VIA	Visual Impact Assessment

1 Introduction

The Visual Impact Assessment (VIA) has been prepared in support of the Final Environmental Impact Statement (FEIS) for the Cape Cod Bridges Program (the Program), in accordance with the following federal and state statutes, regulations, and guidance:

- National Environmental Policy Act (NEPA) of 1969, as amended, 42 United States Code (USC) 4321 et seq.
- *Efficient Environmental Reviews for Project Decisionmaking and One Federal Decision*, 23 USC 139.
- Federal Highway Administration's (FHWA) regulations implementing NEPA, *Environmental Impact and Related Procedures* (23 Code of Federal Regulations [CFR] 771), and corresponding guidance, Technical Advisory (T 6640.8A): *Guidance for Preparing and Processing Environmental and Section 4(f) Documents* (October 30, 1987).

2 Summary of Findings

In accordance with FHWA's Guidelines for the Visual Impact Assessment of Highway Projects (FHWA Guidelines), the Massachusetts Department of Transportation (MassDOT) prepared a VIA to assess the potential changes of the Build Alternative upon the Sagamore Bridge and Bourne Bridge Areas of Visual Effect (AVE), defined as the areas from which the existing Bourne and Sagamore Bridges and their highway approach networks can be viewed.

MassDOT selected 20 visual inventory locations that consisted of views of and from the bridges and the highway interchange networks, including views that could be affected by the Program, such as where project horizontal or vertical elements could affect the visual character of the viewshed, including changes to the scale and character of the neighborhood. MassDOT selected locations that would be viewed by local and regional travelers, as well as residential, commercial, institutional, and recreation neighbors. Simulations were prepared of the Build Alternative at these locations. MassDOT then conducted assessments of the visual inventory locations with respect to the type of impact, compatibility of the impact, sensitivity to the impact, and degree of impact, per FHWA Guidelines.

2.1 Beneficial Changes to the Quality of the AVEs

For the following five visual inventory locations in the interchange approach networks, the degree of visual impact was determined to be beneficial:

- View of Sagamore Bridge from Bourne Park and Ride Lot (SN2)
- View of State Road and Scenic Highway from Meetinghouse Lane (SN3)
- View of Cranberry Highway Extension from Cranberry Highway at Adams Street (SS4)
- View of Diamond Interchange Roundabout from Cumberland Farms Parcel (BS2)
- View of Sandwich Road at Gallo Ice Arena (BS6)

MassDOT determined that **beneficial changes** to the visual quality of the Sagamore Bridge and Bourne Bridge AVEs would result from removing utility poles and overhead signals and wiring at roadway intersections, thereby presenting more harmonious and coherent views to travelers and neighbors; replacing existing intersections or rotaries with roundabouts, resulting in reduced paved areas, increased landscaping, and a sense of orderliness that is not present in the existing condition; and providing shared-use path (SUP) connections across roadways, including pavement markings and pedestrian and bicycle signals, thereby increasing safety and presenting a sense of orderliness and harmony among roadway users; and incorporating landscaping and shared use paths or pedestrian walkways into the transportation network, thereby providing visual interest and relief from the built environment.

2.2 Neutral Changes to the Quality of the AVEs

For a total of 13 visual inventory locations in the Sagamore Bridge and Bourne Bridge AVEs, there would be neutral changes due to the Program.

For 11 visual inventory locations in the interchange approach networks, MassDOT determined that **neutral changes** to the visual quality of the Sagamore Bridge and Bourne Bridge AVEs would result from project impacts. This total number included two locations where shifts in the bridge or roadway location and elevation would not be discernible by the viewer, such as:

- View of Sagamore Bridge from Church Lane at Cape Pine Road (SN4), and
- View of Bourne Bridge from Upper Cape Cod Regional Technical High School Scenic Overlook (BS4).

It included five locations with low to moderate viewer sensitivity where proposed impacts, including the introduction of new infrastructure, generally would be consistent with the visual character of the existing transportation environment and/or elements, consisting of:

- View of Scenic Highway from Church Lane (SN1)
- View of Sagamore Bridge and Expanded Sagamore Recreation Area Parking Lot from Canal Street at Lucia Avenue (extended) (SN5)
- View of Sandwich Road at Mid-Cape Connector (SS1)
- View of Sandwich Road Connector from Sandwich Road (SS3)
- View of Flyover Ramp from Belmont Circle (BN1)

A neutral rating was given to one location where the new transportation infrastructure would provide a continuity of access and visibility to commercial neighbors who would be sensitive to project changes:

- View of Frontage Road and State Route 28 from Nickerson-Bourne Funeral Home (BS1).

The visual inventory included three locations where the more dominant and physically imposing transportation elements would introduce incompatible elements into the existing viewshed, thereby altering the location's rural visual character with a more urban, developed appearance, including:

- View of State Route 25 from Scenic Highway (BN3)
- View of Lower Sandwich Road from West of Roundabout (BS3)

- [View of Bourne Bridge and Railroad Crossing from South Canal Service Road \(BS5\)](#)

However, at these locations with low viewer sensitivity, the visual changes would be neutralized through the introduction of landscaping and pedestrian/bicycle paths to soften the hardscape and provide visual interest, as well as other improvements, such as increased safety, [which](#) would enhance the traveler's driving experience.

For the two visual inventory locations at the bridge sites, MassDOT determined that with the minimization measures incorporated into the Program, the degree of visual impact was determined to be **neutral**:

- [View of Bridge Arches from Motorist on Sagamore Bridge or Bourne Bridge \(B1\)](#)
- [View of Sagamore Bridge or Bourne Bridge from Canal Service Road \(B2\)](#)

While the demolition of Sagamore and Bourne Bridges would be an adverse effect on those National Register of Historic Places (NRHP)-eligible structures, MassDOT selected a replacement bridge design that would closely resemble the existing structures and complement their settings within Cape Cod Canal, to avoid and/or minimize impacts to the NRHP-eligible Cape Cod Canal Historic District.

[Section 7](#) further describes measures that MassDOT will incorporate into the Program to compensate for the loss of the historic structures.

2.3 [Adverse Changes to the Quality of the AVEs](#)

For [the following](#) two visual inventory locations in the interchange approach networks, MassDOT determined that **adverse changes** to the visual quality of the Sagamore Bridge and Bourne Bridge AVEs would result from the [Program's transportation elements](#):

- View [of Sagamore Bridge and U.S. Route 6](#) from Eleanor Avenue (SS2),
- [View of Bourne Scenic Park from Nightingale Road at Scenic Highway \(BN2\)](#)

[For Visual Inventory Location SS2](#), MassDOT determined that the [demolition of](#) residences for the construction [and operation](#) of the [Sagamore Bridge Project](#) would adversely affect the sensitivity of the Round Hill residential viewers on the west side of Eleanor Avenue. [For Visual Inventory Location BN2](#), MassDOT determined that the elevated relocated State Route 25 mainline and flyover ramp would introduce incompatible elements to the existing views of residential neighbors, who would be sensitive to their altered views of the landscaped Bourne Scenic Park entrance.

2.4 [Mitigation Measures](#)

MassDOT has developed [extensive](#) design-related mitigation measures, encompassing minimization, restoration, maintenance, and compensation, to address the adverse change in visual quality and to provide value to areas where a neutral change in visual quality is anticipated. Design-related mitigation would include designing the replacement bridges to resemble the historic bridges and thereby avoid impacts to the Cape Cod Canal Historic District; incorporating [context-sensitive design, such as aesthetic bridge lighting](#); recreational amenities as visual enhancements; landscaping to restore the affected environment and to provide [visual areas of interest](#); and applying visual/aesthetic treatment

of high-visibility bridge abutment walls and retaining walls. [Further, the Section 106 Programmatic Agreement incorporates stipulations that would visually enhance the Sagamore Bridge and Bourne Bridge AVEs.](#) To minimize visual impacts in the Sagamore Bridge and Bourne Bridge AVEs during construction, MassDOT would incorporate construction-related mitigation into the Program through permits, special provisions and guidance documents, and its *Standard Specifications for Highways and Bridges*.

As design [progresses](#), MassDOT will continue to refine the proposed design-related mitigation measures, as well as identify additional mitigation measures, in coordination with stakeholders and the public.

3 Proposed Action and Alternatives

3.1 Purpose and Need

In partnership with FHWA and the New England District of the U.S. Army Corps of Engineers (USACE), MassDOT proposes advancing the Program in the town of Bourne, Barnstable County, Massachusetts.

The purpose of the Program is to improve cross-canal mobility and accessibility between Cape Cod and mainland Massachusetts for all road users and to address the increasing maintenance needs and functional obsolescence of the aging Sagamore and Bourne Bridges (also known as the Cape Cod Canal highway bridges), which the United States owns, and USACE operates and maintains as part of the Cape Cod Canal Federal Navigation Project (FNP).

The needs for the Program are as follows:

- Address the deteriorating structural condition and escalating maintenance demands of the Sagamore and Bourne Bridges.
- Address the substandard design elements of the Sagamore and Bourne Bridges, the immediate mainline approaches, and their adjacent interchanges and intersections.
- Improve vehicular traffic operations.
- Improve accommodations for pedestrians and bicyclists.

Figure 3-1 shows two distinct Project Limits for the Program.

Figure 3-1. Sagamore Bridge Project Limits and Bourne Bridge Project Limits

Source: Massachusetts Department of Transportation, 2025

3.2 Build Alternative

The Program's Build Alternative would incorporate USACE's Major Rehabilitation Evaluation Report and Environmental Assessment's (MRER/EA) preferred alternative of replacing both highway bridges with new bridges, each with four through-travel lanes and two auxiliary lanes (in-kind bridge replacement that would be updated to comply with federal and state highway and design safety standards). The Program proposes to replace the Bourne and Sagamore Bridges with parallel, twin tied-arch bridge structures that would be supported on delta frames with an approximate 700-foot mainline span length. At both the Bourne Bridge and Sagamore Bridge crossings, the replacement mainline alignment locations would be offline and inboard of the existing bridges on the side of the canal between the bridges. At both canal crossings, the Program would reconfigure the highway interchange approach networks north and south of Cape Cod Canal to align with the replacement bridges. The replacement bridges and their interchange approaches would accommodate shared-use pedestrian and bicycle paths that would connect to the local roadway network on both sides of Cape Cod Canal in the town of Bourne.

Table 3-1. presents a description of the Program elements/design parameters of the recommended Build Alternative: Replacement Highway Bridges Built to Modern Design Standards.

Table 3-1. Cape Cod Bridges Program Preferred Alternative

Program Element/ Program Design Parameter	Description
Highway Bridges	<u>Replacement of both highway bridges with new bridges with four through-traffic lanes and two auxiliary lanes (in-kind bridge replacement,</u> updated to comply with federal and state highway and design safety standards).
Highway Bridge Cross-Section and Shared-Use Path	Each replacement highway bridge <u>span</u> would provide <u>two</u> 12-foot-wide through-travel lanes (<u>one</u> in each direction), <u>one</u> 12-foot-wide entrance/exit (auxiliary) lane, a <u>6</u> -foot-wide <u>median</u> shoulder, and a <u>12</u> -foot-wide <u>exterior</u> shoulder. Each crossing location would include one bidirectional pedestrian and bicycle shared-use path, separated from vehicular traffic by the shoulder and barrier. The usable width of the shared-use path would be 14 feet wide on the bridge main spans, 20-foot-wide on the interchange approaches, and 12 feet wide on the connecting roadways.
Bridge Vertical and Horizontal Clearances	The replacement bridges would maintain the existing vertical clearance of 135 feet above mean high water and account for <u>3.3 feet of fluctuations in relative sea level,</u> <u>thereby providing a</u> vertical clearance of <u>138.3</u> feet above mean high water. The replacement bridges would provide a minimum of 500 feet of horizontal channel width consistent with the authorized navigational channel width <u>and</u> <u>existing conditions.</u>

Program Element/ Program Design Parameter	Description
Main Span Length and Bridge Pier Location	The replacement bridges would have a main span length of 720 feet, which would locate the bridge piers at the waterline adjacent to the service road (shoreline piers) into the riprap slope but above the low tide line.
Bridge Deck Configuration	Each bridge (Sagamore and Bourne) would have two separate decks (twin structures).
Mainline Alignment	The mainline alignment locations at both bridges would be offline inboard. Both spans of the replacement highway bridges would be outside the footprint of the existing bridge, 7 feet apart and parallel to each other (offline) and on the side of Cape Cod Canal between the existing bridges (inboard). The replacement main spans at the Sagamore crossing would be west of existing Sagamore Bridge toward Buzzards Bay. The replacement main spans at the Bourne crossing would be east of existing Bourne Bridge toward Cape Cod Bay.
Bridge Type	The replacement bridges would be steel twin network tied-arch bridges, with delta frames supporting a 720 -foot mainline span.
Interchange Approach Network	Interchange approach improvements at each bridge would be as follows: Sagamore Bridge Crossing: Direct connection to State Road in the Sagamore North quadrant and Westbound On-Ramp Under U.S. Route 6 with Sandwich Road Extension in the Sagamore South quadrant Bourne Bridge Crossing: Directional Interchange in the Bourne North quadrant and a Diamond Interchange in the Bourne South quadrant

Program Element/ Program Design Parameter	Description
Interchange Approach Network: Sagamore North Quadrant	The selected interchange approach option for the Sagamore North quadrant is: Direct Connection to State Road (Option SN-8A). Option SN-8A would provide a single exit point from a relocated U.S. Route 6/State Route 3. It would remove the Sagamore Bridge northbound off-ramp connection to Scenic Highway/Meetinghouse Lane eastbound, and instead it would connect to State Road, north of Scenic Highway/Meetinghouse Lane. The remaining ramp connections would remain similar to existing conditions with geometric adjustments to meet the new mainline location. A double roundabout would replace the signalized intersection of Scenic Highway/Meetinghouse Lane/State Road/Canal Street. Signalized intersections along Scenic Highway would be modified for new lane configurations. The intersection of State Road at State Route 3 northbound on-ramp would be modified to accommodate the addition of the new State Route 3 northbound off-ramp with installation of a traffic signal. Option SN-8A would provide a shared-use path on the U.S. Route 6 eastbound main span that would provide connections to the south side of Scenic Highway, Canal Street, and Canal Service Road. This option would provide shared-use paths along the southern side of Scenic Highway and Meetinghouse Lane, as well as along the eastern side of State Road to Homestead Avenue and Canal Street to Bourne Park and Ride.

Program Element/ Program Design Parameter	Description
Interchange Approach Network: Sagamore South <u>Quadrant</u>	<u>The selected interchange approach option for the Sagamore South quadrant is: Westbound On-Ramp Under U.S. Route 6 with Sandwich Road Extension (Option SS-3.1A).</u> <u>Option SS-3.1A would include Cranberry Highway Extension and would relocate the westbound on-ramp so it would share the same entrance point as the eastbound on-ramp off Mid-Cape Connector.</u> <u>Modifications to lane arrangements at the intersections of Mid-Cape Connector with Sandwich Road and Cranberry Highway Extension would accommodate the revised traffic patterns resulting from the extension of Cranberry Highway and the relocation of access to U.S. Route 6 (Scenic Highway) eastbound, including modifications to the existing traffic signals. There would be a connection from Cranberry Highway to Sandwich Road east of the new mainline bridge (Sandwich Road Connector).</u> <u>A roundabout would be provided at the intersection of the U.S. Route 6 westbound off-ramp with Cranberry Highway. An additional roundabout would be provided along Cranberry Highway providing access to Market Basket (Factory Outlet Road). There would be an access driveway to the former Christmas Tree Shops area.</u> <u>Option SS-3.1A would include a shared-use path on the U.S. Route 6 eastbound main span that would provide connections to Factory Outlet Road, Sandwich Road, and Canal Service Road. Pedestrian and bicycle improvements would also be included on Cranberry Highway. This option would add a new connection through Cranberry Highway Extension to Mid-Cape Connector.</u>

Program Element/ Program Design Parameter	Description
Interchange Approach Network: Bourne North Quadrant	The selected interchange approach option for the Bourne North quadrant crossing is: Directional Interchange (BN-14.4b). Option BN-14.4b would provide a combination of direct-connection ramps between State Route 25 and U.S. Route 6 (Scenic Highway). The ramp connecting State Route 25 eastbound to Scenic Highway would be a flyover ramp passing over Nightingale Road and merging with the on-ramp from Belmont Circle before meeting up with State Route 25 mainline. The ramp connecting Scenic Highway eastbound to State Route 25 eastbound would be a flyover ramp passing over Scenic Highway, allowing vehicles to bypass Belmont Circle and eliminating the need for an additional traffic signal. This ramp would use one of the travel lanes on Scenic Highway and be a free-flowing movement to reduce congestion. The existing interchange ramp over the State Route 25 bridge would be relocated to widen the bridge and allow for this new southbound to eastbound ramp movement. The existing southbound off-ramp would be revised to be an option lane, improving the geometry and decision sight distance for drivers. The intersection control at Scenic Highway/Nightingale Road/Andy Oliva Drive would be provided by a single-lane roundabout. The new flyover ramp over Scenic Highway would provide a shared-use path and grade-separated crossing for pedestrians and bicyclists. The Scenic Highway Lane configuration would be reduced from four lanes to three lanes, which would provide additional space for multimodal accommodations. It would provide one continuous 12-foot-wide shared-use path along the south side of Scenic Highway connecting to Belmont Circle and a 6-foot-wide sidewalk along the north side of Scenic Highway.
Interchange Approach Network: Bourne South Quadrant	The selected interchange approach option for the Bourne South quadrant is: Diamond Interchange (BS-2). Option BS-2 would eliminate Bourne Rotary and replace it with a grade-separated diamond interchange, which would allow through movements on State Route 28 to bypass intersections with the non-mainline roadways. The two intersections within the diamond interchange would be a single-lane dogbone roundabout. Changes to the Trowbridge Road and Sandwich Road underpass in this option would consist of a roundabout at a relocated Upper Cape Cod Regional Technical High School driveway entrance. Option BS-2's shared-use path improvements would include providing connections to Trowbridge Road, Canal Service Road, and Bourne Recreation Area.

