

Slide 1

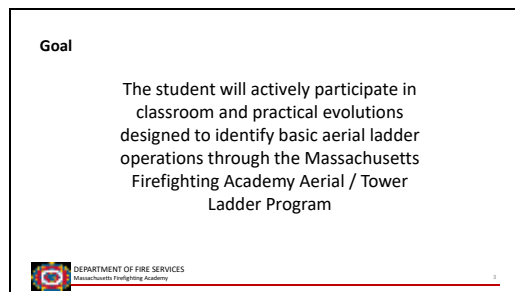

Slide 2

All instructors present should introduce themselves.

Slide 3

Slide 4

Objectives

- Develop an understanding of the components of aerial devices
- Identify the different construction types
- Recognize the specialized equipment needed for operation
- Analyze the positioning for operations
- Explain the need for the importance of stabilization
- Indicate the control devices necessary for deployment

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

4

Slide 5

Objectives (con't.)

- Describe the strategies and tactics
- Analyze the components through an inspection program
- Review the types of communication available for use during operations
- Demonstrate positioning for operations, inspection and equipment checks through a series of practical evolutions

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

5

Slide 6

Aerial Devices Definition

A self-supporting, turntable-mounted, power-operated ladder of two or more sections permanently attached to a self-propelled automotive fire apparatus and designed to provide a continuous egress route from an elevated position to the ground

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

6

NFPA 1901 Chapter 3 Section 3.3.6 – Aerial Ladder Definitions

Slide 7

**BRIEF HISTORY
OF
AERIAL & TOWER LADDERS
IN
THE FIRE SERVICE**

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

7

Slide 8

The Aerial Ladder

- First successful aerial ladder was patented by Daniel Hayes in 1868
- Made of wood and required several firefighters to raise by a hand operated screw system
- The rights to this patent were eventually sold to American LaFrance

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

8

Slide 9

Hayes Aerial Ladder

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

9

Slide 10

Early 20th Century

- Seagrave developed a spring-assisted raising mechanism in 1902 that enabled the aerial ladder to be raised swiftly from the bedded position
- All aerial ladder makers developed their own hoisting systems in the early 1900's

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

10

As the new Century developed early construction allowed for taller buildings to be built. The customary use of ground ladders made access to higher story buildings difficult. The early aerial ladders were being more commonly used in city environments to reach these new heights. As a result of ever-increasing technology combined with these taller buildings resulted in aerial ladder manufacturers using this new technology to build more efficient aerial ladders.

Slide 11

Dahill Spring Loaded Hoist

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

11

Slide 12

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

12

Note the huge wheels just behind the driver. These wheels were used as part of the hoisting system on the aerial.

Slide 13

Spring loaded raising and manual extension required one firefighter on the hand wheel on each side. Rotation was accomplished by means of the hand wheel.

Slide 14

Slide 15

Peter Pirsch Company - 1931

- Introduction of the hydraulic mechanical aerial ladder
- All three aerial ladder functions, raise, rotate and lower now performed by a single firefighter
- Use of Hydraulic Lifting Cylinders used to:
 - Raise the ladder from its bedded position.
 - Turntable rotation
 - Aerial extension
- The first three section 100' aerial ladder was produced by Pirsch in 1935

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

15

Slide 16

Mack Trucks - 1929

- Aerial ladder raised and lowered through a power take-off mechanism from the motor
- This type of aerial ladder operation, with additions and modifications, would become standard

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

16

Slide 17

Standards Relative to Aerial Devices

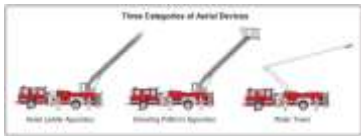

- NFPA 1901 – Standard for Automotive Fire Apparatus, 2016 Edition
 - Chapter 19 deals with Aerial and Platform
- NFPA 1911 – Standard for Inspection, Maintenance & Testing, 2017 Edition
 - Chapter 11 Inspection & Maintenance of Aerial Devices
 - Chapter 22 Performance Testing of Aerial Devices

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

17

Slide 18

NFPA 1901 GROUPS AERIAL DEVICES INTO THREE BASIC CATEGORIES:

* Under **Elevating Platform Apparatus** you have: Aerial Ladder, Telescoping and Articulating

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

18

Slide 19

Slide 20

- An aerial ladder apparatus in the fire department jargon may be called the ladder, the truck, the aerial, or sometimes the stick.
- The aerial ladder apparatus in the most common type of aerial fire apparatus operated in North America.

Slide 21

Slide 22

- More manpower required to operate the tiller
- Quints also are available in a tiller version
- Type of stabilization
 - Jacks
 - Cab placement jacking
- If tillered, are generally more maneuverable than single-chassis vehicles.
- Have superior maneuverability when negotiating narrow streets or heavy traffic and positioning at the emergency scene – if equipped with a tiller.
- If tillered, can be jackknifed to aid in stabilizing the apparatus when the aerial device is deployed.

Slide 23

- An elevating platform equipped with a piping systems and nozzles for elevated master stream operations.
- Telescoping aerial devices are not meant to be climbed and are equipped with a small ladder that is to be used only for escape from the platform in emergency situations.

Slide 24

- Aerial device that consists of two or more booms that are attached with hinges and operate in a folding manner.
- A passenger-carrying platform is attached to the working end of the device.
- **Knuckle** – Joint between two sections of boom in an articulating aerial device.

Slide 25

- These are telescoping or articulating aerial devices whose primary function is to deploy elevated master streams; not generally intended for climbing operation
- Common sizes for these devices range from 50 to 130 feet
- Capable of maximum flows ranging from 1,000 to 5,000 gpm

Slide 26

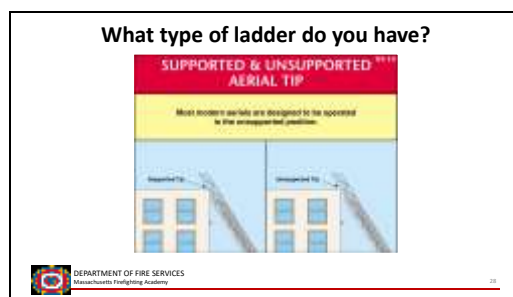

- List the components/specifications that must be met for an apparatus to be called a quint.
 - Fire pump – Must have a capacity in excess of 1,000 gpm.
 - Water tank – Must hold at least 300 gallons of water.
 - Hose – Must carry 800 feet of 2-1/2-inch or larger supply hose and 400 feet of attack hose.
 - Ground ladders – Must carry 85 feet of ground ladders, to include at least one attic ladder, one straight ladder with folding roof hooks, and one extension ladder. All ground ladders must meet NFPA 1931
 - Waterway – May be equipped with a permanently piped waterway.
- Quints

- Selected because some departments feel that it is not effective to tie up a separate pumper when it is necessary to deploy an elevated master stream.
- Selected because some departments think that every major piece of apparatus should have the capability of extinguishing a fire should it be the first apparatus to arrive on the scene.
- May be used by some departments as replacements for traditional pumper and ladder companies.
- Come in various sizes, but most commonly departments use a pumper-sized apparatus with a 50- to 75-foot aerial device.
- May be full-sized aerial apparatus.

Slide 27

Slide 28

- Know whether the aerial device you are operating is designed to be operated in an unsupported (cantilever) or in a supported (resting on a wall) position.
- If the manufacturer recommends that the aerial device be operated in a supported position, be aware that loading or extension must be reduced for low angles of elevation during unsupported operations.
- **NOTE:** The maximum loading for any unsupported aerial device occurs when it is operated at angles between 70 to 80 degrees from horizontal.

- Know that as extension increases, aerial loading must decrease.
- Spot the apparatus as close to the intended target as possible to avoid operating at a low angle of elevation and long extension, the weakest operational position.
- Become familiar with the load limitations of the aerial device when flowing water and when not flowing water.
- Learn the acceptable range of motion for the aerial device when flowing water and when not flowing water.

Slide 29

Slide 30

(Match the parts of a typical aerial ladder apparatus to their functions/specifications.)

- Truss – Framework of bars and rods that permits tension and compression stresses to be distributed over the length of the ladder for maximum strength and minimum weight.
- Fly – Top extendable section of an aerial ladder; must be at least 18 inches wide. (20.2.6)
- Base – Bottom section of an aerial ladder; must be at least 18 inches wide
- Tip – Topmost portion of the aerial ladder fly; must be capable of supporting a 250-pound load when the ladder is fully extended and at any elevation within its normal range.

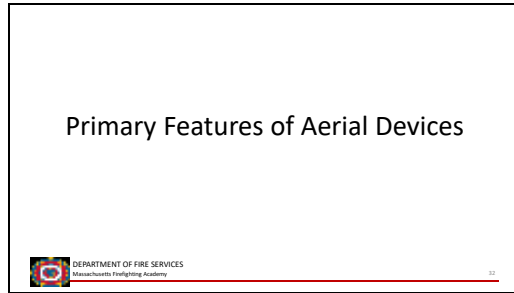

- Top rails – The handrails or top chords of an aerial ladder to which the opposite ends of the trussing are attached; must be at least 1 inch wide and 12 inches above base rail. (20.2.8)
- Base rails – The beams or lower chords of the aerial ladder to which the rungs, trussing, and other portions of the ladder are attached.
- Folding steps – Place for elevated master stream operator to stand for extended periods of time. (20.2.9 or 2.2.91 or 20.2.9.2)
- Rungs – Components attached between the two base rails and used as steps for aerial ladder personnel; spaced 14 inches on center and covered with nonskid material.
- Turntable – Provides continuous rotation of the aerial device on a horizontal plane.

