Rebecca L. Tepper, Secretary
Massachusetts Department of Environmental Protection
Bonnie Heiple, Commissioner
Bureau of Water Resources
Kathleen M. Baskin, Assistant Commissioner**

May 2023

CN 568.1

Massachusetts Department of Environmental Protection

MassDEP's mission is to protect and enhance the Commonwealth's natural resources – air, water, and land – to provide for the health, safety, and welfare of all people, and to ensure a clean and safe environment for future generations. In carrying out this mission MassDEP commits to address and advance environmental justice and equity for all people of the Commonwealth; provide meaningful, inclusive opportunities for people to participate in agency decisions that affect their lives; and ensure a diverse workforce that reflects the communities we serve.

Watershed Planning Program

The Watershed Planning Program is a statewide program in the Division of Watershed Management, Bureau of Water Resources, at MassDEP. We are stewards of the water resources of Massachusetts. Together with other state environmental agencies, we share in the duty and responsibility to protect, enhance, and restore the quality and value of the waters of the Commonwealth. We are guided by the federal Clean Water Act and work to secure the environmental, recreational, and public health benefits of clean water for the residents of Massachusetts. The Watershed Planning Program is organized into five Sections that each have a different technical focus under the Clean Water Act: (1) Surface Water Quality Standards; (2) Surface Water Quality Monitoring; (3) Data Management and Water Quality Assessment; (4) Total Maximum Daily Load; and (5) Nonpoint Source Pollution.

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| | |
|------------------------------------|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |

MassDEP biologists conducted biological and water quality sampling in Chapel Brook upstream of Main Poland Road in Conway during the summers of 2013, 2014, 2015 as part of the Reference Site Network (RSN) monitoring project. Survey results of this Cold Water high gradient habitat can be briefly summarized as follows: the benthic community (Station B0826) IBI scores were all indicative of excellent/satisfactory conditions (64 to 82, n=3), multiple age classes of Eastern brook trout and slimy sculpin documented during backpack electrofishing sampling in October 2013 [Sample ID 5100], August 2014 [SampleID 6337], and September 2015 [SampleID 6379]), most water quality sampling data including both deployed probe and discrete sampling efforts (Station W1362) were indicative of excellent conditions (minimum dissolved oxygen from the deployed probes in place from May through September 2013 – 2015 was 8.4mg/L, pH measurements ranged from 7.2 to 7.6SU (n=11), there were no indications of any nutrient enrichment problems (seasonal average total phosphorus concentrations 0.007 to 0.008mg/L, max diel DO shift 1.3mg/L, maximum saturation 101%, maximum pH 7.6SU), and low concentrations of total ammonia-nitrogen (0.4mg/L) and chloride (maximum 5mg/L, n=13) were found. The maximum temperature recorded during the probe deployments was 22.9°C during the probe deployments 1 June to early/mid-September in summers 2013, 2014, and 2015. The maximum 24-hour rolling average was 21.8°C (below the acute threshold of 23.5°C), however the 7DADM temperatures were above 20.0°C 16 times in 2013 during the 100 day deployment, 0 times in 2014, and one time in 2015. The watershed area has little very development and the exceedances of the chronic thresholds are considered to result from naturally occurring conditions (beaver dams throughout the subwatershed area which is 95% natural and the % Impervious Cover is 1.3%). The Aquatic Life Use for Chapel Brook is assessed as Fully Supporting based on the biological and water quality data collected during the summers of 2013, 2014, and 2015.

2022 Use Attainment Summary

MassDEP staff surveyed Chapel Brook upstream of Main Poland Road in Conway MA (W1362) during the summers of 2013, 2014, and 2015 as part of the Reference Site Network monitoring project. There were generally no objectionable conditions (i.e., odors, deposits, growths, or turbidity) observed during the surveys. The Aesthetics Use for Chapel Brook is assessed as Fully Supporting based on the general lack of any objectionable conditions documented by MassDEP staff during the summers of 2013, 2014, and 2015.

Monitoring Stations

| Station Code | Organization | Type | Water Body | Station Description | Latitude | Longitude |
|--------------|--------------|---------------|--------------|---|-----------|------------|
| W1362 | MassDEP | Water Quality | Chapel Brook | [approximately 300 feet upstream of Main Poland Road, Conway] | 42.484172 | -72.754212 |

*Aesthetic Observations***Aesthetics Summary Statements for MassDEP Stations (2011-2018)** (MassDEP Undated 6)

| Station Code | Waterbody | Data Year | Field Sheet Count | Aesthetics Summary Statement |
|--------------|--------------|-----------|-------------------|--|
| W1362 | Chapel Brook | 2013 | 5 | MassDEP aesthetics observations for station W1362 on Chapel Brook can be summarized as follows: there were generally no noted objectionable conditions (odors, deposits, growths, or turbidity) recorded by DEP field sampling crews during summer 2013. |
| W1362 | Chapel Brook | 2014 | 4 | MassDEP aesthetics observations for station W1362 on Chapel Brook can be summarized as follows: there were generally no noted objectionable conditions (odors, deposits, growths, or turbidity) recorded by DEP field sampling crews during summer 2014. |
| W1362 | Chapel Brook | 2015 | 4 | MassDEP aesthetics observations for station W1362 on Chapel Brook can be summarized as follows: there were generally no noted objectionable conditions (odors, deposits, growths, or turbidity) recorded by DEP field sampling crews during summer 2015. |

| 2022 Use Attainment Summary | |

MA DFG biologists conducted backpack electrofishing in Cherry Rum Brook at the upstream crossing of the brook on Cherry St, Greenfield (SampleID 5401) and further downstream US of Arbor Rd dam to I-91 crossing in Greenfield (SampleID 5403) in August 2014. Both samples were dominated by fluvial fishes. No other recent water quality data have been collected.

The Aquatic Life Use for Cherry Rum Brook will continue to be assessed as Not Supporting with the Benthic Macroinvertebrates impairment being carried forward.

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| | |
|------------------------------------|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |

MA DFG biologists conducted backpack electrofishing along three general reaches of the Chickley River in September of 2014 through 2017 from up to downstream as follows: near Brown and Fuller Brooks near Hawley/Savoy Road in Savoy and Hawley (Sample IDs 5447, 5448, 7489, and 8143), downstream from the confluence with North Brook along West Hawley Road in Hawley (SampleIDs 6721, 5723, 8142, 5449, 5450, 6722, 5103, 5722), and further downstream from the confluence with Mill Brook also along West Hawley Road in Hawley (SampleIDs 5451, 6723, 7490, 6102, 6724, 6101, 5724, 5452). All 20 samples collected contained only fluvial fishes including multiple age classes of Eastern brook trout and/or slimy sculpin although the most upstream reach was noted to have the highest percentage of cold water fish in the samples.

The Aquatic Life Use for the Chickley River is assessed as Fully Supporting based on the presence of cold water fish species which are indicate of excellent habitat and water quality conditions.

Primary Contact Recreation

| | |
|--|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>Connecticut River Conservancy volunteers collected <i>E. coli</i> bacteria samples near the mouth of Clesson Brook, behind Buckland Rec in Buckland between June and September 2019 (n=6) and between July and September 2020 (n=4). Data analysis of this low frequency multi-year dataset indicated only one of two years with GMs that exceeded >20% and only one year with two samples that exceeded the STV of 410cfu/100mls. The seasonal GMs were 255 and 83cfu/100ml in 2019 and 2020, respectively.</p> <p>Since the <i>E. coli</i> concentrations were below the use attainment impairment thresholds for this multi-year low frequency dataset, the Primary Contact Recreational Use for Clesson Brook is assessed as Fully Supporting.</p> | |

Fish, other Aquatic Life and Wildlife

| | |
|------------------------------------|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |

MassDEP biologists conducted biological and/or water quality sampling in the Cold River as part of three different monitoring projects between 2011 and 2018. Between White and Tower brooks confluences (upstream South County Road Florida), long-term sampling is conducted as part of the RMNet project. Benthic sampling here (B0824) is five kick samples not standard 10 kicks so IBIs were not calculated. Long-term temperature data (W2467) can be summarized as follows: during the summer index periods (1 June to 15 September) of 2012, 2013, 2014, 2015, 2016, 2017 the maximum temperature was 24.7°C, the 7DADMs >20.0°C 19 times in 2013 and 31 times in 2016 with no exceedances in any other year and the maximum 24-hour rolling average was 22.4°C in 2013. The single DO and specific conductance measurement in December 2017 was 13.6mg/L (95% saturation) and 111µs/cm, respectively. Further downstream just upstream from the confluence with Black Brook (upstream of Mohawk Trail (Route 2), Florida/Savoy biological and water quality sampling was conducted as part of the Reference Site Network monitoring project during summers 2011, 2012, 2013, 2014, 2015, and 2017. Survey results can be briefly summarized as follows: the benthic community (Station B0739) IBI scores were satisfactory in the sample conducted in July 2011 (pre-Hurricane Irene IBI score 66), moderately degraded in July 2012, August 2013 and 2014 (IBI scores 51, 51, and 48, respectively), and back to satisfactory in July 2015 and 2017 (IBI scores 73 and 63R). Backpack electrofishing in September 2012, October 2013, and Septembers 2014, 2015, 2017 (Sample IDs 5044, 5096, 6319, 6392, and 7066, respectively) documented all fluvial species including slimy sculpin and a few Eastern brook trout. Water quality sampling data including both deployed probe and discrete sampling efforts (Station W2222) were, with the exception of temperature, indicative of excellent conditions (minimum dissolved oxygen 8.5mg/L, pH 7.3 to 7.6SU (n=13), no indications of any nutrient enrichment problems (seasonal average total phosphorus concentrations 0.005 – 0.007mg/L, max diel DO shift 1.7mg/L, maximum saturation 102%, maximum pH 7.6SU), and low concentrations of total ammonia-nitrogen (0.078mg/L maximum) and chloride (maximum 19mg/L, n=24). Temperature monitoring can be summarized as follows: during the summer index periods (1 June to 15 September) of 2012, 2013, 2014, 2015, and 2017 maximum temperature was 25.9°C, 7DADMs >20.0°C 23 times in 2012, 23 times in 2013 and 20 times in 2015 with no exceedances in any other year and the maximum 24-hour rolling average was 23.4°C in 2013. MassDFG biologists also conducted backpack electrofishing further downstream near the DCR picnic site (off Rt 2), Charlemont (SampleIDs 5189, 5716, and 6234) in September 2014, 2015, and 2016. The fish samples also documented all fluvial species including slimy sculpin and a few Eastern brook trout. Further downstream near Cold River Road, Charlemont MassDEP MAP2 Project sampling in summer 2012 (shortly post Hurricane Irene) benthic sample IBI score (B0788) severely degraded (33), fish sample (SampleID 5045) all fluvial fishes including slimy sculpin, and excluding temperature other water quality data were indicative of good conditions (min DO 7.8mg/L, pH 7.5-8.3SU, seasonal average total phosphorus 0.007mg/L with no indication of any enrichment issues or observations dense/very dense algae), and no toxicant issues (max total ammonia-nitrogen 0.02mg/L, chloride 24mg/L (n=5), no exceedances of any of clean metals samples, n=3). Temperature max was 28.4°C, 7DADM >20°C 85 times, and 24-hour rolling average max was 24.9°C.

The Aquatic Life Use of the Cold River is assessed as Fully Supporting based on benthic, fish, and water quality data collected by MassDEP and MA DFG biologists between 2011 and 2018. Temperature exceedances are considered natural since watershed area is 96% natural/wetland and there are no dams.

Fish Consumption

| 2022 Use Attainment | Alert |
|---|-------|
| Not Assessed | NO |
| 2022 Use Attainment Summary | |
| No fish toxics sampling has been conducted in the Cold River, therefore the Fish Consumption Use is Not Assessed. | |

Aesthetic

| 2022 Use Attainment | Alert |
|-----------------------------|-------|
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |

MassDEP staff surveyed the Cold River upstream of the confluence of Black Brook in Florida/Savoy (W2222) during the summers of 2011, 2012, 2013, 2014, 2015, and 2017 as part of the Reference Site Network monitoring project and further downstream near the Mohawk Trail State Forest/Campground ~1150 feet upstream of Cold River Road, Charlemont as part of the MAP2 monitoring project in the summer of 2012. No objectionable conditions (i.e., odors, deposits, growths, or turbidity) were observed during any of the surveys.

