

**Massachusetts Department of Conservation and Recreation
Division of Water Supply Protection, Office of Watershed Management
*Forest Management Project Summary***

Project Title: West of Bullard's Corner (Intersection 29-3)
DWSP Harvest Permit Number: 3142
DWSP Proposal ID: NS-16-17
DCR Forest Cutting Plan File Number: 204-8070-16

Site Information

Watershed: Quabbin
Town(s): New Salem
Acres: 47
Nearest Road: Millington Rd. (Gate 29),
Natural Heritage Atlas overlap?: No
Public Drinking Water Supply Watershed?: Yes
Forest Types: White Pine, Hemlock and Oak
Area of Critical Environmental Concern (ACEC)?: No
Soils: Canton fine sandy loam, Gloucester sandy loam
Wetland Resources: Yes
Vernal Pools: Yes

Harvest Information

Harvest Start Date: May 24, 2017
Harvest End Date: July 20, 2017
Number of Wetland Crossings: 0
Number of Stream Crossings: 1

Best Management Practices Applied

Stream Crossings: Temporary bridge
Filter Strips: One, 50 foot wide
Wetland Crossings: Not Applicable
Harvesting in Wetlands: Not Applicable

DWSP Forester supervising this harvest

Name: Derek Beard
Forester License number: 14
Phone number: 617-780-0631
Email: derek.beard@mass.gov

Narrative

General Description/Forest Composition/History

The project is located west of the Bullard farm inside gate 29 and abuts a high tension power line to the north. The eastern half is composed of white pine, hardwood (mainly mixed oak) and hemlock. Ascending a west slope, the density of white pine drops and is mainly replaced by hardwood and hemlock. This western portion received a light selection harvest in 1995 with the objective of removing diseased hemlock. Resulting regenerating is mostly black birch that is concentrated in skid trails. A portion of the 1995 harvest overlapped with a 1980 harvest completed in the north central part of the area. The overlap section has greater regeneration diversity (black birch, white pine and hemlock). As noted in 1995, the hemlock continues to be plagued by various invaders (elongate scale, adelgid and looper) resulting in overall decline and mortality. Although forest for the past 80 to 100 years; features on the landscape suggest an agricultural past.

Site Selection

The primary goal of the watershed forest management program is to create and maintain a forest that provides high quality drinking water to current users and future generations. To achieve this, DWSP has determined that the forest should contain a diversity of species in various stages of development (seedlings through large legacy trees). In addition, the forest should be vigorous; actively growing and regenerating. Forest in this condition is suited to be resilient to and quickly recover from small- and large-scale disturbances such as disease, insect infestation, ice storms and hurricanes.

Insect infested, dying and dead hemlock coupled with an insufficient young forest layer merits some regeneration cutting begin to trigger development of a healthier, more balanced and diverse forest structure.

Silvicultural Objectives

Reducing stocking of insect infested hemlock, diversifying forest structure and spurring a medley of regeneration are the primary objectives of the project. This will be accomplished by making a series of forest canopy openings randomly spaced through the area. Specifically, there are 11 openings covering 7 of the 47 acres with an average opening size of 0.6 acres. Openings greater than 0.5 acres have some retained canopy trees that will contribute to the long-term forest complexity of the area.

Cultural Resources

The project is home to number of interior stone walls that likely bound areas used for crop production or pasture. Old agricultural ditches drain some of these walled areas. They also link the wetland areas within the project. Clearly the farmers wanted to access these areas as soon as possible following winter. The area is also home to a Continuous Forest Inventory (CFI) plot. These plots were established in 1960 and forest measurements have been recorded from them every decade through 2010. Over time these plots (and the data from them) will be an invaluable resource in tracking forest change.

Rare or Endangered Species

The north central part of the project is home to classic vernal pool. Maintaining unique habitats, like vernal pools, is a primary goal when performing forestry operations. To that end no harvesting occurs within 15 feet of the pool; a shaded or thinned condition is maintained within 100 feet of the pool; and no significant rutting is permitted within 200 feet of the pool.

Landowner

Landowner Signature

The most important information on a cutting plan is the Landowner's objective, as this will determine which trees will be harvested and which will remain; this decision will also determine the future condition of the forest for decades to come. After having read the Massachusetts Forest Cutting Plan Information Sheet on page one, indicate your objective by checking the appropriate box below.