Slide 31

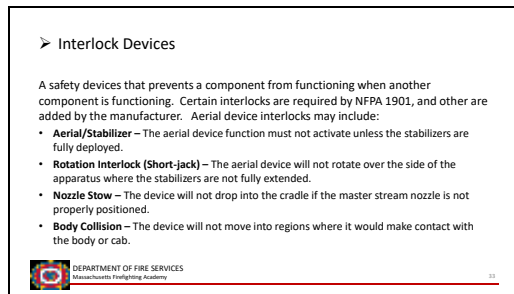

- In aerial ladders made in North America, the fully extended (working) length ranges from 50 to 137 feet.
- Overseas the extended length ranges in excess of 200 feet.

Slide 32

Slide 33

Slide 34

- Four Main Components: actuators, hydraulic fluid, hydraulic pump, reservoir
- Operating the Stabilizer (outriggers) and the Aerial Device
- Under pressures of 3,500 psi or more

Slide 35

Slide 36

- Retract and Extend the Aerial Ladder/Platform

Slide 37

The Turntable

- Rotational structural component of the aerial device. Its primary function is to provide continuous rotation on a horizontal plane.

The Control Pedestals

- Is designed for the operators of all heights and is positioned of the turntable side of the aerial apparatus.
- This position allows the operator a clear view of the tip of the device and of the workers on the device
- Apparatus equipped with a platform, NFPA 1901 also require s a control station in the platform.

The turntable control station must have the ability to override the platform control station.

Slide 38

- Pre-Piped Waterways
 - Telescoping Waterways Systems
 - Bed Ladder Systems
- Elevating Platform Waterways Systems
- Detachable Ladder Pipe Systems

Slide 39

Slide 40

➤ Breathing Air Systems

The slide features two images. On the left is a close-up of a breathing air system control panel with several yellow pressure gauges and a black regulator. On the right is a photograph of two firefighters in full protective gear, including helmets and SCBA tanks, standing next to a fire engine.

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

40

Slide 41

➤ Apparatus-Mounted Special System

The slide contains three images. The left image shows the interior of a fire truck's equipment compartment with various tools and equipment. The middle image is a close-up of a control panel with multiple buttons and a small screen. The right image shows a firefighter operating a large aerial device, possibly a bucket or platform, extended high into the air.

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

41

Slide 42

➤ Portable Equipment Commonly Carried on Aerial Devices

The slide includes four images. At the top are three smaller images showing different types of portable equipment: a blue storage bin with tools, a red storage bin with tools, and a white storage bin with tools. Below these is a larger image of a fire truck with its aerial device extended, and a pile of colorful equipment on the ground in front of it.

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

42

Slide 43

Ground Ladders for Aerial Apparatus

- Minimum 115 feet of ground ladders for Aerial Apparatus
- Minimum 85 feet of ground ladders for Quints
- Complement must include the following:
 - Attic Ladders
 - Roof Ladders
 - Extension Ladders

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

How long can the minimum be for each ground ladder?

(examples)

Attic Ladder.....10 feet

Extension.....1-35 feet

Extension.....1-40 feet

Roof ...1-16 feet

Roof ...1-14 feet

115 feet

- One attic ladder
- Two straight ladders with folding hooks
- Two extension ladders

Slide 44

Aerial Devices Rated Capacity

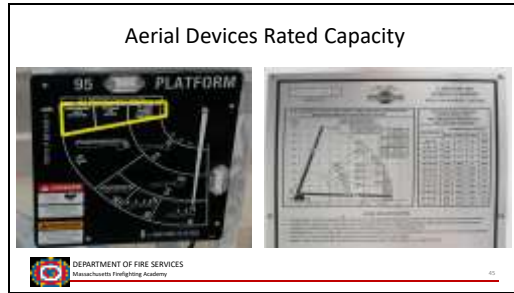

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Load Chart – Graphical or tabular description of the load that can be distributed on an aerial device based on factors such as extension, elevation, stabilizer set-up, wind, water flow and ice-load.

The load chart is criteria should be so familiar to the operator that he or she can instantly recognize when the operation is nearing a critical condition, especially during the stress of rescue operations.

In addition to load charts, some aerial apparatus may have electronic load monitoring or envelop control systems, these systems can fail or provide in accurate information so they should not be relied upon as the only means to determine safe operation practices.

Slide 45

! WARNING !

Tip-Over or Structural Failure Hazard

- Do not exceed rated capacity or rated number of people
- Do not operate in high winds or with excessive ice coating.
- Apparatus must be on a surface that will support the load before raising device

FAILURE TO COMPLY WILL
INJURE OR KILL

Slide 46

Maximum Rated Capacity									
Device or Configuration	25' to 30'	30' to 35'	35' to 40'	40' to 45'	45' to 50'	50' to 55'	55' to 60'	60' to 65'	65' to 70'
Platform	400	300	200	100	100	100	100	100	100
Tray	---	---	---	---	---	---	---	---	---

Bucket (1000)	---	---	---	---	---	---	---	---	---
Water	---	---	---	---	---	---	---	---	---

Maximum Rated Capacity (with 45° water flow)									
Device or Configuration	25' to 30'	30' to 35'	35' to 40'	40' to 45'	45' to 50'	50' to 55'	55' to 60'	60' to 65'	65' to 70'
Platform	300	200	100	100	100	100	100	100	100
Tray	---	---	---	---	---	---	---	---	---
Bucket (500)	---	---	---	---	---	---	---	---	---
Bucket (1000)	---	---	---	---	---	---	---	---	---
Water	---	---	---	---	---	---	---	---	---

- 250 lb horizontal extended
- Permanently mounted horizontal transverse from each side 45° water flow
- Full range of monitor or nozzle movement as permitted by the manufacturer
- Instruction plate and signs

Slide 47

Load Chart – Graphical or tabular description of the load that can be distributed on an aerial device based on factors such as extension, elevation, stabilizer set-up, wind, water flow and ice-load.

The load chart is criteria should be so familiar to the operator that he or she can instantly recognize when the operation is nearing a critical condition, especially during the stress of rescue operations.

In addition to load charts, some aerial apparatus may have electronic load monitoring or envelop control systems, these systems can fail or provide inaccurate information so they should not be relied upon as the only means to determine safe operation practices.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 48

Questions?

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

48

Slide 1

Slide 2

Slide 3

In this module we will introduce you to the concept of the rig being ready to respond. As a firefighter you're expected to be ready to respond as soon as you come on duty. Your personal gear is given a helmet to boots to gloves inspection each time you come on-duty, so you're prepared for whatever the days brings on. Your apparatus is no different. You would not come to work with holes in your gloves and likewise, you would not want to drive a rig with bald tires. Both situations set the scene for disaster when called upon.

Slide 4

Ready to Respond:

- Apparatus should be fully equipped & ready to respond regardless of frequency of use
- Vehicles & equipment must be maintained in optimum operating condition
- This is essential to response readiness

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Do you have all the equipment the apparatus is assigned? Is everything cleaned, fueled and/or serviced as it should be? You wouldn't start a long trip in your vehicle with only a quarter tank of fuel, would you? Always remember, the public is our customer, and our customers expect no less than 100% from us and our equipment. Broken equipment needs to follow local protocols and removed from service. Fuel cans correctly filled with mix (if appropriate), batteries charged on battery-powered equipment.

- All apparatus should be fully equipped & ready to respond regardless of frequency of use

- Vehicles & equipment must be maintained in optimum operating condition
- This is essential to response readiness

Slide 5

Driver Responsibility:

- Every Driver/Operator should know how to inspect apparatus & equipment
- The D/O must ensure that everything is in working order

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Everyone assigned to drive the device must know where to look and understand what they're looking at. Is the item broken, leaking, torn, etc vital to the mission it could be assigned to do? What is your department's SOP/SOG on performing this duty?

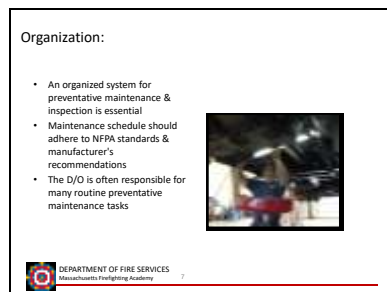

INSTRUCTOR – understand that each FD may have specific guidelines as to what can be touched or looked at. Example – departments having an assigned mechanic may not allow firefighters to “lift” a cab to check such things the oil, or even the batteries. Remind the class if you do raise a cab STOP and look. Does the cab clear the interior objects in the station? Secure doors, run books, lose gear, etc. before raising. Nothing is worse than launching an SCBA bottle through the windshield. Also be aware of

exterior objects on the apparatus such as sirens mounted on the extended front bumper, or front intake suctions, or tools mounted. Know how to secure the cab once it's up! DO NOT place yourself in a position where you could be crushed by a hydraulic failure. More on this subject later.

Slide 6

Slide 7

Organization – not a word we all love to hear but in order to budget and view operational needs of the fire department records must be maintained. Yes, it can seem like a tedious task, but this task helps the Fire Chief arrange the budget. We are entrusted with a piece of equipment worth around a million dollars or more. If we don't keep track of what we're spending to repair/maintain a rig how can a Chief justify replacement?

Likewise, the NFPA and the manufacturer have their recommendations on how a rig is

to be serviced. Sometimes certain items are under a warranty and if records for service and repair are kept current, we can make a strong case for a warranty replacement.

I know these tasks can seem mundane and boring but our lives and safety are dependent on the work being performed.

Slide 8

NFPA Standards:

- NFPA 1002: Standard for Fire Apparatus Driver/Operator Professional Qualifications:
 - Requires that D/O's record & report service functions of the apparatus

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Service Functions – Change a lightbulb, change a battery, fuel it up, replaced the front tires, etc.

