**Craig S. Rose**

**Alaska Fisheries Science Center, National Marine  
Fisheries Service, NOAA, 7600 Sand Point  
Way NE, Seattle WA 98115**

## **Three Main Subjects**

Pot fisheries and pot development

Basic behavioral information/model

Behavior studies

# Sablefish pot development (late 60s early 70s)

## Making Fish Pots from Alaska Crab Pots

HUGHES et al.: KING CRAB POTS FOR SABLEFISH CAPTURE

FIG. 1. Double-frame pot used in gear evaluation experiments and fishing trials. The pot is 8 ft  $\times$  6 ft  $\times$  32 inches.

## Lead to: Smaller Pots (foldable, stackable, etc)

Figure 7.—A tandem tunnel trap showing a cotton destruct panel.

### Fishery Facts 7

a trapping system for harvesting sablefish.

*Anoplopoma fimbria*

HEB 14 1975(2)

# Small Pots are Longlined

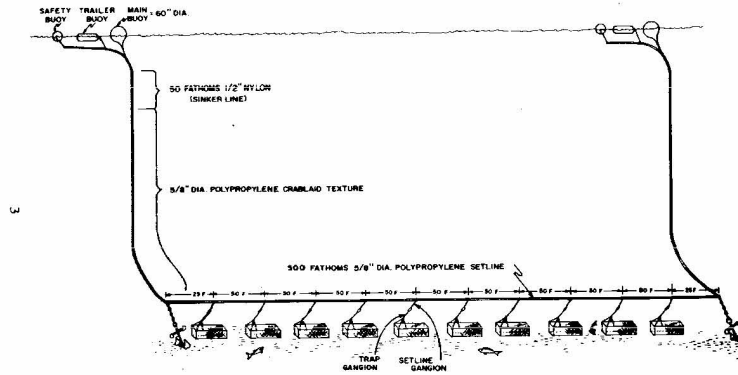

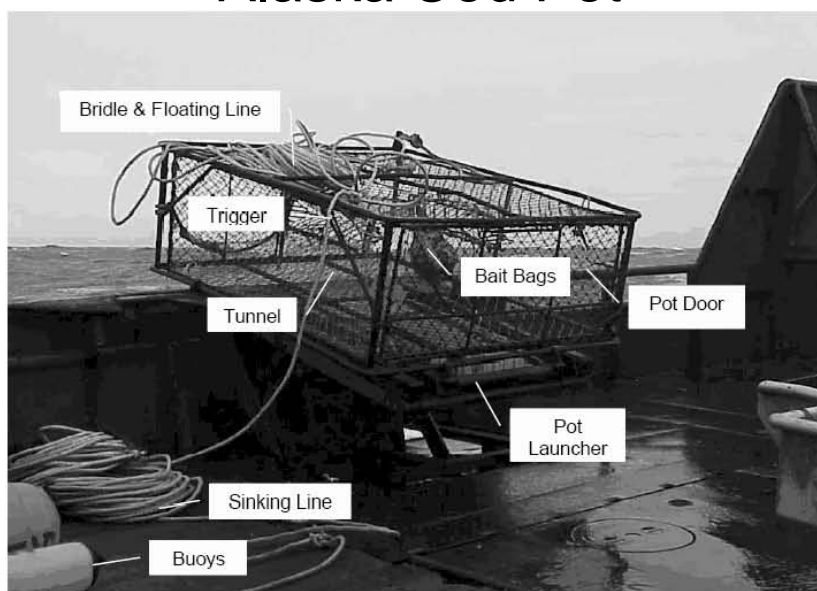

Figure 1.— A pictorial view of a string of sablefish trapping gear.

## Alaska Cod Pot

## Recording triggers

## Al Stoner's Bait Capture Papers

Stoner 2003 Hunger and light level alter response to bait by Pacific halibut: laboratory analysis of detection, location and attack.

Journal of Fish Biology (2003) 62, 1176–1193

Stoner 2004. Effects of environmental variables on fish feeding ecology: implications for the performance of baited fishing gear and stock assessment. Journal of Fish Biology (2004) 65, 1445–1471

