

**Massachusetts Department of Conservation and Recreation  
Division of Water Supply Protection, Office of Watershed Management  
*Forest Management Project Summary***

**Project Title: Lot 5261**

DWSP Harvest Permit Number: 5261

DWSP Proposal ID: WA-16-263

DCR Forest Cutting Plan File Number: 134-8221-16

***Site Information***

Watershed: Wachusett

Town(s): Holden

Acres: 82

Nearest Road: Princeton Street

Natural Heritage Atlas overlap?: No

Public Drinking Water Supply Watershed?: Yes

Forest Types: Mixed oak, Northern red oak

Area of Critical Environmental Concern (ACEC)?: No

Soils: The dominant soils are the Hinckley and Merrimac soils. These are excessively drained soils of outwash origin.

Wetland Resources: Bear Brook and its associated bordering wetland form the western and southwestern boundaries of this area. There is also an isolated wetland that is also a vernal pool in the western-central part of the lot.

Vernal Pools: There are 5 confirmed vernal pools and 2 potential pools that will be checked repeatedly in the next few years.

***Harvest Information***

Harvest Start Date: 7/1/2016

Harvest End Date: 6/29/2018

Number of Wetland Crossings: None

Number of Stream Crossings: None

***Best Management Practices Applied***

Stream Crossings: There are no stream crossings.

Filter Strips: No trees are marked in the filter strip.

Wetland Crossings: There are no wetland crossings.

Harvesting in Wetlands: No harvesting in wetlands will occur.

***DWSP Forester supervising this harvest***

Name: Greg Buzzell

Forester License number: 025

Phone number: 774-261-1841

Email: greg.buzzell@mass.gov

## **Narrative**

### ***General Description/Forest Composition/History***

The forest in this area is overwhelmingly dominated by oaks, primarily black and red oak and some white oak. Such a condition is common where an excessively drained soil is adjacent to an old railroad bed. Forests adjacent to railroads were subjected to both heavy and repeated coppice cutting for fuel for the railroad and frequent fires resulting from sparks from the engines. Both of these disturbances encourage the dominance of oaks species. Along with oak there is red maple, white pine and black birch.

In the eastern half of this area where at most very light cordwood cutting appears to have occurred until MDC acquisition in 1991, there is excellent advance regeneration comprised of white pine, black birch, red and black oak and red maple. The understory shrub layer is dominated by huckleberry along with low-bush blueberry, shadbush and scattered small clumps of mountain laurel.

The western half is very different. It was commercially logged more than 20 years ago with the cutting of white pines scattered throughout. Large, dense patches of mountain laurel dominate the understory with only scattered red oak, red maple, black birch and white pine regeneration.

### ***Site Selection***

The ideal watershed protection forest is one which best serves the function of the land as a producer of high quality drinking water in both short- and long-term. This forest must be vigorous and diverse in tree species and ages, be actively accumulating biomass and actively regenerating. Such a forest will be ideally suited to be resilient to and quickly recover from small- and large-scale disturbances such as diseases, insect infestations, ice storms and hurricanes.

This area was selected for management because of the lack of age diversity both in these 82 acres as well as in the 2,405 DCR-owned acres from which water flows into the Quinapoxet River. Zero percent of the forest is comprised of trees less than 20 years old with 77% of the forest more than 100 years old. The ideal protection forest would have at least 3 distinct age classes of trees distributed throughout this sale area.

### ***Silvicultural Objectives***

Openings will be made in the overstory taking advantage of areas of good advance regeneration thereby releasing these younger trees from the shade of the older, taller forest. 19 openings will be made that range in size from about 1/3rd to nearly 2 acres in size. These openings total 17.4 acres, which represents 21% of the manageable acreage in this area. Given the superior advance regeneration present in the eastern half of this area, these openings are disproportionately located in the eastern half. However, some openings were made in the western half taking advantage of whatever adequate regeneration was present. A few mature trees will be retained within each of these openings, particularly the ones larger than ½ acre. These trees provided important structural diversity within these patches of young trees in the short term and especially in the long term as it is anticipated that these retained trees will never be cut but be allowed to live to their natural lifespan.

### ***Cultural Resources***

There are no known or documented significant historic or archeological resources in this area.

### ***Rare or Endangered Species***

All the vernal pools, whether verified or potential, will be protected using the appropriate Best Management Practices.