Slide 9

NFPA Standards:

- NFPA 1914: Standard for Testing Fire Department Aerial Devices
 - Requires that maintenance records for the aerial device be available during the annual tests

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Annual testing is done by a certified testing agency. When completed a gig sheet will be provided to the FD outlining repairs – service – updates needed. Aerial Ladder testing isn't ground ladder testing, two separate tasks.

Slide 10

Record Keeping:

- Accurate & descriptive records must be kept for inspections & all preventative maintenance
- D/O is responsible for filling out forms for the maintenance tasks they perform

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 10

Accurate record keeping cannot be reinforced enough times. If the rig is involved in a mishap (MVC or a failure for example) a record will be sought by insurance companies, OSHA, attorneys, ISO, etc. Missing records, regardless of how often the task is performed indicates it was not performed.

Slide 11

Value of Records:

Warranty Claims:

- Documentation shows that maintenance has been performed

Accidents:

- Records are likely to be scrutinized by accident investigators
- Documentation of recurrent repairs can assist in purchase decisions or repairs

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 11

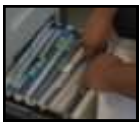

Apparatus and equipment often are accompanied with warranties and the lack of recording events and actions can often mean the difference in a successful claim filing or not.

When a rig is involved in some sort of incident people come out of the woodwork to file claims, and charges against the city, town, fire department, even the individual operating the rig as well as those responsible for making sure the records are maintained.

Slide 12

Documentation Systems:

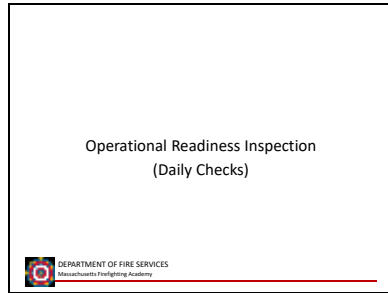

- Use paper checklists or electronic forms for maintenance documentation
- All records & maintenance results should be filed according agency SOP
- Documents should be readily available for review & retrieval

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 12

Follow what your FD requires. Laziness is not an excuse. Records need to be maintained and easily accessible.

Slide 13

Slide 14

Operational Readiness Inspection:

- Regular pre-shift inspection helps to recognize maintenance needs before they become repair problems
- Procedures may vary depending on department policy & vehicle design

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

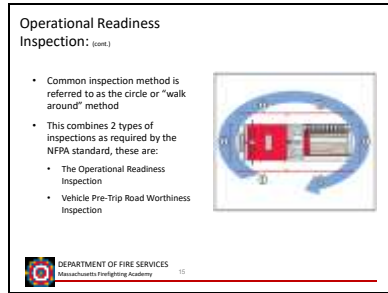

14

If you're a career department an operational readiness inspection should be performed at the start of the shift. If you're in-service for a response immediately at shift change, make sure it's completed as soon as you return.

Do you have a Quint in your station? When was the last time the water tank level was checked? Think about this, at 0200 the company went out on a small pile of mulch smoldering. Maybe a hundred gallons of was used and on return the crew agreed they'd top it off before shift change, they forgot....

If you're a call/vol department, it's just as important these readiness inspections are performed on some consistent level. What is your department policy?

Slide 15

Up, down and all around. If it beeps, beep it. If it flashes, flash it. If it..., I think you get the picture. The time to learn the headlights are not working isn't when the call comes in...

- Common inspection method is referred to as the circle or "walk around" method
- This combines 2 types of inspections as required by the NFPA standard, these are:
 - The Operational Readiness Inspection
 - Inspecting an apparatus and equipment on the apparatus to ensure that all the equipment is in place, clean, and ready for service
 - Vehicle Pre-Trip Road Worthiness Inspection
 - A visual inspection of an apparatus to ensure the major components of the chassis are present

and in proper working condition.

Slide 16

Operational Readiness
Inspection:

- Inspection begins as you approach the vehicle
- Observe overall general condition & cleanliness
- Look for obvious damage, leaks or spots underneath & any leaning of vehicle to one side

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 16

Ever have this happen? A dent and chip of paint are found on a rear cabinet door. Who did it? These are among the most common things found, and not reported. How about this example, day shift did their “inspection” but the night shift came on and found a front tire has no tread on the inside. Who missed this rather important area? Are you comfortable driving on bald tires?

Slide 17

Operational Readiness
Inspection: Tires

- Check condition of tires & wheels
 - Tires should be properly inflated & have enough tread depth
- Look for:
 - Any signs of tread separation
 - Excessive wear on sidewalls
 - Cuts
 - Foreign objects stuck in tires

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 17

How many PSI in the tires? Don't guess! For the most part a majority of the apparatus manufacturers have a plate affixed to the doorframe area on the driver's side indicating proper tire pressures. Apparatus manuals will also have the pressures listed.

Rear duals, do you have a tire pressure extension hose attached? The inner tires are just as critical to the apparatus and must be properly inflated.

Tire Pressure Monitor devices (TPM). According to the

U.S. National Highway Traffic Safety

Administration regulations ^[14] only apply to vehicles under 10,000 pounds. For heavy duty vehicles (Classes 7 and 8, gross vehicle weight [GVW] greater than 26,000 pounds),

Some apparatus companies install a pressure cap that has a battery-powered LED. Green – OK, Red – low pressure indicator light. Replace the batteries as needed. However, do not depend on these devices to be the sole means of confirming tire pressure. Use a gauge.

Slide 18

Operational Readiness
Inspection: (cont.)

- Inspect any exterior compartments & confirm that all equipment is in place & properly stowed
- Front of the vehicle, check for body damage
- Look under front to inspect axle, steering system & pump piping
- Look for evidence of any fresh oil, coolant, or any other leaking fluids

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

At times, the most subtle failures in hoses, springs and more could be discovered at this time. Get on a creeper and look underneath. When inspecting the under-carriage of a vehicle be sure to wear safety glasses to protect your eyes from dirt or other contaminants from enter your eyes. It's also important to have an understanding as to what you're looking at and don't go yanking or pulling on items/wires/belts/hoses without understanding what they do in the grand scheme of the rig. If it doesn't look right notify someone in your chain-of-command.

Slide 19

Operational Readiness
Inspection: (cont.)

- Check condition of windshield & wiper blades
- Glass should be clean & all lights & reflectors in place
- Headlight & signal lenses should be clean & intact
- Check the lights:
 - Brake lights
 - Reverse lights
 - Signal lights
 - Flashing warning lights
 - Scene lights

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 19

Smeared, dirty and water-spotted windshield glass can lead to a lack of visual clarity important for safe vehicle operation. After washing a rig make sure water spots are removed. Clean interior glass as well.

Cracked and worn wiper blades are of no value to anyone, replace them. Wiper blades is not the place to cheap-out. The same goes for all running lights and warning lights. A broken warning light has no safety value unless it is working and can be seen.

Slide 20

Operational Readiness
Inspection Fire - Pumps

- Fire pumps are tested at regularly scheduled intervals
- Some items are checked daily, others may be performed weekly
- Follow SOP's for daily pump inspections (if equipped)
- Some checks include:
 - Check of pump intakes & discharges
 - Visual inspection of water tank to be sure it is full

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 20

If you have a quint, running the pump is just as important as running the aerial or tower device.

Slide 21

Fluids Level Checks:

- Check:
 - Automatic Transmission Fluid
 - Power Steering Fluid
 - Windshield Washer Fluid
 - Brake Fluid
 - Radiator Coolant
 - Oil

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

21

CAUTION: Some of these fluid checks require a warmed-up engine, be care of hot engine parts and fluids. Make sure you're wearing safety glasses and consider wearing hand protection such as ems (or work) gloves to protect your hands. Have a suitable work rag handy for wiping off cap tops, reservoirs, and dip sticks. This will avoid contaminants from enter the system.

Slide 22

Diesel Particulate Filters:

Diesel Particulate Filters (DPF)

- This system has automatic regeneration
 - Periodically burns off exhaust particulate matter accumulated in filters
- If the system fails, clogged filters will cause vehicle to experience a reduction in power & driving capacity

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

22

Know and understand how this system works and follow manufacturer recommended procedures. An error here can cost your department thousands of dollars in repair bills.

Slide 23

Selective Catalyst Reductant:

Selective Catalyst Reductant (SCR):

- An exhaust "after-treatment system"
- Uses Diesel Exhaust Fluid, (DEF) to help further reduce emissions
- Fluid level should be inspected
- Tank is located downstream of the DPF

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

23

This is another area where you need to understand what fluid you add, and how much. Use the fluid recommended, don't mix fluids.

Slide 24

Exhaust System:

- Inspected exhaust system for cracks or leaks
- Inspect exhaust pipe wrap or insulation should
 - Should be intact & undamaged
 - Especially important for apparatus with DPF's

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 24

Again, reinforce the importance of wearing eye protection and hand protection. Caution because the exhaust could be hot. Check cold!

An exhaust system crack can effect the health of vehicle occupants. Report suspected leaks, cracks, or potential failures to your chain-of-command.

Slide 25

Battery Check:

Batteries are typically maintenance free

- Confirm battery is secure
- Confirm terminal connections are clean & tight

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 25

Look for build-up of corrosion, this is an indication of a potential battery failure. Clean debris build-up away from terminal posts.

Slide 26

Interior Inspection:

- Confirm that any equipment in rear portion of cab is properly stowed & any required equipment is in place
- Check that seatbelts are in good condition & operate smoothly
- Confirm that the seat, mirrors & steering wheel are adjusted properly

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 26

Remember, every loose item inside a cab is a potential missile should the vehicle have to come to an aggressive stop.

