value of Asthma Surveillance

The value of the Massachusetts approach to asthma surveillance is several-fold. As part of a separate investigation of asthma in the Merrimack Valley, the MDPH found school nurses and student health records to be a valuable and reliable source of health information. Further, tracking the prevalence of asthma through the schools will make it possible for the first time to assess the magnitude of the problem of pediatric asthma at the local level, and notably to better determine the role of indoor and outdoor environmental exposures in the etiology of the disease. While the statewide prevalence of pediatric asthma observed through this project was similar to that seen in other types of surveys, including year one results from a smaller number of MA schools, surveillance at the community level makes it possible to observe a wide range of different prevalence values by school, information that was previously unavailable through data sources that focused on statewide or nationwide data. Community-level asthma prevalence data will be useful in planning and implementing environmental health investigations and public health interventions based on factors specific to the community in question.

## **V. Future Efforts Aimed at Pediatric Asthma Surveillance**

This report summarizes the second of a three year effort that the MDPH is scheduled to carry out as part of its Environmental Public Health Tracking Project. During the project's first year, asthma surveillance was carried out in a subset of Massachusetts schools. In year two the MDPH expanded its pediatric asthma tracking effort to include all public, private, and charter schools serving any of grades K-8 in each of the Commonwealth's 372 school districts. Year three data, currently being collected, also targets all Commonwealth schools serving any of grades K-8. Once three years of data have been collected, and the validity of school nurse reports has been investigated as discussed previously, analyses of the changes in reported school asthma prevalence over the three year data collection period can be performed.

This report highlights important progress that has been made toward the establishment of a comprehensive, statewide pediatric asthma surveillance system in the Commonwealth of Massachusetts.