The Aesthetics Use for the Cold River is assessed as Fully Supporting based on the lack of any objectionable conditions documented by MassDEP staff during the summers of 2011, 2012, 2013, 2014, 2015, and 2017.

Monitoring Stations

| Station Code | Organization | Type | Water Body | Station Description | Latitude | Longitude |
|--------------|--------------|---------------|------------|---|-----------|------------|
| W2222 | MassDEP | Water Quality | Cold River | [approximately 325 feet upstream of Mohawk Trail (Route 2), Florida/Savoy (upstream of Black Brook confluence)] | 42.632569 | -72.974395 |
| W2251 | MassDEP | Water Quality | Cold River | [approximately 1150 feet upstream of Cold River Road, Charlemont] | 42.639199 | -72.938084 |

Aesthetic Observations

Aesthetics Summary Statements for MassDEP Stations (2011-2018) (MassDEP Undated 6)

| Station Code | Waterbody | Data Year | Field Sheet Count | Aesthetics Summary Statement |
|--------------|------------|-----------|-------------------|--|
| W2222 | Cold River | 2011 | 3 | MassDEP aesthetics observations for station W2222 on Cold River can be summarized as follows: there were generally no noted objectionable conditions (odors, deposits, growths, or turbidity) recorded by DEP field sampling crews during summer 2011. |
| W2222 | Cold River | 2012 | 4 | MassDEP aesthetics observations for station W2222 on Cold River can be summarized as follows: there were generally no noted objectionable conditions (odors, deposits, growths, or turbidity) recorded by DEP field sampling crews during summer 2012. |
| W2222 | Cold River | 2013 | 5 | MassDEP aesthetics observations for station W2222 on Cold River can be summarized as follows: there were generally no noted objectionable conditions (odors, deposits, growths, or turbidity) recorded by DEP field sampling crews during summer 2013. |
| W2222 | Cold River | 2014 | 4 | MassDEP aesthetics observations for station W2222 on Cold River can be summarized as follows: there were generally no noted objectionable conditions (odors, deposits, growths, or turbidity) recorded by DEP field sampling crews during summer 2014. |
| W2222 | Cold River | 2015 | 4 | MassDEP aesthetics observations for station W2222 on Cold River can be summarized as follows: there were generally no noted objectionable conditions (odors, deposits, growths, or turbidity) recorded by DEP field sampling crews during summer 2015. |
| W2222 | Cold River | 2017 | 5 | MassDEP aesthetics observations for station W2222 on Cold River can be summarized as follows: there were generally no noted objectionable conditions (odors, deposits, growths, or turbidity) recorded by DEP field sampling crews during summer 2017. |

| Station Code | Waterbody | Data Year | Field Sheet Count | Aesthetics Summary Statement |
|--------------|------------|-----------|-------------------|---|
| W2251 | Cold River | 2012 | 6 | MassDEP aesthetics observations for station W2251/MAP2-173 on Cold River can be summarized as follows: there were generally no noted objectionable conditions (odors, deposits, growths, or turbidity) recorded by DEP field sampling crews during summer 2012. |

| 2022 Use Attainment Summary | |

MA DFG biologists conducted backpack electrofishing in Davis Mine Brook off of Davis Mine Road in Rowe (SampleID 6094) in September 2016. The sample was comprised entirely of multiple age classes of Eastern brook trout. This sampling reach is located upstream of the Davis Mine drainage. Although multiple age classes of Eastern brook trout are present in Davis Mine Brook upstream of the Davis Mine drainage, no recent data have been collected downstream from the mine drainage so the Fish Bioassessments and pH, Low impairments are being carried forward.

Recommendations

| 2022 Recommendations |
|--|
| ALU: Conduct additional benthic macroinvertebrate sampling along the upper reaches of this Deerfield River AU (MA33-01) -- below Fife Brook Dam, above Bridge to nowhere, upstream Cold River confluence, and downstream Charlemont. These sample data should be evaluated using High Gradient IBI thresholds to confirm flow regime modification impairment using updated benthic analysis methodology. |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| 2022 Use Attainment | Alert |
|--|-------|
| Not Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MA DFG biologists conducted backpack electrofishing (five sites) and snorkeling surveys (five sites) along this Deerfield River AU (MA33-01) between the confluences with Fife and Pelham brooks in September 2016 (SampleIDs 6009 through 6019). All samples were comprised entirely by fluvial fishes including slimy sculpin. Multiple ages of Eastern brook trout were found in one sample. These and a few additional backpack samples (total of 11 in all including Sample IDs 5927, 5928, 5929, 5930, 6012, 6013, 6016, 6017, 6019, 6021, 6022) were collected by MA DFG biologists in the Deerfield River (AUs MA33-01, MA33-02, MA33-03) in September 2016. The overall percent similarity with the Deerfield Target Fish Community was 66.12% (note that the percent similarity was 60.37% for MA33-01, the 1st coldwater AU, when evaluated alone, and it was 50.83% for MA33-02, the 2nd coldwater AU). Of the 4 most common species (blacknose dace, longnose dace, common shiner, slimy sculpin) in the TFC, all made it to the top 5 positions among the study samples (combined among AUs), although at slightly different ranks (additionally, white sucker came in at #4). This comparison of fish community data with the Deerfield TFC model is an indicator of good water quality in these Deerfield River AUs (MA33-01, MA33-02, MA33-03).</p> <p>Although the fish sample data are indicative of generally good cold water habitat conditions, the Aquatic Life Use for this Deerfield River AU (MA33-01) will continue to be assessed as Not Supporting with the Flow Regime Modification impairment being carried forward. The impacts from the hydropower operations affecting this Deerfield River AU were documented as part of the 2016 IR reporting cycle based on MassDEP's analysis of benthic sampling data collected by ABR, Inc. biologists in September 2006 for the Deerfield River Watershed Association (MassDEP Undated 7).</p> | |

Comparison of fish community samples (2005-2017) to the Deerfield Target Fish Community (TFC) Model.
 (MassDFG 2018, MassDEP Undated 2, Kashiwagi and Richards 2009)

Eleven fish community samples (Sample IDs 5927, 5928, 5929, 5930, 6012, 6013, 6016, 6017, 6019, 6021, 6022) were collected in the Deerfield River (AUs MA33-01, MA33-02, MA33-03) in 2016. The overall percent similarity with the Deerfield Target Fish Community was 66.12% (note that the percent similarity was 60.37% for MA33-01, the 1st coldwater AU, when evaluated alone). Of the four most common species (blacknose dace, longnose dace, common shiner, slimy sculpin) in the TFC, all made it to the top five positions among the study samples (combined among AUs), although at slightly different ranks (additionally, white sucker came in at #4). This comparison of fish community data with the Deerfield TFC model is an indicator of good water quality in these Deerfield River AUs (MA33-01, MA33-02, MA33-03).

Fish Community Samples in the Deerfield River (AUs MA33-01, MA33-02, MA33-03):

Deerfield TFC Model:

Table A4. Species percent composition for reference rivers used to develop the Deerfield River target fish community model. Species are ordered by mean rank. Non-native, stocked, and out-of-range species were deleted from the ranking and calculation of expected proportion in the target fish model. The ranks were converted to expected proportions (as a percent) using a rank-weighting technique as outlined by Bain and Meixler (2008).

| Species | EB Westfield River | Third Branch White River | Tenmile River | Ashuelot River | Ammonoosuc River | Piscataquog River | Total | Rank | Expected Proportion |
|--------------------|--------------------|--------------------------|---------------|----------------|------------------|-------------------|-------|------|---------------------|
| Blacknose dace | 41.3 | 25.0 | 14.9 | 19.8 | 24.1 | 22.5 | 147.6 | 1 | 31.8 |
| Longnose dace | 18.7 | 19.9 | 9.3 | 12.7 | 38.5 | 15.2 | 114.2 | 2 | 15.9 |

| 2022 Use Attainment | Alert |
| Fully Supporting | YES |
| 2022 Use Attainment Summary | |

MA DFG biologists conducted a snorkeling survey in this Deerfield River AU (MA33-02) behind the Mohawk State Park campground upstream of Route 2 bridge in Charlemont (SampleID 6020), backpack electroshocking upstream of the Route 2 bridge @ the Mohawk State Park campground (SampleID 6021) and off Route 2 west of the USGS gage (SampleID 6022) in Charlemont, as well as boat electrofishing further downstream at Route 2 bridge upstream to behind crabapple in Shelburne Falls (SampleID 6008) in September 2016. Except for the most downstream boat electrofishing site, all samples were comprised entirely by fluvial fishes including slimy sculpin. One small Eastern brook trout was found in one sample. Fluvial fishes dominated the boat electrofishing sample. These and a few additional backpack samples (total of 11 in all including Sample IDs 5927, 5928, 5929, 5930, 6012, 6013, 6016, 6017, 6019, 6021, 6022) were collected by MA DFG biologists in the Deerfield River (AUs MA33-01, MA33-02, MA33-03) in September 2016. The overall percent similarity with the Deerfield Target Fish Community was 66.12% (note that the percent similarity was 50.83% for MA33-02, the 2nd coldwater AU). Of the four most common species (blacknose dace, longnose dace, common shiner, slimy sculpin) in the TFC, all made it to the top five positions among the study samples (combined among AUs), although at slightly different ranks (additionally, white sucker came in at #4). This comparison of fish community data with the Deerfield TFC model is an indicator of good water quality in these Deerfield River AUs (MA33-01, MA33-02, MA33-03).

The Aquatic Life Use for this Deerfield River AU (MA33-02) will continue to be assessed as Fully Supporting based on the fish community sample data collected in September 2016 documenting the presence of slimy sculpin in this Cold Water habitat. The Alert for hydromodification and regulated streamflow is being carried forward.

Comparison of fish community samples (2005-2017) to the Deerfield Target Fish Community (TFC) Model.

(MassDFG 2018, MassDEP Undated 2, Kashiwagi and Richards 2009)

Eleven fish community samples (Sample IDs 5927, 5928, 5929, 5930, 6012, 6013, 6016, 6017, 6019, 6021, 6022) were collected in the Deerfield River (AUs MA33-01, MA33-02, MA33-03) in 2016. The overall percent similarity with the Deerfield Target Fish Community was 66.12% (note that the percent similarity was 60.37% for MA33-01, the 1st coldwater AU, when evaluated alone, and it was 50.83% for MA33-02, the 2nd coldwater AU). Of the 4 most common species (blacknose dace, longnose dace, common shiner, slimy sculpin) in the TFC, all made it to the top 5 positions among the study samples (combined among AUs), although at slightly different ranks (additionally, white sucker came in at #4). This comparison of fish community data with the Deerfield TFC model is an indicator of good water quality in these Deerfield River AUs (MA33-01, MA33-02, MA33-03).

Fish Community Samples in the Deerfield River (AUs MA33-01, MA33-02, MA33-03):

Deerfield TFC Model:

Table A4. Species percent composition for reference rivers used to develop the Deerfield River target fish community model. Species are ordered by mean rank. Non-native, stocked, and out-of-range species were deleted from the ranking and calculation of expected proportion in the target fish model. The ranks were converted to expected proportions (as a percent) using a rank-weighting technique as outlined by Bain and Meixler (2008).

| Species | EB Westfield River | Third Branch White River | Tenmile River | Ashuelot River | Ammonoosuc River | Piscataquog River | Total | Rank | Expected Proportion |
|--------------------|--------------------|--------------------------|---------------|----------------|------------------|-------------------|-------|------|---------------------|

| 2022 Use Attainment | Alert |
| Not Assessed | NO |
| 2022 Use Attainment Summary | |
| No recent fish toxics sampling has been conducted in this Deerfield River AU (MA33-02), and since no site-specific advisory has been issued the Fish Consumption Use is Not Assessed. | |

Aesthetic

| | |
|------------------------------------|--------------|
| 2022 Use Attainment | Alert |
| Not Assessed | NO |
| 2022 Use Attainment Summary | |

No data are available to assess the status of the Aesthetics Use for this Deerfield River AU (MA33-02), so it is Not Assessed.