3.3 No Build Alternative

Sagamore and Bourne Bridges, as components of the Cape Cod Canal FNP, are federal assets that are managed by USACE’s New England District. The Commonwealth of Massachusetts owns the connecting major highway corridors at the bridges, which consist of the State Route 3/U.S. Route 6 corridor at Sagamore Bridge and the State Route 25/State Route 28 corridor at Bourne Bridge.

For the No Build Alternative, Sagamore and Bourne Bridges would retain their current configuration of four 10-foot-wide travel lanes (two in each direction) with one 6-foot sidewalk and a 2-foot safety curb. USACE would continue to [operate and maintain](#) Sagamore Bridge and Bourne Bridge and would implement a maintenance and repair program as needed to maintain bridge operations and public safety. MassDOT would continue to own, operate, and maintain the state highway interchange approach networks at the two bridges.

The No Build Alternative would include recently completed and proposed Commonwealth of Massachusetts-sponsored and local transportation improvements projects in and near the Program as indicated in the Federal Fiscal Year [2026-2030](#) Transportation Improvement Program for the Cape Cod Metropolitan Planning Organization.¹ [Table 3-2](#) identifies the Transportation Improvement Program projects within and near the Program to be incorporated in the No Build Alternative.

Table 3-2. Transportation Improvement Program Projects, [2026-2030 in the No Build Alternative](#)

Project Number	Year	Transportation Project	Project Description	Status ^[2]
606900	2020	Belmont Circle Traffic and Multimodal Improvements	Traffic and multimodal improvements at Belmont Circle at U.S. Route 6 and State Route 25 and State Route 28	Completed
608422	2022	Trail Improvements – Sandwich	Shared-use path on Service Road (State Route 130 to Chase Road)	Completed

¹ [The Transportation Improvement Program for the Cape Cod Metropolitan Planning Organization was endorsed on May 19, 2025, and amended on November 17, 2025.](#)

² [Status as of October 2025](#)

Project Number	Year	Transportation Project	Project Description	Status ^[2]
610542	2023	Bourne Rotary Improvements	• Restriping Bourne Rotary to two lanes and adding a channelized right-turn lane from State Route 28 northbound to Sandwich Road eastbound • Adding signs at Bourne Rotary • Installing flashing beacons at the Bourne Rotary approaches	Completed
613195	2024	Bridge Systematic Maintenance	Bridge deck replacement of the Quaker Meetinghouse Road Bridge over U.S. Route 6/Mid-Cape Highway as part of an overall bridge preservation strategy	Underway
609262	2025	Bourne Rail Trail, Phase 1	First phase of four planned phases of the Bourne Rail Trail connection to the Shining Sea Bikeway to the south in Falmouth and to the Cape Cod Canal path (Canal Service Road) in the town of Bourne; Phase 1 is approximately one-half mile long within the existing right-of-way of the Old Colony Railroad (Woods Hole branch line) from the Canal Service Road to Monument Neck Road.	Programmed
610673	—	Bourne Rail Trail, Phase 2	Phase 2 of four planned phases of the Bourne Rail Trail connection to Shining Sea Bikeway to the south in Falmouth and to the Cape Cod Canal path (Canal Service Road) in the town of Bourne; Phase 2 is approximately 2 miles long from Monument Neck Road to Monk's Park/ Valley Bars Road.	Not Programmed

Project Number	Year	Transportation Project	Project Description	Status ^[2]
613864	—	Bourne Rail Trail, Phase 3 and Phase 4A	Phase 3 and Phase 4A of four planned phases of the Bourne Rail Trail connection to Shining Sea Bikeway to the south in Falmouth	Not Programmed
607394/611998	—	Bourne Rail Trail, Phase 4B	Phase 4B of four planned phases of the Bourne Rail Trail connection to the Shining Sea Bikeway to the south in Falmouth and to the Cape Cod Canal path (Canal Service Road) in the town of Bourne; Phase 4B is approximately 1 mile long, extending the Shining Sea Bikeway from its current terminus in North Falmouth into the town of Bourne.	Not Programmed
606082	2025	U.S. Route 6 Scenic Highway Median Installation	• Resurfacing • Safety improvements, including a raised center median and expanded shoulders to separate eastbound and westbound travel lanes • Drainage improvements • Traffic signal improvements at two intersections • Shared-use path	Underway
612053	2025	Bourne/Sandwich, Resurfacing and Related Work on U.S. Route 6	Improvements to pavement serviceability, condition, and roadway safety on U.S. Route 6 from Sagamore Bridge to the Sandwich town line (8.55 miles)	Programmed
613200	—	Chase Road over U.S. Route 6 Bridge	Bridge deck replacement of Chase Road over U.S. Route 6 (Mid-Cape Highway) bridge structure in the town of Sandwich	Not Programmed

Project Number	Year	Transportation Project	Project Description	Status ^[2]
612063	2030	State Route 28 Resurfacing and Related Work	Improvements to pavement serviceability, condition, and roadway safety on MacArthur Boulevard (State Route 28) from Bourne Rotary to Otis Rotary	Programmed
613199	---	U.S. Route 6 over State Route 130 Bridge	Bridge deck replacement of U.S. Route 6 (Mid-Cape Highway) bridge structure over State Route 130 in the town of Sandwich	Not Programmed
613271	—	Shared-use path, State Route 130 to Canal Service Road	Shared-use path from State Route 130 to Canal Service Road in the town of Sandwich	Not Programmed

Source: [Cape Cod Transportation Improvement Program for FFY 2026-2030](#)

Notes:

— No date available.

Note: **Table 3-2** includes only those projects in the Federal Fiscal Year (FFY) 2026-2030 Transportation Improvement Program (TIP) within the Study Areas that are part of the No Build Alternative.

The No Build Alternative represents the “Fix as Fails” Base Condition of USACE’s MRER/EA. In the No Build Alternative, USACE would implement an ongoing program of continued inspections and maintenance and repair of both existing bridges as needed to maintain safety. No major rehabilitation efforts involving extensive repairs and replacement of major bridge components would occur. Structural components would be repaired, and critical elements would be replaced only when inspections indicate unsatisfactory reliability ratings. The MRER/EA indicates that Sagamore and Bourne Bridges are in deteriorated condition and well beyond the state in which actions and funding from USACE’s operations and maintenance program could correct the deficiencies and restore and sustain reliability. USACE has indicated that as the bridges continue to age, routine maintenance and minor component replacement would result in an unacceptable structural condition. As a result, it is likely that lower vehicle weights, traffic volume restrictions, and speed limits would be required and posted to maintain continued bridge safety.

The No Build Alternative would not meet any of the Program’s identified needs:

- It would not address the deteriorating structural condition and escalating maintenance demands of the existing bridges.
- It would not address the substandard design elements of the bridges, the immediate mainline approaches, and their adjacent interchanges and intersections.
- It would not improve vehicular traffic operations.
- It would not improve accommodations for pedestrians and bicyclists.

Per NEPA requirements, the No Build Alternative is the [alternative of not undertaking a project, for the purpose of establishing a future baseline in relation to which a project can be described and analyzed, and its potential environmental impacts and mitigation measures can be assessed](#).³

4 Regulatory Context and Methodology

4.1 Regulatory Context

This VIA follows FHWA's guidelines for assessing visual impacts described in its [Guidelines for the Visual Impact Assessment of Highway Projects](#) (2015).⁴ FHWA Guidelines contain a Comparative Matrix Table that is used to determine the level of VIA required based on the character of the Program. Using this table, MassDOT determined that a Standard VIA would be the appropriate level of analysis.

In addition to FHWA Guidelines, the following provide the regulatory context and guidance for the Program's VIA:

- [Section 106 of the National Historic Preservation Act](#), 36 CFR 800⁵
- [Programmatic Agreement between the U.S. Army Corps of Engineers \(USACE\) and the Massachusetts Historic Preservation Officer \(MA SHPO\) regarding the Cape Cod Canal Highway Bridges Project](#), March 11, 2022, executed concurrently with the Finding of No Significant Impact for USACE's Major Rehabilitation and Evaluation Report/Environmental Assessment (MRER/EA)⁶
- [Section 4\(f\) of the U.S. Department of Transportation Act of 1966](#), 23 CFR 774⁷
- [MassDOT, Project Development and Design Guide](#), Context Sensitive Design⁸
- [Town of Bourne Open Space and Recreation Plan](#), February 8, 2018⁹
- [Town of Bourne Local Comprehensive Plan](#), approved October 29, 2019¹⁰
- [Cape Cod Commission, Cape Cod Regional Policy Plan](#), December 2018¹¹

4.2 Definitions of Visual Impact Assessment Terms

FHWA Guidelines considers visual quality as a result of the interaction between viewers and their environment. A visual impact is therefore defined as a change to the environment, which is measured by the compatibility of the impact; or a change to the viewers, which is measured by their sensitivity to the impact. Together, the compatibility of the impact and the viewer's sensitivity to the impact

¹⁰ <https://www.townofbourne.com/planning/news/local-comprehensive-final-certified-plan>

¹¹ <https://www.capecodcommission.org/our-work/rpp/>

determine the degree of impact to visual quality. This section presents the terms FHWA Guidelines use to assess visual impacts.

4.2.1 Compatibility of the Impact with the Environment

Compatibility of the impact is defined as the ability of the environment to visually absorb the proposed project, because the project and the environment have compatible visual characters (elements). A project's compatibility is measured by the following:

- **Project size and scale** refer to the size of the project
- **Project form** refers to the project design
- **Project materials** refer to the materials used to construct the project.

FHWA Guidelines assigns the ratings for compatibility of the proposed impacts as compatible or incompatible.

4.2.2 Viewer Sensitivity to the Impact

Viewer sensitivity to the impact is defined as the ability of viewers to see and care about a project's impacts. Viewer sensitivity to an impact is the result of viewer exposure to the impact and viewer awareness of the impact. The greater the exposure and awareness, the more viewers will be concerned about visual impacts (i.e., higher viewer sensitivity).

Viewer exposure to the impact is measured by:

- **Physical proximity** refers to closeness versus distance to the impact. In general, the farther a viewer is from an impact, the less exposure the viewer has and the less sensitive the viewer is to the impact. In contrast, the closer the viewer is to the impact, the more sensitive the viewer is to the impact.
- **Extent** refers to the number of people who have views of the impact. An impact with fewer viewers, or where potential views of a project are screened or filtered by intervening terrain, has less viewer sensitivity. An impact that is highly prominent, open to view, and with a high number of viewers has high viewer sensitivity.
- **Duration** refers to how long viewers see the impact. In general, there is less viewer sensitivity when a view is of short duration, such as a commuter on the highway who sees a visual change for a short time. In contrast, there is higher viewer sensitivity when a view is of a longer duration, such as a park where scenery is the primary focus or in a residential neighborhood where the visual change is viewed from a stationary viewpoint for long periods of time.

Viewer awareness of the impact is measured by:

- **Attention** refers to whether a view is routine or unique. In general, the more routine the view is, the less sensitive the viewer is to the view.

- **Focus** refers to whether a view has a focal point (single visual element) or multiple visual elements. In general, the more the viewer is focused on a single or limited number of visual elements, the more sensitive the viewer is to the details within the viewshed.
- **Protections** refers to whether the resource being viewed has protections, such as historic or ecological value.

FHWA Guidelines assigns the ratings for viewer sensitivity to proposed impacts as low, moderate, or high sensitivity.

4.2.3 Degree of Impact

The result of the compatibility of the impact with the environment and the viewer's sensitivity to the impact determine the degree of the impact. FHWA Guidelines assigns the ratings for degree of proposed impacts as beneficial, neutral, or adverse.

4.2.3.1 Beneficial Change

A beneficial change to the visual quality indicates the following:

- The project impact would enhance visual resources or create better views, would improve the community's aesthetic character, would advance the community's aesthetic goals, and/or would improve the character of the surrounding area.
- The project impact would enhance visual quality by removing undesirable (inharmonious, disorderly, or incoherent) visual resources; by rehabilitating formerly desirable (harmonious, orderly, or coherent) visual resources that are in disrepair; and/or by adding desirable visual resources.
- The project impact would enhance visual quality by limiting exposure to and awareness of undesirable views or by improving exposure to and awareness of desirable views.

4.2.3.2 Neutral Change

A neutral change to the visual quality indicates the following:

- The project impact would neither benefit nor degrade the existing visual resources.
- The project impact would not affect the visual resources of the natural, cultural, and project environments, nor would the impact affect the ability of the affected populations to view visual resources.

4.2.3.3 Adverse Change

An adverse change to the visual quality indicates the following:

- The project impact would degrade visual resources or obstruct or alter desired views, would create adverse impacts on visual quality by adversely affecting the sensitivity of viewers; and/or would

create adverse impacts on visual quality through changes to the visual resources of the natural, cultural, and project environments.

- The project impact would be inconsistent with the community's aesthetic character and goals, would contrast strongly with the character of the surrounding area, and/or would have an adverse effect on the Cape Cod Canal Historic District, or a park, recreational destination, or other area defined as an important visual resource under Section 4(f) of the U.S. Department of Transportation Act of 1966.

4.3 Methodology

To develop the AVEs for Sagamore and Bourne Bridges, MassDOT performed a viewshed analysis by identifying areas where the proposed bridges would be visible using geographic information system software. The software accounted for visual obstructions (such as topography, vegetation, and buildings) when developing the viewsheds. The results of the analysis were compared to the areas where the existing bridges are visible to identify the influence of the proposed bridge design.

To ascertain the visual quality of the Program AVEs, MassDOT reviewed local and regional policy and planning documents addressing visual quality and the viewshed-related stipulations of the Programmatic Agreement between USACE and MA SHPO regarding the Program. Additionally, MassDOT polled the public to assess viewers' preferences during its public meetings presenting optional bridge types.

To determine the Program's visual impacts, MassDOT photographed existing conditions from different viewpoints of the bridge's AVEs and abutting the existing roadways in the four Program quadrants: Sagamore North, Sagamore South, Bourne North and Bourne South. These viewpoints include static viewsheds (defined as what neighbors of the bridges or roadways would see from their stationary location) and dynamic viewsheds (defined as what travelers on the bridge or road would see as they travel through the Project Limits). Using these photographs, MassDOT identified 17 visual inventory locations across the four Program quadrants, including the bridges and highway interchange networks. MassDOT focused on views that could be affected by the Program, such as where project horizontal or vertical elements could affect the visual character of the viewshed, including changes to the scale and character of the neighborhood. Based on the preliminary design plans and in accordance with FHWA Guidelines, MassDOT selected views within each Program quadrant that would present the greatest impact to the greatest number of representative viewers, and represent a cross-section of viewers, including residential, commercial, recreational, and institutional neighbors and travelers.

Simulations were prepared of the Build Alternative at these [20](#) locations. Proposed 3D design models were imported from Computer Aided Design software and placed into the environment with proper geospatial alignment, resulting in an accurate representation of how the completed project will appear from any vantage point.

MassDOT then conducted the assessments of the visual inventory locations with respect to the type of impact, compatibility of the impact, sensitivity to the impact, and degree of impact, per FHWA Guidelines and as discussed in [Section 4.2](#).

The Program's VIA comprises the following phases:

- **Section 5, Establishment of Baseline Conditions**, defines the Program setting and viewsheds.
- **Section 6, Inventory of Existing Conditions**, determines who has views of the proposed Program, defines the visual quality, and identifies key viewpoints (visual inventory locations) for the assessment of visual impacts.
- **Section 7, Impacts Analysis**, assesses the Program's visual impacts.
- **Section 8, Mitigation**, proposes methods to mitigate adverse visual impacts.

5 Establishment of Baseline Conditions

5.1 Purpose

The purpose of the Baseline Conditions phase of the VIA is to establish the baseline conditions for the assessment of visual impacts by identifying the existing visual character, including establishing the AVEs. **Section 4** presents the methodology for defining visual impacts.