Slide 27

Engine & Idling:

- Once engine has been started, listen for any unusual engine noises
- Follow the manufacturer's recommendations on idling
 - Allowing a diesel engine to idle unnecessarily can waste fuel
 - May lead of a buildup of carbon in injectors, valves & pistons

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 27

Slide 28

Gauge Checks:

- Check that gauges
- Oil pressure gauge
- Ammeter and/or voltmeter

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 28

Provide manufacturer's info about recommended oil pressure range.

Slide 29

Gauge Checks: (cont.)

- Air pressure gauge
- Make sure you have enough fuel
 - Most departments maintain the tank at least three-quarters full at all times

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 29

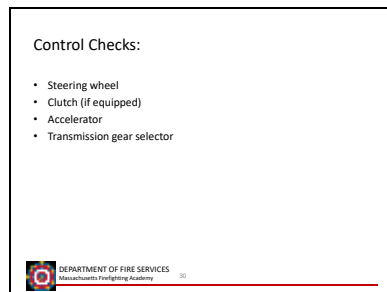

When you're performing your inspection part of the process is listening for air leaks. Exposed rubber boots and connections can allow for grit and dirt to enter and cause excessive wear resulting in air leaks.

- Air pressure gauge to ensure that adequate

pressure is
built up to
release parking
brake &
operate
service brake

- Make sure you have enough fuel
 - Most departments maintain the tank at least three-quarters full at all times

Slide 30

- Try all controls & check for stiffness, looseness, or improper alignment
 - Steering wheel

- Clutch (if equipped)
- Accelerator
- Transmission gear selector

Slide 31

Visible & Audible Warning Devices:

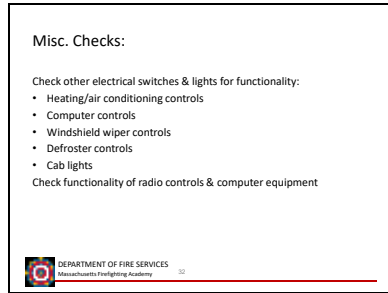

- Hearing protection when checking sirens & air horns
- Check turn signals & high-beam headlights
 - A second person is useful in assisting with this procedure

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 31

- Personnel should be wearing hearing protection when checking sirens & air horns
- Check turn signals & high-beam headlights
 - A second person is useful in assisting with this procedure

Slide 32

HVAC that doesn't adequately clear a windshield or windows creates a driving safety hazard.

Check other electrical switches & lights for functionality:

- Heating/air conditioning controls
- Computer controls
- Windshield wiper controls
- Defroster controls
- Cab lights

Check functionality of radio controls & computer equipment

Slide 33

Slide 34

Inspection Procedures:

- Complete a visual inspection of aerial device features
- Check fluid level in hydraulic reservoir
 - Typically done when system is cold
 - Consult manufacturer's recommendations
- Check & fill hydraulic fluid only when stabilizers & aerial devices are in stowed position

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Understand the critical nature of the inspection process. Also understand what you're looking at and where these hydraulic levels should be. Often is the case where the manufacturer specifies level must be checked when warm. Hydraulic fluid expands as it warms, in a cold state the fluid level may appear as low while it's not. Also remember when handling hydraulic fluid exercise basic safety precautions by wearing eye protection and ems gloves to protect hands.

Consult local protocols BEFORE adding hydraulic fluid and make sure you have the fluid appropriate for the task.

Slide 35

Stabilizer Inspection:

- Inspect stabilizers:
 - Damage
 - Fluid leaks
 - Worn components
- Ensure that warning lights are clean & undamaged
- Inspect the condition of stabilizer pads

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Use a clean rag while inspecting. If items such as pins are missing or bent, this is a problem and needs to be reported to your chain-of-command.

Slide 36

Turntable Inspection:

- Check turntable assembly:
 - Proper gear alignment
 - Evidence of wear
 - Proper lubrication
- Inspect tower control pedestal for wear or damage
- Make sure that controls move freely & automatically return to their "neutral" positions
- Check that electrical connections are tight & free of wear

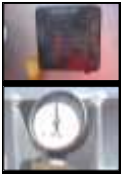

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Often hydraulic leaks are found in the turntable area. If noticed spend some time tracking down the exact source of the leak. Due to the movement of so many parts and to so many different angles you may not find the source area right away.

Slide 37

Equipment Check:

- Inspect aerial device communications system components for wear or damage
- Check status & operation of breathing air supply system, if equipped
- Check the elevation/lifting cylinders for:
 - Leaks
 - Signs of wear or damage
 - Missing components

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

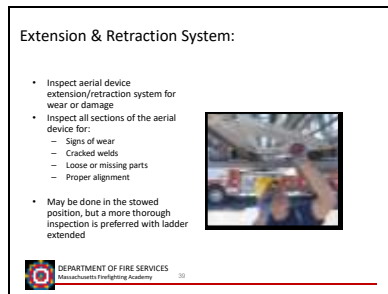

Because the speakers on the ladder are exposed to so much environmental, as well as physical abuse, do a test. Wiring can easily be corroded from the elements.

What is your department's SOP for refilling the air cylinder on the ladder? Can anyone perform this task?

Slide 38

Slide 39

Extension of the ladder can be somewhat challenging if your fire station's parking area isn't big enough. However, due to the importance of this inspection it must be done. Find a parking lot where the ladder can be fully extended. Perform a visual inspection of every section looking for cracks or wear damage. There are heavy-duty plastic guides that do wear and need replacement every so often. Some manufacturers recommend a dry lube be sprayed along the tracks followed by a gentle wipe-down to keep the guides lubricated.

Don't forget to look at the cables and pullies. They wear out as well. Subtle splitting of the cable wires can eventually lead to a failure.

Slide 40

Waterway, Platform & Ladder:

- Inspect piped waterway system for visible damage or signs of water leaks
- Elevating platform (if equipped), check:
 - Assembly components for fluid leaks
 - Wear or damage
- Inspect ladder rungs for:
 - Looseness
 - Weld cracks
 - Wear or damage

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 41

Check, check, and re-check.
Cracks, worn treads, damage all could point to a failure if not addressed.

Slide 41

Aerial Device Operational Check

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 42

The Operational Check:

- The operational check serves 2 purposes:
 - To ensure that the aerial device is in proper working condition
 - As a review of the aerial operations

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 42

- The operational check serves 2 purposes:
 - To ensure that the aerial device is in proper working condition

- As a review of the aerial operations

Slide 43

Familiar & Prepared:

- The aerial vehicle may be used regularly on calls, but the aerial device equipment may not be used for weeks or months
- By operating it during the inspection process, the D/O is familiarized again with device & prepared to use it

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

If you have a new person on shift, or newly assigned to the truck, let them practice using the controls. The time to understand limitations isn't at the fire scene.

- The aerial vehicle may be used regularly on calls, but the aerial device equipment may not be used for weeks or months
- By operating it during the inspection process, the D/O is familiarized again

with device &
prepared to use it

Slide 44

Basic Steps of
Operational Check:

Basic steps include:

- Park apparatus in a suitable location for operating aerial device
 - Location should be free of overhead obstructions
 - Capable of supporting the weight of the apparatus

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

The stowed height of most aerial devices is usually the highest in a department's fleet, but during a response other common obstructions will be present. Know what areas have low-hanging trees. Is there a pedestrian bridge? What about low-hanging service drops or other wires? At a scene we have many of these same obstructions present and task at hand could be more challenging. Avoid potentially soft area such as a lawn. Local sidewalks, while appearing strong, are likely not built using rebar and thus will not support the weight of an +80,000-pound ladder truck.

Slide 45

Basic Steps of Operational Check: (cont.)

- Place the transmission in neutral
- Set the parking brake
- Transfer power from the drivetrain to the aerial device hydraulic system
- Chock the tires

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

CAUTION: advise students there could be slight variances in their rig from this procedure.

Slide 46

Fluid Checks:

- Check fluid level in the hydraulic system
 - Fluid checks & adding of fluid should only be done when stabilizers & aerial device in the stowed position
- Once fluid checks are completed deploy stabilizers according to manufacturer's recommendations

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

- Check fluid level in the aerial device hydraulic system
 - Fluid checks & adding of fluid should only be done when stabilizers & aerial device in the stowed position
- Once fluid checks are completed deploy stabilizers according to manufacturer's recommendations

Slide 47

Stabilizer Check:

- Check stabilizers for:
 - Signs of damage
 - Leaking hydraulic fluid
- Move the hydraulic system selector valve control to the aerial device position

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 47

Slide 48

Level Indicators

Point to Black and Red to Stop

- Green zone is the safest area for operations
- Yellow zone for CAUTION
- Red zone status: DO NOT OPERATE

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 48

Slide 49

Aerial Device Check:

- Raise & extend aerial device
- Operate appropriate controls to fully elevate & extend the device
 - Listen for unusual noises
 - Look for jerky movements
 - Look for unusual bending or twisting of the aerial device
- Rotate aerial device
 - Listen for unusual noises
 - Look for jerky movements or fluid leaks

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy 49

Especially for new operators, try to use two hands on the controls. While this might be a little challenging given how different manufacturers set up their controls, using two hands for the new operator can allow them to discover how the control the different functions.

Remember, the ladder is a massive amount of weight being held in place by two pistons. Jerky movements on the part of the operator can have devastating effect and a whipping action on the ladder. This is a lot of energy being

sent up the ladder and back when you “cowboy” the stick.

Slide 50

Aerial Device Check: (cont.)

- Test operation of auxiliary equipment on the aerial device
 - Remote control nozzles
 - Video cameras
 - Flood lights
 - Other auxiliary equipment

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy (50)

New aerials are being built with remote devices. Some of these devices are tethered, and some are not. Check the battery operation as well.

Slide 51

Aerial Device Check: (cont.)