Best Management Practices

**Stream Crossings**

Indicate location on map	SC-1	SC-2	SC-3	SC-4
Type of Crossing				
Existing Structure				
Type of Bottom				
Bank Height (ft)				
Stabilization				

**Wetland Crossings**

Indicate location on map	WC-1	WC-2	WC-3	WC-4
Length of Crossing				
Mitigation				
Stabilization				

**Filter Strips**

Indicate location on map	FS-1	FS-2	FS-3	FS-4
Width (50', 100', or VA)	VA			

**Harvesting in Wetlands**

Indicate location on map	HW-1	HW-2	HW-3	HW-4
Forest Type (see pg 2)				
Acres to be Harvested				
Resid. Basal Area (>50%)				

**Service Forester Comments**

\* ALL SLUD ROADS / TRAILS ARE EXISTING  
 \* PLEASE CONSIDER VERNAL POOL ECOS (see attached)

Note:  
 Applicant must provide DCR with all relevant information before plan may be approved and cutting may begin. Some forestry activities, such as prescribed burning and pesticide or fertilizer application may require additional permits. Consult MA Forestry BMP Manual for further information.

Forest Products

Products to be Harvested\*

Table with 4 columns: Species, MbF/Cds, and MbF/Cds. Rows include White Pine, Red Pine, Pitch Pine, Hemlock, Spruce, Other Sftwd., White Ash, Beech, White Birch, B & Y Birch, and Black Cherry.

\*Note: Volumes and values indicated in the Plan are as reported by the plan preparer and have not been independently verified by the service forester upon approval. MbF = thousand board feet.

Stand Treatment

Cutting Standards

Table with 5 columns: Indicate location on map, ST-1, ST-2, ST-3, ST-4. Rows include Forest Type, Acres, Landowner Objective, Designation of Trees, Type of Cut, and Source of Regeneration.

Landowner

Landowner Signature

The most important information on a cutting plan is the Landowner's objective, as this will determine which trees will be harvested and which will remain; this decision will also determine the future condition of the forest for decades to come.

[X] LT - Long-term Forest Management

Planned management of the forest to achieve one or more of the following objectives: produce immediate and maximize long-term income, enhance wildlife habitat, improve recreational opportunities, protect soil and water quality, or produce forest specialty products.

[ ] ST - Short-term Harvest

Harvest of trees with the main intention of producing short-term income with minimal consideration given to improving the future forest condition, which often results in a forest dominated by poor quality and low value species.

I (we) have read the Massachusetts Cutting Plan Information Sheet, and am aware of my (our) management options. I (we) hereby certify that I (we) have the legal authority to carry out the operation described above.

Signature of landowner(s)

Date 5/20/16

Service Forester

Determination and Status

Form with checkboxes for Approved, Disapproved, Expires, Extension, and Amendment. Includes handwritten dates and signatures.

Final Report and Comments

I hereby certify that the afore described Forest Cutting Plan and all relevant statutes have been substantially complied with.

Signature of Service Forester/Director's Agent Date

Codes

Table with 4 columns: Forest Types, Designation of Trees, Type of Cut, and Source of Regeneration. Lists various codes and their corresponding descriptions.

\*If Other (OT) or a non-standard system is used an explanation must be given on attached narrative page pg 4 of 5

# Forest Cutting Plan

## Narrative Page

Landowner: DCR - DWSP

Town: Holden

File Number: 134-8001-16

Use only if further explanation is required of information on pages one or two or if "other" was used in any category.

BMPs	<p><u>There are no stream or wetland crossings in this lot. There are 7 (verified or potential) vernal pools that are known within this lot, all of which have filter strips around them.</u></p>
Silviculture	<p><u>In order to release advance regeneration, 19 openings in the overstory are being created, covering 17.42 acres. These openings range from 0.3 acres to 2.0 acres in size with an average of .92 acres. They are well distributed throughout the eastern side of the sale area with a focus on releasing pine regeneration which will help convert the site to a more suitable species. The western portion of this sale is characterized by a thick understory of mountain laurel where a few openings have been made.</u></p>
Objectives	<p><u>The main objective of this operation is to diversify the age structure of the forest by removing the overstory in patches thereby releasing the advance regeneration. The current age structure is limited with an insufficient component of young forest. A secondary objective is to target pine regeneration for release.</u></p>
Other	<p><u>Because there are no stream or wetland crossings combined with topographical limitations and DCR Forester oversight haul roads have not been flagged.</u></p>

Figure 2. Maps of harvest area showing approximate boundary, proposed openings and other features