Primary Contact Recreation

| 2022 Use Attainment | Alert |
|--|-------|
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>Connecticut River Conservancy volunteers collected <i>E. coli</i> bacteria samples at four locations along this Deerfield River AU (MA33-02) during the summers of 2019 and/or 2020 from up to downstream as follows: Shunpike Rest Area, Route 2 (CRC_MA-DFR_28.9), Zoar Ramp, Route 2 (CRC_MA-DFR_27.6), Near Academy at Charlemont (CRC_MA-DFR_24.0), and above confluence with North River (CRC_MA-DFR_18.9). None of the limited frequency single or multi-year data sets had any GM intervals above 126 cfu/100mls, nor did any sample exceed the STV of 410 cfu/100mls. The seasonal GMs ranged from 29 to 63cfu/100mls.</p> <p>The Primary Contact Recreational Use for this Deerfield River AU (MA33-02) is assessed as Fully Supporting based on the low <i>E. coli</i> bacteria data collected by CRC volunteers during the summers of 2019 and/or 2020.</p> | |

| 5 | 2 | Escherichia Coli (E. Coli) | | Removed |

Supporting Information for Removed Impairments

| 2018/20 Removed Impairment | Removal Reason | Removal Comment |
|----------------------------|--|---|
| Escherichia Coli (E. Coli) | Applicable WQS attained; based on new data | This Deerfield River AU (MA33-03) was first listed as impaired for E. coli in the 2016 reporting cycle. The impairment decision was based on MassDEP WPP E. coli bacteria sample data collected in the river ~200 feet upstream of the south bound lane of Route 91, Deerfield (Station LD, W0002) five times between 17 May and 21 September 2005 since the geometric mean (GM) of the results was 187 cfu/100ml (exceeded the standard of 126 cfu/100ml). Between July and September 2020, CRC staff/volunteers collected five E. coli bacteria samples at each of two additional sites in this Deerfield River AU: at Stillwater Bridge, Deerfield (CRC_MA-DFR_08.0) and near Deerfield Academy, Deerfield (CRC_MA-DRF_0.5.1). These two sites bracket the location of W0002. E. coli concentrations did not exceed the use attainment impairment thresholds described in the 2022 CALM Guidance Manual for single year, low frequency datasets at either site sampled in 2020: none of the intervals had GMs > 126 cfu/100ml, and no samples exceeded the 410 cfu/100ml statistical threshold value (STV), with overall seasonal GMs of 35 and 40 at sites CRC_MA-DFR_08.0 and CRC_MA-DFR_05.1, respectively. Both precipitation data from the Greenfield Weather Station (USC00190120) and discharge data from the nearby Deerfield River gage in West Deerfield (01170000) indicate generally similar conditions during the two summer survey periods. Based on this analysis and since E. coli collected by CRC staff/volunteers during the summer of 2020 at two sites along this Deerfield River AU did not exceed use attainment impairment thresholds, the E. coli impairment for this Deerfield River AU is being delisted. |

Escherichia Coli (E. Coli)

Original data used to make impairment decision.

E. coli was first listed as an impairment for the Primary Contact Recreational Use for this Deerfield River AU in the 2016 reporting cycle based on E. coli data collected by MassDEP staff as part of the 2005 water quality survey in the Deerfield River ~200 feet upstream of the south bound lane of Route 91, Deerfield (Station LD, W0002) between 17 May and 21 September 2005 (n=5) (geo mean=187) MassDEP.

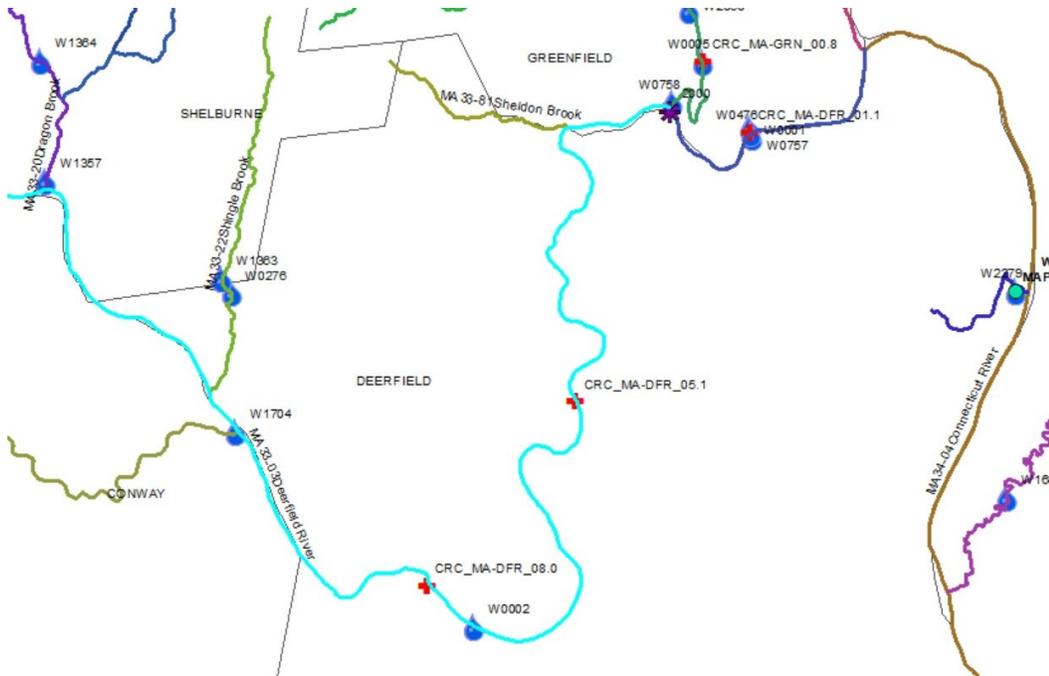

| Station Code | Organization | Indicator | Start Date | End Date | Sample Count | Minimum Sample Result | Maximum Sample Result | Seasonal Geometric Mean |
|--------------|--------------|-----------|------------|----------|--------------|-----------------------|-----------------------|-------------------------|
| W0002 | MassDEP | E. coli | 05/17/05 | 09/21/05 | 5 | 9 | 2046 | 187 |

New Data Supporting the E. coli delisting:

Connecticut River Conservancy volunteers collected *E. coli* bacteria samples at two locations along this Deerfield River AU (MA33-01) during the summer of 2020 from up to downstream as follows: Stillwater Bridge, Deerfield (CRC_MA-DFR_08.0) and near Deerfield Academy, Deerfield (CRC_MA-DFR_05.1). None of the limited frequency single data sets had any GM intervals above 126 cfu/100mls, nor did any sample exceed the STV of 410 cfu/100mls. The seasonal GMs were 35 and 40cfu/100mls.

The Primary Contact Recreational Use for this Deerfield River AU (MA33-03) is assessed as Fully Supporting based on the low *E. coli* bacteria data collected by CRC volunteers during the summer of 2020.

Spatial locations of sampling stations (CRC sites bracket the MassDEP site):

Discharge data from the nearby Deerfield River gage in West Deerfield (01170000) for both years that data were available seem to generally be similar to the median conditions at the gaging station based on available historical records.

Weather summary from Greenfield Weather Station (USC00190120) indicated precipitation in the region in 2005 and 2020 were similar. October 2005 had high precipitation but was outside sampling season timeframe so did not influence analysis.

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| 2022 Use Attainment | Alert |
|------------------------------------|-------|
| Fully Supporting | YES |
| 2022 Use Attainment Summary | |

MA DFG biologists conducted backpack electrofishing at four sites along this Deerfield River AU (MA33-03) in September 2016 from up to downstream as follows: ~120m upstream from Bardwells Ferry Road bridge, Shelburne Falls (SampleID 5927), Melnik Farm., Deerfield (SampleID 5928), and two sites near the Old Deerfield WWTP (SampleIDs 5929 and 5930). Three of the four samples were dominated by fluvial fishes including intolerant/moderately tolerant species. These and a few additional backpack samples (total of 11 in all including Sample IDs 5927, 5928, 5929, 5930, 6012, 6013, 6016, 6017, 6019, 6021, 6022) were collected by MA DFG biologists in the Deerfield River (AUs MA33-01, MA33-02, MA33-03) in September 2016. The overall percent similarity with the Deerfield Target Fish Community was 66.12% (note that the percent similarity was 31.45% when the data from MA33-03, a designated warmwater fishery AU, were evaluated alone). Of the four most common species (blacknose dace, longnose dace, common shiner, slimy sculpin) in the TFC, all made it to the top five positions among the study samples (combined among AUs), although at slightly different ranks (additionally, white sucker came in at #4). This overall comparison of fish community data with the Deerfield TFC model was an indicator of good water quality in these Deerfield River AUs (MA33-01, MA33-02, MA33-03). While the TFC comparison was not specifically designed to evaluate individual reaches of a large mainstem river, it was noted that when the data from this warmwater fishery AU (MA33-03) were compared with the TFC, the percent similarity was low (31%).

The Aquatic Life Use for this Deerfield River AU (MA33-02) will continue to be assessed as Fully Supporting based on the fish community sample data collected in September 2016 documenting the presence fluvial fish including intolerant/moderately tolerant species in this warm water habitat. The Alert for hydromodification and regulated streamflow is being carried forward and a new alert is being identified because of the low percent similarity to the TFC in this AU.

Monitoring Stations

| Station Code | Organization | Type | Water Body | Station Description | Latitude | Longitude |
|--------------|--------------|----------------|-----------------|---|----------|-----------|
| 5927 | MassDFG | Fish Community | Deerfield River | Upstream ~ 120 m from Bardwells ferry Rd bridge., Shelburne Falls | 42.55687 | -72.67930 |
| 5928 | MassDFG | Fish Community | Deerfield River | Melnik Farm., Deerfield | 42.52352 | -72.61524 |
| 5929 | MassDFG | Fish Community | Deerfield River | Site 2 WWTP, pool-run braid along river left., Deerfield | 42.55133 | -72.61250 |
| 5930 | MassDFG | Fish Community | Deerfield River | Behind WWTP, Deerfield | 42.55133 | -72.61250 |

Comparison of fish community samples (2005-2017) to the Deerfield Target Fish Community (TFC) Model.

(MassDFG 2018, MassDEP Undated 2, Kashiwagi and Richards 2009)

Eleven fish community samples (Sample IDs 5927, 5928, 5929, 5930, 6012, 6013, 6016, 6017, 6019, 6021, 6022) were collected in the Deerfield River (AUs MA33-01, MA33-02, MA33-03) in 2016. The overall percent similarity with the Deerfield Target Fish Community was 66.12% (note that the percent similarity was 31.45% when the data from MA33-03, a designated warmwater fishery AU, were evaluated alone). Of the 4 most common species (blacknose dace, longnose dace, common shiner, slimy sculpin) in the TFC, all made it to the top 5 positions among the study samples (combined among AUs), although at slightly different ranks (additionally, white sucker came in at #4). This overall comparison of fish community data with the Deerfield TFC model was an indicator of good water quality in these Deerfield River AUs (MA33-01, MA33-02, MA33-03). While the TFC comparison was not specifically designed to evaluate individual reaches of a large mainstem river, it was noted that when the data from the downstream warmwater fishery AU (MA33-03) were compared with the TFC, the percent similarity was low (31%); therefore, an Alert is being identified for MA33-03.

Fish Community Samples in the Deerfield River (AUs MA33-01, MA33-02, MA33-03):

Deerfield TFC Model:

Table A4. Species percent composition for reference rivers used to develop the Deerfield River target fish community model. Species are ordered by mean rank. Non-native, stocked, and out-of-range species were deleted from the ranking and calculation of expected proportion in the target fish model. The ranks were converted to expected proportions (as a percent) using a rank-weighting technique as outlined by Bain and Meixler (2008).

| Species | EB Westfield River | Third Branch White River | Tennile River | Ashuelot River | Ammonoosuc River | Piscataquog River | Total | Rank | Expected Proportion |

2022 Use Attainment Summary

Connecticut River Conservancy volunteers collected *E. coli* bacteria samples at two locations along this Deerfield River AU (MA33-01) during the summer of 2020 from up to downstream as follows: Stillwater Bridge, Deerfield (CRC_MA-DFR_08.0) and near Deerfield Academy, Deerfield (CRC_MA-DFR_05.1). None of the limited frequency single data sets had any GM intervals above 126 cfu/100mls, nor did any sample exceed the STV of 410 cfu/100mls. The seasonal GMs were 35 and 40cfu/100mls.