After completing aerial device inspection:

- Stow aerial device, once stowed stabilizers should be retracted & the apparatus made ready for travel

After these tests, make sure that:

- No fluid leaks have appeared
- All indicator lights go out when the appropriate systems are de-energized

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy (51)

Make sure you do a complete 360-degree review and note any fluid leaks

Slide 52

Aerial Device Check: (cont.)

- Once the operational check is complete, fill out all required forms & route them according to departmental SOP

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Here's a thought, it's the same as writing an ems report, if you don't document it, you never did it. This isn't about just filling out another "useless" piece of paper. More over it's about protecting you, those you work with and our customers, the public. The public expects you and all equipment to be a peak readiness and performance.

Slide 53

Maintenance

All issues should be reported immediately to the proper person in your department.

***ALWAYS BE SURE TO FOLLOW
MANUFACTURERS RECOMMENDATIONS.***

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 54

Summary:

- Maintenance & Inspection Record Keeping
- Operational Readiness Inspection
- Engine Compartment & Cab Inspection
- Aerial Device Inspection Procedures
- Aerial Device Operational Check

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 55

Summary:

- A strong inspection & preventative maintenance program ensures:
 - Apparatus reliability
 - Reduces the frequency & cost of repairs
 - Decreases out-of-service time
- By following department maintenance & inspection procedures you can help reduce unexpected & catastrophic equipment failures that could threaten life and/or property

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Questions?

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 1

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Safety

Slide 2

Safety

- Only trained and authorized personnel should operate and maintain the apparatus

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

2

Slide 3

Remember - Safety First

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

3

Slide 4

Safety

- Personal Protective Equipment (PPE) must be used during practical training.
- Follow Department SOPs.
- Minimum, helmets, gloves and ladder belts will be worn.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

SAFETY FIRST – EVERY DAY

- Personal Protective Equipment (PPE) must be used during practical training.
- Follow Department SOPs.
- Minimum, helmets, gloves and ladder belts will be worn.

Slide 5

Safety - NFPA 1901 Seat Belts

- Always Wear Your Color Compliant **RED** Seat Belt

Remember...Only YOU can prevent injury or death

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 6

It Can Happen to You!!!!

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Don't think it can't happen to you.

Aerial/Tower Ladders carry an enormous amount of the overall weight up high.

Roadway design can lead to rollover situations.

Wet surfaces suitable for an automobile can be deadly for fire apparatus and especially hazardous for aerial/tower rigs.

Slide 7

This guy was lucky. Very lucky especially since he wasn't wearing a seatbelt.

Expect the unexpected. After all, you're driving a rig that weighs over 80,000 lbs. Braking, maneuvering, and acceleration react differently than an engine, or your car.

Slide 8

REMINDE STUDENTS: NOT ONLY KNOW THE APPARATUS HEIGHT, WEIGHT, LENGTH AND WIDTH BUT LOW OVERHANGS IN YOUR RESPONSE AREA.

WHEN ON MUTUAL AID KEEP THESE
NUMBERS IN MIND AS WELL.

Slide 9

Don't guess. Know your apparatus weight and height. It can be a very expensive and costly mistake.

Same goes for mutual aid responses.
Don't guess the sign... You'll lose!

Slide 10

Know Your Travel Height

- The driver must confirm the vehicle can freely pass low underpasses

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

10

Slide 11

Watch Your Turning

- Increased overhangs, especially at the rear, must be kept in mind. In narrow crossings, the driver must confirm that there is enough space for turning

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

11

Slide 12

Remember High Center of Gravity

- Note: Speeding with the vehicle when turning a corner is dangerous! 60% of your weight is ABOVE you.

19

Providence, RI

Slide 20

Safety – Electricity Hazards

Treat all wires as dangerous and energized at high voltage until tested and proven otherwise

DEPARTMENT OF FIRE SERVICES
Marion/Heath Training Academy

20

Slide 21

Safety – Electricity Hazards

- Establish a safety zone. The ground around the vehicle may be energized.
- Unless threatened by fire or some other danger, occupants should remain on/in the vehicle until it is confirmed that the power is off.
- If the ladder makes contact with any energized electrical lines, do not allow any person on the ground to touch the apparatus or any person on it.

DEPARTMENT OF FIRE SERVICES
Marion/Heath Training Academy

21

Slide 22

Safety – Electricity Hazards

If you must abandon the apparatus while ladder is in contact with power lines –

YOU MUST JUMP COMPLETELY CLEAR OF THE APPARATUS

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

22

Slide 23

Think it can't it can happen to you...?

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

23

Slide 24

Safety – Electricity Hazards

Follow these guidelines when working in the vicinity of power lines;

- Make sure the work area is clear of overhead obstructions.
- New OSHA Standard requires 20 feet between the device and electric lines of less than 350 kilovolts
- 50 feet if unknown or over 350 kilovolts.
- Do not work within 50 feet of high-voltage transmission lines.
- **Look up and Live:** Always check the operating vicinity for power lines before you drive into it. Tree branches can hide power lines or cables from view. If operating at night, use powerful lights to search for power lines or poles.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

24

Slide 25

Electrocution Death

- Fire Captain killed while in the bucket of a ladder truck
- The bucket came in contact with a 12,400 volt overhead power line

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

25

Slide 26

Electrocution Death

Three firefighters were also injured in the incident but their injuries are not life-threatening

"PPL did cut the power to the house, but didn't cut the high voltage wires. Maybe there was a communication break between the chief and PPL, but that's to be determined later on," indicated Fire Chief Tom Davis.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

26

- STRESS – IC/DESIGNATE MUST CONFIRM WITH POWER COMPANY REP THAT POWER IS IN FACT CUT.
- NO GUESSING
- DON'T TAKE THE WORD OF A BYSTANDER OR WELL-INTENTIONED FIREFIGHTER
- PPL – Pennsylvania Power & Light, Scranton, Pa home base.

Slide 27

NIOSH Investigative Report of the Death

- Proximity to energized powerlines
- Suboptimal incident command
- Absence of relevant SOPs
- Absence of specific periodic training
- Heightened sense of urgency given civilian occupants
- Lack of verification of the powerline energy state

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

27

Slide 28

Safety – Electricity Hazards

- Articulating boom operators have two areas of the apparatus to monitor: the platform and the boom, particularly in the area of the boom joints or hinge.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

28

Slide 29

Safe Operations – Electricity Hazards

The entire vehicle may be energized, causing tires and fluids to burn, and other components to fail, especially pressured cylinders and hydraulic tools

DEPARTMENT OF FIRE SERVICES

30

FF UNAWARE NEWLY HUNG POWER LINES WERE OPERATIONAL – SITUATIONAL AWARENESS

Slide 31

MAKE NOTE OF THE POSITION OF THE TOWER IN CONJUNCTION TO THE 69 KV POWER LINES.

Slide 32

MAKE NOTE OF POWER LINES ON BOTH SIDES OF THE STREET. THE TOWER IS DIRECTLY BENETH BOTH LINES. THE TOWER DID NOT COME IN DIRECT CONTACT WITH THE LINE CLOSEST TO THE BUCKET, WHEN IT WAS RAISED IT CAME CLOSE ENOUGH TO CAUSE AND ARC FROM THE 69KV LINE TO THE LADDER, THE FIREFIGHTERS HAD NO IDEA WHAT WAS HAPPENING, THE ARC WAS DIRECTLY BEHIND THEM.

Slide 33

WATER WAS FLOWING WHEN THE INCIDENT HAPPENED.

Slide 34

Slide 35

Safety - In a Lightning Storm

Do not operate the ladder in a lightning storm! If on the scene emergency conditions dictate the aerial to be used during a lightning storm, extreme caution should be used during the operation to avoid severe personal injury!

DEPARTMENT OF FIRE SERVICES
Marion/Heath Training Academy

Slide 36

Safety - High Wind Conditions

- Moderate to high winds impose a dynamic load on the aerial device and may reduce the overall stability by forcing movement for which the apparatus was not designed.
- The driver/operator should always adhere to the manufacture's recommendations for operations in windy conditions.

DEPARTMENT OF FIRE SERVICES
Marion/Heath Training Academy

Slide 37

Safety – Cold Weather Conditions

- Cold weather causes an increased viscosity of the hydraulic oil, slowing overall operation
- Ice can add a significant amount of weight to an aerial device
- Limit of ice build-up allowed by NFPA is ¼ inch, consult load chart
- *Ice Shrugging*- slowly extending and retracting the aerial device to remove accumulated ice.**

January 23, 2009, 15 Washington Ave., Boston, MA
Group 1 - 4.0000

DEPARTMENT OF FIRE SERVICES
Massachusetts Training Academy

*** If the ice becomes so thick that it cannot be shrugged off, another method of deicing will have to be used. The manufacturer should indicate which thawing agents and techniques are acceptable for the apparatus.

Slide 38

DEPARTMENT OF FIRE SERVICES
Massachusetts Training Academy

In this video you hear the statement, “...firefighters responded to a vacant apartment building, first responders didn’t think much of it.” Is there COMPLACENCY being demonstrated here? Is everyone on their “A-game”?

Other safety notes – 1) firefighters working with a rig beyond its safe operational limits. 2) firefighters not in proper PPE. 3) extension of aerial.

Slide 39

Questions?

DEPARTMENT OF FIRE SERVICES
Massachusetts Training Academy

Slide 1

Slide 2

Positioning

- D/O must be trained in the basics of proper positioning so that they can apply them swiftly and properly when necessary on the fireground.
- SOP's can establish for aerial apparatus placement pursuant to the type of aerial apparatus and incident.

DEPARTMENT OF FIRE SERVICES
Advanced/Rescue Training Academy

Each incident is unique and different positioning techniques for aerial operations may be required.