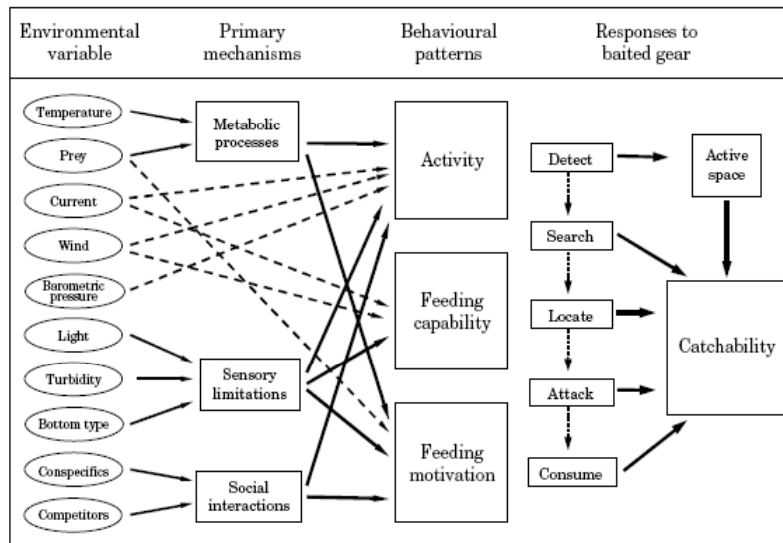

Stoner and Ottmar 2004. Fish density and size alter Pacific halibut feeding: implications for stock assessment.

Journal of Fish Biology (2004) 64, 1712–1724.

Stoner and Strum 2004. Temperature and hunger mediate sablefish (*Anoplopoma fimbria*) feeding motivation: implications for stock assessment.

Can. J. Fish. Aquat. Sci. **61**: 238–246.

## Baited fishing gear behavior model

# Observing Fish Near Pot with Sonar and Camera

## Tests and environmental conditions

### Observations

Within 1 m of a 1 x 2 m fish pot (and baited hooks)  
5 – 10 m away from (downstream) bait

### Tools

ICCD camera with infrared illumination  
DIDSON sonar 'camera'

### Environment

366 m deep  
current 2 – 15 cm/sec  
Temperature 5.5 – 6.5 degrees C  
Light  $< 10^{-7}$  micromoles-photons  $m^{-1} s^{-1}$

## Observing Fish Near Pot with Sonar and Camera

## Number of Fish by Time

## Highlights of results from pot/hook study

Of 2000 + 5000 entries of sablefish into the observed field (sonar) 19 sablefish were caught

Restricted view of video camera can give a biased impression of fish abundance and behavior

– particularly dependant on relation of observed side to current direction

**‘Rotating’ Sonar Mount**  
Range 5-10 m

## Launch of Rotating Sonar Mount

## Sonar Image

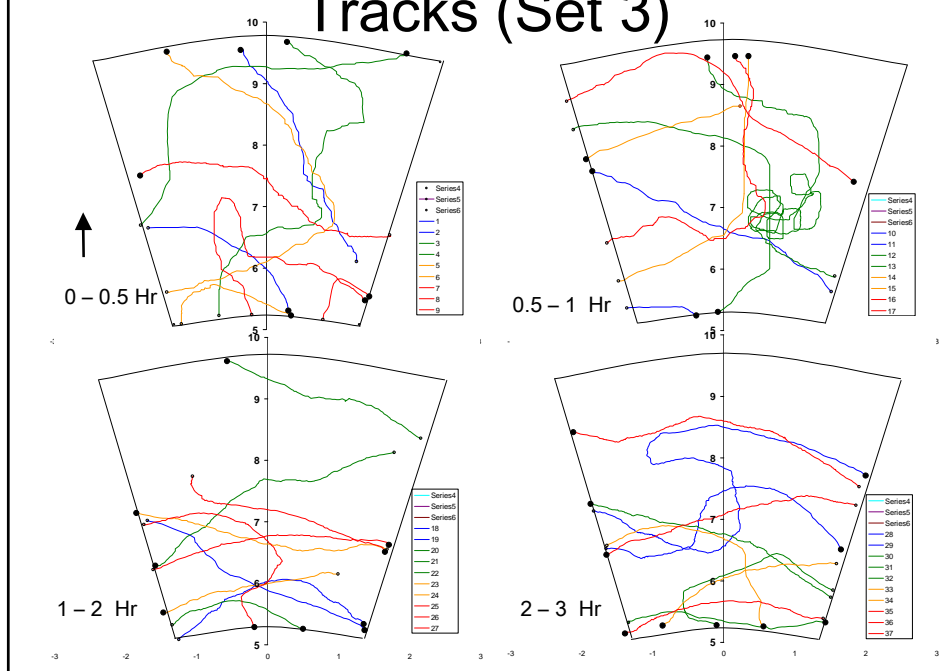

# Sonar Image

With background subtraction

## Tracks (Set 3)

## Initial highlights from 'approach' study

Fish commonly 5 – 10 m from bait

Much fish motion is circulation around  
the bait, not just to and from the bait

## Ways Forward

### Improved pots

Improve proportion entering

Active tunnels

Behavioral tuning

Volume / Number optimization

Bait optimization

Ways Forward –  
Alternative combinations/gear

Baited tangle gear (short gill nets)