5.2 Existing Visual Character

The section provides an overview of the existing visual character of the Program, which consists of Sagamore and Bourne Bridges and their highway interchange networks on both sides of Cape Cod Canal. The bridges are nearly identical. Both bridges have a vertical clearance of 135 feet above mean high water (MHW) and a 500-foot horizontal clearance. At each bridge, the rise of the arch is approximately 128 feet above the deck, resulting in a total rise of approximately 263 feet above MHW. Both bridge main spans are supported on each side by two granite-stone facing concrete piers. The piers are 24 feet by 24 feet at the base and taper to 15 feet by 15 feet. The bridges each consist of four 10-foot-wide vehicular travel lanes separated by a double yellow centerline, a single 6-foot-wide sidewalk on one side, and a 2-foot-wide safety curb on the opposite side; the total main span width at each crossing is 54 feet.

Sagamore Bridge is a 3-span steel truss bridge with a length of 1,408 feet connecting U.S. Route 6 (Scenic Highway) in the south with State Route 3/Pilgrims Highway in the north, with an arched 616-foot center span supported on concrete piers within the waterway and flanked by 396-foot truss spans. There are hollow abutments at either end of the bridge of approximately 220 feet that are vaulted and consist of concrete T-beams.¹²

Bourne Bridge is a 7-span steel truss bridge of 2,384 feet connecting State Route 28 in the south with State Route 25 in the north, with an arched 616-foot center span supported on concrete piers within the waterway and flanked by three truss spans, measuring 398.5 feet, 274.5 feet, and 242 feet on the southern side, and 398.5 feet, 244.5 feet, and 210 feet on the northern side. There are hollow

¹² MassDOT, Bridge Type Selection Worksheet, Bridge No. B-17-005, Sagamore Bridge Arch/Delta Spans, April 2025. Draft.

abutments at either end of the bridge of approximately 150 feet that are vaulted and consist of concrete T-beams.¹³

At both canal crossings and in both directions, there is a steep grade from the highway interchange approaches to the bridges. Approaching Sagamore Bridge in the southbound direction (Sagamore North quadrant), State Route 3 carries two 12-foot-wide travel lanes in each direction with an eight-foot-wide shoulder in each direction separated by a grassed median. It then narrows to a single lane as State Route 3 approaches the bridge. The single lane from State Route 3 is joined by an add-lane from the entrance ramp from Scenic Highway (U.S. Route 6), to form the two lanes that are carried over the bridge. Approaching the bridge in the northbound direction (Sagamore South), U.S. Route 6 carries two 12-foot-wide travel lanes toward Sagamore Bridge.

Approaching Bourne Bridge in the southbound direction (Bourne North), State Route 25 carries three 12-foot-wide travel lanes per direction, with an 8-foot-wide shoulder in each direction separated by a grassed median. State Route 25 then narrows to two travel lanes approaching the bridge. State Route 25 eastbound terminates at the State Route 25/U.S. Route 6 (Scenic Highway) interchange in Bourne, where the highway designation changes to State Route 28 and immediately crosses Cape Cod Canal on the bridge. Continuing south from Bourne Bridge is the Bourne Rotary, which handles traffic from several roadways, including State Route 28, Sandwich Road, and Trowbridge Road. Approaching Bourne Bridge in the northbound direction (Bourne South quadrant), State Route 28 carries two 12-foot-wide travel lanes in each direction, with a 10-foot-wide shoulder separated by a forested median.

Located approximately 3.5 miles apart, Sagamore and Bourne Bridges are interchangeably used by local and regional travelers. Both bridges and the four interchange approach networks are heavily traveled. Scenic Highway generally carries two lanes of east-west traffic per direction and connects Bourne Bridge with Sagamore Bridge on the north side of the canal. Sandwich Road generally carries one lane of east-west traffic per direction connecting the bridges on the south side of the canal.

The Program's proposed visual changes would include the following:

- Removal and replacement of the existing bridges, including the bridges, piers, and abutments
- Improvements and new connections to the highway interchange approach networks, including state routes and local roadways

New SUPs at the bridge crossings would provide connections to the existing pedestrian and bicycle networks in the four Program quadrants.

5.3 Areas of Visual Effect

The Study Areas for this assessment, referred to as the Visual Resources AVEs, include the areas from which the existing Bourne and Sagamore highway bridges and their highway approach networks can be viewed. Given the topography of the surrounding area, and their height, the viewing distance of the bridges is substantial. The AVEs of the highway intersection network at the four Program quadrants

¹³ MassDOT, Bridge Type Selection Worksheet, Bridge No. B-17-004, Bourne Bridge Arch/Delta Spans, May 2025. Draft.

include the areas abutting or along the roadways within the visual range of different viewers, including residential, recreational, commercial, and institutional and civic viewers, and travelers through the Program limits. [Figure 6-1](#) presents the Sagamore Bridge and Bourne Bridge AVEs.

6 Inventory of Existing Conditions

6.1 Purpose

This section consists of the Inventory Phase of the VIA. It defines the existing conditions of the AVEs, including the existing visual resources and environment, the affected populations (neighbors) of the bridges and roadways, and the visual quality. It also includes visual inventory locations in the four Program quadrants that are assessed in this section.

6.2 Existing Visual Environment

This section describes the existing visual environment within the Sagamore Bridge and Bourne Bridge AVEs in terms of visual resources, consisting of the following:

- Natural visual resources are areas with limited human-made structures
- Cultural visual resources refer to the built environment
- Project-related visual resources are the elements of the visual environment that directly relate to the project

Cape Cod Canal is the most prominent natural visual resource within the Sagamore Bridge and Bourne Bridge AVEs. Sagamore and Bourne Bridges are the most prominent cultural visual resources. In addition to the bridges, project-related visual resources consist of the Sagamore Bridge and Bourne Bridge highway interchange networks on both sides of the canal.

Figure 6-1. Areas of Visual Effect (Sagamore Bridge and Bourne Bridge)

Source: Massachusetts Department of Transportation, 2025

This section also describes the existing visual environment in terms of landscape units. In accordance with FHWA Guidelines, a landscape unit is defined as a geographic unit on which impacts on visual character, viewers, and visual quality are assessed. Landscape units are “defined areas within the AVE that have similar visual features and homogeneous visual character and frequently, a viewshed.” Cape Cod Canal and Bourne and Sagamore Bridges each represent separate landscape units. The Sagamore Bridge and Bourne Bridge highway interchange networks on both sides of the canal also represent separate landscape units. It is important to note that the existing terrain varies greatly and includes several steep bluff areas, altering viewsheds throughout the AVEs. As noted in FHWA Guidelines, and applicable to the areas of the Sagamore North and Sagamore South and Bourne North and Bourne South quadrants highway interchange networks, a landscape can be heterogeneous with more than one viewshed or landscape type. [Section 6.5](#) further describes the different viewsheds and landscape type that comprise the landscape units within the Sagamore Bridge and Bourne Bridge AVEs.

6.2.1 Cape Cod Canal

Cape Cod Canal and the coasts of Cape Cod Bay and Buzzards Bay comprise the town of Bourne’s most unique natural visual resource. Cape Cod Canal, the dominant landscape unit in the AVEs and both a natural and a cultural visual resource, defines the boundary of the Cape Cod region and is referred to as the “gateway to Cape Cod.” Nearly the entirety of the Cape Cod Canal land cut (8.1 miles) is within the town of Bourne. Cape Cod Canal comprises the Cape Cod Canal Historic District, which is listed on the State Register of Historic Places and is eligible for listing on the National Register of Historic Places (NRHP). Cape Cod Canal and its abutting lands, including the Canal Service Roads paralleling the waterway north and south of the canal, are part of the FNP, owned and operated by the U.S. Army Corps of Engineers (USACE). [Exhibit 6-1](#) and [Exhibit 6-2](#) show different views of Cape Cod Canal.

Exhibit 6-1. View of Cape Cod Canal, facing west to Bourne Bridge and Buzzards Bay

Source: Massachusetts Department of Transportation, 2024

Exhibit 6-2. View of Cape Cod Canal, facing east to Sagamore Bridge and Cape Cod Bay

Source: Massachusetts Department of Transportation, 2024

6.2.2 Sagamore and Bourne Bridges

Sagamore and Bourne Bridges are iconic historic structures in the town of Bourne that, along with the waterway, serve as the “gateways to Cape Cod,” connecting mainland Massachusetts to Cape Cod over Cape Cod Canal. The historic plaques at the entrances to the bridges reinforce the sense of a “portal gateway” to travelers entering or leaving Cape Cod. Constructed in 1933, Sagamore and Bourne Bridges are individually eligible for listing in the NRHP and are contributing resources to the Cape Cod Canal Historic District. [Exhibit 6-3](#) shows the historic plaque at the entrance to Bourne Bridge. [Exhibit 6-4](#) and [Exhibit 6-5](#) present views of Sagamore and Bourne Bridges.

Source: Massachusetts Department of Transportation, 2024

Exhibit 6-4. Sagamore Bridge

Source: Massachusetts Department of Transportation, 2024

Exhibit 6-5. Bourne Bridge

Source: Massachusetts Department of Transportation, 2024

6.2.3 Sagamore Bridge Interchange Network Visual Environment

The Sagamore Bridge interchange network is in the Sagamore Beach and Sagamore communities of Bourne. North of Cape Cod Canal, State Route 3 abuts medium-density residential development, such as the Canalside Apartments, with commercial development located primarily around the Canal Road and Meetinghouse Road intersection. MassDOT's [Bourne](#) Park and Ride commuter lot is located west of State Route 3 and northeast of Sagamore Bridge. The Sagamore North quadrant includes Scenic Highway east of State Route 3, which consists of low-density residential and commercial development, recreational areas, and scenic overlooks with views of Cape Cod Canal. [Exhibit 6-6](#) presents an aerial view of typical existing conditions in the Sagamore North quadrant.

South of the canal, large commercial developments (such as Market Basket and Factory Outlet Road development to the west and the former Christmas Tree Shops development to the east) are interspersed among low-density residential development east of the Mid-Cape Connector to Cranberry Highway. Extending south from Sagamore Bridge, U.S. Route 6 abuts forested and natural areas of the Camp Edwards Wildlife Management Area, located within the boundaries of Joint Base Cape Cod, to the west; to the east, U.S. Route 6 abuts medium-density residential development and a portion of the Shawme-Crowell State Forest. The Sagamore South Project Limits include Sandwich Road east and west of U.S. Route 6. Sandwich Road includes a mix of low-density residential and commercial development, recreational areas, and institutional uses. [Exhibit 6-7](#) presents an aerial view of typical existing conditions in Sagamore South.

6.2.4 Bourne Bridge Interchange Network Visual Environment

The Bourne Bridge interchange network is in the Buzzards Bay community of the town of Bourne. North of Cape Cod Canal, State Route 25 abuts forest and natural areas. Commercial development is centered around Belmont Circle, which is located immediately west of the State Route 25 approach to the bridge; roadway approaches to Belmont Circle include Scenic Highway, Main Street, Buzzards Bay Bypass, Head of the Bay Road, and State Route 25 ramps. East of State Route 25, Bourne North Project Limits include Scenic Highway and the entrance to Bourne Scenic Park. [Exhibit 6-8](#) presents an aerial view of typical existing conditions in Bourne North.

South of the canal at Bourne Rotary, the Cape Cod hedge sign welcomes southbound travelers from Bourne Bridge to Cape Cod. Development adjacent to the Bourne Rotary includes low- to medium-density commercial development and the Massachusetts State Police barracks. Extending south from the Bourne Rotary, State Route 28 is bordered to the west by the Bourne High School, flanked on both sides by commercial development; and to the area east by natural and forested areas of the Camp Edwards Wildlife Management Area. The Bourne South quadrant includes Sandwich Road, which includes low-density residential development, recreation areas, and Upper Cape Cod Regional Technical High School. [Exhibit 6-9](#) presents an aerial view of typical existing conditions in the Bourne South quadrant.

6.3 Affected Populations

Per FHWA Guidelines, the Program would affect two distinct viewers, or populations:

- Neighbors, defined as people who view the bridges and/or interchange network
- Travelers, defined as people who use and have views from the bridge and the interchange network

The affected populations in the Sagamore Bridge and Bourne Bridge AVEs include residential, recreational, commercial, and institutional and civic neighbors, as well as travelers on state and local roadways within the Project Limits. Neighbors described in this section may be part of multiple populations. For example, as the operator of the Cape Cod Canal FNP, USACE is both a recreational neighbor and a civic neighbor; additionally, residential neighbors are travelers.

Section 6.3.1 through Section 6.3.5 describe the affected populations and present 15 typical neighbor views of Sagamore and Bourne Bridges in the existing conditions. **Figure 6-2** and **Figure 6-3** identify the neighbor viewer locations in the Sagamore Bridge and Bourne Bridge AVEs, respectively.

Figure 6-2. Neighbor Viewer Locations (Sagamore Bridge Areas of Visual Effect)

Source: Massachusetts Department of Transportation, [2025](#)

Figure 6-3. Neighbor Viewer Locations (Bourne Bridge Areas of Visual Effect)

Source: Massachusetts Department of Transportation, 2025

6.3.1 Residential Neighbors

Residential neighbors within the Sagamore Bridge and Bourne Bridge AVEs include residents with minimal or partial bridge views, as well as residents with prominent views of the bridges. As shown in [Exhibit 6-10](#) and [Exhibit 6-11](#), residents with a distant views of the bridges, such as the partial view of Sagamore Bridge from the Canalside apartment complex on Church Lane ([Figure 6-2](#), SV1) or the partial view of Bourne Bridge from the Coady School Residences on Cotuit Street ([Figure 6-3](#), BV1), would likely have low sensitivity to the replacement bridge. For these residential neighbors, the bridge represents a small portion of their viewshed.

Exhibit 6-10. View of Sagamore Bridge from Church Lane at Cape Pine Road, facing south

Source: Massachusetts Department of Transportation, 2024

Exhibit 6-11. View of Bourne Bridge from Coady School Residences, facing northeast

Source: Massachusetts Department of Transportation, 2024

In contrast, as shown in [Exhibit 6-12](#) and [Exhibit 6-13](#), residential neighbors who live relatively close to the bridge, such as the Hunters Brook condominiums on Canal Street ([Figure 6-2](#), SV2) with prominent views of Sagamore Bridge, or the Winslow Street neighborhood ([Figure 6-3](#), BV2) with prominent views of Bourne Bridge, have the potential to be the most sensitive to and most affected by the replacement bridge. For these residential neighbors, the bridge represents a predominant part of their viewshed.

Exhibit 6-12. View of Sagamore Bridge from Hunters Brook Condominiums, facing southwest

Source: Massachusetts Department of Transportation, 2024

Exhibit 6-13. View of Bourne Bridge from Winslow Street, facing northeast

Source: Massachusetts Department of Transportation, 2024

6.3.2 Recreational Neighbors

Recreational neighbors within the Sagamore Bridge and Bourne Bridge AVEs include individuals who view the bridges when participating in the many recreational activities (such as sightseeing, walking, running, bike riding, saltwater fishing, boating, picnicking, and camping) offered by Cape Cod Canal, the Canal Service Roads, and recreation areas and scenic outlooks abutting the canal. Recreational neighbors include residents and tourists. Recreational neighbors also include recreational providers, such as Keith Field on Sandwich Road, and Bourne Scenic Park, at the base of Bourne Bridge north of the canal. **Exhibit 6-14** shows a vista of Sagamore Bridge from Herring Run Recreation Area within the Cape Cod Canal FNP (**Figure 6-2**, SV3). **Exhibit 6-15** shows a view of Sagamore Bridge from Keith Field (**Figure 6-2**, SV4). **Exhibit 6-16** shows view of Bourne Bridge from the entrance to Bourne Scenic Park, off Scenic Highway (**Figure 6-3**, BV3). **Exhibit 6-17** shows a vista of Bourne Bridge from the South Canal Service Road (**Figure 6-3**, BV4).

As demonstrated in these photographs, both bridges have a prominent position in the viewshed of their recreational neighbors, either as vista focal points or due to their proximity to their recreational neighbors. Like residential neighbors, recreational neighbors potentially would be sensitive to and affected by changes in their viewshed, particularly with respect to the historical significance of Sagamore and Bourne Bridges and Cape Cod Canal.