Examples of SOP's

- When two aerials respond to a given location, first –arriving aerial takes the front and the second the rear or side, depending on building access
- When two aerials respond to a given location, the first position is based on the present conditions. The second aerial apparatus stages one block away or in accordance with departmental SOPs and awaits instructions.
- Single aerial responds to a given location, the apparatus takes a strategically sound location in front of the building unless otherwise directed.

Slide 3

Positioning - Spotting

Spotting refers to positioning the apparatus in a location that provides the utmost efficiency for operating on the fireground. Often, this location is the final operating position for the aerial apparatus at the scene.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 4

Positioning - Spotting

The D/O must consider certain factors when determining this final operating position of the aerial apparatus:

- Surface conditions
- Grade
- Windy Conditions
- Ground or overhead obstructions
- Angle and location of aerial device operation
- Special situations

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 5

Positioning – Collapse Zone

Aerial apparatus responds to a given location, the apparatus take a strategically sound location in front of the fire building unless otherwise directed by the IC. For example, the apparatus may be centered in front of the involved portion of the building for offensive operations or at a corner of the building (out of the collapse zone) for defensive operations.

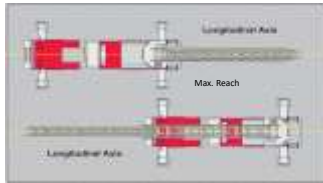

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 6

Positioning – Angle and Location of Aerial Device

- Apparatus stability is **greatest** when the aerial device can be operating in line with the longitudinal axis of the apparatus.

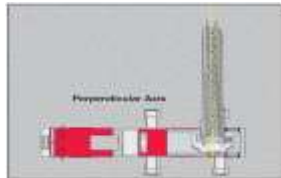

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 7

Positioning – Angle and Location of Aerial Device

- An aerial apparatus is **least** stable when the aerial device is operated perpendicular to the longitudinal axis of apparatus.

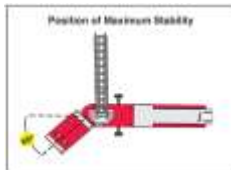

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 8

Positioning – Angle and Location of Aerial Device

- Jackknifing** the tractor of a 60 degree angle from inline with the trailer provides **greatest** stability.
- Good stability occurs at angles up to 90 degree, **but decreases at angles beyond that.**

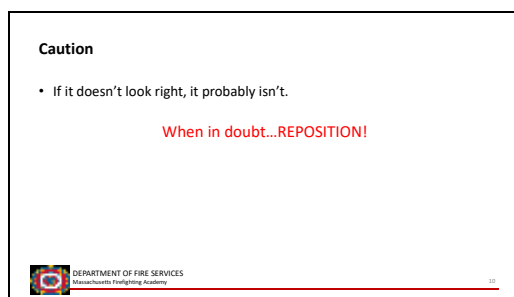

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 9

- Slopes – The center of gravity will shift to the lower side of apparatus parked on a lateral grade.
- 5-7 degree
- 8.4 percent of grade
- Lateral grades may adversely affect the stability of the truck
- Define lateral grades?
- Lower the stabilizers on the high side of truck until they just touch the ground
- Lower the stabilizers on the low side until truck is brought to level
- Most manufacturers recommend that on a lateral grade the stabilizers on the high side of the vehicle be lowered first.
- On a lateral grade, after the apparatus is stabilized, it is preferable that the aerial device be operated over the high side of the apparatus.
- Operate the aerial ladder on the high side of the apparatus.

Slide 10

Slide 11

Slide 12

Positioning on Hills and Slopes

Always Position the Aerial on Level or Near Level to Roll

Aerial Grade	Knock Down	Supporting
100 ft	0 to 1.5 degrees	1.5 ft
15 ft	0 to 1.5 degrees	1.5 ft
15 ft	1.5 to 3.0 degrees	1.5 ft
15 ft	3.0 to 4.5 degrees	2.0 ft

Always Position the Aerial on Level or Near Level to Roll

Aerial Grade	Knock Down	Supporting
100 ft	0 to 1.5 degrees	1.5 ft
15 ft	0 to 1.5 degrees	1.5 ft
15 ft	1.5 to 3.0 degrees	1.5 ft
15 ft	3.0 to 4.5 degrees	2.0 ft

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

- When approaching from the uphill side, reduce torsional stress on the aerial device by spotting the turntable downhill from the point of operation
- When approaching from the downhill side, reduce stress on the aerial device by stopping short of the building and operating the aerial over the cab
- NFPA 1901 – Section 20.21.3 Sloping Surfaces
- Section 20.24.2.8.1

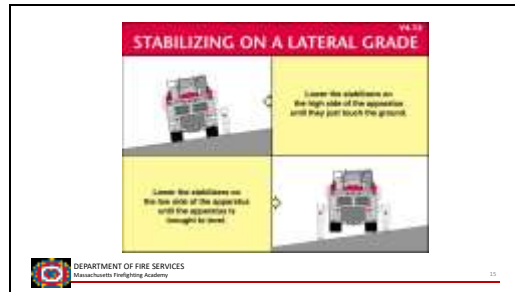

Slide 13

Slide 14

Slide 15

Slide 16

Slide 17

Conducting Preliminary Checks

Before the actual deployment of the stabilizers, D/O should conduct some preliminary checks:

- If not automatically accomplished, activate the front brake
- Make sure that the PTO engaged
- Chock the wheels, **follow the manufacturer's recommendations.**

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

- Some newer apparatus has automatically front brake when you put into PTO.
- The wheels should have chocks placed both in front and rear of the tire on both sides of the apparatus, leaving approximately an inch of space between the tire and the chock.
- Reposition the chocks if needed after lifting the apparatus.
- If using the collapsible types of chocks, it is critical that they are locked and properly deployed.

Slide 18

Stabilizers

- There are three common stabilizer configurations; Post-Type, Box & A-Frame
- Avoid deploying stabilizers on unstable surfaces
- Use Stabilizer Pad as recommended by manufacturer

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 19

- Avoid positioning near trees, overhangs, parked vehicles, trash containers, and similar obstructions that may affect the operation of the stabilizers and/or aerial device.
- When operating single-chassis apparatus on grades perpendicular to the long centerline of the vehicle, level the chassis by using the stabilizers to raise one side or to lift the chassis completely off the ground.
- Does the manufacturer recommend lifting off the ground?
- NFPA 1901, Section 20.23

Slide 20

Stabilizer – Cold Weather Conditions

- Ice reduces the stabilizer ability to make solid contact with the ground; avoid ice if possible
- Frozen ground can also melt from the exhaust or water runoff and leave an unreliable surface from the stabilizer (be prepared to lower them further for maximum contact with the ground)
- If the surface is on an angle, the aerial can move or chatter along the surface due to the combination of vibration and gravity; this can be prevented with wheel chocks & sand.

Void due to melted snow/ice

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 21

NFPA 1901, Section 20.21.4 through 20.21.4.4

- Park it in position
- Brake and chock (front wheels)
- Lower or place stabilizers and pads
- Balance and a firm unmoving position is essential

TURNTABLE CONSOLE CONTROLS -

Contains most controls and indicators needed to operate the aerial.

STABILIZER CONTROL PANEL -

Contains stabilizer, hydraulic filter, PTO, high idle, EPU, and diverter valve controls and indicators.

RIGHT STABILIZER CONTROLS -

Contains right side stabilizer beam and jack controls.

LEFT STABILIZER CONTROLS - Contains left side stabilizer beam and jack controls.

ANGLE INDICATOR (SLOPE) - Indicates vehicle slope in degrees.

MANUAL OVERRIDE CONTROLS -

Contains stabilizer and aerial override controls.

Slide 22

- Lighting of stabilizers points, watch the colors.

TURNTABLE CONSOLE CONTROLS -

Contains most controls and indicators needed to operate the aerial.

STABILIZER CONTROL PANEL -

Contains stabilizer, hydraulic filter, PTO, high idle, EPU, and diverter valve controls and indicators.

RIGHT STABILIZER CONTROLS -

Contains right side stabilizer beam and jack controls.

LEFT STABILIZER CONTROLS - Contains left side stabilizer beam and jack controls.

ANGLE INDICATOR (SLOPE) - Indicates vehicle slope in degrees.

MANUAL OVERRIDE CONTROLS - Contains stabilizer and aerial override controls.

Slide 23

Level Indicators

Front to Back and Side to Side

- Green zone is the safest area for operations
- Yellow zone for CAUTION
- Red zone states DO NOT OPERATE

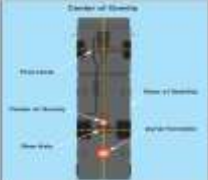

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

23

Slide 24

Stabilizing Principles

The center of gravity of an apparatus is limited if the stabilizers are not deployed before using the aerial device.

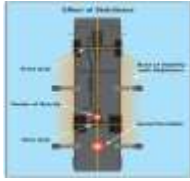

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

24

Slide 25

Stabilizing Principles

By deploying the apparatus stabilizers, the base of stability for the aerial apparatus is effectively increased.

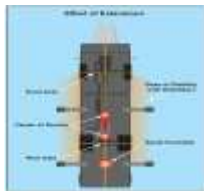

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

25

Slide 26

Stabilizing Principles

The center of gravity shifts forward if the aerial device is extended over the front of the apparatus.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

26

Slide 27

Stabilizing Principles

The center of gravity shifts as the aerial device is rotated

Gravity Circle – Theoretical safety zone that surrounds the center of gravity on an aerial apparatus.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

27

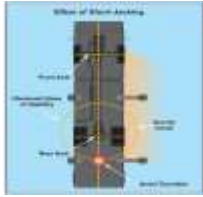

Rotating the device 360 degrees will trace a gravity circle. As long as this gravity circle does not extend outside the base of stability, the apparatus should remain stable.