The Primary Contact Recreational Use for this Deerfield River AU (MA33-03) is assessed as Fully Supporting based on the low *E. coli* bacteria data collected by CRC volunteers during the summer of 2020.

Recommendations

| 2022 Recommendations |
|--|
| REC: Conduct additional <i>E. coli</i> bacteria sampling in this Deerfield River AU (MA33-04) at the Route 5&10 Bridge, Greenfield to evaluate if the <i>E. coli</i> impairment could be delisted. |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| | |
|---|--------------|
| 2022 Use Attainment | Alert |
| Not Assessed | YES |
| 2022 Use Attainment Summary | |
| No recent data are available to assess the Aquatic Life Use for this Deerfield River AU (MA33-04) so it is Not Assessed. The Alert for hydromodification and regulated streamflow is being carried forward. | |

Fish Consumption

| | |
|---|--------------|
| 2022 Use Attainment | Alert |
| Not Assessed | NO |
| 2022 Use Attainment Summary | |
| No recent fish toxics sampling has been conducted in this Deerfield River AU (MA33-04), and since no site-specific advisory has been issued the Fish Consumption Use is Not Assessed. | |

Aesthetic

| | |
|--|--------------|
| 2022 Use Attainment | Alert |
| Not Assessed | NO |
| 2022 Use Attainment Summary | |
| No data are available to assess the status of the Aesthetics Use for this Deerfield River AU (MA33-04), so it is Not Assessed. | |

Primary Contact Recreation

| | |
|--|--------------|
| 2022 Use Attainment | Alert |
| Not Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>Connecticut River Conservancy volunteers collected <i>E. coli</i> bacteria samples from the Deerfield River at the Route 5&10 Bridge, Greenfield (CRC_MA-DFR_01.1) between June and September 2019 (n=6) and between July and September 2020 (n=5). Data analysis of this low frequency multi-year dataset indicated only one of two years with GMs that exceeded 20% and only one year with two samples that exceeded the STV of 410cfu/100mls. The seasonal GMs were 2420 and 68cfu/100ml in 2019 and 2020, respectively.</p> <p>Although the <i>E. coli</i> concentrations were below the use attainment impairment thresholds for this multi-year low frequency dataset, the Primary Contact Recreational Use for this Deerfield River AU (MA33-04) will continue to be assessed as Not Supporting with the <i>E. coli</i> impairment being carried forward. Since one of the two years of recent <i>E. coli</i> data indicated high bacteria concentrations, too limited data are available to delist the <i>E. coli</i> impairment.</p> | |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| | |
|------------------------------------|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |

MassDEP biologists sampled Dunbar Brook upstream from the Dunbar Brook Dam in Florida MA during the summers of 2012, 2013, 2014, and 2015 as part of the Reference Site Network monitoring project. Survey results of this Cold Water habitat can be briefly summarized as follows: the benthic community (Station B0820) IBI scores were all indicative of excellent/satisfactory conditions (58 to 94, n=5), multiple age classes of Eastern brook trout were documented (backpack electrofishing in Septembers 2012, 2014, and 2015 [SampleIDs 5043, 6316, and 6393] and October 2013 [SampleID 5099]), and water quality sampling data including both deployed probe and discrete sampling efforts (Station W2286) were indicative of excellent conditions -- minimum dissolved oxygen 8.1mg/L during summers 2013 – 2015, maximum temperature 21.8°C during summers 2012 – 2015 (7DADM exceeded 20°C 5 times only in 2013) with maximum 24 hour rolling average 20.7°C, pH 6.4 to 7.0SU (n=11), no indications of any nutrient enrichment problems (seasonal average total phosphorus concentrations ranged from 0.005 to 0.013mg/L, max diel DO shift 1.5mg/L, maximum saturation 102%, maximum pH 7.0SU), and low concentrations of total ammonia-nitrogen (0.083mg/L) and chloride (maximum 4mg/L) (n=17).

The Aquatic Life Use of Dunbar Brook is assessed as Fully Supporting based on benthic macroinvertebrate, fish population, and water quality monitoring data collected by MassDEP biologists between 2012 and 2015.

Recommendations

| 2022 Recommendations |
|---|
| <p>ALU: Additional long-term temperature data should be collected in the East Branch North River to better evaluate the appropriateness of the 2022 Temperature impairment (which was based off of data collected in the year following Hurricane Irene), the effectiveness of Connecticut River Conservancy habitat restoration efforts (in CRC's comment on the draft 2022 IR, the group indicated that restoration projects were completed upstream of this AU and downstream of Jesse Wood Lane in 2020), and to potentially target additional areas for improved riparian corridor health to provide additional shading. Cooperative efforts (both VT and MA towns in this subwatershed) to reduce thermal stress should be prioritized to protect/maintain/restore cold water habitat in this river. REC: Conduct additional <i>E. coli</i> bacteria sampling in the East Branch North River including "Lyonsville Road", Colrain (site of old Arthur Smith Covered Bridge, no road crossing here (MassDEP sampling site W1347) to better evaluate status of Primary Contact Recreational Use and potential delisting of the <i>E. coli</i> impairment.</p> |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| 2022 Use Attainment | Alert |
|---|-------|
| Not Supporting | YES |
| 2022 Use Attainment Summary | |
| <p>MassDEP biologists sampled the East Branch North River just south of the VT/MA border ~2225 feet upstream of the Route 112 crossing nearest Jesse Wood Road in Colrain during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. The benthic community (B0792) sample, collected in September 2012, had an IBI score of 53 (high end of Moderately Degraded conditions for a high gradient Western Highland region stream). Backpack electrofishing (Sample ID 5038) in September 2012 documented slimy sculpin and one young Eastern brook trout as well as other fluvial fishes. Water quality sampling data including both deployed probe and discrete sampling efforts (Station W2255) can be summarized as follows: minimum dissolved oxygen 8.1mg/L during three short term DO deploys, maximum temperature 26.6°C between June 1st and September 15th with 7DADM exceeding 20°C 82 times. The maximum 24-hour rolling average temperature was 23.2°C, pH ranged from 7.9 to 8.7SU (n=3), and there was a slight indication of a nutrient enrichment problem (seasonal average total phosphorus concentrations was low 0.008mg/L, max diel DO shift only 1.7mg/L, maximum saturation 112%, maximum pH 8.7SU, a one observation of dense/very dense filamentous algae of six site visits). There were no toxicant issues (maximum total ammonia-nitrogen concentration was 0.02mg/L, chloride was 7mg/L (n=5), and there were no exceedances of any of clean metals or aluminum samples (n=3) although it should be noted that dissolved Al data were compared to total recoverable Al criteria, so exceedances cannot be ruled out). Slightly further downstream just upstream and downstream from the confluence with Spur Brook at Route 112 bridge in Colrain, MA DFG biologists conducted backpack electrofishing in August 2016. Fluvial fish including slimy sculpin comprised both samples. MA DFG biologists also conducted backpack electrofishing slightly further downstream in the East Branch North River along Route 112 (near a turnoff) in Colrain as follows: SampleID 5170 in September 2014, SampleID 5697 in August 2015, SampleID 6276 in September 2016, SampleID 6464 in August 2017, and Sample ID 8264 in August 2019. All samples were comprised entirely with fluvial fishes including slimy sculpin as well as one or a few Eastern brook trout in half of the samples. Overall, however, cold water fish represented ≤25% of the samples. The Aquatic Life Use for the East Branch North River is assessed as Not Supporting based on the elevated temperatures above Cold Water habitat criteria during the summer of 2012. While most of the watershed area in MA is Natural/Wetland with a low % of impervious cover, the agricultural areas are fairly concentrated within the stream buffer zone, so the elevated temperature is considered to be exacerbated by anthropogenic activities. Land-Use data in VT were not readily available but cooperative efforts to reduce thermal stress should be prioritized. While the benthic data IBI score was in the high end of the Moderately Degraded category, since the data were collected in the year following Hurricane Irene, a benthic impairment is not being added. The Alert for habitat degradation due to bank erosion and sedimentation identified by (Cole 2014) is being carried forward.</p> | |

|--|-------|
| Not Assessed | NO |
| 2022 Use Attainment Summary | |
| No fish toxics sampling has been conducted in the East Branch North River, therefore the Fish Consumption Use is Not Assessed. | |

Aesthetic

| 2022 Use Attainment | Alert |
|--|-------|
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| MassDEP staff surveyed the East Branch North River ~2225 feet upstream of the Route 112 crossing nearest Jesse Wood Road in Colrain (W2255) during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. There were generally no noted objectionable conditions (odors, deposits, growths, or turbidity) recorded. The Aesthetics Use for the East Branch North River is assessed as Fully Supporting based on the general lack of objectionable conditions documented by MassDEP staff during the summer of 2012. | |

| Not Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MassDEP staff conducted <i>E. coli</i> bacteria sampling in the East Branch North River upstream of the Route 112 crossing nearest Jesse Wood Road in Colrain (W2255) between May and September 2012 (n=6). Data analysis for this location indicated 33% of the intervals had GMs >126 cfu/100ml, none of the samples exceeded the 410 cfu/100ml STV, and the seasonal GM was 77 cfu/100ml. Further downstream Connecticut River Conservancy volunteers collected <i>E. coli</i> bacteria samples from the East Branch North River at Foundry Village Road in Colrain (CRC_MA-EBN_02.4) between June and September 2019 (n=5) and between July and September 2020 (n=5). Data analysis of this low frequency multi-year dataset indicated only one of two years with GMs that exceeded 20% (cumulative 30% exceedance) and only one year with one sample that exceeded the STV of 410cfu/100mls. The seasonal GMs were 147 and 66 cfu/100ml in 2019 and 2020, respectively.</p> <p>Although the <i>E. coli</i> concentrations were below the use attainment impairment thresholds at both sites for a single year low frequency dataset at the upstream site and for the multi-year low frequency dataset at the downstream sampling site, the Primary Contact Recreational Use for the East Branch North River will continue to be assessed as Not Supporting with the <i>E. coli</i> impairment being carried forward. The original <i>E. coli</i> impairment was first listed in the 2016 IR reporting cycle based on elevated <i>E. coli</i> bacteria concentrations in the river further downstream at "Lyonsville Road", Colrain (site of old Arthur Smith Covered Bridge, no road crossing here (MassDEP sampling site W1347 during summer of 2005). Given the recent sampling sites do not encompass the lower portion of the river where the original impairment was identified, too limited data are available to delist the <i>E. coli</i> impairment.</p> | |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| | |
|------------------------------------|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |

MassDEP biologists sampled East Glen Brook east of East Glen Road, approximately 4225 feet upstream of the inlet of the Greenfield Reservoir in Leyden during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. The benthic community (B0800) sample, collected in August 2012, had an IBI score of 51 (near high end of Moderately Degraded conditions for a high gradient Western Highland region stream). Backpack electrofishing (Sample ID 5022) in August 2012 documented multiple age classes of Eastern brook trout. Water quality sampling data including both deployed probe and discrete sampling efforts (Station W2263) can be summarized as follows: minimum dissolved oxygen 8.7mg/L during three short term DO deploys, maximum temperature 19.9°C between June 1st and September 15th. The maximum 24-hour rolling average temperature was 19.1°C, pH ranged from 7.6 to 7.9SU (n=3), and there were no indications of any nutrient enrichment problems (seasonal average total phosphorus concentrations 0.018mg/L, max diel DO shift only 0.8mg/L, maximum saturation 99%, maximum pH 7.9SU, no observations of any dense/very dense filamentous algae). There were no toxicant issues (maximum total ammonia-nitrogen concentration was 0.02mg/L, chloride was 4mg/L (n=5), and there were no exceedances of any of clean metals or aluminum samples (n=3) although it should be noted that dissolved Al data were compared to total recoverable Al criteria, so exceedances cannot be ruled out).