Source: Massachusetts Department of Transportation, 2024

Exhibit 6-17. View of Bourne Bridge from South Canal Service Road, facing west

Source: Massachusetts Department of Transportation, 2024

6.3.3 Commercial Neighbors

Commercial neighbors within the Sagamore Bridge and Bourne Bridge AVEs include retailers, employees, and customers who view the bridges and/or the highway interchange networks from their commercial properties. [Exhibit 6-18](#) and [Exhibit 6-19](#) show views of the bridges from commercial neighbors within the Sagamore North quadrant, at McDonald's Restaurant on Meetinghouse Lane ([Figure 6-2](#), SV5), and Sagamore South quadrant, at the Factory Outlet Road development ([Figure 6-2](#), SV6). [Exhibit 6-20](#) and [Exhibit 6-21](#) show views of the bridges from commercial neighbors within the Bourne North quadrant, at Ocean State Job Lot on Main Street ([Figure 6-3](#), BV5), and Bourne South quadrant, at Nickerson-Bourne Funeral Home on MacArthur Boulevard ([Figure 6-3](#), BV6). While many commercial neighbors have views of Sagamore and Bourne Bridges, it is anticipated that the commercial neighbors would be most sensitive to changes in their visibility from abutting roadways, as opposed to their views of the bridges, within the Project Limits.

Exhibit 6-18. View of Sagamore Bridge from McDonald's Restaurant, facing southwest

Source: Massachusetts Department of Transportation, 2024

Exhibit 6-21. View of Bourne Bridge from Nickerson-Bourne Funeral Home, facing north

Source: Massachusetts Department of Transportation, 2024

6.3.4 Institutional and Civic Neighbors

Institutional and civic neighbors within the Sagamore Bridge and Bourne Bridge AVEs include those that provide or receive services from a variety of institutions, such as schools, government organizations, and federal, state, and local agencies. [Exhibit 6-22](#) and [Exhibit 6-23](#) show views of Sagamore Bridge from MassDOT's [Bourne](#) Park and Ride Lot in Sagamore Circle ([Figure 6-2](#), SV7) and Bridgeview Montessori School on Sandwich Road ([Figure 6-2](#), SV8). [Exhibit 6-24](#) and [Exhibit 6-25](#) show views of Bourne Bridge from the Massachusetts State Police Barracks at the Bourne Rotary ([Figure 6-3](#), BV7) and the scenic outlook at Cape Cod Regional Technical High School on Sandwich Road ([Figure 6-3](#), BV8). Institutional and civic neighbors that require visibility, such as the State Police Barracks, would be sensitive to changes in their visibility from roadways within the Project Limits.

Source: Massachusetts Department of Transportation, 2024

Exhibit 6-25. View of Bourne Bridge from Upper Cape Cod Regional Technical School Scenic Outlook, facing northwest

Source: Massachusetts Department of Transportation, 2024

6.3.5 Travelers

Travelers are a broad range of users of the Program bridges and highway interchange networks, including SUPs, within the Sagamore Bridge and Bourne Bridge Project Limits ([Figure 6-2](#) and [Figure 6-3](#)). The definition of travelers, which includes motorists, pedestrians, and bicyclists, consists of the following:

- Commuting travelers comprise regular travelers of the same route, including commuters living in the immediate vicinity of the Program (residents) and commuters traveling through the Project Limits to regional destinations (on- or off-Cape).
- Touring travelers comprise visitors traveling to the town of Bourne and farther destinations on Cape Cod.
- Shipping travelers comprise commercial and/or freight travelers using the bridges and highways to move goods.

6.4 Visual Quality of the Environment

Per FHWA Guidelines, visual quality, identifying what people like and dislike about the visual character of the AVEs, serves as the baseline for determining the degree of visual impacts (assessed as beneficial, neutral, or adverse changes, as defined in [Section 4.2](#)). Additionally, the visual quality of the AVEs provides a design goal for determining the need to mitigate for adverse effects. [Section 6.4.1](#) through

Section 6.4.3 describe visual preferences as identified by local and regional policy and planning documents, the Programmatic Agreement between USACE and MA SHPO [executed with the Finding of No Significant Impact \(FONSI\) for USACE’s Major Rehabilitation Evaluation Report/Environmental Assessment \(MRER/EA\), and the public](#) during the Program’s public meetings.

6.4.1 Visual Preferences Identified by Local and Regional Policy and Planning Documents

In its 2019 revision, the [Town of Bourne Local Comprehensive Plan](#)¹⁴ (Comprehensive Plan) cites the vision for the town of Bourne that was established in its first (2009) Local Comprehensive Plan:

“a vision of a town of village centers serving the daily needs of surrounding neighborhoods, with an active downtown in Buzzards Bay that would be a center for government, marine research, and education. Regional commercial and industrial uses would be located on MacArthur Boulevard and other areas with good highway access. Village centers would be connected by pedestrian and bicycle paths, as well as local roads that were off the path of regional traffic.”

The Comprehensive Plan notes that over the 10 years since the initial comprehensive planning effort, substantial progress has been made toward achieving the town’s vision.

The [Town of Bourne Open Space and Recreation Plan](#)¹⁵ (Recreation Plan) identifies the town as a medium-sized rural community that is unique due to its community of villages, its abundance of cultural and natural resources, its home to Cape Cod Canal, and its reputation as the “Gateway to Cape Cod.”

As integral elements of Cape Cod Canal and as contributing resources to the Cape Cod Canal Historic District, Sagamore and Bourne Bridges occupy prominent roles in the AVEs, including protections through community and regional goals and zoning.

The Recreation Plan provides context for defining the visual quality of the AVEs, as well as the visual preferences within the town. According to the Recreation Plan, the most distinctive landform and physically impressive element of the town of Bourne’s landscape is Cape Cod Canal. Nearly all of Cape Cod Canal is within the town. The Recreation Plan notes that the canal’s “scenic and recreational value is an indisputable asset to the community.” The Recreation Plan also identifies two scenic landscapes and viewsheds within the Sagamore Bridge and Bourne Bridge AVEs as “being important to its heritage:”

- The view down Cape Cod Canal from the Upper Cape Regional Technical High School dining rooms (which includes views of both bridges)

¹⁴ https://www.townofbourne.com/sites/g/files/vyhlf12841/f/uploads/2019_final_revision_comprehensive_version_2.14.20.pdf

¹⁵ https://www.townofbourne.com/sites/g/files/vyhlf12841/f/uploads/open_space_plan_fina_2018.pdf

- The view of large/tall ships passing through the canal ([Exhibit 6-26](#))

Exhibit 6-26. View of Large Ship Passing through Cape Cod Canal

Source: Massachusetts Department of Transportation, 2024

The Recreation Plan includes the following “community character” goal focused on natural and cultural resources, developed with input from the public:

“Protect existing cultural and landscape assets. Such features are critical to Bourne’s self-understanding and sense of community. They provide linkages between the history and the present and help shape the Town’s unique character.”¹⁶

The Town of Bourne Zoning Bylaw (amended October 2022) and Zoning Map (October 25, 2011) have designated areas between the two bridges and abutting Scenic Highway to the south and an area abutting Sandwich Road to the west as Scenic Development Districts. The Zoning Bylaw states that one of the purposes of these districts is to preserve and enhance highway views of Cape Cod Canal and landscaping and tree cover; further, the Scenic Development District should be located to provide views of the canal.¹⁷

Local and regional documents cite the importance of Cape Cod Canal and Bourne and Sagamore Bridges as cultural visual resources. [The Town of Bourne Local Comprehensive Plan](#) acknowledges the need for the bridges to be replaced and cites the importance of constructing replacement bridges that “respect the iconic natures of these bridges to the Cape’s image,” noting that the bridges are integral

¹⁶ https://www.townofbourne.com/sites/g/files/vyhlf12841/f/uploads/open_space_plan_fina_2018.pdf

¹⁷ https://www.townofbourne.com/sites/g/files/vyhlf12841/f/uploads/zoning_bylaw_2022_for_website_1.pdf

to the local heritage of Cape Cod.¹⁸ The Cape Cod Commission’s [Cape Cod Regional Policy Plan](#)¹⁹ (Policy Plan) includes two policy goals applicable to the existing bridges and their replacements:

- Community Design, to “protect and enhance the unique character of the region’s built and natural environment based on the local context.”
- Cultural Heritage, to “protect and preserve the significant cultural, historic, and archaeological values and resources of Cape Cod.”

Further, the Policy Plan’s vision for historic areas, including local and/or NRHP districts, is to protect historic resources and to support development that respects the form, scale, and character of existing historic areas.²⁰

6.4.2 Visual Preferences Identified in the MRER/EA Programmatic Agreement

The [Programmatic Agreement between USACE and MA SHPO for the Cape Cod Canal Highway Bridges Project](#)²¹ (i.e., the Program) addresses the importance of viewsheds of and from the NRHP-eligible Cape Cod Canal Historic District. The Programmatic Agreement states that viewshed analyses of the existing and proposed bridges shall be prepared to determine if historic properties within the Historic District and outside the Cape Cod Canal FNP have views that could be affected by the construction of the proposed bridges. Further, the Programmatic Agreement states that USACE and MassDOT shall “make a good faith effort to design, position, and construct new bridges that will avoid adverse effects” to the Cape Cod Canal Historic District and any NRHP-eligible properties within the viewshed of the proposed undertaking.²²

6.4.3 Visual Preferences Identified through the Program’s Public Involvement Process

As part of its series of public meetings to identify recommendations for Program elements, in November 2022, MassDOT conducted two virtual public meetings to [introduce the public to the bridge-type analysis](#), review preliminary recommendations of feasible bridge types, obtain public sentiment on the bridge types, and confirm the bridge type to be advanced for further design.

¹⁸ https://www.townofbourne.com/sites/g/files/vyhlf12841/f/uploads/2019_final_revision_comprehensive_version_2.14.20.pdf

²⁰ https://www.capecodcommission.org/resource-library/file/?url=/dept/commission/team/Website_Resources/RPP/2018_Cape_Cod_Regional_Policy_Plan_for_web.pdf

²¹ <https://www.nae.usace.army.mil/Portals/74/docs/Topics/Cape%20Cod%20Canal%20Bridges/Agreements/USACE-MassDOTCapeCodCanalBridgesApproachesCollaborativeMemorandumofUnderstanding.pdf>

²² <https://www.nae.usace.army.mil/Portals/74/docs/Topics/Cape%20Cod%20Canal%20Bridges/Agreements/USACE-MassDOTCapeCodCanalBridgesApproachesCollaborativeMemorandumofUnderstanding.pdf>

MassDOT conducted a poll to determine the community's visual preferences relative to the existing bridges and preferences for the replacement bridges via two questions:

- How important is it that the new Cape Cod Bridges resemble the current Bourne and Sagamore Bridges?
- How important is it to replace the Cape Cod Bridges with landmark structures?

MassDOT received over 2,200 responses during and following the two public meetings. As indicated in [Figure 6-4](#) and [Figure 6-5](#), the majority of respondents indicated that it is somewhat to very important that the replacement bridges resemble the existing Sagamore and Bourne Bridges, indicating a high level of viewer sensitivity to the bridges.

Figure 6-4. Assessment of Community Visual Preferences, Public Polling Question No.1

Source: Massachusetts Department of Transportation, 2024

Figure 6-5. Assessment of Community Visual Preferences, Public Polling Question No.2

Source: Massachusetts Department of Transportation, 2024

MassDOT also polled the meeting participants on their preferences regarding the three bridge types that were selected for further analysis: concrete box girder, cable stayed, and arch. As presented in Table 6-1, with an average rating of 2.5 out of 5, the Tied-Arch Bridge with Delta Frame received the most favorable public review rating, compared to the Cable-Stayed Bridge with a 2.9 rating, and the Concrete Box Girder Bridge with a 1.7 rating, thereby confirmed the preferred bridge type.

Table 6-1. Public Review of Bridge Types

Rate the Bridge Type According to Your Preference *	Tied Arch Bridge with Delta Frame		Two-Tower Cable-Stayed Bridge		Concrete Box Girder Bridge	
	Count	Percentage	Count	Percentage	Count	Percentage
☆	64	2.9	510	23.0	1,479	66.8
☆☆	52	2.4	307	13.9	278	12.6
☆☆☆	209	9.4	608	27.5	250	11.3

☆☆☆☆☆	1,561	70.5	373	16.8	107	4.8
Total Responses	2,214	100.0	2,214	100.0	2,214	100.0
Average Rating	4.5		2.9		1.7	

☆= least preferred; ☆☆☆☆☆= most preferred

6.5 Visual Inventory Locations

MassDOT identified 21 visual inventory locations in the Sagamore Bridge and Bourne Bridge AVEs as the basis for assessing visual impacts of the Program. They show different visual character and represent different viewers and landscape units throughout the AVEs. [Section 6.5.1 through Section 6.5.5](#) present the visual inventory locations for Sagamore and Bourne Bridges and the interchange networks in the four Program quadrants, along with tables describing the viewsheds, viewer types, and viewer sensitivity. MassDOT determined viewer sensitivity based on FHWA's VIA definitions of viewer sensitivity, discussed in [Section 4.2.2](#).

6.5.1 Sagamore and Bourne Bridges

[Table 6-2.2](#) lists two visual inventory locations for Sagamore and Bourne Bridges. These locations apply to both bridges.

Table 6-2. Description of Visual Inventory Locations (Sagamore and Bourne Bridges)

Visual Inventory Location*	Viewshed	Description	Viewer Types	Viewer Sensitivity
B1	View of Bridge Arch from Motorist on Sagamore Bridge or Bourne Bridge	Viewshed of a portal entry onto the bridge, with prominent historic plaque at the portal entrance, reinforced by tall safety/visual fences on both sides of the highway and heavily trafficked narrow traffic lanes.	Travelers	High
B2	View of Sagamore Bridge or Bourne Bridge from Canal Service Road	Viewshed includes the expanse of the waterway and the extensive length of the parallel service road, with the curve of the waterway in the distant view.	Recreational Neighbors	High

Source: Massachusetts Department of Transportation, 2024

* Visual Inventory Location B1 is shown on [Figure 6-96-9](#) and Visual Inventory Location B2 is shown on [Figure 6-66-6](#); however, the bridge visual inventory locations are applicable to all figures.

6.5.2 Sagamore North Quadrant Interchange Approach Network

[Figure 6-6](#) and [Table 6-3](#) identify [five](#) visual inventory locations in the Sagamore North quadrant highway interchange approach network.

Figure 6-6. Visual Inventory Locations (Sagamore North Quadrant Interchange Approach Network)

Source: Massachusetts Department of Transportation, 2025

Table 6-3. Description of Visual Inventory Locations (Sagamore North Quadrant Interchange Approach Network)

Visual Inventory Location Quadrant	Viewshed	Description	Viewer Types	Viewer Sensitivity
SN1 (Figure 6-6)	View of Scenic Highway from Church Lane, facing east	Viewshed includes a string of overhead signals across 4-lane divided Scenic Highway (with a State Route 3 turning lane) and the State Route 3 South on-ramp from Scenic Highway, directional signage, and forested areas bordering both sides of Scenic Highway.	Residential Neighbors, Travelers	Moderate
SN2 (Figure 6-6)	View of Sagamore Bridge from Bourne Park and Ride Lot, facing south	Viewshed includes parked vehicles, dense vegetation, sidewalk to Canal Street, commercial building (Starbucks) and signs, and Sagamore Bridge arch to the west.	Travelers	Low
SN3 (Figure 6-6)	View of State Road and Scenic Highway from Meetinghouse Lane, facing northwest	Viewshed includes high abutment wall and State Route 3 to the west, overhead and side traffic signals, utility poles and overhead wiring, directional signage, divided 4-lane Scenic Highway directly west.	Residential and Commercial Neighbors, Travelers	Moderate
SN4 (Figure 6-6)	View of Sagamore Bridge from Church Lane at Cape Pine Road, facing south	Viewshed includes the Sagamore Bridge arch in the distance.	Residential Neighbors	Low
SN5 (Figure 6-6)	View of Sagamore Bridge from Canal Street at Lucia Avenue (extended), facing southwest	Viewshed includes forested area of Cape Cod Canal Federal Navigation Project land with Cape Cod Canal and Sagamore Bridge arch in distance.	Residential Neighbors, Travelers	Moderate

Source: Massachusetts Department of Transportation, 2025

6.5.3 Sagamore South Quadrant Interchange Approach Network

Figure 6-7 and Table 6-4.4 identify four visual inventory locations in the Sagamore South quadrant highway interchange approach network.

Figure 6-7. Visual Inventory Locations (Sagamore South Quadrant Interchange Approach Network)

Source: Massachusetts Department of Transportation, 2025

Table 6-4. Description of Visual Inventory Locations (Sagamore South Quadrant Interchange Approach Network)

Visual Inventory Location	Viewshed	Description	Viewer Types	Viewer Sensitivity
SS1 (Figure 6-7)	View of Sandwich Road at Mid-Cape Connector, facing east	Viewshed includes median island, a crossarm with three overhead signals, two ground-level signals lights, utility pole and overhead wiring, directional signage, Sagamore Bridge arch and span, and residential and commercial uses on both sides of Sandwich Road.	Residential and Commercial Neighbors, Travelers	Moderate
SS2 (Figure 6-7)	View of Sagamore Bridge from Eleanor Avenue at John's Lane, facing northeast	Viewshed includes the intersection with John's Lane, single-family residential houses on the east side of Eleanor Avenue, trees lining the roadway, dense canopy cover at rear of houses, and Sagamore Bridge arch in the background.	Residential Neighbors	High
SS3 (Figure 6-7)	View of Sagamore Bridge South Abutment from Sandwich Road, facing south	Viewshed includes concrete abutment of Sagamore Bridge against steep embankment, overhead wires, and sidewalk in front of abutment. The vertical under-clearance of the bridge over Sandwich Road is 21 feet.	Travelers	Low
SS4 (Figure 6-7)	View of Cranberry Highway at Adams Street, facing west	Viewshed includes two-lane striped roadway separated from frontage road by narrow, grassed median strip with utility poles and overhead electrical wiring; scattered individual residential and commercial buildings; distant view of facades of shopping development; and minimal landscaping.	Residential and Commercial Neighbors, Travelers	Moderate

Source: Massachusetts Department of Transportation, 2025

6.5.4 Bourne North Quadrant Interchange Approach Network

Figure 6-8 and Table 6-5 identify three visual inventory locations in the Bourne North quadrant highway interchange approach network.