LT - Long-term Forest Management

Planned management of the forest to achieve one or more of the following objectives: produce immediate and maximize long-term income, enhance wildlife habitat, improve recreational opportunities, protect soil and water quality, or produce forest specialty products.

ST - Short-term Harvest

Harvest of trees with the main intention of producing short-term income with minimal consideration given to improving the future forest condition, which often results in a forest dominated by poor quality and low value specie

I (we) have read the Massachusetts Cutting Plan Information Sheet, and am aware of my (our) management options.

I (we) hereby certify that I (we) have the legal authority to carry out the operation described above.

I (we) certify that I (we) have notified the Conservation Commission in the town in which the operation is to take place and the abutters of record within two hundred feet of the area to be harvested.

I (we) understand that the volumes and values (Ch61 only) in this plan have not been independently verified by the service forester upon approval and will report final values and volumes to the Director or his/her agent if the final figures differ from those reported.

BMPs

Use this Section to provide further explanation or if Other (OT) was used in any category in the Best Management Practices Section on Page 3.

This harvest is an aggregation of 11 canopy openings (patches) spread across 47 acres. Opening size ranges from 0.3 to 1.0 acre with an average of 0.6 of an acre. The 11 openings cover a total of 7 acres. Openings greater than 0.5 acres have between 3 and 10 square feet of residual basal area also known as green tree retention. Trees to be harvested in openings are marked with orange paint. Trees within main skid roads are marked with blue paint. The project is home to a vernal pool. To maintain the integrity of the pool and adjacent habitat, no harvesting has been designated inside 100 feet from the high water mark of the pool.

Designation of Trees

Use this Section to describe the types of trees to be harvested and/or retained if Other (OT) was used for "Designation of Trees" in the Stand Treatment Section on page 4.

Stand No.	Species to be Cut	Size of Trees to be Cut	Quality of Trees to be Cut	% BA/Acre Removed

Regeneration & Future Condition

Use this Section to describe how Chapter 132 requirements will be met if a non standard system (HG, DL, or OT) was used for the "Type of Cut" in the Cutting Standards Section on page 4.

Stand No.	Source of Regeneration (ex. AD, SE)	How will Regeneration be obtained/protected? If using AD - Describe the species present and how the regeneration will be protected If using SE - Describe the source of the seed and the number of seed trees/acre