The Aquatic Life Use for East Glen Brook is assessed as Fully Supporting based on the biological and water quality data collected by MassDEP biologists during the summer of 2012. While the benthic data IBI score was in the high end of the Moderately Degraded category, since the data were collected in the year following Hurricane Irene, a benthic impairment is not being added since all other data were indicative of excellent conditions.

| <p>MassDEP staff surveyed East Glen Brook east of East Glen Road, approximately 4225 feet upstream of the inlet of the Greenfield Reservoir, Leyden (W2263) during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. No objectionable conditions (i.e., odors, deposits, growths, or turbidity) were observed during any of the surveys.</p> <p>The Aesthetics Use for East Glen Brook is assessed as Fully Supporting based on the lack of any objectionable conditions documented by MassDEP staff during the summer of 2012.</p> | |

Monitoring Stations

| Station Code | Organization | Type | Water Body | Station Description | Latitude | Longitude |

Recommendations

2022 Recommendations

ALU: Additional sampling (long-term temperature and fish community) data should be conducted in this Glen Brook AU (MA33-96); OTHER: This Glen Brook AU (MA33-96) should be protected as a Tier 1 Cold Water resource and review of any additional sampling data (long-term temperature and fish community) should be conducted for potential reclassification as Cold Water in a future revision of the MA SWQS.

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| | |
|------------------------------------|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |

MA DFG biologists conducted backpack electrofishing in Glen Brook in Leyden Glen, upstream of roadway arch, below Greenfield Reservoir in July 2014 (SampleID 5381). This sample was comprised almost entirely (95%) by fluvial fish including multiple age classes of Eastern brook trout. Further downstream upstream of a culvert above Leyden Road, a second backpack electrofishing sample was collected in August 2014 (SampleID 5404). This sample was comprised entirely by fluvial fish including multiple age classes of Eastern brook trout as well as slimy sculpin. The Aquatic Life Use for this Glen Brook AU (MA33-96) is assessed as Fully Supporting based on the presence of Cold Water fish documented by MA DFG biologists in summer 2014.

Recommendations

| 2022 Recommendations |
|---|
| <p>ALU: Additional long-term temperature data should be collected in this Green River AU (MA33-28) to better evaluate the thermal regime and potentially target areas for improved riparian corridor health to provide additional shading. Cooperative efforts (both VT and MA towns in this subwatershed) to reduce thermal stress should be prioritized to protect/maintain/restore cold water habitat in this river.</p> |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| 2022 Use Attainment | Alert |
|--|-------|
| Not Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MA DFG biologists conducted backpack electrofishing in this Green River AU (MA33-28) upstream of Borden Brook along River Road in August 2017 (SampleID 6659). This sample contained slimy sculpin and was comprised almost entirely by fluvial fish. Slightly further downstream backpack electrofishing in September 2016 (SampleID 6272) also contained one small Eastern brook trout as well as slimy sculpin and other fluvial species. MassDEP biologists sampled upstream of Thorne Brook confluence in Leyden in summers 2013, 2014, and 2015 as part of the Reference Site Network monitoring project. Survey results can be briefly summarized as follows: the benthic community (Station B0560) IBI scores were indicative of moderately degraded conditions in August 2013 and 2014 (scores 44 and 48) but had improved to satisfactory condition (score 65) in the July 2015 sample, backpack electrofishing in October 2013 (SampleID 5098), September 2014 (Sample ID 6318), and September 2015 (SampleID 6395), documented a few Eastern brook trout (multiple age classes), slimy sculpin, and other fluvial fishes. Water quality sampling data (both deployed probe and discrete sampling - Station W2414) documented minimum dissolved oxygen 7.9mg/L during three long term DO deploys, maximum temperature 25.6°C between June 1st and September 15th each year with 7DADMs exceeding 20°C 54 times in 2013, 6 times in 2014, 59 times in 2015 and a maximum 24-hour rolling average temperature 23.6°C (above 23.5°C 6 times in 2013 but no acute cold water threshold exceedances in 2014 or 2015), pH ranged from 7.6 to 8.3SU (n=11), and except for elevated total phosphorus concentration in 2014 (seasonal average 0.119mg/L), there were no other indications of any nutrient enrichment problems (seasonal average total phosphorus concentrations low in 2013 and 2015 both years ≤ 0.006mg/L, max diel DO shift only 1.9mg/L, maximum saturation 107%, maximum pH 8.3SU, no observations of dense/very dense filamentous algae). Lastly, there were no toxicant issues (maximum total ammonia-nitrogen concentration 0.084mg/L and chloride 4mg/L (n=13)). MA DFG biologists also conducted backpack electrofishing in this area in September 2019 (SampleID 8282) and documented slimy sculpin and other fluvial species as well as just a bit further downstream in August 2015 (SampleID 5705) where multiple age classes of Eastern brook trout and slimy sculpin were present. A single small Eastern brook trout and slimy sculpin were present in the river just upstream from the confluence with Katley Brook in September 2014 (SampleID 5167). Slightly further downstream a few small brook trout and slimy sculpin were present in samples collected in September 2014 and August 2015 (SampleIDs 5168 and 5706) however no cold water fish were collected during backpack electrofishing surveys by MA DFG biologists in September 2016, August 2017, or September 2019 (SampleIDs 6274, 6660, and 8283, respectively) although these samples were comprised entirely by fluvial species.</p> <p>The Aquatic Life Use for this Green River AU (MA33-28) is assessed as Not Supporting based on the elevated temperatures above Cold Water habitat criteria during the summers 2013 to 2015. While most of the watershed area in MA is Natural/Wetland with a low % of impervious cover, agricultural areas and roadways are fairly near the river, so temperature is likely exacerbated by anthropogenic activities. Land-Use data in VT were not readily available but cooperative efforts to reduce thermal stress should be prioritized. The benthic data IBI scores indicated Moderately Degraded conditions following Hurricane Irene but had improved to Satisfactory Conditions in 2015, the fish sample data identify cold water species throughout most of this section of the river (numbers somewhat low) with cold water species absent in 2016, 2017, and 2019 downstream from the confluence of Katley Brook. All other water quality data were indicative of excellent conditions.</p> | |

| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MassDEP staff surveyed this Green River AU (MA33-28) east of Green River Road in Colrain near the confluence of Thorne Brook (W2414) during the summers of 2013, 2014, and 2015 as part of the Reference Site Network monitoring project. Generally no objectionable conditions (i.e., odors, deposits, growths, or turbidity) were observed during any of the surveys.</p> <p>The Aesthetics Use for this Green River AU (MA33-28) is assessed as Fully Supporting based on the general lack of any objectionable conditions documented by MassDEP staff during the summers of 2013, 2014, and 2015.</p> | |

Monitoring Stations

Secondary Contact Recreation

| | |
|------------------------------------|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |

Connecticut River Conservancy volunteers collected *E. coli* bacteria samples in the Green River at "Bare Ass Beach" in Colrain (CRC_MA-GRN_09.8) between June and September 2019 (n=6) and between July and September 2020 (n=5). Data analysis of this low frequency multi-year dataset indicated neither year had GMs that exceeded 630 cfu/100mls by more than 20% and no samples that exceeded the STV of 1260 cfu/100mls. The seasonal GMs were 63 and 58cfu/100ml in 2019 and 2020, respectively.

Since the *E. coli* concentrations were below the use attainment impairment thresholds for this multi-year low frequency dataset, the Secondary Contact Recreational Use for this Green River AU (MA33-28) is assessed as Fully Supporting.

Recommendations

| 2022 Recommendations |
|---|
| <p>ALU: Additional long-term temperature data should be collected along the Green River (MA33-30) to better evaluate the appropriateness of the 2022 Temperature impairment (which was based off of data collected in the year following Hurricane Irene) and to potentially target areas for improved riparian corridor health to provide additional shading. Cooperative efforts (both VT and MA towns in this subwatershed) to reduce thermal stress should be prioritized to protect/maintain/restore cold water habitat in this river.</p> |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| 2022 Use Attainment | Alert |
|--|-------|
| Not Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MassDEP biologists sampled this Green River AU (MA33-30) east of Route 91, ~915 meters upstream of Colrain Street in Greenfield during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. The benthic community (B0785) sample, collected in September 2012, had an IBI score of 84 indicative of Exceptional conditions compared to the statewide low gradient index). Barge electrofishing (Sample ID 5033) in September 2012 documented fluvial fish (99% of sample) although no cold water species were present. Water quality sampling data including both deployed probe and discrete sampling efforts (Station W2248) can be summarized as follows: minimum dissolved oxygen 7.3mg/L during three short term DO deploys, maximum temperature 26.5°C between June 1st and September 15th with 7DADM exceeding 20°C 90 times. The maximum 24-hour rolling average temperature was 25.2°C (frequently exceeding the acute threshold of 23.5°C, pH ranged from 7.4 to 7.6SU (n=3), and there were few indications of any nutrient enrichment problems (seasonal average total phosphorus concentrations was low 0.008mg/L, max diel DO shift only 2.4mg/L, maximum saturation 120%, maximum pH 7.6SU, and there were no observations of dense/very dense filamentous algae during the five site visits). There were no toxicant issues (maximum total ammonia-nitrogen concentration was 0.02mg/L, chloride was 11mg/L (n=5), and there were no exceedances of any of clean metals or aluminum samples (n=3) although it should be noted that dissolved Al data were compared to total recoverable Al criteria, so exceedances cannot be ruled out).</p> <p>The Aquatic Life Use for this Green River AU (MA33-30) is assessed as Not Supporting based on the lack of cold water fish and temperatures that exceed frequently exceeded Cold Water criteria during the summer of 2012 (both acute and chronic thresholds were exceeded). The benthic sample and other water quality data collected were indicative of generally good conditions. The former Alert related to habitat issues from the dams is no longer needed since the temperature impairment is being added.</p> | |

| 2022 Use Attainment Summary | |
| MassDEP staff surveyed one reach along this Green River AU (MA33-30) ~3000 feet upstream of Colrain Street in Greenfield (W2248) during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. Except for high turbidity observations during two of the five surveys, there were generally no other objectionable conditions (i.e., odors, deposits, growths) during the surveys. The Aesthetics Use for this Green River AU (MA33-30) will continue to be assessed as Not Supporting with the Turbidity impairment being carried forward. | |

Monitoring Stations

| Station Code | Organization | Type | Water Body | Station Description | Latitude | Longitude |
|--------------|--------------|---------------|-------------|--|-----------|------------|
| W2248 | MassDEP | Water Quality | Green River | [east of Route 91, approximately 3000 feet upstream of Colrain Street, Greenfield] | 42.598248 | -72.615920 |

Aesthetic Observations

Aesthetics Summary Statements for MassDEP Stations (2011-2018) (MassDEP Undated 6)

| Station Code | Waterbody | Data Year | Field Sheet Count | Aesthetics Summary Statement |
|--------------|-------------|-----------|-------------------|---|
| W2248 | Green River | 2012 | 6 | The Aesthetics use for the Green River is assessed as Fully Supporting based on observations (generally no odors, deposits, or growths) by MassDEP staff during field surveys at station W2248/MAP2-169 in summer 2012 (n=6). However, the use is identified with an Alert status due to 2 observations of highly turbid water. |

Primary Contact Recreation

| 2022 Use Attainment | Alert |
|------------------------------------|-------|
| Not Supporting | NO |
| 2022 Use Attainment Summary | |

E. coli bacteria samples were collected at three sites along this Green River AU (MA33-30) in Greenfield from up to downstream as follows: by MassDEP staff ~3000 feet upstream of Colrain Street (W2248) during the summer of 2012 (n=6), and by Connecticut River Conservancy volunteers between MA Route 2A and the Railroad Bridge (CRC_MA-GRN_02.0) in the summers of 2019 (n=6) and 2020 (n=5), and near Petty Plain Road (CRC_MA-GRN_00.8) during the summer of 2019 (n=6). Data analysis of these single and multiple year low frequency datasets indicated between 75 and 100% of the intervals had GMs >126 cfu/100ml, and two or more samples exceeded the 410 cfu/100ml STV at each site in at least one year. The seasonal GMs ranged from 157 to 1005cfu/100ml. Since the *E. coli* concentrations exceeded the use attainment impairment thresholds at all three sampling locations, the Primary Contact Recreational Use for this Green River AU (MA33-30) will continue to be assessed as Not Supporting with the *E. coli*, Fecal Coliform, and Turbidity impairments being carried forward.