Figure 6-8. Visual Inventory Locations (Bourne North Quadrant Interchange Approach Network)

7 Impacts Analysis

7.1 Purpose

This section consists of the Analysis Phase of the VIA: it assesses the potential changes to the visual quality of the Sagamore Bridge and Bourne Bridge AVEs due to the No Build Alternative and the Build Alternative.

7.2 Visual Impacts of the No Build Alternative

The No Build Alternative would not alter the visual quality of Sagamore and Bourne Bridges or affect the visual landscape of the interchange highway networks because they would retain their current configurations. It is not anticipated that USACE's program of continued inspections and maintenance and repair of both existing bridges as needed ("Fix as Fails") in the No Build Alternative would substantially alter the viewsheds of the motorist crossing the bridges or the views of the bridges from the Canal Service Roads.

The No Build Alternative would include proposed transportation improvements projects in and near the Project Limits within the interchange improvements network ([Table 3-2](#)), consisting primarily of traffic safety improvements at Belmont Circle, Bourne Rotary, Scenic Highway, and State Route 28. It is not anticipated that these improvements, such as restriping, additional lanes, signage, and flashing beacons, raised medians, and deck replacement, would alter the existing visual landscape.

The No Build Alternative would include changes to the viewsheds of travelers on the regional and local roadways networks due to proposed development, such as the proposed Cumberland Farms retail development on MacArthur Boulevard, the proposed storage unit facility at Bourne Rotary, and the proposed mixed-use development on Canal Street.²³ However, travelers are expected to have low viewer sensitivity due their generally narrow viewshed and the short amount of time that drivers

²³ Town of Bourne Planning Department, August 14, 2024; updated November 26, 2024.

would be exposed to the new views. As a result, it is anticipated that the degree of impact from new development abutting the highway networks would likely be neutral.

7.3 Visual Impacts of the Build Alternative

Using the visual inventory locations to identify potential visual changes due to the Build Alternative, this section presents a description of visual changes, a comparison of existing and simulated viewsheds, and an assessment of impacts to viewsheds based on FHWA Guidelines. The simulated views are based on MassDOT's selection of the preferred intersection control type to be included in the Base Technical Concept plans. The simulated views also include proposed street and pedestrian lighting, SUP pavement markings and pedestrian and bicycle signal crossings, and landscaping based on preliminary design.

7.3.1 Sagamore and Bourne Bridges

7.3.1.1 Summary of Visual Changes

Like the existing bridges, the replacement Sagamore and Bourne Bridges would be nearly identical. The replacement bridges would be steel twin tied-arch bridges with delta frames supporting an approximate 700-foot mainline span over the canal. The 600-foot steel network tied arch of the replacement bridge would be approximately 115 feet above the deck, resulting in an overall bridge rise (top of arch) of approximately 261 feet above MHW, which would be approximately 17 feet lower than existing conditions. At each crossing, the two main spans would have an overall width of approximately 167 feet, which would be more than triple the width of the existing bridge's single main span width.

The proposed 720-foot distance between the centerlines of the canal side piers would be substantially wider than the existing 616-foot main span. As a result, the two new concrete bridge piers would be located outside the waterway and into the riprap portion of the canal cut, closer to the edges of the canal than in existing conditions. Due to the depth requirements of the proposed bridge delta frame, the top of the new bridge piers would be approximately 10 feet lower than the existing piers.

The twin-deck structures would be 7 feet apart and parallel to each other; each main span would include two through-traffic lanes, one auxiliary lane, and shoulders and barriers in compliance with current MassDOT and FHWA standards and guidelines for highway and bridge design. Each crossing location would include one bidirectional pedestrian and bicycle SUP, separated from vehicular traffic by the shoulder and barrier.

At Sagamore Bridge, the main span would be flanked to the north by two delta spans (measuring 320 feet and 200 feet), an expansion joint, and 233 feet of approach bridge structure. The main span would be flanked to the south by two delta spans (measuring 320 feet and 200 feet), an expansion joint, and 320 feet of approach bridge structure. At Bourne Bridge, the main span would be flanked to the north by two delta spans (measuring 320 feet and 200 feet), an expansion joint, and 1,620 feet of approach bridge structure. The main span would be flanked to the south by two delta spans (measuring 320 feet and 200 feet), an expansion joint, and 634.5 feet of approach bridge structure.

Figure 7-1 and **Figure 7-2** present comparison images of the proposed and existing Sagamore Bridge and Bourne Bridge. As demonstrated in these figures, the form of the proposed bridges closely adheres to the design of the existing bridges.

Figure 7-1. Comparison of Existing and Proposed Sagamore Bridge

Source: Massachusetts Department of Transportation, 2025

Figure 7-2. Comparison of Existing and Proposed Bourne Bridge

Source: Massachusetts Department of Transportation, 2025

7.3.1.2 Comparison of Existing and Simulated Viewsheds

The two existing and simulated viewsheds are applicable to both bridge crossings.

B1. View of Bridge Arch from Motorist on Bridge (Sagamore Bridge or Bourne Bridge)

Exhibit 7-1a and **Exhibit 7-1b** present existing and simulated viewsheds of motorists on the bridges

(Figure 6-9, B1). In the existing condition, the viewshed is of a single portal entry onto the bridge, with a prominent historic plaque at the portal entrance, reinforced by tall safety/visual fences on both sides of the highway and heavily trafficked narrow travel lanes. Minimal roadway lighting is provided.

In the proposed view, the viewshed would include two bridge arches. The overall shape of the delta-frame-supported arches would replicate the rounded arches of the existing steel truss bridges and would be compatible with the existing steel truss bridge in scale and form. It would successfully mimic the portal “gateway” entrance of the existing bridges. The proposed use of steel and concrete, with grey as the finish color, would provide a traditional look consistent with the appearance of the existing bridge.

In the proposed view, the view of the opposing traffic would be separated physically, via a separate span, and visually, via a bridge barrier. The bridge barrier on the canal crossing would be composed of open steel railing on the arch above the canal (45 inches high). The bridge barrier on the approach spans on either side of the arch would be composed of solid concrete (42 inches high). The bridge barrier on the proposed bridge would be topped with a stainless-steel mesh that would provide more open views to motorists than the closely spaced pickets on the existing bridges. Further, the separation of traffic, as well as the additional width of the travel lanes, would provide travelers with a sense of visual separation and orderliness that is not present in the existing conditions; while the steel mesh would facilitate enhanced views of the canal as drivers travel over the bridge. Lighting would be provided on the roadway and selected bridge elements, and pedestrian lighting would be provided on the pedestrian and bicycle facility.

Exhibit 7-1a. Existing View of Bridge Arch from Motorist (Sagamore and Bourne Bridges)

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-1b. Simulated View of Bridge Arches from Motorist (Sagamore and Bourne Bridges)

Source: Massachusetts Department of Transportation, 2025

B2. View of Sagamore Bridge or Bourne Bridge from Canal Service Road

Exhibit 7-2a and **Exhibit 7-2b** present existing and simulated views of the bridges from the Canal Service Road (**Figure 6-6**, B2). The views of the replacement bridges from the Canal Service Roads would be consistent with the existing views of the bridges. From the viewpoint of the recreational neighbor, the increased height of the bridge deck and the lower height of the top of the arch would not be obvious. The placement of the new piers into the riprap portion of the canal would open views of the waterway from the Canal Service Roads, enhancing the natural vista. While the expanded riprap at the pier bases would give a more uniformly developed appearance, it would not detract from the view of the expansive, meandering waterway. The piers would be physically closer to the Canal Service Roads and due to the depth of the delta frame, would be approximately 10 feet lower in height than the existing piers; however, the visual differences would be negligible.

Exhibit 7-2a. Existing View of Sagamore Bridge or Bourne Bridge from Canal Service Road

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-2b. Simulated View of Sagamore Bridge or Bourne Bridge from Canal Service Road

7.3.2 Sagamore North Quadrant Interchange Approach Network

7.3.2.1 Summary of Visual Changes

The Sagamore North quadrant interchange approach network would provide a single exit point from a relocated U.S. Route 6/State Route 3. It would remove the Sagamore Bridge northbound off-ramp connection to Scenic Highway/Meetinghouse Lane eastbound and instead would connect to State Road, north of Scenic Highway /Meetinghouse Lane. The remaining ramp connections would remain similar to existing conditions with geometric adjustments to meet the new mainline location. A double roundabout would replace the signalized intersection of Scenic Highway/Meetinghouse Lane/State Road/Canal Street. Signalized intersections along Scenic Highway would be modified for new lane configurations. The intersection of State Road at State Route 3 northbound on-ramp would be modified to accommodate the addition of the new State Route 3 northbound off-ramp with installation of a traffic signal. The network improvements would be approximately 1 to 2 feet higher than the existing elevations; however, this change in elevation would be a negligible difference that would be difficult for travelers to discern.

The Sagamore North quadrant interchange approach network would provide a [SUP](#) on the U.S. Route 6 eastbound main span; the SUP would connect to SUPs on the south side of Scenic Highway, Canal Street, and North Canal Service Road. Additionally, a SUP would be provided along the southern side of Scenic Highway and Meetinghouse Lane and along the eastern side of State Road to Homestead Avenue. [Pedestrian and bicycle signals would be provided at the following signalized crossings in the Sagamore North quadrant: Scenic Highway/Church Lane/U.S. Route 6 eastbound on-ramp, Scenic Highway/State Route 3 southbound off-ramp, and State Road/State Route 3 northbound ramps.](#)

[Additional visual changes in the Sagamore North quadrant would be an expansion of the existing Sagamore Recreation Area gravel overflow parking lot to the east in a wooded portion of USACE's Cape Cod Canal Federal Navigation Project land. Existing vegetation, including trees, would be cleared and a driveway entrance would be constructed off Canal Street across from Lucia Avenue \(extended\). A new](#)

sidewalk bordering the parking lot to the south would extend along the length of the new parking lot and the entirety of Sagamore Recreation Area, connecting to the existing comfort station and recreation area entrance at Canal Street. Due to the higher-grade elevation of the recreation area, views from the north Canal Service Road would be consistent with existing conditions.

7.3.2.2 Comparison of Existing and Simulated Viewsheds

SN1. View of Scenic Highway from Church Lane

Exhibit 7-3a and **Exhibit 7-3b** present existing and simulated views of Scenic Highway, facing east, at its intersection with Church Lane (**Figure 6-6**, SN1). The proposed view generally would be consistent with the existing view by maintaining the signalized intersection. In the proposed condition, however, a striped SUP crossing and pedestrian and bicycle signals would be provided at the signalized crossing on the south side of Scenic Highway where the SUP crosses the entrance to the on-ramp. Scenic Highway travelers and residential neighbors from the Church Lane area would have views of the SUP on the south side of Scenic Highway and partial views of Sagamore Bridge. The elimination of overhead utilities would present a more harmonious and coherent view to travelers.

Exhibit 7-3a. Existing View of Scenic Highway from Church Lane, facing east

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-3b. Simulated View of Scenic Highway from Church Lane, facing east

Source: Massachusetts Department of Transportation, 2025

SN2. View of Sagamore Bridge from Bourne Park and Ride Lot

Exhibit 7-4a and **Exhibit 7-4b** present existing and simulated views from Bourne Park and Ride Lot facing south toward Sagamore Bridge (**Figure 6-6**, SN2). In the proposed view, Sagamore Bridge would be less prominent because the bridge location would shift to the west. However, State Route 3 would be more prominent to viewers than in existing conditions. In the proposed condition, the State Route 3 mainline would be approximately 15 feet higher than the existing roadway on average, ranging from approximately 7 feet closer to Scenic Highway to a maximum 20-foot difference at the abutment of the replacement bridge, which would align with the existing Starbucks parking lot. The hardness of the concrete mainline would be softened by extensive landscaping. The natural environmental features of the setting and views of the new SUP that would start at Bourne Park and Ride Lot would be visually appealing, introducing a harmonious view that would provide both visual interest and visual relief. Additionally, pedestrians and bicyclists would provide visual interest.

Exhibit 7-4a. Existing View of Sagamore Bridge from Bourne Park and Ride Lot, facing south

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-4b. Simulated View of Sagamore Bridge from Bourne Park and Ride Lot, facing south

Source: Massachusetts Department of Transportation, 2025

SN3. View of State Road and Scenic Highway from Meetinghouse Lane

Exhibit 7-5a and **Exhibit 7-5b** present existing and simulated views from Meetinghouse Lane at State Road/Scenic Highway, facing northwest (**Figure 6-6**, View SN3). In the proposed view, the removal of the utility poles, overhead signals, and wiring would eliminate visual clutter and present a more harmonious and coherent view. The introduction of a roundabout would be more visually appealing than the existing signalized intersection; it would reduce the amount of paved area and the landscape treatment in the center island would provide a natural feature and visual relief. The channelized entry of the roundabout would provide travelers with a sense of orderliness that is not present in the existing condition.

Exhibit 7-5a. Existing View of State Road and Scenic Highway from Meetinghouse Lane, facing northwest

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-5b Simulated View of State Road and Scenic Highway from Meetinghouse Lane, facing north

Source: Massachusetts Department of Transportation, 2025

SN4. View of Sagamore Bridge from Church Lane at Cape Pine Road

Exhibit 7-6a and **Exhibit 7-6b** present existing and simulated views from Church Lane at Cape Pine Road, facing south toward Sagamore Bridge (**Figure 6-6**, SN4). The proposed view would be consistent with existing conditions, where the residential neighbor would have only a distant view of Sagamore Bridge. The change in bridge alignment would not be readily apparent from this distant view.

Exhibit 7-6a. Existing View of Sagamore Bridge from Church Lane at Cape Pine Road, facing south

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-6b. Simulated View of Sagamore Bridge from Church Lane at Cape Pine Road, facing south

Source: [Massachusetts Department of Transportation, 2025](#)

SN5. View of Sagamore Bridge from Canal Street at Lucia Avenue (Extended)

Exhibit 7-7a and **Exhibit 7-7b** present existing and simulated views from Canal Street at Lucia Avenue (extended), facing southeast toward Cape Cod Canal Federal Navigation Project and Sagamore Bridge (**Figure 6-6**, SN5). In both the existing condition and simulated view, residential neighbors would have a distant view of Sagamore Bridge. In the existing condition, however, the view of the bridge is partially obscured by the dense tree canopy of the Federal Navigation Project lands. The change in bridge alignment would not be readily apparent from this viewpoint. While the expanded parking lot would open vistas of Sagamore Bridge and Cape Cod Canal to the southeast, it also would replace the natural wooded setting of the Federal Navigation Project land with pavement and transportation land uses. Because the proposed parking lot would be an expansion of the existing Sagamore Recreation Area lot, the proposed condition would not be incompatible with existing conditions. Landscaping along the south side of Canal Street would provide a visual buffer to travelers and residential neighbors. Pedestrians and bicyclists at the far southern edge of the parking lot would also provide visual interest.

Exhibit 7-7a. Existing View of Sagamore Bridge and Cape Cod Canal Federal Navigation Project from Canal Street at Lucia Avenue (extended), facing southeast

Source: Massachusetts Department of Transportation, 2025

Exhibit 7-7b. Simulated View of Sagamore Bridge and Expanded Parking Lot from Canal Street at Lucia Avenue (extended), facing southeast

Source: [Massachusetts Department of Transportation, 2025](#)

7.3.2.3 Viewshed Impact Assessment: Sagamore North Quadrant Interchange Approach Network

Table 7-2 presents a summary of anticipated impacts to viewsheds within the Sagamore North quadrant highway interchange approach network.

Table 7-2. Anticipated Impacts to Viewsheds (Sagamore North Quadrant Interchange Approach Network)

Visual Inventory Location	Exhibit No.	Simulated Viewshed	Impact Compatibility	Viewer Sensitivity	Degree of Impact
SN1 (Figure 6-6)	7-3a, 7-3b	View of Scenic Highway from Church Lane, facing east	Compatible	Moderate	Neutral

7.3.3 Sagamore South Quadrant Interchange Approach Network

7.3.3.1 Summary of Visual Changes

The Sagamore South quadrant interchange approach network would involve the most substantial visual changes of the Program. In the Sagamore South quadrant, two new roadways—Cranberry Highway Extension and Sandwich Road Connector—would be constructed. [Most](#) of the right-of-way impacts, including demolition of commercial and residential units and conversion to state highway layout, would occur in [the](#) Sagamore South [quadrant](#).