Angles of crossing

Bait combined with active gear

Time to highest concentration

Local bottom disturbance as bait

# It isn't the Pot – It's the Cod

## East Coast Pots

Lobster *Homarus americanus*,  
scup *Stenotomus chrysops*, Black  
Sea Bass *Centropristis striata*,  
Channeled whelk *Busycon  
canaliculatum*, Red Crabs

Flounders: David Beutel; Pingguo  
He and Kelo Pinkham: Not much  
luck; low densities

Gadoids: P. He and Proctor Wells:  
Not much luck; low densities. Pot  
modified from CSAR design

Cliff Goudey and Mathew  
Thompson: Round pot; no luck

# CSAR Pots

**Frame:** Either coated wire (183 cm by 183 cm by 106 cm), 16 mm rigid steel frame, or collapsible steel (183 cm by 183 cm by 102 cm).

**Top:** 30 M of 10 cm diamond PE with float.

**Entrances (2):** Rectangular opening,, 41-cm ring with SS one-way triggers spaced ~5 cm apart. 20 M of 2.5 in nylon

**Bait:** Squid, salted herring, clam, scallop, other using buckets, cages, and skivers.

# Results

**348 cod in 137 soaks; 2.5 cod/soak; first ever! Maximum of 13**

**Length range = 32-75 cm; average = 47 cm**

**Construction type did not matter**

**Location mattered**

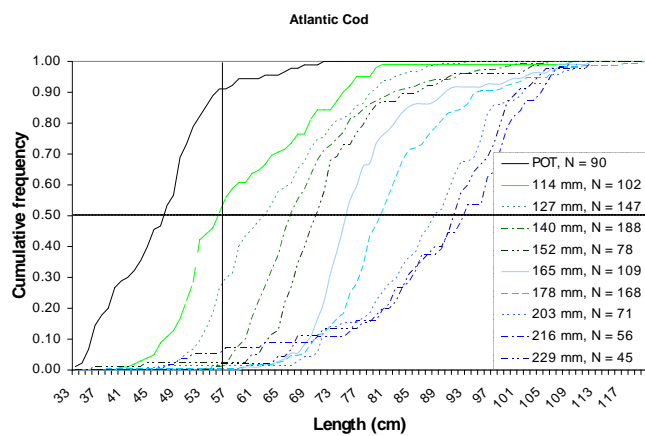

**Cod in pots had empty stomachs, and were not spawning.**

**Pot alterations had no impact**

**Zero mortalities and many recaptures**

# Results

## Inside the Box

## Nip at String

## Loose Bait Frenzy plus Penetration

## Entrance Attempt?

## Conclusions and Directions

Pots can catch cod in two seasons; changing entrances did not improve catches.

Focus on hunger and spawning relationships.

Compare pots to longlines – although same season.

Alter bait contrast or induce flashing - feeding “frenzy” necessary?

Or is it just density dependent?

## Feasibility of a Directed Atlantic Haddock Pot Fishery in the Gulf of Maine

Ken La Valley,  
University of New Hampshire and NH Sea Grant  
Nesmith Hall, Durham, NH 03824  
and  
Kelo Pinkham, ME Fishermen  
Bill Lee, MA Fishermen

## Why a Haddock Pot Fishery?

---

- recent increase in abundance of the Gulf of Maine haddock,
- recent unexpectedly low projection of cod abundance, and
- inability of the current means of harvest to access these fish without the taking of excessive amounts of bycatch (species of greatest concern being Cod).

## Project Objectives

- Evaluate three trap designs for their ability to catch fish in general, and target Haddock.
- Evaluate fish behavior in and around fish traps using underwater video.
- Evaluate three several baits for their ability to catch fish in general, and target Haddock.

## Trap Designs

### Pacific Cod Pot

- Offset Entrance Head Trap
- 48" Mesh Balloon
- 9" x 18" Funnel Eye w/ Triggers
- Collapsible

### Alaskan Crab Pot

- In-line Entrance Head Trap
- 9" x 18" Funnel Eye
- Triggers
- Collapsible

## Trap Designs Cont.

### Norwegian 2-Chamber Pot

- two 30" chambers
- 15" Mesh Balloon
- 20" Entrance w/o Triggers
- Collapsible

\* Photograph courtesy of Bill Lee

## Evaluated Bait Types

- Artificial haddock bait (NORBAIT)
- Surf Clam
  - shucked, bait quality
- Herring
  - bait quality

**Norbait™** is manufactured by restructuring waste fish and fish offal from processing industry and mixed with gelling agents, binders and other attractants. The mixture is then extruded into a fiber mesh tube for a continuous "sausage".