2012

Secondary Contact Recreation

| | |
|------------------------------------|--------------|
| 2022 Use Attainment | Alert |
| Not Supporting | NO |
| 2022 Use Attainment Summary | |

E. coli bacteria samples were collected at three sites along this Green River AU (MA33-30) in Greenfield from up to downstream as follows: by MassDEP staff ~3000 feet upstream of Colrain Street (W2248) during the summer of 2012 (n=6), and by Connecticut River Conservancy volunteers between MA Route 2A and the Railroad Bridge (CRC_MA-GRN_02.0) in the summers of 2019 (n=6) and 2020 (n=5), and near Petty Plain Road (CRC_MA-GRN_00.8) during the summer of 2019 (n=6). Data analysis of these single and multiple year low frequency datasets indicated none of the interval GMs at the two upstream sampling locations were >630 cfu/100ml and no more than one sample exceeded the 1260 cfu/100ml STV at either of these two sites but at the most downstream site (CRC_MA-GRN_00.8) 100% of the intervals had GMs >630 cfu/100ml, and three samples exceeded the 1260 cfu/100ml STV. The seasonal GMs ranged from 157 to 1005cfu/100ml.

Since the *E. coli* concentrations exceeded the use attainment impairment thresholds at the most downstream sampling location (CRC_MA-GRN_00.8 near Petty Plain Road in Greenfield), the Secondary Contact Recreational Use for this Green River AU (MA33-30) will continue to be assessed as Not Supporting with the *E. coli*, Fecal Coliform, and Turbidity impairments being carried forward.

Recommendations

| 2022 Recommendations |
|---|
| <p>ALU: Additional long-term temperature data should be collected in Hinsdale Brook to better evaluate the appropriateness of the 2022 Temperature impairment (which was based off of data collected in the year following Hurricane Irene) and to potentially target areas for improved riparian corridor health to provide additional shading. REC: Conduct <i>E. coli</i> bacteria sampling in Hinsdale Brook along Green River Road in Greenfield downstream of the storm water swale and discharge pipes (W1346) to evaluate if a delisting of <i>E. coli</i> bacteria impairment is appropriate since sampling upstream of this location in summer 2012 [upstream of Green River Road, Shelburne (~ 700 feet downstream of the Stewart Brook confluence)] had no <i>E. coli</i> bacteria exceedances.</p> |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| 2022 Use Attainment | Alert |
|---|-------|
| Not Supporting | YES |
| 2022 Use Attainment Summary | |
| <p>MA DFG biologists conducted backpack electrofishing in the upper reach of Hinsdale Brook upstream of Wilson Graves Rd crossing in Shelburne in July 2014 (SampleID 5388) and near the confluence with Stewart Brook at Brook Road crossing in Shelburne in September 2014 and August 2015 (SampleIDs 5166 and 5707). The samples were all comprised of fluvial fish including multiple age classes of Eastern brook trout these sites as well as slimy sculpin at all but the most upstream location. Slightly further downstream MassDEP biologists also sampled Hinsdale Brook upstream of Green River Road, Shelburne (and ~700 feet downstream of the Stewart Brook confluence) during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. The benthic community (B0782) sample, collected in August 2012, had an IBI score of 47 (Moderately Degraded conditions for a high gradient Western Highland region stream). Backpack electrofishing by MassDEP biologists in August 2012 (SampleID 501=23) documented a sample comprised entirely by fluvial fish including multiple age classes of Eastern brook trout as well as slimy sculpin. Water quality sampling data including both deployed probe and discrete sampling efforts (Station W2275) can be summarized as follows: minimum dissolved oxygen 8.5mg/L during three short term DO deploys, maximum temperature 22.0°C between June 1st and September 15th with 7DADM exceeding 20°C 25 times. The maximum 24-hour rolling average temperature was 20.7°C, pH ranged from 8.2 to 8.4SU (n=3), and there no indications of a nutrient enrichment problem (seasonal average total phosphorus concentrations was 0.010mg/L, max diel DO shift only 0.9mg/L, maximum saturation 106%, maximum pH 8.4SU, no observations of dense/very dense filamentous algae in any of the six site visits). There were no toxicant issues (maximum total ammonia-nitrogen concentration was 0.02mg/L, chloride was 8mg/L (n=5), and there were no exceedances of any of clean metals or aluminum samples (n=3) although it should be noted that dissolved Al data were compared to total recoverable Al criteria, so exceedances cannot be ruled out). Lastly MA DFG biologists also conducted backpack electrofishing in Hinsdale Brook at the Greenfield/Shelburne town line at Colrain/Brook roads in September 2016, August 2017, and September 2018 (SampleIDs 6275, 6657, and 7602, respectively). These samples were also comprised entirely by fluvial fish including a few Eastern brook trout (multiple age classes) as well as slimy sculpin.</p> <p>The Aquatic Life Use for the Hinsdale Brook is assessed as Not Supporting based on the elevated temperatures above Cold Water habitat criteria during the summer of 2012. The watershed area is 72.4% Natural/Wetland with 2.2% of impervious cover, with a fairly high percentage of agricultural area (22.9%), so the elevated temperature is considered to be exacerbated by anthropogenic activities. While the benthic data IBI score was in the Moderately Degraded category, since the data were collected in the year following Hurricane Irene, a benthic impairment is not being added. The former Alert for suboptimal habitat previously identified in the brook downstream From Greenfield Road in Shelburne is also being carried forward.</p> | |

Primary Contact Recreation

| 2022 Use Attainment | Alert |
|---|-------|
| Not Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MassDEP staff collected <i>E. coli</i> bacteria samples from Hinsdale Brook upstream of Green River Road, Shelburne (and ~700 feet downstream of the Stewart Brook confluence) (W2275) between May and September 2012 (n=6). Data analysis indicated none of the intervals had GMs >126 cfu/100ml, none of the samples exceeded the 410 cfu/100ml STV, and the seasonal GM was 24 cfu/100ml.</p> <p>Despite low <i>E. coli</i> concentrations in the river upstream of Green River Road, Shelburne (and ~700 feet downstream of the Stewart Brook confluence) (W2275) during the summer 2012, the Primary Contact Recreational Use for Hinsdale Brook will continue to be assessed as Not Supporting with the <i>E. coli</i> impairment being carried forward. The impairment was first listed in the 2016 IR reporting cycle based on <i>E. coli</i> bacteria concentrations in Hinsdale Brook a little further downstream along Green River Road in Greenfield downstream of a storm water swale and discharge pipes (W1346) during the summer 2005 (n=5 samples with overall geo mean 139cfu/100mls) so a recommendation will be made to sample that location again to evaluate if a delisting is appropriate.</p> | |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| | |
|---|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| MA DFG biologists conducted backpack electrofishing in this Mill Brook AU (MA33-69) upstream of the bridge on Middle Road in Hawley in August/early September 2014 through 2019 (SampleIDs 5146, 5675, 6273, 6492, 7608, 8263). The samples were comprised entirely by fluvial fish including multiple age classes of Eastern brook trout and slimy sculpin. The Aquatic Life Use of this Mill Brook AU (MA33-69) is assessed as Fully Supporting based on the presence of cold water fish species documented in August/early September 2014 through 2019 which are indicative of excellent habitat and water quality conditions. | |

Recommendations

| 2022 Recommendations |
|---|
| ALU: Conduct benthic macroinvertebrate sampling in this Mill Brook AU (MA33-70) to reevaluate conditions using appropriate IBI gradient metrics (sampling site used by Deerfield River Watershed Association project monitoring in 2005). Long-term temperature monitoring should also be conducted to evaluate thermal regimes with potential for future Cold Water designation. |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| 2022 Use Attainment | Alert |
|--|-------|
| Not Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MA DFG biologists conducted backpack electrofishing at two sites along this Mill Brook AU (MA33-70) from up to downstream as follows: upstream of Eden Trail Road Crossing in Bernardston (SampleID 7373) in August 2018 and upstream of the Country Club Road crossing at Arch Bridge in Greenfield (SampleID5402) in August 2014. Both samples were comprised entirely by fluvial fish with multiple age classes of Eastern brook trout and slimy sculpin at the upstream site and Eastern brook trout (not stocked) at the downstream sampling location.</p> <p>Despite the presence of cold water fish (Eastern brook trout and slimy sculpin) which are indicative of excellent habitat and water quality conditions, the Aquatic Life Use for this Mill Brook AU (MA33-70) will continue to be assessed as Not Supporting with the Benthic Macroinvertebrate impairment being carried forward (2005 benthic survey documented moderately impacted conditions so this impairment was added during the 2016 reporting cycle) (MassDEP Undated 7).</p> | |

| Temperature | Source Unknown (N) | X | | | | |

Recommendations

| 2022 Recommendations |
|---|
| <p>ALU: Additional long-term temperature data should be collected in the North River to better evaluate the thermal regime and potentially target areas for improved riparian corridor health to provide additional shading. Cooperative efforts (both VT and MA towns in this subwatershed) to reduce thermal stress should be prioritized to protect/maintain/restore cold water habitat in this river. Additional benthic and water quality sampling are also recommended to follow up on indicators of problems (moderately degraded benthic community and some indications of enrichment issues) during the MassDEP 2012 survey.</p> |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| 2022 Use Attainment | Alert |
|---|--------------|
| Not Supporting | YES |
| 2022 Use Attainment Summary | |
| <p>MA DFG biologists conducted backpack electrofishing in the North River upstream of the DPW gravel piles/turnout along Call Road in Colrain in September 2014 and again in September 2016 (SampleIDs 5188 and 6236, respectively). Both samples were comprised entirely by fluvial fish but the cold water species included only a single brown and rainbow trout in the 2014 sample and a single rainbow trout in the 2016 sample. Further downstream, but upstream of the Main Road (Route 112) crossing nearest the Johnson Brook confluence, MassDEP biologists conducted benthic and water quality sampling during the summer 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. The benthic community (B0814) sample, collected in September 2012, had an IBI score of 35 (low end of Moderately Degraded conditions for a high gradient Western Highland region stream). Water quality sampling data including both deployed probe and discrete sampling efforts (Station W2277) can be summarized as follows: minimum dissolved oxygen 5.9mg/L during three short term DO deploys, maximum temperature 28.8°C between June 1st and September 15th with 7DADM exceeding 20°C 93 times. The maximum 24-hour rolling average temperature was 25.8°C, pH was high ranging from 8.7 to 9.1SU (n=3), and there were indications of a nutrient enrichment problem (while seasonal average total phosphorus concentrations was low 0.037mg/L and there was one only observation of dense/very dense filamentous algae of six site visits, the max diel DO shift was 4.9mg/L, maximum saturation 145%, and the maximum pH was 9.1SU). Except for one slight chronic copper exceedance (1.23TU), there were no indications of any other toxics issues (maximum total ammonia-nitrogen concentration was 0.02mg/L, chloride was 7mg/L (n=5), and there were no exceedances of any other clean metals or aluminum samples (n=3) although it should be noted that dissolved Al data were compared to total recoverable Al criteria, so exceedances cannot be ruled out). Also, in September 2019, a sulfuric acid spill/leak at Barnhardt Manufacturing Company in Colrain resulted in a fish kill in the North River (~270,000 fish including thousands of state listed rare species). The Company's settlement (December 2021) will compensate the state for harms to natural resources and the Cold Water Fishery and ensure safe operation of the Colrain bleaching facility (Office of Attorney General 2021).</p> <p>The Aquatic Life Use for the North River is assessed as Not Supporting based on the elevated temperatures in this designated Cold Water stream during the summer of 2012 and the general lack of cold water fish in September 2014 and 2016. While most of the watershed area in MA is Natural/Wetland with a low % of impervious cover, there is one dam (the Kendall Company No 1 Dam, NATID MA00047), and it is also noted the agricultural areas are fairly concentrated within the stream buffer zone, so the elevated temperature is considered to be exacerbated by anthropogenic activities. Land-Use data in the upper watershed area in VT were not readily available but cooperative efforts to reduce thermal stress should be prioritized. While the benthic data IBI score was in the low end of the Moderately Degraded category, since the data were collected in the year following Hurricane Irene, a benthic impairment is not being added but additional benthic sampling is being recommended. The former alerts for habitat degradation due to bank erosion and sedimentation identified by (Cole 2014) in the 2016 IR cycle, whole effluent toxicity in the Barnhardt discharge, and potential impact on flow in the 0.6 mile reach of river that is bypassed via a canal (Duerring, Kennedy and Mitchell 2004) are being carried forward and new Alerts for benthic degradation and nutrient enrichment signals are being added.</p> | |