The Sagamore South quadrant would include a new Cranberry Highway Extension and would relocate the westbound on-ramp, so that it would share the same entrance point as the eastbound on-ramp off Mid-Cape Connector. Modifications to lane arrangements at the intersections of Mid-Cape Connector with Sandwich Road and Cranberry Highway would accommodate the revised traffic patterns resulting from the extension of Cranberry Highway and relocation of access to [Scenic Highway](#) eastbound, including modifications to the existing traffic signals. [The Mid-Cape Connector/Cranberry Highway Extension signalized crossing would include pedestrian and bicycle signals.](#) There would be a connection from [Cranberry Highway to](#) Sandwich Road east of the new mainline bridge structure ([and within the footprint of the existing Sagamore Bridge mainline](#)); [the new Sandwich Road Connector would be signalized and would include pedestrian and bicycle signals.](#) A roundabout would be provided at the [intersection of the U.S. Route 6 westbound off-ramp with Cranberry Highway.](#) [An additional roundabout would be provided along Cranberry Highway providing access to Market Basket \(Factory Outlet Road\).](#) [Access to Market Basket's two driveways would be maintained in the new configuration.](#) [There would be](#) an access driveway to the former Christmas Tree Shops area. A new SUP would be provided on the U.S. Route 6 eastbound main span; it would connect to SUPs along Factory Outlet Road, Sandwich Road, and the South Canal Service Road. Bicycle and pedestrian improvements on Cranberry Highway would consist of buffered bicycle lanes with concrete sidewalks east of Sandwich Road Connection to Vermont Street. A new SUP connection would be added through Cranberry Highway Extension to Mid-Cape Connector, [extending north along Mid-Cape Connector to provide access to the south Canal Service Road with an at-grade railroad crossing, and extending east on both sides of Sandwich Road past Adams Street.](#) A new SUP connection located directly west of Keith Field Recreation Area ballfield would connect pedestrians and bicyclists to south Canal Service Road with an at-grade railroad crossing.

[MassDOT is proposing two new at-grade SUP connections to south Canal Service Road in the Sagamore South quadrant, in the vicinity of the Sandwich Road and Mid-Cape Connector intersection and south](#)

of Keith Field Recreation Area. Both SUP connections across the railroad would provide signage and pavement markings, detectable warning surfaces, lighting, visual and auditory warning devices, and gate crossing arms.

7.3.3.2 Comparison of Existing and Simulated Viewsheds

SS1. View of Sandwich Road at Mid-Cape Connector

Exhibit 7-8a and **Exhibit 7-8b** present existing and simulated views of Sandwich Road at its intersection with Mid-Cape Connector, facing east (**Figure 6-7**, SS1). In the proposed view, the signalized intersection would remain and include SUP pavement markings and pedestrian and bicycle signals. The elimination of the overhead wiring and utility poles would provide a more coherent and harmonious view. Travelers and commercial and residential neighbors would have views of a new SUP on the south side of Sandwich Road, which would provide visual interest. Views of the existing residences and commercial uses along Sandwich Road would not change. The relocated Sagamore Bridge would be a more prominent feature in the viewshed; however, the differences in height between the existing and proposed arches would be difficult to discern.

Exhibit 7-8a. Existing View of Sandwich Road at Mid-Cape Connector, facing east

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-8b. Simulated View of Sandwich Road at Mid-Cape Connector, facing east

Source: Massachusetts Department of Transportation, 2025

SS2. View of Sagamore Bridge from Eleanor Avenue

Exhibit 7-9a and **Exhibit 7-9b** present existing and simulated views from Eleanor Avenue, facing northeast toward Sagamore Bridge (**Figure 6-7**, SS2). In existing conditions, the view of Eleanor Avenue at John's Lane consists of houses along a tree-lined residential road, with a forested area in the middle ground and Sagamore Bridge in the distance. The residences along the east side of Eleanor Avenue would be demolished to provide sufficient area to construct the new bridge and demolish the existing bridge in the temporary condition. In the proposed view (permanent condition), the area would be graded to provide permanent stormwater control measures and a SUP connecting Eleanor Avenue, Mid-Cape Connector, and Sandwich Road at Sandwich Road Connector.

The replacement Sagamore Bridge and reconfigured U.S. Route 6 mainline would be closer to the neighborhood on the west side of Eleanor Avenue and would be more prominent features in viewsheds. At the southern end of Eleanor Avenue, the mainline would be approximately 37 feet higher than in existing conditions, increasing to a 103-foot height difference at the northern end of Eleanor Avenue. The dense tree canopy along the embankment of the existing U.S. Route 6 would be removed and replaced with a landscaped buffer area. While the buffer area would separate the Round Hill neighborhood on the west side of Eleanor Avenue from the elevated U.S. Route 6 mainline, the loss of residential units and the existing dense tree canopy, and the resulting view of the more prominent transportation elements, would substantially alter the neighborhood's existing visual character and would adversely affect the sensitivity of the residential viewers. **Section 8** describes the proposed mitigation measures, such as extensive landscaping and the addition of park features, to address this adverse effect.

Exhibit 7-9a. Existing View of Sagamore Bridge from Eleanor Avenue at John's Lane, facing northeast

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-9b. Simulated View of Sagamore Bridge and U.S. Route 6 from Eleanor Avenue, facing northeast

Source: Massachusetts Department of Transportation, 2025

SS3. View of Sagamore Bridge South Abutment from Sandwich Road

Exhibit 7-10a presents an existing view from Sandwich Road at the Sagamore Bridge south abutment, facing south; **Exhibit 7-10b** presents a simulated view of the new Sandwich Road Connector from Sandwich Road, facing south (**Figure 6-7**, SS3). The existing view consists of the massive concrete Sagamore Bridge abutment, fronted by a sidewalk, and steep embankments and a guardrail flank the abutment to the east and west. In the proposed view, the existing Sagamore Bridge would be eliminated; the existing bridge and U.S. Route 6 mainline footprint would be replaced with a new road connecting Sandwich Road with the new Cranberry Highway Extension. This signalized intersection would include SUP pavement markings and pedestrian and bicycle signals. Sidewalks would be provided on both sides of Sandwich Road Connector. The new Sandwich Road Connector would parallel the newly constructed U.S. Route 6 eastbound and westbound highways. Located approximately 100 feet west of the connector, the view of the roadways, delta piers, and SUP would be prominent features within the traveler's viewshed.

With its distinct and straight lines, and a vista of the roundabout in the distance, Sandwich Road Connector would introduce a sense of orderliness, while providing a new view to travelers in this area of the town of Bourne. Travelers along this corridor would view the windmill of the former Christmas Tree Shops development to the east, giving viewers a sense of familiarity and placemaking within the new vista. Due to the rolling terrain at this location, construction of Sandwich Road Connector would require substantial excavation of up to 58 feet; the areas bordering the road would be landscaped. The landscaping and passing pedestrians and bicyclists would provide visual interest to travelers.

The connector road would introduce a new appealing view to an area from Sandwich Road with an existing void. While the new view would be substantially different from the current view of the bridge abutment, it would be generally consistent with the character of the transportation network in this section of Sandwich Road. Further, travelers typically would have low sensitivity to this travel corridor because the intent of Sandwich Road Connector is to improve traffic operations and bypass local traffic with destinations to Market Basket and Mid-Cape Connector. MassDOT determined that due to the viewers' low sensitivity and the general compatibility between existing and proposed transportation elements, the degree of impact would be neutral.

Exhibit 7-10a. Existing View of Sagamore Bridge South Abutment from Sandwich Road, facing south

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-10b. Simulated View of Sandwich Road Connector at Sandwich Road, facing south

Source: Massachusetts Department of Transportation, 2025

SS4. View of Cranberry Highway at Adams Street

Exhibit 7-11a presents an existing view of Cranberry Highway at its intersection with Adams Street, facing west, and **Exhibit 7-11b** presents a simulated view of the new Cranberry Highway Extension from Cranberry Highway at its intersection with Adams Street, facing west (**Figure 6-6**, SS4). In the proposed view, the removal of the utility poles and overhead wiring would eliminate visual clutter and present a more harmonious and coherent view. The roundabout would be more visually appealing than the existing diverging roadways that lack visual directional cues; it would reduce the paved area and incorporate a landscaped treatment in the center island, providing visual relief. The channelized entry of the roundabout would provide travelers with a sense of orderliness that is not present in the existing condition and would be a visual entry for travelers to the Market Basket commercial area. Travelers and residential and commercial neighbors would have prominent views of the elevated U.S. Route 6 mainline beyond the roundabout. While the elevated structure would be a new viewshed element, it would be consistent with the character of the transportation corridor.

Exhibit 7-11a. Existing View of Cranberry Highway at Adams Street, facing west

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-11b. Simulated View of Cranberry Highway Extension from Cranberry Highway at Adams Street, facing west

Source: [Massachusetts Department of Transportation, 2025](#)

7.3.3.3 Viewshed Impact Assessment: Sagamore South Quadrant Interchange Approach Network

Table 7-3 presents a summary of anticipated impacts to viewsheds within the Sagamore South quadrant highway interchange approach network.

Table 7-3. Anticipated Impacts to Viewsheds (Sagamore South Quadrant Interchange Approach Network)

Visual Inventory Location*	Exhibit No.	Simulated Viewshed	Impact Compatibility	Viewer Sensitivity	Degree of Impact
SS1 (Figure 6-7)	Exhibit 7-8a, 7-8b	View of Sandwich Road at Mid-Cape Connector, facing east	Compatible	Moderate	Neutral
SS2 (Figure 6-7)	Exhibit 7-9a, 7-9b	View of Sagamore Bridge and U.S. Route 6 from Eleanor Avenue, facing northeast	Incompatible	High	Adverse
SS3 (Figure 6-7)	Exhibit 7-10a, 7-10b	View of Sandwich Road Connector at Sandwich Road , facing south	Compatible	Low	Neutral

Visual Inventory Location*	Exhibit No.	Simulated Viewshed	Impact Compatibility	Viewer Sensitivity	Degree of Impact
SS4 (Figure 6-7)	Exhibit 7-11a, 7-11b	View of Cranberry Highway Extension from Cranberry Highway at Adams Street, facing west	Compatible	Moderate	Beneficial

7.3.4 Bourne North Quadrant Interchange Approach Network

7.3.4.1 Summary of Visual Changes

The Bourne North quadrant interchange approach network would provide a combination of direct connection ramps between State Route 25 and U.S. Route 6 ([Scenic Highway](#)). The ramp connecting State Route 25 eastbound to Scenic Highway would be a direct connect ramp, allowing access to Scenic Highway eastbound only. The new flyover ramp, with an 18-foot clearance, would connect Scenic Highway to State Route 25 and would allow vehicles to bypass Belmont Circle without an additional traffic signal. This ramp would utilize one of the travel lanes on Scenic Highway and would be a free-flowing movement to reduce congestion. The existing State Route 28 over the State Route 25 bridge would be relocated to widen the bridge to allow for this new southbound to eastbound ramp movement. The existing southbound off-ramp would be revised to be an option lane, improving the geometry and decision sight distance for drivers. The intersection control at [Scenic Highway/Nightingale Road/Andy Oliva Drive](#) would be a single-lane roundabout.

Additional visual changes would include new west side access to Bourne Scenic Park from Scenic Highway at Pool Road and an extension of the park's boundary to the east, to incorporate acreage from USACE's Cape Cod Canal Federal Navigation Project land. While substantial grading would be required to provide additional camping facilities, a forested buffer would be retained between the park boundaries and north Canal Service Road. As a result, views from the north Canal Service Road would be consistent with exiting conditions.

The Bourne North quadrant interchange approach network would provide a SUP and a grade-separated crossing for pedestrians and bicyclists via the new flyover ramp over Scenic Highway. The [Scenic Highway](#) lane configuration would be reduced from four lanes to three lanes, allowing for one continuous 12-foot-wide SUP along the south side of [Scenic Highway](#) connecting to Belmont Circle and a 6-foot-wide sidewalk along the north side of [Scenic Highway](#).

7.3.4.2 Comparison of Existing and Simulated Viewsheds

BN1. View of State Route 25 from Belmont Circle

[Exhibit 7-12a](#) and [Exhibit 7-12b](#) present existing and simulated views from Belmont Circle, facing east toward State Route 25 ([Figure 6-8](#), BN1). In the proposed view, the viewshed of the new 18-foot-high flyover ramp connecting Scenic Highway to State Route 25 would add a higher structural element than in existing conditions; however, the new flyover ramp would be consistent with the visual character of

the existing transportation environment. Further, commercial neighbors and travelers would not be sensitive to these visual changes; as in the current view, the altered transportation elements in the background would not occupy a prominent position in their viewshed. The visibility of and access to existing commercial uses in Belmont Circle would not be affected. [The elimination of overhead utilities would present a more harmonious and coherent view to travelers.](#)

Exhibit 7-12a. Existing View of State Route 25 from Belmont Circle, facing east

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-12b. Simulated View of Flyover Ramp from Belmont Circle, facing east

Source: Massachusetts Department of Transportation, 2025

BN2. View of Bourne Scenic Park from Nightingale Road at Scenic Highway

Exhibit 7-13a and **Exhibit 7-13b** present existing and simulated views of the Bourne Scenic Park entrance from Nightingale Road at its intersection with Scenic Highway, facing south (**Figure 6-8**, BN2). In the proposed view, the relocated Bourne Bridge would be diminished by the approximate 80-foot relocated State Route 25 mainline and the approximate 30-foot-high new elevated flyover ramp connecting State Route 25 eastbound to Scenic Highway eastbound, which would be the dominant visual structural elements in the viewshed. The removal of the utility poles, overhead signals, and wiring would eliminate visual clutter and present a more harmonious and coherent view. The roundabout would be more visually appealing than the existing signalized intersection; it would reduce the amount of paved area and the landscape treatment in the center island would provide a natural feature and visual interest. The SUP would provide a new element of visual interest to the viewshed. The viewshed of neighbors exiting the Nightingale Pond neighborhood onto Scenic Highway would substantially change from existing conditions, however, conveying an urban form with hard lines of the highways in contrast to their current view of the natural, park setting of the Bourne Scenic Park entrance. **Section 8** describes the proposed mitigation measures, such as landscaping and abutment wall treatments, to address this adverse effect.

Exhibit 7-13a. Existing View of Bourne Scenic Park from Nightingale Road at Scenic Highway, facing south

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-13b. Simulated View of Bourne Scenic Park from Nightingale Road at Scenic Highway, facing south

Source: Massachusetts Department of Transportation, 2025

BN3. View of State Route 25 from Scenic Highway

[Exhibit 7-14a](#) and [Exhibit 7-14b](#) present existing and simulated views from Scenic Highway, facing west toward State Route 25 ([Figure 6-8](#), BN3). [In the proposed view, travelers](#) would have views of the elevated State Route 25 mainline, the elevated flyover ramp connecting State Route 25 eastbound to Scenic Highway eastbound, and the new State Route 28 northbound on-ramp. The existing dense canopy of trees on both sides of Scenic Highway would be replaced with an extensive roadway network, creating a more developed, urban character to this portion of Scenic Highway. The reconfigured State Route 25, approximately 28 feet higher than existing conditions, and the new ramps would be dominant structures within the viewshed. The single-lane roundabout would be a traffic calming measure; it would provide travelers with a sense of orderliness and serve as a visual entry to the Belmont Circle commercial area. [The elimination of overhead utilities would contribute to the sense of orderliness.](#) The landscaped treatment in the center of the roundabout and the sidewalks on the south side of Scenic Highway would add visual interest.

While the more physically dominating presence of the transportation network would constitute a substantial change from existing conditions, travelers along this portion of Scenic Highway typically would have low sensitivity to this travel corridor. Further, the inclusion of the roundabout, sidewalks, and landscaping would provide visually appealing features to the viewshed. As a result, MassDOT determined that the degree of impact would be neutral.

Exhibit 7-14a. Existing View of State Route 25 from Scenic Highway, facing west

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-14b. Simulated View of State Route 25 from Scenic Highway, facing west

Source: Massachusetts Department of Transportation, 2025

7.3.4.3 Viewshed Impact Assessment: Bourne North Quadrant Interchange Approach Network

Table 7-4 presents a summary of anticipated impacts to viewsheds within the Bourne North interchange network.

