**ORGAN OR DISEASE-ORIENTED PANELS**

These panels were developed for coding purposes only and should not be interpreted as clinical parameters. The tests listed with each panel identify the defined components of that panel. These panel components are not intended to limit the performance of other tests. If one performs tests in addition to those specifically indicated for a particular panel, those tests should be reported separately in addition to the panel code.

86593	quantitative

The following codes (86628–86804) are qualitative or semi-quantitative immunoassays performed by multiple-step methods for the detection of antibodies to infectious agents. For immunoassays by single-step method (eg, reagent strips), use code 86318. Procedures for the identification of antibodies should be coded as precisely as possible. For example, an antibody to a virus could be coded with increasing specificity for virus, family, genus, species, or type. In some cases, further precision may be added to codes by specifying the class of immunoglobulin being detected.

When multiple tests are done to detect antibodies to organisms classified more precisely than the specificity allowed by available codes, code each as a separate service. For example, a test for antibody to an enterovirus is coded as 86658. Coxsackieviruses are enteroviruses, but there are no codes for the individual species of enterovirus. If assays are performed for antibodies to coxsackie A and B species or for antibodies of different immunoglobulin classes, each assay should be separately coded.

When a coding option exists for reporting IgM specific antibodies (eg, 86632), the corresponding nonspecific code (eg, 86631) may be reported for performance of either an antibody analysis not specific for a particular immunoglobulin class or an IgG analysis.

86628	Antibody; Candida
86631	Chlamydia
86632	Chlamydia, IgM

Codes 88141–88155, 88164–88167, and 88174–88175 are used to report cervical or vaginal screening by various methods and to report physician interpretation services. Use codes 88150, 88152, and 88153 to report conventional Pap smears that are examined using non-Bethesda reporting. Use codes 88164–88167 to report conventional Pap smears that are examined using the Bethesda System of reporting. Use codes 88142–88143 to report liquid-based specimens processed as thin-layer preparations that are examined using any system of reporting (Bethesda or non-Bethesda). Use codes 88174 and 88175 to report automated screening of liquid based specimens that are examined using any system of reporting (Bethesda or non-Bethesda).

Within each of these 3 code families choose the one code that describes the screening method(s) used. Codes 88141 and 88155 should be reported in addition to the screening code chosen when the additional services are provided. Manual rescreening requires a complete visual assessment of the entire slide initially screened by either an automated or manual process. Manual review represents as assessment of selected cells or regions of a slide identified by initial automated review.