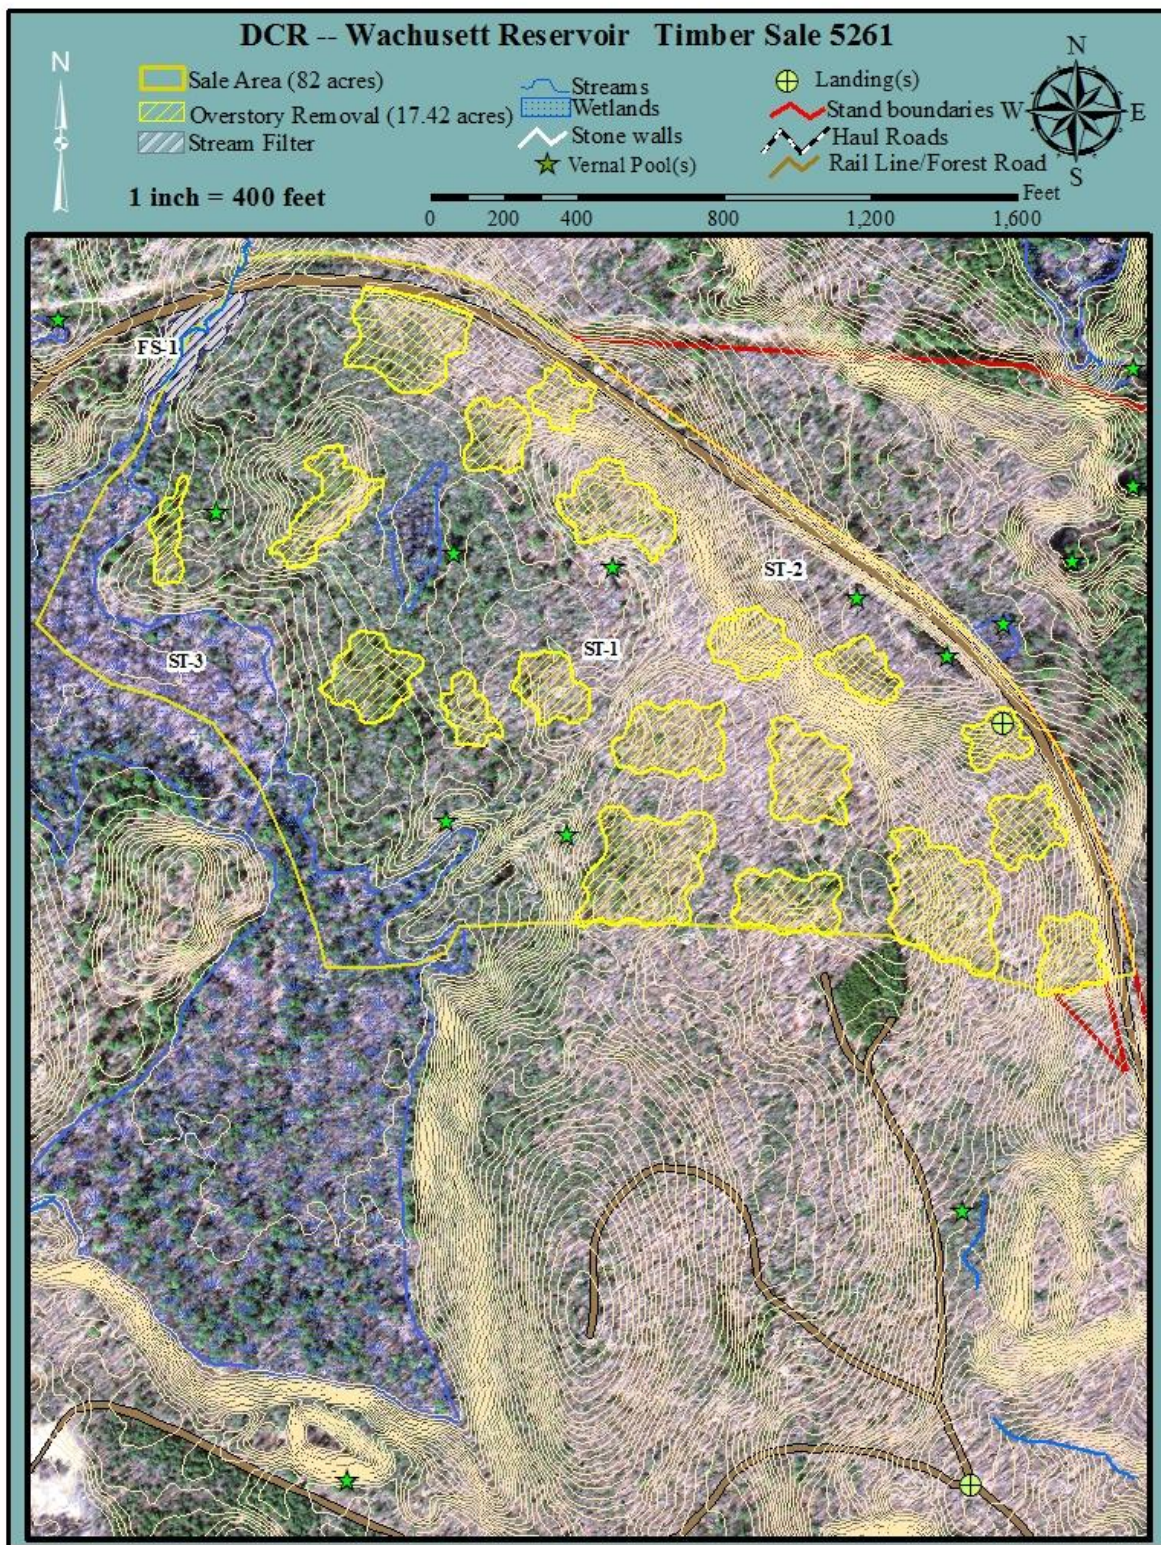

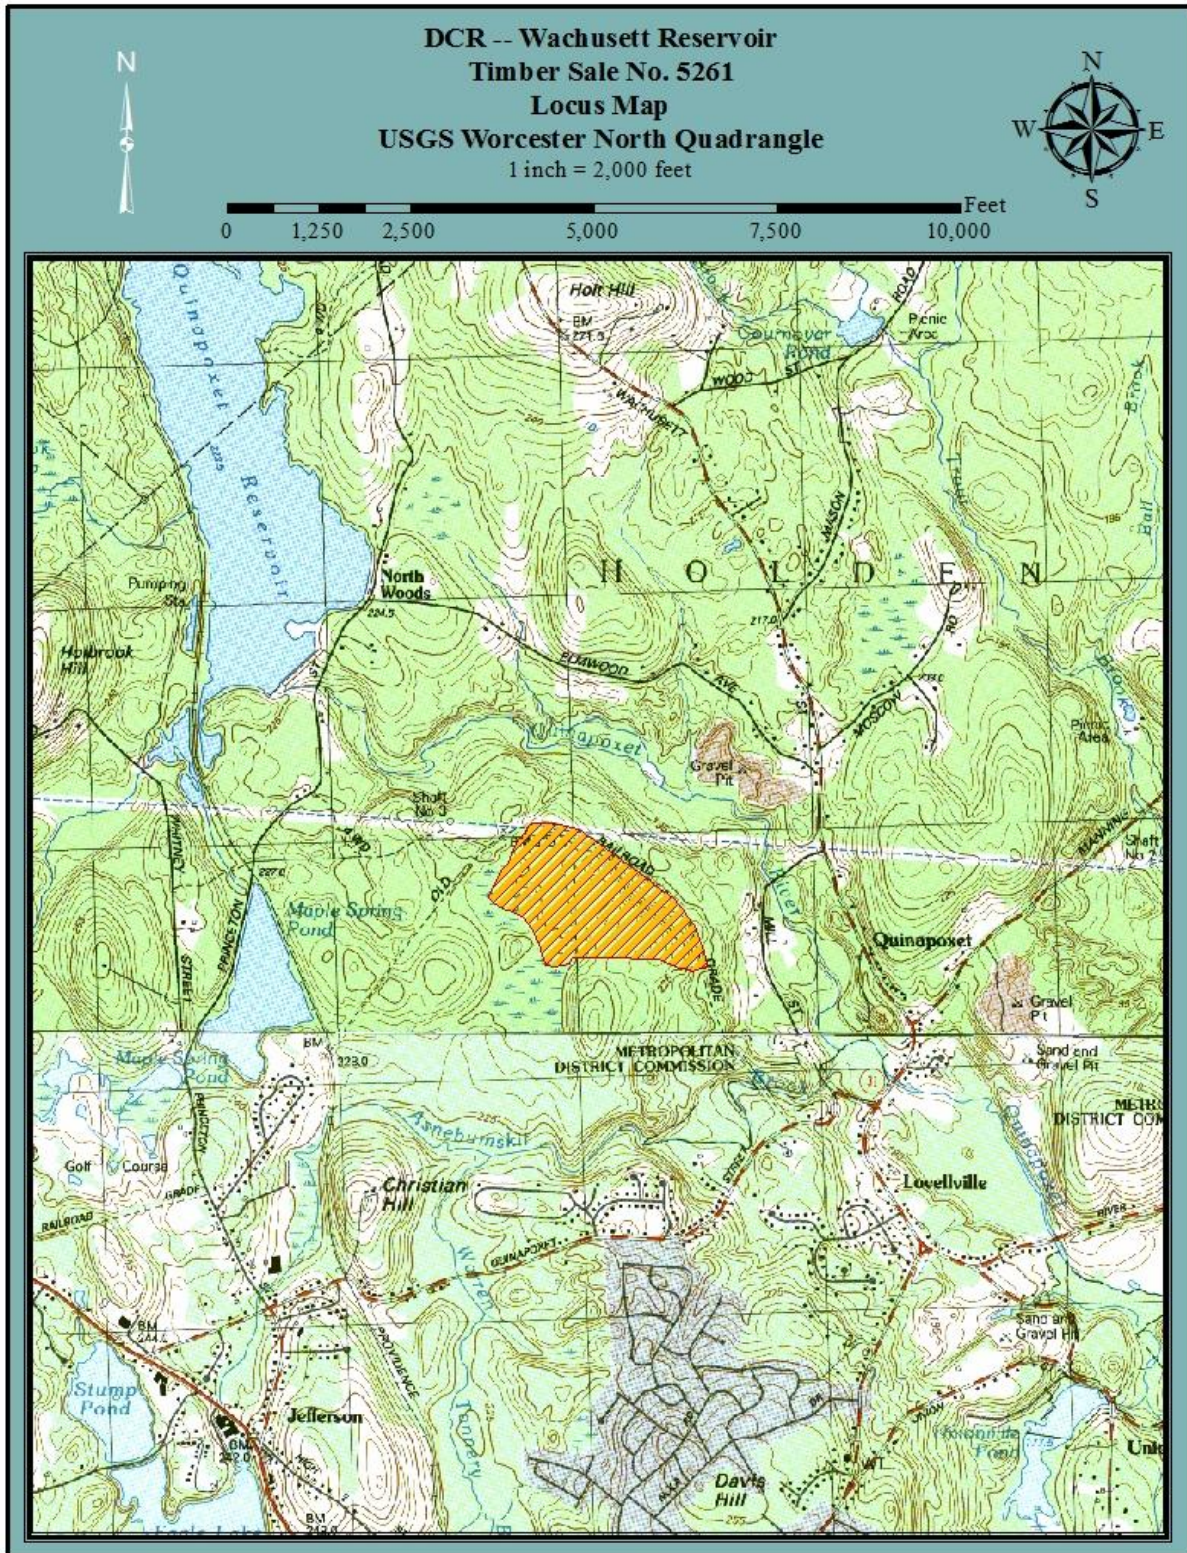

Figure 3. General locus map showing the location of the proposed timber harvest

**Figure 4. Pre-Harvest Photographs, A-D**

A. The landing is located on the left (south) side of the old railroad bed.

B. The overstory in this area is being removed to release the white pine and hardwood saplings. Note the red oak in the foreground which is being retained to provide important structural diversity. It is anticipated that trees such as these will never be cut but will be allowed to live out their natural life-span.

C. The focus of this operation is to release white pine regeneration by removing portions of the oak-dominated overstory. White pine is well adapted to grow vigorously and healthy on these very dry sites.

D. A DCR-approved bike trail goes through the middle of this opening. While the trail will be closed during the harvest operation, it will be cleared of material and usable when the harvest is complete.

**Figure 5. Post-Harvest Photographs, A-C**

A. These young white pine now have the space and light they need with the removal of the overstory which was primarily oaks. The pine trees on the right of the photograph were retained to provide structural diversity.

B. This was the primary landing for this operation. The restoration of this abandoned railroad bed by DCR heavy equipment crews recently now allows good access to this large chunk of DWSP property.

C. This small vernal pool was discovered by DCR Foresters during the marking of this forest management operation. After it was verified by DCR Natural Resource staff to be a functioning vernal pool, steps were taken to protect it from the tree cutting operation including ensuring that it remains in a fully shaded condition.