Slide 28

Stabilizing Principles

The gravity circle extends beyond the base of stability on the short-jacked side indicating that extending the aerial device on the short-jacked side will likely overturn the apparatus.

Newer apparatus may be equipped with rotational interlocks, that prevent the movement of the aerial device to the short-jacked side.

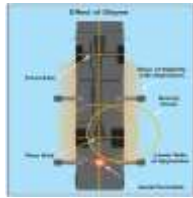

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

However, the driver/operator should not rely on these automatic features to prevent a serious accident from occurring. **Once again, only short-jack if you have to. MFA recommends fully deploying stabilizers and stabilizer pads during every stabilizer setup and every time the aerial device is raised from its bed.**

Slide 29

Stabilizing Principles

When operating on a grade, the gravity circle will shift to the lower side. When the aerial device is raised on that side, it may extend beyond the base of stability.

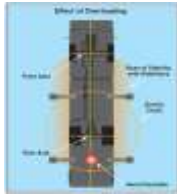

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 30

Stabilizing Principles

Overloading the aerial device expands the gravity circle, potentially beyond the base of stability.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

An example of this would be an overextended, older aerial device that is operating at low angles of elevation.

Slide 31

Jack Foot Plates

- Make sure the jack plates are on the ground prior to lifting the truck.
- Jack plates are mandatory and provide essential disbursement of ground pressure beneath the outrigger
- Jacks should be on firm surface at ALL times!

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Some jack plates are build into the stabilizers

Slide 32

Set the Pins

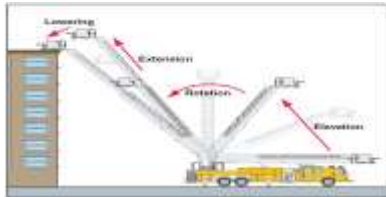

WELD POINT CAN BE WEAK

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

- When you set the pins leave 1 inch on the handle side to prevent shearing.
- Some outriggers do not have pins.

Slide 33

The aerial device should be elevated, rotated, extended and lowering in that order.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Using one motion at a time is recommended unless the situation is critical and the operator is qualified to operated the apparatus in that manner, or the apparatus is equipped with a system that is designed for multi-use operations. Because of the forces being generated, especially as length increases, all movements must be slow, smooth and controlled (also known as feathering). No rapid movements of the control are permitted. Regardless of the skill of the operator, full-speed operations should be minimized due to the large amount of dynamic stress placed upon

the aerial device when motion is halted.

Lowering the aerial device is typically the reverse of the process used to place it into position.

Slide 34

Aerial Device Water Delivery Systems

Water delivery Systems are divided into the following three categories:

- Aerial ladders pre-piped/telescoping waterways and water towers
- Aerial ladders with detachable waterways
- Elevating platforms

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

24

Slide 35

Pre-piped /telescoping waterway system

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

25

- True pinnable waterways are permanently attached nozzle systems that can be operated from either the tip of the aerial or one section (fly) lower, fire fighting mode is where the master stream nozzle is at the tip of the aerial, and in rescue mode the nozzle is one aerial section lower.
- Generally, the minimum internal diameter in these piping system is 4" inches. (NFPA 1901 requires it to flow 1000 gpm @ 100 psi)

Slide 36

- Detachable ladder pipes should be operated from the turntable or ground level using ropes that are attached to the nozzle. These ropes allow the nozzle to be raised and lowered as needed.
- Always located the supply hose in the center of the ladder and secure it with a hose strap on each section of the ladder.
- Always follow specific operating guidelines that the aerial device manufacturer provides.

Slide 37

- Some elevating platforms are equipped with two nozzles at the platform. These nozzles may be operated individually or simultaneously to provide maximum stream placement efficiency.
- Most platforms are equipped with at least one 2.5" discharge, allows a handlines to be stretched from the platform if they are needed on upper levels of a structure, also it create an elevated standpipe connection
- NFPA required heat shield and a protective water curtain (or cooling spray) nozzle beneath the platform.

Slide 38

The aerial device should be elevated to 75 degrees, extended no more than 80 percent of its length, and the nozzle pressure for a solid stream nozzle should be no more than 80 psi.

Slide 39

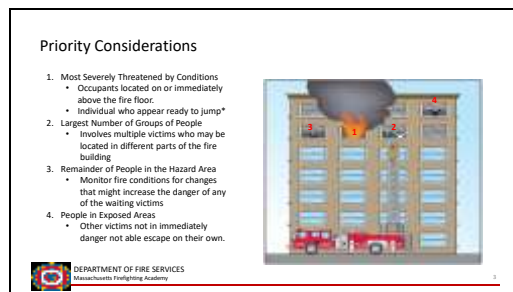

Slide 1

Slide 2

Slide 3

In situations that require using aerial apparatus for rescue, the main objective is to reach as many victims or points of egress as possible with a minimum number of aerial movements. The slide – victim rescue priority from highest to lowest.

* Firefighters should not pass up those in greatest danger just to rescue a panicked person who is in a safe area

Slide 4

Raising the Aerial Device to a Victim

- The best position is one in which the extended and rotated aerial device is perpendicular to the objective.
- Depending on the aerial platform's angle of approach, it may be possible to perform a rescue through the platform's gate.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

4

Slide 5

The ladder should be raised to a point above a victim to prevent them from attempting to jump onto the ladder.

The ladder should then be lowered into position to rescue the victim.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

5

Slide 6

- If the aerial ladder is designed to be used in the unsupported position, the tip should be placed above the target sport (the sill) to keep it from contacting the building.
- The tip must be positioned, so it doesn't diminish the window opening.
- The first rung of the ladder tip should be placed even with the windowsill. This positioning also allows firefighters to place victims directly on the ladder with minimum lifting.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

6

Slide 7

When approaching a window squarely with the platform, place the top rail of the platform even with the windowsill. With the platform railing even with the window, rescuers can help the victims board the platform feet first.

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 8

Rescue from a Roof

- The tip of an aerial ladder should extend at least 6 feet about the roof line.
- Position the floor of an aerial platform at the roof level.
- This position allows victims to have a handhold while climbing onto the ladder or into the platform.

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 9

Rescue from a Roof

- Placement of the aerial device for rescue from balconies with railings or roofs with parapet walls should follow the same guidelines
- It may be necessary to use roof ladders to get over the parapet to the aerial device
- Caution must be used when laddering a parapet walls because parapets can be weakened by time or fire
- Simply repositioning the truck to an area of the building that doesn't have a parapet may be the best option

 DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 10

Removing Victims Using Aerial Ladder

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

10

- Capable adults should be guided down the ladder under their own power. A firefighter should always lead the victim down the ladder.
- Caution should be taken to make sure that multiple victims are adequately spaced down the length of the ladder according to the manufacturer's recommendation to avoid overloading it.
- Infants or small children should be cradled in the firefighter's arms as the firefighter descends the ladder.

Slide 11

Removing Victims Using Aerial Ladder

For unconscious or severely injured victims who are not able to physically assist:

- After positioning the victims across the rails of the ladder, place both hands under the victim's body and grasp the handrails, securing the victims.
- This method poses little or no risk to fall

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

11

Slide 12

Removing Victims Using Aerial Ladder

The over-the-shoulder carry is the most difficult and should only be performed with two firefighters on the ladder, one carrying the victim and the other assisting the descent.

In order to perform this carry safely, a firefighter inside the building should assist with loading the victim onto the shoulder of the firefighter.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

12

Slide 13

Using aerial platform to move victims is considerably easier than backing them down aerial ladders. However, it is slower and not suited to mass evacuations from a single point.

- Load capacity & space inside the platform will determine the number of passenger
- **A potentially severe and damaging dynamic load can be created when victims jump into the platform
- One rescuer should stay with the victims remaining in the structure until the aerial device can return for them
- Rescuers inside a structure should pass an unconscious victim to rescuers in the aerial platform

Slide 14

- Some aerial platforms are equipped with extendable arms designed to hold a stokes basket
- It may be possible to slide a strokes basket down the ladder between the handrails of wider ladders.

Slide 15

VENTILATION

- The aerial ladder should be placed so it extends a minimum of 6 feet over the roof edge, this makes it visible in smoky conditions. This also allows firefighters to safely get on and off the aerial ladders.
- When using an platform, the bottom of the platform should be positioned even with or extended slightly over the roof edge, allowing firefighters to easily exit and enter the platform.
- Use roof ladders as needed.
- When possible, the roof should be laddered on more than one side during ventilation operations to provide an alternate escape route.

The diagram illustrates the correct placement of an aerial ladder for ventilation. It shows a side view of a building with a roof. An aerial ladder is extended from the ground, reaching over the roof edge. A firefighter is shown on the platform of the ladder. The ladder is positioned such that it extends at least 6 feet beyond the roof edge. The diagram also shows a roof ladder being used on the roof surface. The text 'Firefighter' is visible on the ladder platform.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

15

Proper aerial apparatus placement can make the ventilation process quicker.

Slide 16

When breaking windows to provide cross ventilation, position the aerial device slightly above the window to the upwind side. Ensure that firefighters below the window(s) being broken stay clear to avoid falling glass and debris.