## Road Blocks

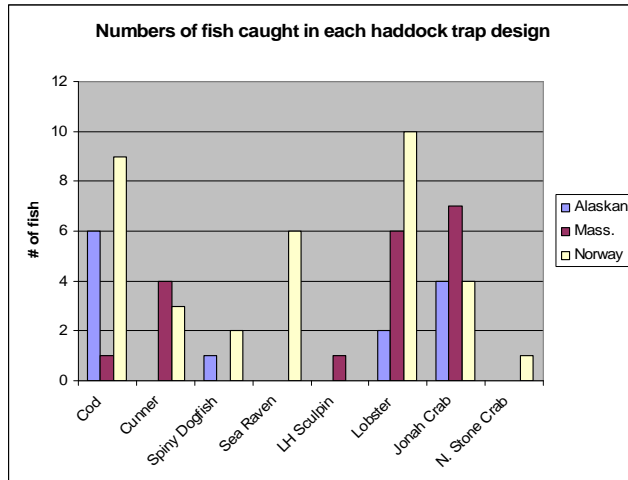

- Field trials were scheduled for spring and summer 2006 during high abundance of inshore haddock.
- NMFS EFP permitting process delayed experiments until October.
- Charter vessels and gill net fishermen reported low haddock catch rates. October is the tail end of haddock movement out of the inshore area.
- We decided to begin trials to evaluate design construction and camera systems.

## Initial Results

Conducted (5)  
Experimental hauls  
with 24 hour soak  
times.

Initial results appear  
to indicate the Norway  
design to be most  
effective and the  
whole clam bait to  
perform the best.

## Off-Set Entrance Pacific Cod Pot Design

\* Photograph courtesy of Bill Lee

## What Can We Say?

- Each pot design successfully caught fish.
- Seasonal correlation between fish abundance and trap CPUE probably accounted for low catch.
- The Norway trap w/ surf clam bait appeared to be the most successful combination.
- Field trials are scheduled to begin in April/May 2007 when high haddock abundance is observed.

## Potential Modifications

---

- Evaluate a “Floated” two-chamber design to eliminate lobster/crab bycatch, and allow free rotation with current which will maintain optimum bait plume directionality.
- Add triggers to the two-chamber design?

# Fish Potting in Asia and Some Recent Works in Japan

A map of Asia with several orange fish pot icons placed across the continent, primarily in East and Southeast Asia. A small inset image shows a fish being caught in a pot.

Philippines  
Malaysia  
UAE  
Thailand (A.Boutson)  
Indonesia (J.Haluan)  
Korea (An Young-II)  
Taiwan  
Okinawa

## Fish Pot in Malaysia

## Fish Pot in U.A.E

### Collapsible blue swimming crab pot

## A set of single crab pot

### Body

- Iron structured
- Box shape
- PE 38 mm
- Hook

### Float line

- PP rope
- Length 2-3 times of water depth
- small lead (sinker)

### Float

- Plastic/Foam

## Collapsible crab pot (single pot) operation

- 200-300 pots
- 6-8 m boat length

- One man operation
- 12-24 hr Soaking time

## Commercial crab pot boat

- 2,000—5,000 Pots/boat
- Hauling machine

## Escaping from the **lower side panel** position (VDO)

Arabesque greenling *Pleurogrammus azonus*

(a) Commercial trap dimensions, and  
 (b) simulated trap entrance model

## What can we learn from ...?

- Comparison from others
  - Gill net, longline, hand line, ... trawl,...?
- Comparison from other traps
  - crustaceans
- Possibility for trawl ban alternatives...?
  - Eco-friendly aspects
  - Size / species selectivity
- Possibility for increasing efficiency

## Research Topics

- Enter / Escape
- Inter/Intra-specific Behaviour inside pot
- Accumulation and Soaking Time
- Density related aspects
- Improving efficiency
  - Larger space
  - Long-line system with collapsible/piling-up
  - Entrance / Funnel design
  - Bait

$$C(t) = \frac{h_0}{k} (1 - e^{-\alpha N k t})$$

$$= C_{\infty} (1 - e^{-\alpha N k t})$$