Primary Contact Recreation

| 2022 Use Attainment | Alert |
|--|-------|
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MassDEP staff collected E. coli bacteria samples from the North River upstream of the Main Road (Route 112) crossing nearest the Johnson Brook confluence (which is ~500 feet upstream of station) in Colrain (W2277) between May and September 2012 (n=6). Data analysis of this low frequency single year dataset indicated 67% of the intervals had GMs >126 cfu/100ml, one of the samples exceeded the 410 cfu/100ml STV, and the seasonal GM was 118 cfu/100ml. Further downstream near the mouth of the North River at "Sunburn Beach" in Charlemont Connecticut River Conservancy volunteers collected E. coli bacteria samples from the river between June and September 2019 (n=5) and again between July and September 2020 (n=5). Data analysis of this low frequency multi-year dataset indicated only one of two years with GMs that exceeded >20% and neither year had two samples that exceeded the STV of 410cfu/100mls. The seasonal GMs were 152 and 50cfu/100ml in 2019 and 2020, respectively.</p> <p>Since the E. coli concentrations were below the use attainment impairment thresholds at both sampling locations (a single year and a multi-year low frequency dataset at each), the Primary Contact Recreational Use for the North River is assessed as Fully Supporting.</p> | |

Secondary Contact Recreation

| | |
|------------------------------------|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |

MassDEP staff collected *E. coli* bacteria samples from the North River upstream of the Main Road (Route 112) crossing nearest the Johnson Brook confluence (which is ~500 feet upstream of station) in Colrain (W2277) between May and September 2012 (n=6). Data analysis of this low frequency single year dataset indicated none of the intervals had GMs >630 cfu/100ml, none of the samples exceeded the 1260 cfu/100ml STV, and the seasonal GM was 118 cfu/100ml. Further downstream near the mouth of the North River at “Sunburn Beach” in Charlemont Connecticut River Conservancy volunteers collected *E. coli* bacteria samples from the river between June and September 2019 (n=5) and again between July and September 2020 (n=5). Data analysis of this low frequency multi-year dataset also indicated no GM or STV exceedances. The seasonal GMs were 152 and 50cfu/100ml in 2019 and 2020, respectively. Since the *E. coli* concentrations were below the use attainment impairment thresholds at both sampling locations (a single year and a multi-year low frequency dataset at each), the Primary Contact Recreational Use for the North River is assessed as Fully Supporting

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| | |
|--|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| MA DFG biologists conducted backpack electrofishing in Pelham Brook accessed down a logging road off of Zoar Road in Rowe (near pole #57) in August 2014, September 2015, August 2016, and August 2018 (SampleIDs 5162, 5715, 6246, and 7610, respectively). All samples were comprised almost entirely by fluvial fish including multiple age classes of Eastern brook trout. The Aquatic Life Use for Pelham Brook is assessed as Fully Supporting based on the presence of cold water fish species which are indicate of excellent habitat and water quality conditions. | |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| | |
|--|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MA DFG biologists conducted backpack electrofishing at two sites along Poland Brook in Conway from up to downstream as follows: upstream of a bridge on North Poland Road ~ ¼ mile north of Bullitt Road (SampleIDs 5126, 5679, 6621, 6624, and 7613) in August 2014 through 2017 and September 2018, respectively and further downstream near the first North Poland Road Bridge crossing closest to the mouth of Poland Brook in September 2019 (SampleID 8315). The fish samples were all comprised entirely by fluvial fishes with a few multiple age classes of Eastern brook trout in samples collected 2014 through 2016, a few small Eastern brook trout and slimy sculpin were in the 2017 sample, and one small brook trout was in the 2018 sample. No cold water fish were collected in the sample collected near the mouth of Poland Brook in 2019. This small watershed area (~6.7mi²) is Natural/Wetland (94.6%) with a low % of impervious cover (1.1%) and beaver dams are present upstream from the sampling locations.</p> <p>The Aquatic Life Use for Poland Brook is assessed as Fully Supporting based on the presence of a few cold water fish species which are indicate of excellent habitat and water quality conditions even their overall numbers were low.</p> | |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| | |
|--|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MA DFG biologists conducted backpack electrofishing fairly near the mouth of Sanders Brook upstream of the bridge on Adamsville Road near Colrain/Heath border in August 2014 through 2017, September 2018, and again in August 2019 (SampleIDs 5159, 5697, 6252, 6627, 7615, and 8266) and one additional site slightly farther upstream in August 2016 (SampleID 5936). All of the samples were comprised entirely by fluvial fish including multiple age classes of Eastern Brook trout as well as slimy sculpin.</p> <p>The Aquatic Life Use for Sanders Brook is assessed as Fully Supporting based on the presence of cold water fish species which are indicate of excellent habitat and water quality conditions.</p> | |

Recommendations

2022 Recommendations

ALU: Conduct long-term temperature monitoring in Smith Brook to better evaluate thermal regime and acquire data to consider designated as Cold Water Fishery in a future SWQS update.

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| 2022 Use Attainment | Alert |
|--|-------|
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| MA DFG biologists conducted backpack electrofishing in Smith Brook near the pull-off before Clesson Brook Road along Route 112 in Ashfield in August 2014 (SampleID 5440). The sample was comprised entirely by fluvial fish including multiple age classes of Eastern brook trout and slimy sculpin. The Aquatic Life Use for Smith Brook is assessed as Fully Supporting based on the presence of cold water fish species which are indicative of excellent habitat and water quality conditions. | |

Fish, other Aquatic Life and Wildlife

| | |
|----------------------------|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |

2022 Use Attainment Summary

MA DFG biologists conducted 11 backpack electrofishing samples along this South River AU (MA33-101) between August 2014 and August 2017 as follows: between the confluences of Creamery and Poland brooks along Route 116 in Ashfield (Sample IDs 5439, 7491, 7496, 5438, 5437, 7497, 5680, and 6623) and further downstream along Route 116 near the bridge close to Eldridge Road in Conway (SampleIDs 5681, 6241, and 6622). The samples were comprised entirely (with a single exception) of fluvial fish including multiple age classes of Eastern brook trout as well as slimy sculpin. The Aquatic Life Use for this South River AU (MA33-101) is assessed as Fully Supporting based on the presence of cold water fish species which are indicate of excellent habitat and water quality conditions.

Recommendations

| 2022 Recommendations |
|---|
| <p>ALU: Additional long-term temperature data should be collected in the South River to better evaluate the appropriateness of the 2022 Temperature impairment (which was based off of data collected in the year following Hurricane Irene) and to potentially target areas for improved riparian corridor health to provide additional shading. Cooperative efforts (MA towns in this subwatershed) to reduce thermal stress should be prioritized to protect/maintain/restore cold water habitat in this river. REC: Conduct additional <i>E. coli</i> bacteria sampling at historic sampling locations along this South River AU (MA33-102) to evaluate if the <i>E. coli</i> and Fecal Coliform bacteria impairments can be delisted [include CRC sampling location in the South River off Reeds Bridge Road in Conway (CRC_MA-SOU_02.4)].</p> |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| 2022 Use Attainment | Alert |
|---|-------|
| Not Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MassDEP biologists sampled this South River AU (MA33-102) upstream of Main Street (Route 116) in Conway (upstream of the confluence of Pumpkin Hollow Brook) during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. The benthic community (B0797) sample, collected in July 2012, had an IBI score of 46 (Moderately Degraded conditions for a high gradient Western Highland region stream). Water quality sampling data including both deployed probe and discrete sampling efforts (Station W2260) can be summarized as follows: minimum dissolved oxygen 8.1mg/L during three short term DO deploys, maximum temperature 25.4°C between June 1st and September 15th with 7DADM exceeding 20°C 61 times. The maximum 24-hour rolling average temperature was 23.5°C, pH ranged from 8.0 to 8.7SU (n=3), and there was no indication of a nutrient enrichment problem (seasonal average total phosphorus concentrations was low 0.007mg/L, max diel DO shift only 1.3mg/L, maximum saturation 107%, maximum pH 8.7SU, and there were no observations of any dense/very dense filamentous algae of six site visits). There were no toxicant issues (maximum total ammonia-nitrogen concentration was 0.02mg/L, chloride was 32mg/L (n=5), and there were no exceedances of any of clean metals or aluminum samples (n=3) although it should be noted that dissolved Al data were compared to total recoverable Al criteria, so exceedances cannot be ruled out). Slightly further downstream along Route 116 in Conway, MA DFG biologists conducted backpack electrofishing in August 2016 (SampleID 6240). The sample was comprised of fluvial fish including multiple age classes of Eastern brook trout as well as slimy sculpin. The Aquatic Life Use for this South River AU (MA33-102) is assessed as Not Supporting based on the elevated temperatures above Cold Water habitat criteria during the summer of 2012. While most of the watershed area is Natural/Wetland (87.8%) with 2.2% impervious cover, the proximal stream buffer is 80.6% Natural/Wetland and has 8.8% agricultural areas often occur along the stream buffer zone, as do roadways, rural development, and at least one dam (Ashfield Pond Dam)so the elevated temperature is considered to be exacerbated by anthropogenic activities. While the benthic data IBI score was in the Moderately Degraded category, since the data were collected in the year following Hurricane Irene, a benthic impairment is not being added. The Physical Substrate Habitat Alteration impairment is also being carried forward.</p> | |

Fish Consumption

| 2022 Use Attainment | Alert |
|---|-------|
| Not Assessed | NO |
| 2022 Use Attainment Summary | |
| No fish toxics sampling has been conducted in this South River AU (MA33-102), therefore the Fish Consumption Use is Not Assessed. | |

Aesthetic

| 2022 Use Attainment | Alert |
|---|-------|
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| MassDEP staff surveyed this South River AU (MA33-102) upstream of Main Street (Route 116) in Conway (upstream of the confluence of Pumpkin Hollow Brook) during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. There were generally no objectionable conditions (i.e., odors, deposits, growths, or turbidity) observed during any of the surveys. The Aesthetics Use for this South River AU (MA33-102) is assessed as Fully Supporting based on the general lack of objectionable conditions noted by MassDEP sampling crews during the summer of 2012. | |

Primary Contact Recreation

| 2022 Use Attainment | Alert |
|-----------------------------|-------|
| Not Supporting | NO |
| 2022 Use Attainment Summary | |

MassDEP staff collected *E. coli* bacteria samples from this South River AU (MA33-102) upstream of Main Street (Route 116) in Conway (upstream of the confluence of Pumpkin Hollow Brook) during the summer of 2012 (W2260) between May and September 2012 (n=6). Data analysis indicated none of the intervals had GMs >126 cfu/100ml, none of the samples exceeded the 410 cfu/100ml STV, and the seasonal GM was 91 cfu/100ml. Connecticut River Conservancy volunteers collected *E. coli* bacteria samples further downstream from the river off Reeds Bridge Road in Conway (CRC_MA-SOU_02.4) between June and September 2019 (n=6) and between July and September 2020 (n=5). Data analysis of this low frequency multi-year dataset indicated only one of two years with GMs that exceeded >20% and only one year with two samples that exceeded the STV of 410cfu/100mls. The seasonal GMs were 336 and 68cfu/100ml in 2019 and 2020, respectively.

Although the *E. coli* concentrations were below the use attainment impairment thresholds for both the single year and multi-year low frequency datasets, the Primary Contact Recreational Use for this South River AU (MA33-102) will continue to be assessed as Not Supporting with the *E. coli* and Fecal Coliform bacteria impairments being carried forward. Since one of the two years of recent *E. coli* data indicated high bacteria concentrations, too limited data are available to delist the *E. coli* impairment.