Table 7-4. Anticipated Impacts to Viewsheds (Bourne North Quadrant Interchange Approach Network)

Visual Inventory Location*	Exhibit No.	Simulated Viewshed	Impact Compatibility	Viewer Sensitivity	Degree of Impact
BN1 (Figure 6-8)	7-12a, 7-12b	View of Flyover Ramp from Belmont Circle, facing east	Compatible	Low	Neutral
BN2 (Figure 6-8)	7-13a, 7-13b	View of Bourne Scenic Park from Nightingale Road at Scenic Highway, facing south	Incompatible	Moderate	Adverse
BN3 (Figure 6-8)	7-14a, 7-14b	View of State Route 25 from Scenic Highway, facing west	Incompatible	Low	Neutral

7.3.5 Bourne South Quadrant Interchange Approach Network

7.3.5.1 Summary of Visual Changes

The Bourne South quadrant highway interchange network would eliminate Bourne Rotary and replace it with a grade-separated diamond interchange, allowing through movements on State Route 28 to bypass the intersections with the non-mainline roadways. [The two intersections within the diamond interchange would be](#) a single-lane dogbone roundabout. Changes to the Trowbridge Road and Sandwich Road underpass would consist of a roundabout at a relocated Upper Cape Cod Regional Technical High School Driveway entrance.

A new service frontage road of approximately 0.5 mile would be constructed from Trowbridge Road parallel to State Route 28 southbound, [providing travelers](#) with direct access [to abutting businesses](#).

[Changes in the Bourne South quadrant that would be visible from the south Canal Service Road include the relocation of Bourne Recreation Area facilities and features, including the comfort station, parking, picnic tables, and Bourne Station, approximately 0.75 miles to the east within USACE's Cape Cod Canal Federal Navigation Project land and partially located on the USACE-leased Gallo Ice Arena parcel. Approximately 3.1 acres of land at the base of Bourne Bridge would be converted to State Highway Layout via a permanent easement from USACE. Land not occupied by the bridge and mainline support structures \(land piers\) would be restored and/or used for stormwater control. The remaining land \(approximately 1 acre\) would be restored to natural conditions and reverted to navigation and navigation support as part of the Cape Cod Canal Federal Navigation Project.](#)

[MassDOT is proposing two new at-grade SUP connections to the south Canal Service Road in the Bourne South quadrant, adjacent to the Bourne Bridge and the relocated Bourne Recreation](#)

Area/Gallo Ice Arena parcel. Both SUP connections across the railroad would provide signage and pavement markings, detectable warning surfaces, lighting, visual and auditory warning devices, and gate crossing arms.

Additional visual changes in the Bourne South quadrant would include SUP connections to Trowbridge Road. Additionally, SUPs on both sides of Sandwich Road would extend between Upper Cape Regional Technical High School and Gallo Ice Arena, and they would include pedestrian-scale lighting and a SUP crossing with pavement markings and a pedestrian and bicycle rapid flashing beacon on Sandwich Road at the Harbor Light Road intersection.

7.3.5.2 Comparison of Existing and Simulated Viewsheds

BS1. View of State Route 28 from Nickerson-Bourne Funeral Home Parcel

Exhibit 7-15a and **Exhibit 7-15b** present existing and simulated views of State Route 28 from Nickerson-Bourne Funeral Home, facing north (**Figure 6-9**, BS1). The new frontage road, implemented for safety and access management, would provide visibility of and access to commercial neighbors, similar to existing conditions where commercial businesses and their patrons have access and visibility to and from State Route 28. The new SUP along the frontage road would provide visual interest. The forested area along existing State Route 28 would be removed; the highway would be relocated approximately 35 feet to the east, elevated by approximately 5 feet, and separated from the frontage road by a landscaped area. Views of Bourne Bridge would be more prominent with the change in realignment, but the difference in the arch height would not be discernible from this distance. Views of the project impacts along this heavily trafficked corridor would be consistent with the visual character of the existing transportation elements. The frontage road would meet the needs of commercial neighbors who would be sensitive to their visibility and accessibility. The elimination of overhead utilities would promote a sense of orderliness and present a more coherent and harmonious view.

Exhibit 7-15a. Existing View of State Route 28 from Nickerson-Bourne Funeral Home, facing north

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-15b. Simulated View of Frontage Road and State Route 28 from Nickerson-Bourne Funeral Home, facing north

Source: Massachusetts Department of Transportation, 2025

BS2. View of Bourne Rotary from Cumberland Farms Parcel

Exhibit 7-16a and **Exhibit 7-16b** present existing and simulated views from Cumberland Farms Parcel, facing northeast (**Figure 6-9**, BS2). The existing view of Bourne Rotary from the Cumberland Farms parcel presents a vegetated center island encircled by a roadway, with overhead wiring, signage, and utility poles in the foreground and middle ground, and the Bourne Bridge abutment in the distance. In the proposed view, removal of the utility poles and overhead wiring would eliminate visual clutter and present a more harmonious and coherent view. Replacement of the two-lane Bourne Rotary with a single-lane, double (dog-bone) roundabout, would serve as a traffic calming measure and the channelized entry would allow for visual traffic separation, providing travelers with a sense of orderliness that is not present with the existing rotary that allows for higher speeds. The dog-bone roundabout would improve visibility and access to commercial neighbors. The two center islands of the dog-bone roundabout would provide opportunities for landscaping to add natural elements and visual interest.

As the “entry” into Cape Cod from Bourne Bridge, there would be an opportunity for the roundabout to incorporate elements to welcome visitors to Cape Cod, such as the way the existing Cape Cod hedge welcomes visitors to Cape Cod. **Section 8** provides more information about design mitigation measures.

Exhibit 7-16a. Existing View of Bourne Rotary from Cumberland Farms Parcel, facing northeast

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-16b. Simulated View of Diamond Interchange Roundabout from Cumberland Farms Parcel, facing northeast

Source: Massachusetts Department of Transportation, 2025

BS3. View of Upper Sandwich Road from Lower Sandwich Road

Exhibit 7-17a and **Exhibit 7-17b** present existing and simulated views from Sandwich Road, facing west (**Figure 6-9**, BS3). In the proposed view, the existing fork separating upper and lower Sandwich Road would be replaced with a single-lane roundabout and the existing dense forested canopy bordering Sandwich Road would be removed and replaced with landscaped sloped areas and relocated State Route 28 as prominent features. At this location just west of the new roundabout, upper Sandwich Road would be barely visible from lower Sandwich Road. While the more prominent elevated roadway and the loss of the existing tree canopy would alter the existing rural character along this portion of Sandwich Road, travelers generally would be less sensitive to viewshed changes. Further, the newly landscaped area, and the SUP on the north side of lower Sandwich Road would create a harmonious, visually appealing viewshed that would be comfortable for all modes of travel. Additionally, the substantially improved sight lines for travelers on Sandwich Road would enhance traveler safety and promote a sense of orderliness. As a result of these improvements, MassDOT determined that the degree of impact would be neutral.

Exhibit 7-17a. Existing View of Upper Sandwich Road from Lower Sandwich Road, facing west

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-17b. Simulated View of Lower Sandwich Road from West of Roundabout, facing west

Source: Massachusetts Department of Transportation, 2025

BS4. View of Bourne Bridge from Upper Cape Regional Technical High School Scenic Overlook

Exhibit 7-18a and **Exhibit 7-18b** existing and simulated views from the scenic overlook at Upper Cape Regional Technical High School, facing northwest (**Figure 6-9**, BS4). Institutional and recreational neighbors would be sensitive to project impacts affecting their views of Bourne Bridge from the scenic overlook. The view of the replacement bridge from the scenic overlook would be consistent with the existing view of Bourne Bridge. Due to the distance from this focal point, the lower height of the top of the arch would not be discernible to the viewer.

Exhibit 7-18a. Existing View of Bourne Bridge from Upper Cape Regional Technical High School Scenic Overlook, facing northwest

Source: Massachusetts Department of Transportation, 2024

Exhibit 7-18b. Simulated View of Bourne Bridge from Upper Cape Regional Technical High School Scenic Overlook, facing northwest

Source: Massachusetts Department of Transportation, 2025

BS5. View of Bourne Bridge from South Canal Service Road, facing south

Exhibit 7-19a and **Exhibit 7-19b** present existing and simulated views from South Canal Service Road at Bourne Bridge, facing south toward the Federal Navigation Project land (**Figure 6-9, BS5**). In the existing view, the Mass Coastal Railroad tracks, slightly elevated from the south Canal Service Road, dominate the foreground view, and the forested land of USACE's Cape Cod Canal Federal Navigation Project dominate the background view. The trees partially obscure the view of the elevated Bourne Bridge and mainline to the east and almost fully obscure the view of residences to the west.

In the proposed conditions, the forested area would be cleared and the land would convert to State Highway Layout. In the simulated view, the signalized and signed railroad crossing and trailhead dominate the foreground view and the massive land piers of Bourne Bridge and mainline dominate the background view. New landscaping would continue to almost fully obscure views of residences from Canal Service Road pedestrians and bicyclists. While the loss of the tree canopy and the more physically dominating presence of the transportation infrastructure would alter the existing rural character along this portion of the south Canal Service Road, passing pedestrians and bicyclists would be less sensitive to viewshed changes. The new SUP connection and railroad crossing would enhance safety and comfort and promote a sense of orderliness. **Section 8** describes additional mitigation measures, such as benches and other amenities that would be incorporated to neutralize impacts and enhance pedestrian and bicyclist comfort. As a result of these improvements, MassDOT determined that the degree of impact would be neutral.

Exhibit 7-19a. Existing View of Bourne Bridge from South Canal Service Road, facing south

Source: Massachusetts Department of Transportation, 2025

Exhibit 7-19b. Simulated View of Bourne Bridge and Railroad Crossing from South Canal Service Road, facing south

Source: Massachusetts Department of Transportation, 2025

BS6. View of Sandwich Road at Gallo Ice Arena, facing east

Exhibit 7-20a and **Exhibit 7-20b** present existing and simulated views of Sandwich Road at Gallo Ice Arena, facing east (**Figure 6-9**, BS6). In existing conditions, the two-lane roadway is bordered to the north and south by a dense canopy of trees. Access to residential land uses is provided via Weather Deck Road to the south, and access to Gallo Ice Arena is provided via two entrances from Sandwich Road to the north. In the proposed condition, both sides of Sandwich Road would be bordered by sidewalks. Additionally, just east of the Weather Deck Road entrance and directly south of the Gallo Ice Arena entrance, a SUP connection with pavement markings and a pedestrian and bicycle rectangular rapid flashing beacon would be constructed on Sandwich Road. The relocation of utility poles and overhead wiring outside of the roadway improvements at this location would eliminate visual clutter. In the simulated view, the new SUP connection, grass-bordered sidewalks, and pedestrian lighting would present a more harmonious and coherent view to travelers and recreational and residential neighbors. Further, the SUP connection and Gallo Ice Arena access improvements would enhance traveler safety and promote a sense of orderliness for all modes of travel.

Exhibit 7-20a. Existing View of Sandwich Road at Gallo Ice Arena, facing east

7.3.5.3 Viewshed Impact Assessment: Bourne South Quadrant Interchange Approach Network

Table 7-5 presents a summary of anticipated impacts to viewsheds within the Bourne South quadrant interchange approach network.

Table 7-5. Anticipated Impacts to Viewsheds: Bourne South Quadrant Interchange Approach Network

Visual Inventory Location	Exhibit No.	Simulated Viewshed	Impact Compatibility	Viewer Sensitivity	Degree of Impact
BS1 (Figure 6-9)	7-15a, 7-15b	View of Frontage Road and State Route 28 from Nickerson-Bourne Funeral Home, facing north	Compatible	High	Neutral
BS2 (Figure 6-9)	7-16a, 7-16b	View of Diamond Interchange Roundabout from Cumberland Farms Parcel, facing northeast	Compatible	Moderate	Beneficial
BS3 (Figure 6-9)	7-17a, 7-17b	View of Lower Sandwich Road from West of Roundabout, facing west	Incompatible	Low	Neutral
BS4 (Figure 6-9)	7-18a, 7-18b	View of Bourne Bridge from Upper Cape Cod Regional Technical School Scenic Overlook, facing northwest	Compatible	High	Neutral
BS5 (Figure 6-9)	7-19a, 7-19b	View of Bourne Bridge and Railroad Crossing from South Canal Service Road, facing south	Incompatible	Moderate	Neutral
BS6 (Figure 6-9)	7-20a, 7-20b	View of Sandwich Road at Gallo Ice Arena, facing east	Compatible	Moderate	Beneficial

7.3.6 Summary of Visual Impacts

This section summarizes the findings of the visual impact assessments. As indicated in [Section 6.5](#), MassDOT selected [20](#) visual inventory locations in the Sagamore Bridge and Bourne Bridge AVEs that consisted of key views of and from the bridges and the highway interchange networks, including views that could be affected by the Program, such as where project horizontal or vertical elements could affect the visual character of the viewshed, including changes to the scale and character of the neighborhood.

7.3.6.1 Beneficial Changes to the Visual Quality of the Areas of Visual Effect

MassDOT determined that the degree of visual impact would be **beneficial** for the following [five](#) visual inventory locations in the interchange approach networks:

- View [of Sagamore Bridge](#) from [Bourne](#) Park and Ride Lot (SN2)
- View [of State Road and Scenic Highway](#) from Meetinghouse Lane (SN3)
- View [of Cranberry Highway Extension](#) from Cranberry Highway at Adams Street (SS4)
- [View of Diamond Interchange Roundabout](#) from Cumberland Farms Parcel (BS2)
- [View of Sandwich Road at Gallo Ice Arena \(BS6\)](#)

MassDOT determined that **beneficial changes** to the visual quality of the Sagamore Bridge and Bourne Bridge AVEs would result from the following:

- Removing utility poles and overhead signals and wiring at roadway intersections, thereby presenting more harmonious and coherent views to travelers and neighbors
- Replacing existing intersections or rotaries with roundabouts, resulting in reduced paved areas, increased landscaping, and a sense of orderliness that is not present in the existing condition.
- [Providing SUP connections across roadways, including pavement markings and pedestrian and bicycle signals, thereby increasing safety and presenting a sense of orderliness and harmony among roadway users](#)
- Incorporating landscaping and [SUPs](#) or pedestrian walkways into the transportation network, thereby providing visual interest and relief from the concrete environment.

7.3.6.2 Neutral Changes to the Visual Quality of the Areas of Visual Effect

For [11](#) visual inventory locations in the interchange approach networks, MassDOT determined that **neutral changes** to the visual quality of the Sagamore Bridge and Bourne Bridge AVEs would result from project impacts. This total number included the following locations where shifts in the bridge or roadway location and elevation would not be discernible by the viewer:

- View [of Sagamore Bridge](#) from Church Lane at Cape Pine Road (SN4)
- View [of Bourne Bridge](#) from Upper Cape Cod Regional Technical High School Scenic Overlook (BS4)

The neutral changes ratings included the following locations with low to moderate viewer sensitivity where proposed impacts, including new and/or expanded infrastructure, generally would be consistent with the visual character of the existing transportation environment:

- View [of](#) Scenic Highway [from](#) Church Lane (SN1)
- View [of Sagamore Bridge and Expanded Parking Lot](#) from [Canal Street at Lucia Avenue \(extended\) \(SN5\)](#)
- [View of](#) Sandwich Road at Mid-Cape Connector (SS1)
- View [of Sandwich Road Connector](#) from Sandwich Road (SS3)
- View [of Flyover Ramp](#) from Belmont Circle (BN1)

A neutral rating was given to the following one location where the new transportation infrastructure would provide a continuity of access and visibility to commercial neighbors who would be sensitive to project changes:

- View [of Frontage Road](#) from Nickerson-Bourne Funeral Home (BS1)

Neutral ratings also included three locations where the more dominant and physically imposing transportation elements would transform the roadway's rural visual character with a more urban appearance, introducing incompatible elements into the existing viewshed. However, at these locations with low [to moderate](#) viewer sensitivity, the visual changes would be neutralized through the introduction of landscaping, shared use paths, and pedestrian/bicycle [amenities](#) to soften the hardscape and provide visual interest, as well as other improvements (such as increased safety) that would enhance the traveler's experience:

- View [of State Route 25](#) from Scenic Highway (BN3)
- View [of Lower](#) Sandwich Road from west [of Roundabout](#) (BS3)
- [View of Bourne Bridge from South Canal Service Road \(BS5\)](#)

For the two visual inventory locations at the bridge sites, MassDOT determined that with the minimization measures incorporated into the Program, the degree of visual impact would be **neutral**:

- View [of Bridge Arches from](#) Motorist, [Sagamore Bridge or Bourne](#) Bridge (B1)
- View of Sagamore Bridge or Bourne Bridge from Canal Service Road (B2)

While the demolition of Sagamore and Bourne Bridges would be an adverse effect on those NRHP-eligible structures, MassDOT selected a replacement bridge design that would closely resemble the existing structures and complement their setting within Cape Cod Canal, to avoid and/or minimize impacts to the NRHP-eligible Cape Cod Canal Historic District. [Section 8](#) further describes measures that MassDOT's will incorporate into the Program to compensate for the loss of the historic structures.