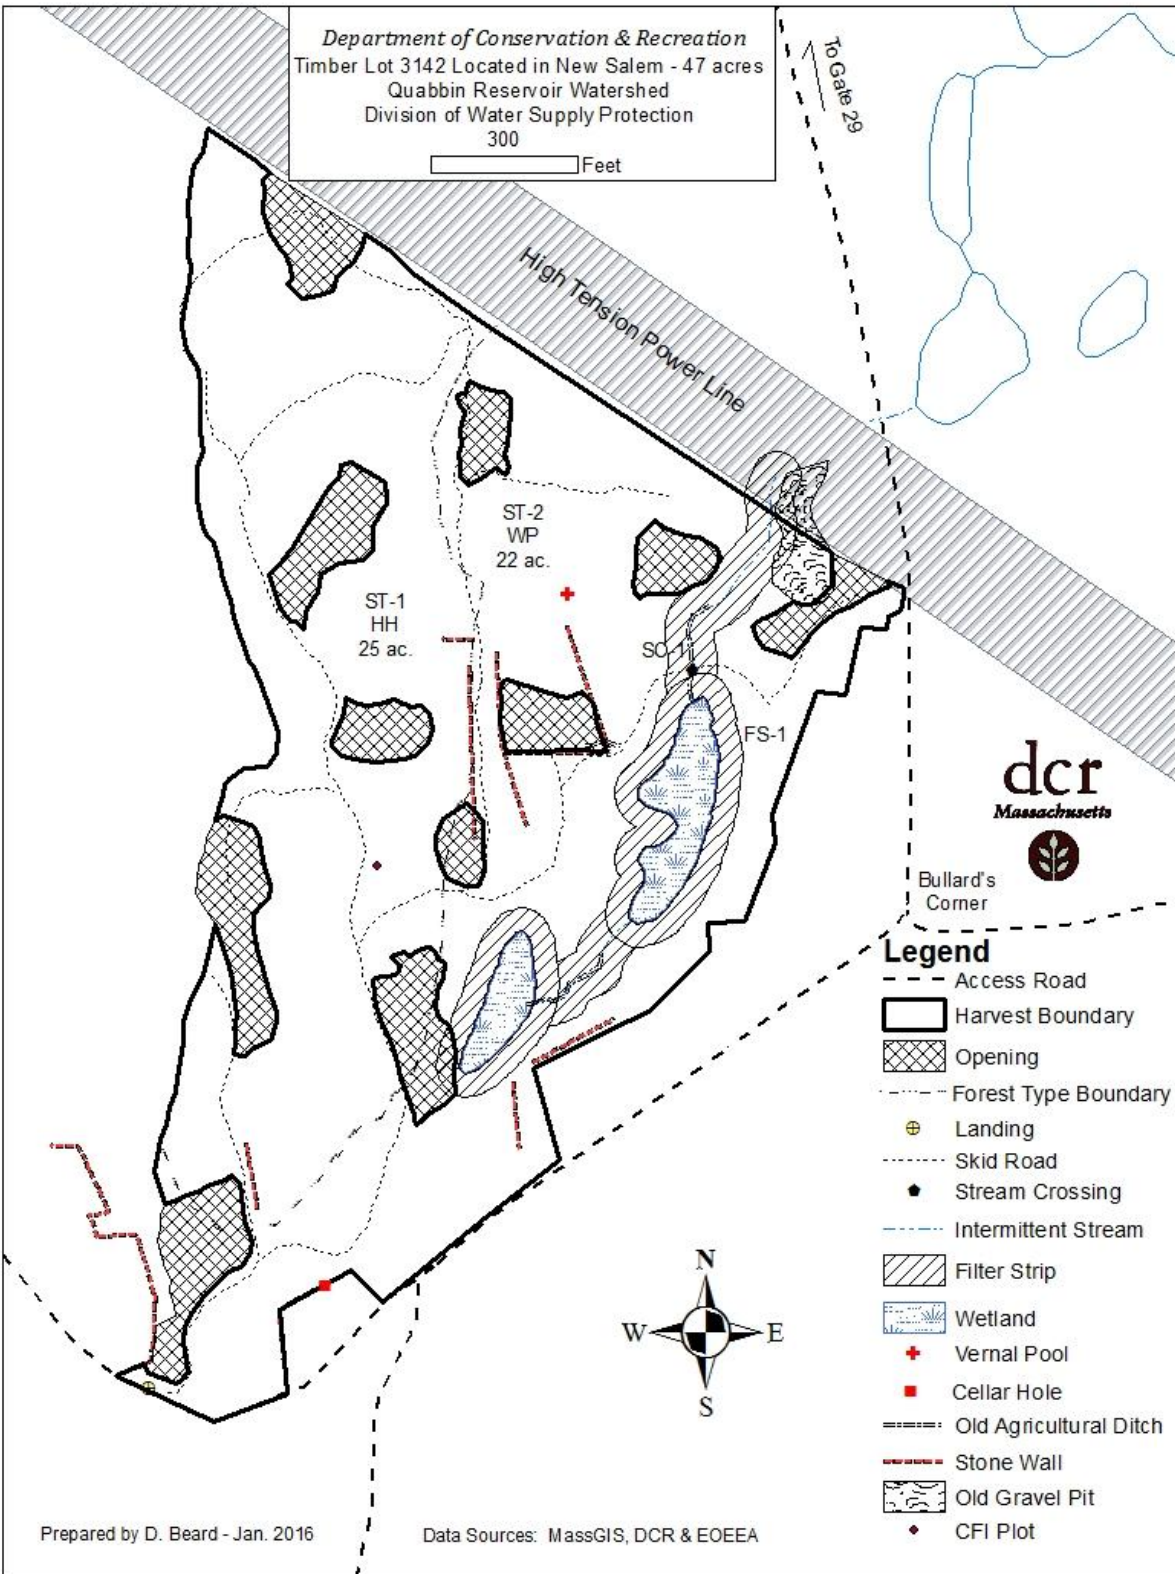

Stand No. **Desired Future Condition**
Describe what the stand is expected to look like five years from the harvest, including the condition of the overstory & understory