2012

Secondary Contact Recreation

| | |
|------------------------------------|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |

MassDEP staff collected *E. coli* bacteria samples from this South River AU (MA33-102) upstream of Main Street (Route 116) in Conway (upstream of the confluence of Pumpkin Hollow Brook) during the summer of 2012 (W2260) between May and September 2012 (n=6). Data analysis indicated none of the intervals had GMs >630 cfu/100ml, none of the samples exceeded the 1260 cfu/100ml STV, and the seasonal GM was 91 cfu/100ml. Connecticut River Conservancy volunteers collected *E. coli* bacteria samples further downstream from the river off Reeds Bridge Road in Conway (CRC_MA-SOU_02.4) between June and September 2019 (n=6) and between July and September 2020 (n=5). Data analysis of this low frequency multi-year dataset indicated none of the GMs exceeded 630 cfu/100mls and did any sample exceed the STV of 1260 cfu/100mls. The seasonal GMs were 336 and 68cfu/100ml in 2019 and 2020, respectively.

The Secondary Contact Recreational Use for this South River AU (MA33-102) is assessed as Fully Supporting based on the *E. coli* concentration data from the summers of 2012, 2019, and 2020.

Monitoring Stations

2012

Spur Brook (MA33-106)

| | |
|----------------------------------|--|
| Location: | Headwaters, outlet small pond just west at intersection of Christian Hill Road and Thompson Road, Colrain to confluence with East Branch North River, Colrain. |
| AU Type: | RIVER |
| AU Size: | 2.1 MILES |
| Classification/Qualifier: | B |

No usable data were available for Spur Brook (MA33-106) for the 2022 Integrated Reporting cycle, therefore its category, use attainments, impairments, associated actions, and sources remain unchanged from the previous cycle.

| 2018/20 AU Category | 2022 AU Category | Impairment | ATTAINS Action ID | Impairment Change Summary |
|---------------------|------------------|------------|-------------------|---------------------------|
| 2 | 2 | None | | Unchanged |

Stafford Brook (MA33-98)

| | |
|----------------------------------|--|
| Location: | Headwaters, perennial portion south of East Colrain Road, Colrain to confluence with Green River, Colrain. |
| AU Type: | RIVER |
| AU Size: | 1.4 MILES |
| Classification/Qualifier: | A: PWS, ORW, HQW, CWF (Tributary) |

No usable data were available for Stafford Brook (MA33-98) for the 2022 Integrated Reporting cycle, therefore its category, use attainments, impairments, associated actions, and sources remain unchanged from the previous cycle.

| 2018/20 AU Category | 2022 AU Category | Impairment | ATTAINS Action ID | Impairment Change Summary |
|---------------------|------------------|------------|-------------------|---------------------------|
| 2 | 2 | None | | Unchanged |

Staples Brook (MA33-121)

| | |
|----------------------------------|---|
| Location: | Headwaters east of Spruce Hill, North Adams to confluence Tower Brook, Florida. |
| AU Type: | RIVER |
| AU Size: | 1.4 MILES |
| Classification/Qualifier: | B |

No usable data were available for Staples Brook (MA33-121) for the 2022 Integrated Reporting cycle, therefore its category, use attainments, impairments, associated actions, and sources remain unchanged from the previous cycle.

| 2018/20 AU Category | 2022 AU Category | Impairment | ATTAINS Action ID | Impairment Change Summary |
|---------------------|------------------|------------|-------------------|---------------------------|
| 2 | 2 | None | | Unchanged |

Steele Brook (MA33-85)

| | |
|----------------------------------|---|
| Location: | Headwaters, perennial portion north of Tunnel Road, Rowe to confluence with Pelham Brook, Rowe. |
| AU Type: | RIVER |
| AU Size: | 1.7 MILES |
| Classification/Qualifier: | B |

No usable data were available for Steele Brook (MA33-85) for the 2022 Integrated Reporting cycle, therefore its category, use attainments, impairments, associated actions, and sources remain unchanged from the previous cycle.

| 2022 Recommendations |
|--|
| <p>ALU: Conduct follow-up benthic sampling and long-term, continuous temperature monitoring in this Unnamed Tributary to Creamery Brook AU (MA33-137) downstream of West Road in Ashfield (B0790) since the 2022 Temperature impairment was identified based on data in the year following Hurricane Irene, and the IBI score was in the Severely Degraded category in the year following Hurricane Irene. REC: Conduct additional <i>E. coli</i> bacteria sampling to better evaluate the status of the Primary Contact Recreational Use and determine if the <i>E. coli</i> impairment should be retained or delisted.</p> |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| 2022 Use Attainment | Alert |
|--|-------|
| Not Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MassDEP biologists sampled this Unnamed Tributary to Creamery Brook AU (MA33-137) ~ 520 meters downstream of West Road in Ashfield during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. The benthic community (B0790) sample, collected in July 2012, had an IBI score of 30 (Severely Degraded conditions for a high gradient Western Highland region stream). Backpack electrofishing by MassDEP biologists in August 2012 (SampleID 5017) resulted in a sample comprised entirely by fluvial fish that was dominated (97%) by multiple age classes of Eastern brook trout so this stream will be assessed as a Tier 1 Existing Use Cold Water resource. Water quality sampling data including both deployed probe and discrete sampling efforts (Station W2253) can be summarized as follows: minimum dissolved oxygen 7.4mg/L during three short term DO deploys, maximum temperature 27.6°C between June 1st and September 15th with 7DADM exceeding 20°C 87 times. The maximum 24-hour rolling average temperature was 22.9°C, pH ranged from 7.3 to 7.7SU (n=3), and there was no indication of a nutrient enrichment problem (seasonal average total phosphorus concentrations was low 0.014mg/L, max diel DO shift only 1.6mg/L, maximum saturation 96%, maximum pH 7.7SU, and there were no observations of any dense/very dense filamentous algae of six site visits). There were no toxicant issues (maximum total ammonia-nitrogen concentration was 0.05mg/L, chloride was 45mg/L (n=5), and there were no exceedances of any of clean metals or aluminum samples (n=3) although it should be noted that dissolved Al data were compared to total recoverable Al criteria, so exceedances cannot be ruled out).</p> <p>The Aquatic Life Use for this Unnamed Tributary to Creamery Brook AU (MA33-137) is assessed as Not Supporting based on the elevated temperatures above Tier 1 Existing Use Cold Water habitat criteria (this stream was dominated by multiple age classes of Eastern brook trout) during the summer of 2012. Approximately 84% of this small subwatershed is Natural/Wetland with 4% of impervious cover, while the proximal watershed is only 73% Natural/Wetland so the elevated temperature is considered to be exacerbated by anthropogenic activities. While the benthic data IBI score was in the Severely Degraded category, since the data were collected in the year following Hurricane Irene, a benthic impairment is not being added but additional benthic sampling is being recommended.</p> | |

Fish Consumption

| 2022 Use Attainment | Alert |
|---|-------|
| Not Assessed | NO |
| 2022 Use Attainment Summary | |
| No fish toxics sampling has been conducted in this Unnamed Tributary to Creamery Brook AU (MA33-137), therefore the Fish Consumption Use is Not Assessed. | |

Aesthetic

| 2022 Use Attainment | Alert |
|---|-------|
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| MassDEP biologists sampled this Unnamed Tributary to Creamery Brook AU (MA33-137) ~ 520 meters downstream of West Road in Ashfield (W2253) during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. No objectionable conditions (i.e., odors, deposits, growths, or turbidity) were observed during any of the surveys. The Aesthetics Use for this Unnamed Tributary to Creamery Brook AU (MA33-137) is assessed as Fully Supporting based on the lack of any objectionable conditions documented by MassDEP staff during the summer of 2012. | |

Monitoring Stations

Recommendations

| 2022 Recommendations |
|--|
| ALU: Additional long-term temperature data should be collected in the West Branch North River to better evaluate the thermal regime and potentially target areas for improved riparian corridor health to provide additional shading. Cooperative efforts (both VT and MA towns in this subwatershed) to reduce thermal stress should be prioritized to protect/maintain/restore cold water habitat in this river. Additional benthic sampling is also recommended to follow up on indicators of the moderately degraded benthic community which followed Hurricane Irene. |

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| 2022 Use Attainment | Alert |
|--|-------|
| Not Supporting | NO |
| 2022 Use Attainment Summary | |
| <p>MA DFG biologists conducted backpack electrofishing in two reaches of the West Branch North River from up to downstream as follows: near the Crowning Shield property off of West Branch Road in Heath in August 2016 and 2017 (SampleIDs 5935, 6732, 6733, 6734) and further downstream along Adamsville Road near the farm stand in Colrain upstream of the confluence with Taylor Brook in September 2014 and August 2015, 2016, 2017, 2019 (SampleIDs 5169, 5695, 6254, 6549, and 8265, respectively). All samples were comprised almost entirely by fluvial fish including multiple age classes of Eastern brook trout and/or slimy sculpin. MassDEP biologists also sampled the West Branch North River downstream of Heath Road crossing in Colrain during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. The benthic community (B0782) sample, collected in August 2012, had an IBI score of 46 (Moderately Degraded conditions for a high gradient Western Highland region stream). Water quality sampling data including both deployed probe and discrete sampling efforts (Station W2244) can be summarized as follows: minimum dissolved oxygen 7.9mg/L during three short term DO deploys, maximum temperature 26.1°C between June 1st and September 15th with 7DADM exceeding 20°C 56 times. The maximum 24-hour rolling average temperature was 23.4°C, pH ranged from 7.6 to 8.2SU (n=3), and there no indications of a nutrient enrichment problem (seasonal average total phosphorus concentrations was low 0.005mg/L, max diel DO shift only 1.9mg/L, maximum saturation 109%, maximum pH 8.2SU, no observations of dense/very dense filamentous algae in any of the six site visits). There were no toxicant issues (maximum total ammonia-nitrogen concentration was 0.02mg/L, chloride was 8mg/L (n=5), and there were no exceedances of any of clean metals or aluminum samples (n=3) although it should be noted that dissolved Al data were compared to total recoverable Al criteria, so exceedances cannot be ruled out).</p> <p>The Aquatic Life Use for the West Branch North River is assessed as Not Supporting based on the elevated temperatures above Cold Water habitat criteria during the summer of 2012 while the presence of cold water fish (Eastern brook trout and slimy sculpin) and the other water quality data were indicative of otherwise excellent conditions. While most of the watershed area in MA is Natural/Wetland (89.7%) with a low % of impervious cover (1.5%), the agricultural areas are fairly concentrated within the stream buffer zone (proximal stream buffer watershed of Natural/Wetland 83.2%), so the elevated temperature is considered to be exacerbated by anthropogenic activities. Land-Use data in VT were not readily available but cooperative efforts to reduce thermal stress should be prioritized. While the benthic data IBI score was in the Moderately Degraded category, since the data were collected in the year following Hurricane Irene, a benthic impairment is not being added.</p> | |

Fish Consumption

| | |
|--|--------------|
| 2022 Use Attainment | Alert |
| Not Assessed | NO |
| 2022 Use Attainment Summary | |
| No fish toxics sampling has been conducted in the West Branch North River, therefore the Fish Consumption Use is Not Assessed. | |

Aesthetic

| | |
|--|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| MassDEP staff surveyed the West Branch North River downstream of Heath Road crossing in Colrain (W2244) during the summer of 2012 as part of the MAP2 Probabilistic Wadeable Streams monitoring project. No objectionable conditions (i.e., odors, deposits, growths, or turbidity) were observed during any of the surveys. The Aesthetics Use for the West Branch North River is assessed as Fully Supporting based on the lack of any objectionable conditions documented by MassDEP staff during the summer of 2012. | |

Monitoring Stations

Designated Use Attainment Decisions

Fish, other Aquatic Life and Wildlife

| | |
|--|--------------|
| 2022 Use Attainment | Alert |
| Fully Supporting | NO |
| 2022 Use Attainment Summary | |
| MA DFG biologists conducted backpack electrofishing in Workman Brook upstream of Glen River Road in Colrain in August 2017 (SampleID 6658). The sample was comprised entirely of fluvial fish including multiple age classes of Eastern brook trout and slimy sculpin. The Aquatic Life Use for Workman Brook is assessed as Fully Supporting based on the presence of cold water fish species which are indicative of excellent habitat and water quality conditions | |