The photograph shows an aerial device, likely a bucket or platform, positioned above a window on a building. The device is angled upwards towards the window. The building is a multi-story structure with a red brick facade. The sky is clear and blue.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

16

Slide 17

ELEVATED FIRE ATTACK & EXPOSURE PROTECTION

The photograph shows a fire scene at night. A large fire is burning in a building, with thick smoke rising. An aerial device is extended from the ground, reaching over the roof of the building. A firefighter is visible on the platform of the aerial device, directing a stream of water onto the fire. The scene is illuminated by the fire and emergency lights.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

17

Elevated master streams are most commonly used in defensive operations. In this type of operation, the elevated stream may be used to directly attack the fire, cool embers and gases within the thermal column, and protect exposures. When a defensive attack is employed, the risk of building collapse must be considered.

Slide 18

Solid and straight streams are more likely to reach the seat of the fire than a fog pattern. The water from a fog stream evaporates before reaching the seat of the fire.

Solid streams provide excellent penetration into the fire area.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

18

Slide 19

An aerial device may be used as a master stream device at ground level.

If the aerial device is to be used in this manner, D/O should position the apparatus so the turntable is directly in line with the intended target if possible.

This position allows the fire stream to penetrate as far into the fire area as possible.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

19

Slide 20

If only one master stream nozzle is available, the stream should be alternated between the exposure and the fire building.

If two master stream nozzles are available, one can attack the fire while the other protects the exposure.

DEPARTMENT OF FIRE SERVICES
Massachusetts Firefighting Academy

Slide 21

Slide 1

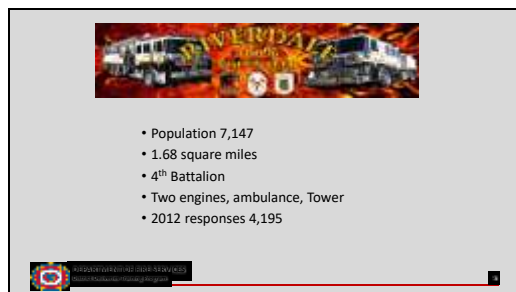

- Without the input from Assistant Doubleday this program would not be possible. Chief Doubleday was very open and forthcoming with his information and understands the needs and importance of sharing his experience with others. For this we express our deep-found respect and thanks for the time he has taken to share this information with us.

Slide 2

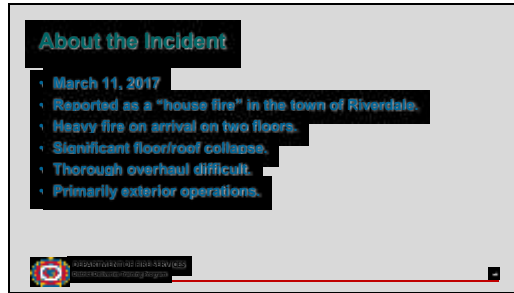

- source Wikipedia and Assistant Chief Doubleday

Slide 3

- source – Riverdale VFD website, and Princes George's County FD website

Slide 4

- Significant fire on arrival created a necessity for exterior (defensive) mode.

Slide 5

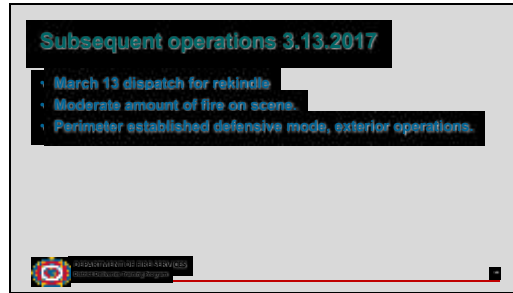

- Heavy fire and use of heavy caliber streams from both deck guns and ladder pipe.
- NOTE – right photo. Overhead power lines and trees.
- SAFETY REMINDER – nighttime operations are dangerous enough without the addition of overhead hazards. High voltage awareness.

Slide 6

- Night of March 11, heavy involvement.
- Exterior operations with large caliber streams.

Slide 7

- Hot spot rekindle dispatch on 3/13 brought fire units back to the scene.
- Moderate fire observed on arrival.
- Decision made to go into a defensive mode as entry into structure was not safe.

Slide 8

- Tower 807

Slide 9

- Note – this view shows a large quantity of water on the street further reinforcing the possibility of seriously saturated ground in the area.

Slide 10

- Undercarriage of Tower 807. Exhaust system has been seriously compromised by impact with the ground. What else could be impacted? How about the points where the exhaust manifold enters the engine??

Slide 11

- Front-end view shows how high up the left side was extended.
- Keep in mind – any vehicle is designed with points at which it will “flex”. This flexing is good and important to maintaining the overall stability of a rig as it travels, and in use at an operation. However, over-extension of the flex will create a ripple-effect throughout the vehicle. Usually the end result is a weaker point will give way creating damage to remote areas of the rig. This is why it’s critically necessary for a engineer to completely evaluate the rig’s integrity for service. An example, a weld far from the impact point could snap/twist/or otherwise become compromised. Make sure an inspection reviews all critical areas of the rig.

Slide 12

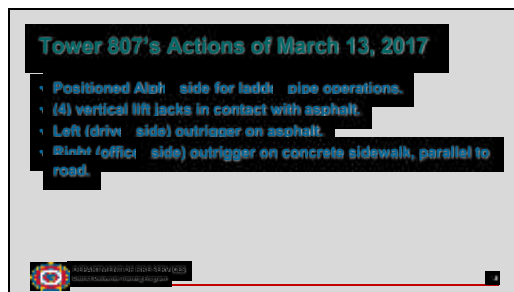

- Picture on left shows how far the stabilizer sunk into the earth.
- Picture on right shows angle shot from the right-rear side of Tower

Slide 13

Slide 14

- Positioning of ladder or tower device is extremely important to the safety of the operation.
- REMEMBER – where are the hazards?

Slide 15

- Two FF's in the bucket. SAFETY ITEM – make sure personnel in bucket are ALWAYS secure.
- Bucket elevation was about 30'

Slide 16

- Thousands of gallons of water will absorb into the earth like a sponge and become an unstable surface.
- Runoff water seeks easy spots to drain into and can undermine an otherwise firm surface. Use the example of a hydrant not properly opened/closed. The constant stream flowing will undermine the dirt and will create a cave-in.
- Operators, you need to understand LOAD LIMITS. Load limits take in angle of stick, loading in a bucket, flow of water. Outriggers are designed to hold boom/ladder extension to a certain weight. WATCH YOUR LIMITS. Don't allow the people in the basket to over-extend.
- In this case the FD was lucky and the basket hit the dirt. Next time it could be the basket dropping the crew into a fire.

Slide 17

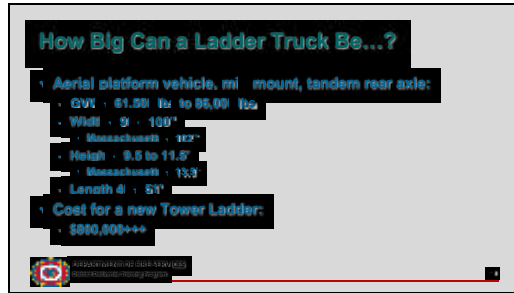

- A rig OOS creates a ripple-effect throughout a community.
- OOS means this vehicle isn't available to respond. Most communities don't have multiple aerial devices. Now a town must rely on mutual aid coming in. This mutual aid now advances the ripple-effect into surrounding communities. So when your rig goes down, it's not all about you.
- Important equipment may have to be moved to other rigs. On the same token, some important equipment may not be able to be moved, again, the ripple-effect extends.

Slide 18

- These are common "Situational Awareness" points to cover with students.
- Avoid becoming drawn into the action of the scene that you fail to observe what can most immediately effect YOU.
- Be alert for potentially soft ground when positioning outriggers off the road.
- Septic systems are sometimes difficult to access. Look for a breather pipe nearby.
- Trees and overhead electrical hazards often go unseen at night and during inclement weather conditions.
- Getting into, and out of, tight spots
USE A SPOTTER, USE MULTIPLE SPOTTERS FRONT AND BACK.

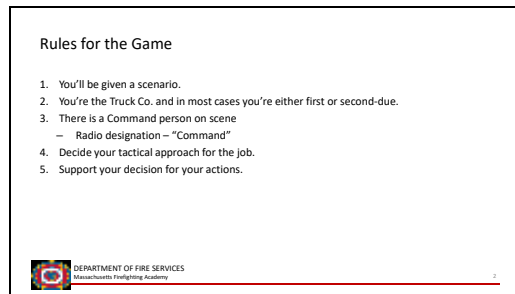

- Source – “Emergency Vehicle Size and Weight Regulation Guideline”, 11/22/2011
- These are standard representative numbers. Specialized equipment can make the rig heavier – longer.
- Just because a rig is a Massachusetts rig, it could very well have been bought “used” there by changing some of the dimensions. Interior of cab must have important stats visible for operator to reference.
- SAFETY – SAFETY – SAFETY! It’s all about situational awareness which includes awareness of the environment around you to operate safe so “we all go home” at the end of the day.

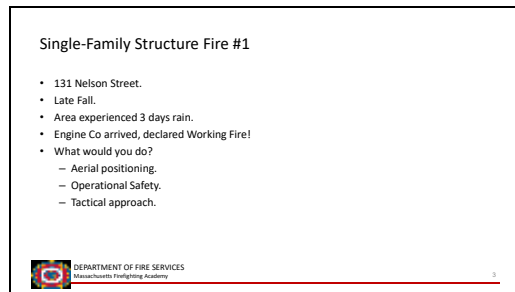

Slide 1

Slide 2

Slide 3

In this module we will introduce you to the concept of the rig being ready to respond. As a firefighter you're expected to be ready to respond as soon as you come on duty. Your personal gear is given a helmet to boots to gloves inspection each time you come on-duty, so you're prepared for whatever the days brings on. Your apparatus is no different. You would not come to work with holes in your gloves and likewise, you would not want to drive a rig with bald tires. Both situations set the scene for disaster when called upon.