7.3.6.3 Adverse Changes to the Visual Quality of the Areas of Visual Effect

For two visual inventory locations in the interchange approach networks, MassDOT determined that **adverse changes** to the visual quality of the Sagamore Bridge and Bourne Bridge AVEs would result from project impacts:

- View [of Sagamore Bridge and U.S. Route 6](#) from Eleanor Avenue (SS2)
- View [of Bourne Scenic Park](#) from Nightingale Road [at Scenic Highway](#) (BN2)

For the View [of Sagamore Bridge and U.S. Route 6](#) from Eleanor Avenue (SS2), MassDOT determined that the project impacts—acquiring [and demolishing](#) residences for the construction of the new bridge, demolition of the existing bridge, and the [permanent](#) incorporation of [a SUP and its connections as well as](#) stormwater control measures—would adversely affect the sensitivity of the Round Hill residential viewers on the west side of Eleanor Avenue. For the View [of Bourne Scenic Park](#) from Nightingale Road at Scenic Highway (BN2), MassDOT determined that the elevated relocated State Route 25 mainline and flyover ramp would introduce incompatible elements to the existing views of residential neighbors, who would be sensitive to their altered views of the landscaped Bourne Scenic Park entrance. To address these adverse visual impacts, MassDOT is proposing minimization and mitigation measures, which are described in [Section 8](#).

8 Mitigation

8.1 Purpose

The purpose of this phase of the VIA is to describe mitigation used throughout the Program to address the visual character of the Sagamore Bridge and Bourne Bridge AVEs. FHWA Guidelines note that the goal of the VIA is to maintain or enhance visual quality by providing mitigation for the natural, cultural, or project environments, such as either rehabilitating the degraded resource or adding complementary visual features to the resource, by providing mitigation for the visual experience of viewers. Mitigation will include the following:

- Avoiding the impact by not taking certain actions or portions of actions.
- Minimizing impacts by limiting the degree or magnitude of the action.
- Rectifying the impact by repairing, rehabilitating, or restoring the affected environment.
- Reducing or eliminating impacts over time by preserving or maintaining operations during the life of the action.
- Compensating for impacts by replacing or providing substitute resources or environments.

8.2 Mitigation Approach

MassDOT conducted a detailed alternatives analysis process to determine the Preferred Alternative, which included multiple evaluations of the bridge design parameters and the options for the highway interchange approach network components. MassDOT determined that the No Build Alternative,

which would avoid project impacts, would not meet the Program’s Purpose and Need. MassDOT’s recommended Preferred Alternative would minimize adverse project impacts to the maximize extent practicable.

Sections 8.3 and 8.5 describe MassDOT’s proposed design-related and construction-related mitigation measures, encompassing minimization, restoration, maintenance, and compensation, for visual impacts that cannot be avoided, including the adverse visual impacts to the Round Hill neighborhood on the west side of Eleanor Avenue and the Nightingale Road neighborhood viewers resulting from new and realigned transportation infrastructure. [Section 8.5 provides examples of Section 106 and Section 4\(f\) mitigation measures that also would enhance the visual experience for neighbors and travelers within the Program Limits.](#)

8.3 Design-Related Mitigation

A guiding principle of MassDOT’s Project Development and Design Guide is “context-sensitive design,” which is defined as follows:

Context-sensitive design is a collaborative, interdisciplinary approach that involves all constituents to develop a transportation facility that fits its physical setting and preserves scenic, aesthetic, historic, and environmental resources while maintaining safety and mobility for all users.

MassDOT has incorporated the principle of context-sensitive design throughout the Program’s planning and design.

8.3.1 Bridge Design

Because of the historic significance of Sagamore and Bourne Bridges and Cape Cod Canal, and the high sensitivity of neighbors and travelers to the loss of the NRHP-eligible structures, MassDOT has selected a design for the replacement bridges that would resemble the overall shape of the historic bridge arches, while also incorporating modern elements into the design and maximizing constructability. For example, the 115-foot rise of the bridge arch was selected to echo the appearance of the existing bridges; the height would also be the upper bound limits that would meet clearance requirements for the anticipated construction method of floating in the completed arch on barges. The number of delta frames in the superstructure have been minimized to create clean lines. Additionally, the series of connected Y-shapes of the proposed piers would introduce a more contemporary version of the straight, vertical pier stems of the existing bridges.

8.3.2 Aesthetic Bridge Lighting

Existing bridge lighting is limited to minimal roadway lighting. MassDOT proposes to provide standard roadway and pedestrian-scale lighting along the replacement bridges, the approach highway networks, and SUPs. In keeping with the [historically low-light environment](#) of Cape Cod Canal [and its abutting land](#), MassDOT is [proposing](#) understated, low-level lighting of the [interior spaces of the](#) bridge arch and different bridge components, such as the bridge cables, inner piers, and inner delta frames. [Exhibit 8-1](#)

and **Exhibit 8-2** provide renderings of the proposed bridge lighting, as viewed from a highway bridge motorist and Canal Service Road, respectively.

Exhibit 8-1. View of Bridge Lighting from Motorist (Sagamore and Bourne Bridges)

Source: [Massachusetts Department of Transportation, 2025](#)

Exhibit 8-2. View of Bridge Lighting from Canal Service Road (Sagamore and Bourne Bridges)

Source: [Massachusetts Department of Transportation, 2025](#)

MassDOT reviewed the proposed lighting concept with the public at an open house and confirmed that the lighting approach retained the character of the existing bridges and canal, while also being aesthetically pleasing.

8.3.3 Incorporation of Recreational Amenities as Visual Enhancements

At each bridge crossing, MassDOT is proposing to create a walkway/viewing platform at the top of the delta pier footing, with pedestrian and bicyclist access provided from Canal Service Road.²⁴

Additionally, at each bridge crossing, MassDOT proposes to incorporate a scenic overlook at the top of the bridge arch. The overlook would be constructed by widening the proposed pedestrian/bicycle SUP. Both recreational amenities would provide visual enhancements of the Cape Cod Canal Historic District by providing new vistas of Cape Cod Canal as a visual natural resource and cultural resource.

Exhibit 8-3 provides a plan of the pier walkway/viewing platform, and **Exhibit 8-4** provides a plan of the scenic overlook at the bridge arch.

Exhibit 8-3. Plan of Pier Walkway/Viewing Platform

Source: Massachusetts Department of Transportation, 2025

²⁴ While the platforms proposed at the bridge piers initially were intended to provide for fishing opportunities, due to the proposed installation of a riprap pier protection system, there would be diminished opportunities for fishing at these locations at lower tidal conditions.

Exhibit 8-4. Plan of Bridge Scenic Overlook

Source: Massachusetts Department of Transportation, 2025

8.3.4 Landscaping

To compensate for the disturbance and clearing required for the Program, including bridge replacements and connections to the local roadway networks on the mainland and on Cape Cod, MassDOT proposes to implement a substantial landscaping plan to repair, restore, and enhance the landscape flanking the mainline highways, bridges, and local roads and connections. MassDOT's goals for the landscaping plan correlate with the goal of the VIA to maintain and enhance visual quality:

- Revegetate all areas disturbed by construction around the new Sagamore and Bourne Bridges, adjacent highways, local roadways, SUPs, stormwater and utility infrastructure, and construction staging areas.
- Develop landscape zones that restore and/or enhance existing habitats and reinforce the unique landscape character of the region.
- Screen undesirable views for both users of the Project Limits as well as abutters.
- Improve sight lines and views while mitigating the appearance of undesirable areas within and beyond the bridge sites.
- Soften the visual appearance of new and expanded infrastructure to maintain the character of the region.
- Utilize landscape to create gateways as visitors approach Cape Cod, including placemaking opportunities as visitors enter and exit Cape Cod.

- Enhance pedestrian zones with planting at trailheads, in medians, and in roundabouts in lieu of impervious surfaces.
- Integrate stormwater basins with the surrounding restored landscapes so they appear natural and contribute to the creation of habitat as much as possible.
- Maintain site visibility for safety along highways and roadways and around pedestrian zones and off-road areas for site security.

MassDOT's landscape plan consists of developing several landscape types to restore the disturbed site and to integrate the new infrastructure into the landscape. These landscape types include landscape restoration, reforestation, street tree planting, limited areas for lawn, stormwater basins and rain gardens, buffer planting, roundabout planting, and special plantings. [Figure 8-1 through Figure 8-4 present enlarged partial plans of MassDOT's proposed design within the Program quadrants, consisting of the following:](#)

- [Sagamore North Quadrant, SUP at Sagamore Bridge and State Route 3, with connections to North Canal Service Road \(Figure 8-1\)](#)
- [Sagamore South Quadrant, East of Eleanor Avenue to Sandwich Road Connector corridor at U.S. Route 6 \(Figure 8-2\)](#)
- [Bourne North Quadrant, Scenic Highway at its intersection with Nightingale Pond Road facing State Route 25 \(Figure 8-3\)](#)
- [Bourne South Quadrant, SUP at Route 28 and Diamond Interchange Roundabouts \(Figure 8-4\)](#)

Source: [Massachusetts Department of Transportation, 2025](#)

Figure 8-4. Landscape Plan and Amenities: Shared-Use Path at State Route 28 and Diamond Interchange Roundabouts, Bourne South Quadrant

Source: Massachusetts Department of Transportation, 2025

Two landscape plans, **Figure 8-2** and **Figure 8-4** include two visual inventory locations – View of Sagamore Bridge and U.S. Route 6 from Eleanor Avenue (SS2 on **Figure 6-7**) and View of Bourne Scenic Park from Nightingale Road at Scenic Highway (BN2 on **Figure 6-8**) – where MassDOT determined that adverse changes to the visual quality of the Sagamore Bridge and Bourne Bridge AVEs would result from the Program’s transportation elements. The intent of the landscape design, incorporating park features and amenities, is to mitigate the adverse visual impacts in these locations with high viewer sensitivity. For the View of Sagamore Bridge and U.S. Route 6 from Eleanor Avenue (SS2), the meandering SUPs and variety of landscape types, as well as the incorporation of stormwater basins as water features, would soften the hardscape of the U.S. Route 6 mainline and provide visual relief to residential neighbors. For the View of Bourne Scenic Park from Nightingale Road at Scenic Highway (BN2), the addition of a landscaped roundabout, along with surface wall treatments, would provide visual interest and restore the previous visual character of this location.

One landscape plan, **Figure 8-3**, includes a visual inventory location – View of Diamond Interchange Roundabout from Cumberland Farms Parcel (BS2 on **Figure 6-9**) – where the new infrastructure, along with landscaping and coordinated design elements, would substantially improve the visual character of the area. In this location, the landscaping features would create a gateway experience for local and regional travelers in this part of Cape Cod.

8.3.5 Coordinated Design of Shared Use Path Site Elements

In recognition of the community’s goals to protect its existing cultural and landscape assets, MassDOT is designing features and amenities of the Program’s pedestrian and bicycle zones and SUPs to provide a coherent and coordinated appearance and complement the town’s unique character. Examples include designating trailheads, overlooks, and waysides through special pavements or stamped/colored concrete; using natural and color-coordinated site furnishings along the SUPs, such as bench seating, trash receptacles, and railings; and providing themed interpretive and wayfinding signage. **Figure 8-5** presents an example of features for a SUP roundabout. **Exhibit 8-5** presents an example of wayfinding signage that could be used through the Project areas to provide a coordinated appearance.

Source: [Massachusetts Department of Transportation, 2025](#)

Exhibit 8-5. Example of Wayfinding Signage

Source: Massachusetts Department of Transportation, 2025

8.3.6 Aesthetic Treatment of Surface Walls

MassDOT is investigating the visual/aesthetic treatment of bridge abutment walls and retaining walls throughout the Sagamore Bridge and Bourne Bridge AVEs. Based on their visibility to travelers and neighbors, different finish materials, including materials echoing the character of Cape Cod, may be utilized. MassDOT has [assessed retaining walls in the AVEs by their exposure potential, as follows:](#)

- **High Exposure Walls** would be adjacent to public spaces or SUPs, and would be very visible to the public, including pedestrians and bicyclists.
- **Medium Exposure Walls** would be visible to roadway users and abutters, including most bridge abutments and wingwalls that are near and visible from local roadways and SUPs, and walls that retain local roadways that would be visible to residential and commercial neighbors. [Medium exposure walls would be difficult to screen with plantings.](#)
- **Low Exposure Walls** would include retaining walls with limited visibility from highways or SUPs, including walls supporting highways and ramps that are oriented toward naturalized areas, such as wetlands, stormwater control measures, or new forested areas; interior walls to off- and on-ramps; and walls that are distant from local roads and residential neighbors. [Low exposure walls would be easily screened with plantings.](#)

[Figure 8-6](#) presents an example of MassDOT’s assessment of the potential for retaining walls in the Bourne South quadrant. MassDOT is conducting similar assessments of surface walls in the Sagamore

North, Sagamore South, and Bourne North Program quadrants. The many wall types being evaluated include stone masonry walls; mechanically stabilized earth (MSE) walls or prefabricated walls with stamped, textured, and/or colored designs; prefabricated modular walls; and cast-in-place concrete walls which can include precast concrete veneers with a variety of textures and finishes. Exhibit 8-6 through Exhibit 8-9 present examples of wall surface treatments that could be used throughout the Sagamore Bridge and Bourne Bridge AVEs.

Source: [Massachusetts Department of Transportation, 2025](#)

8.4 Section 106 and Section 4(f) Mitigation Measures as Visual Enhancements

In accordance with the Programmatic Agreement, MassDOT would design the replacement bridges as steel twin network tied-arch bridges to reflect the character and profile of the historic bridges and thereby avoid an adverse effect on the Cape Cod Canal Historic District. In addition to the replacement bridge design, Section 106 mitigation measures that would visually enhance the Sagamore Bridge and Bourne Bridges AVEs include incorporating aesthetic designs into the Program, such as bridge lighting (Section 8.3.2) and surface wall treatments (Section 8.3.6).

An additional Programmatic Agreement stipulation would commit MassDOT to investigating the salvage and reuse of elements of the historic bridge, such as portions of the steel truss, granite from piers and abutments, and granite sidewalk, within the Program Limits of work, including, but not limited to, the replacement bridge sites and SUPs. As part of the preliminary design, MassDOT is evaluating the feasibility of reusing the large granite pier abutment blocks as granite benches and edging and incorporating a portion of the granite as part of a gateway sign or landmark feature for the Sagamore Bridge Project. As design progresses, MassDOT will continue to assess the potential to salvage and reuse elements of the bridge superstructure.

Exhibit 8-10 presents an example of salvage of a steel bridge truss panel point plate and granite state seal from MassDOT's Whittier Bridge Replacement Project and their installation at the Main Street Visitor's Center in Amesbury, Massachusetts. Similar to the Whittier Bridge Project, MassDOT would salvage and reuse parts of the historic Sagamore and Bourne Bridges, such as steel bridge elements, abutment granite, portal insignias, and bridge plaques.

Exhibit 8-10. Example of Adaptive Reuse of Bridge Components, Whittier Bridge Replacement Project

Source: Massachusetts Department of Transportation, 2025

Mitigation proposed for impacts to Section 4(f) resources also would provide visual relief and improve viewsheds. For example, the expanded parking lot at Sagamore Recreation Area (**Exhibit 7-7b**) would offer enhanced views of Sagamore Bridge from residential neighbors and travelers along Canal Street. Additionally, the expanded camping areas at Bourne Scenic Park (**Chapter 5, Final Section 4(f) Evaluation, Figure 5-19**) would provide recreational users with new vistas of Cape Cod Canal.

8.5 Construction-Related Mitigation

To minimize visual impacts in the Sagamore Bridge and Bourne Bridge AVEs, MassDOT would incorporate construction-related mitigation into the Program through permits, special provisions and guidance documents, and its Standard Specifications for Highways and Bridges.

The Program's Construction Stormwater General Permit would contain multiple measures that, in addition to minimizing adverse effects to natural resources, also would reduce adverse visual effects of construction, such as stabilizing disturbed areas through seeding immediately when construction has ceased and will not resume for more than 14 days, minimizing the extent of disturbance at any one time, providing for dust suppression, installing sediment controls to prevent runoff, and stabilizing construction exits to prevent sediment tracking from the work areas onto public ways. These measures would provide visual relief during the construction period by softening areas disturbed by construction with vegetative and other stabilization measures and would create a more visually neutral appearance of the construction site through good housekeeping measures such as containing dust and minimizing soil track-out onto public roadways.

MassDOT has issued extensive guidance for tree preservation, including plant protection fencing for public places and staging or other construction activity near desirable vegetation. As applicable, MassDOT will use plant protection fencing to minimize impacts to visual natural resources.

MassDOT's manual of Standard Specifications for Highways and Bridges (2024 Edition, Division II) contains standard specifications to mitigate for temporary construction-related impacts, including potential effects to visual quality. Construction-related mitigation to be incorporated into the Program would include minimizing fugitive light from portable sources, directing light sources away from residential areas, and restoring all disturbed areas at the completion of construction.
