The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

**CAUTION:** This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Director McKiernan:

My wife and I are strongly opposed to the proposed right whale closure mainly in the Area 2 Southern New England. We believe the justification for this closure is non-existent and it will create an undue hardship on our local independent lobstermen. We believe the south coast lobster business can't take this type of economic impact. There are no right whales in these water to save and a closure in this area won't save one whale. But it will put many hard-working citizens out of business.

Thank you for your consideration,

Richard and Brenda Motta

Attn: Daniel McKiernan

Hello,

I am writing this letter to voice my concern on the issue of closing access to fixed gear fishing during the months of February-April. As a small business owner and commercial fisherman, fishing helps sustain our boat building business and vice versa year round. Our boat shop employs 6 men all of whom fish through the winter in state water and it's a business model that has proven successful making a living for all of us over the last few years and improving every year.

On our particular boat, we fish through the winter fishing only relatively long trawls (16 traps) and in 20 fathom or greater water. Our end lines are 5/16 or 3/8. To my understanding, there has been no direct evidence to date that whales are becoming entangled in state water gear but more often flotsam or offshore fishing gear often from outside the country. I know whales have beached and died with "signs of entanglement" but attributing their death to vertical lines would be akin to a smoker dying in a car accident and showing cause of death to be cigarettes.

I understand the DMF is not necessarily the architect of these proposed closures and that there is a level of bureaucracy to navigate that most fisherman including myself are not completely apprised of. I would say as a fisherman, of all 7 possible regulations the DMF has outlined, 3, 4, 5, and 6 seem like reasonable first steps. Number 7 I have no comment because I am not a gill netter and I have no knowledge of instances where they have become entangled in the Cape Cod area. Number 5 should make an allowance to grandfather in anyone who is fishing singles currently because they most likely fish by themselves and there is a level of danger being added to make them change how they are currently fishing.

Number 1 & 2 seem hasty and lack any sort of evidence or science to support the closures. I would say its absolutely legal and reasonable to require those filing lawsuits and judges entertaining such filings to show indisputable evidence that Massachusetts state end lines are the direct cause of right whale mortality in those months and if that is not possible then the closure has no merit.

Commercial fishing, particularly Atlantic Lobster fishing in Massachusetts is something that is unique and special for the state to be a part of. As we know fishing is one of the oldest professions known to man, and in a world becoming largely ruled by technology, home offices, staying indoors, it provides a sense of normalcy and makes people feel good to see it happening. I remember in early April pulling into the dock in Salem and the folks out walking were happy to see a local business still working to provide a food source for local and country wide families.

There is on the other hand, of course, a group of individuals, many from out of state, who have an agenda along with their best strategy on how to save the whales. Why do they pursue this? I'm not entirely sure, some of them have probably figured out how to make a living for themselves through this pursuit, many are most likely financially solvent so they find issues like this to pursue to create some sense of purpose in their life. On their agenda, I would imagine they have developed a list of their perceived opponents to whales and of course fisherman are on that list. I would hope that included on that list are the following:

1. Whale Watch boats, who chase whales for the amusement of passengers which I assume is often confusing and antagonizing to whales
2. The national and international shipping and cruise ship industry. We know that there is actual evidentiary proof that they are the leading and potentially the only cause of death for right whales in Massachusetts state waters.
3. Offshore wind construction. As we know, whales are one of the most sensitive mammals in the ocean and erecting a structure in the ocean floor to travel through the water column emitting a constant low or

high frequency sound or vibration is of course something that can only be detrimental to whales since they have existed so long without these structures in their way and interrupting their sense of communication and direction. As a matter of fact, the argument could be made that if whales are becoming comfortable with a structure emitting a mechanical sound that does not physically harm them, perhaps that is why they would be slow to move out of the way of large vessels and ship strikes are occurring.

In any case, all of the groups listed above either share a common interest with these whale groups, or are far too large and powerful to be bothered by their decree and have greater financial backing than the litigators .

So, unfortunately, it has come down to monetary capability of fighting this closure. The groups seeking closures are very well funded and quite well organized. Commercial fisherman, largely independent and with no large funding source to fight the closure, are relying on the DMF to be a voice of reason in this. As a citizen of MA and the United States, I would think there needs to be irrefutable evidence available before the state closes a means of living for so many individuals in the state. Even if that evidence became available, we know that since the dawn of time, an immeasurable number of species have become extinct through one means or another and extinctions will continue long after we are gone. So in order for humans and animals to cohabitate on this earth, there needs to be a level of reproduction sustained or we will see exactly what is happening to the right whale. They encounter all of the same hazards that every other whale species encounters yet they are having a hard time sustaining. This is most likely due to reasons beyond the control of man. So why would we end a means for individuals in this state to make a living on a whim that the closures are helping a sea creature that is likely going to become extinct regardless.

Lastly, it is a huge shock to me that when we are considering the closure of an entire area for 3 months out of the year (more like 5 because a month on each end will be dedicated to setting and retrieving all gear) that the state is still issuing recreational licenses. If the situation is so dire to consider shutting down the fishery, I would think the very most elementary step to take in eliminating vertical lines would be to shut down all recreational fixed gear efforts. This would eliminate a huge number of end lines in the water.

I hope you can take the time to read this letter and consider some of the points made. I would appreciate any acknowledgment of reception of the letter so I at least know it reached the intended recipient. Thanks so much for your time and consideration.

Hi,

I am writing to you with objection to the call for seasonal closure of lobstering. While I have only been lobstering a couple of years, I am a charter captain and commercial tuna fisherman. Most rec lobstering is done in less than 50ft of water. During my short years, I have seen 1 right whale w/ calf, in 75ft or less, 1! With out incident. I hope DMF is not using republican impeachment strategy, I.E. No witnesses and no facts, I read a lot of posts about the heavy regulation commercial lobstermen have to go thru as a result of non evidence supported rule changes. We have to work with science and not just conservation. Why can't we tag whales with a radar deflection devices that will aid in preventing, the true killer of whales, cruise ships, from doing and more damage? Let's tax an industry out of existence to save whales while at the same time, allowing corporations to pollute the ocean w/ pcb's and other hard metal compounds?

Enough of the misdirected and misguided efforts by people who have no connection or experience, to the industry! Trash is killing all sea creatures, a sperm whale dissection's found plastic bags, even a 25ft section of garden hose in its' belly. Lobstermen are not threatening whales, cruise ships, ARE! Let us move beyond trump and the disinformation techniques used to manipulate the truth and stop hurting the fishermen that provide food! Enough is enough!

Thank you,  
Captain Justin A. Vyce

Citizens Opposing Active Sonar Threats (COAST)  
536 Point Road  
Hancock, Maine 04640

December 15, 2020

Director Daniel McKiernan  
251 Causeway Street, Suite 400  
Boston, MA 02114

Re: New Protected Species Regulations Affecting Trap and Gillnet Fishing

Dear Director McKiernan:

I am writing on behalf of COAST to provide comments on the New Protected Species Regulations Affecting Trap and Gillnet Fishing. Scientists are telling us that we need to seriously reduce human-caused injuries and mortalities of North Atlantic right whales if this species is to avoid extinction within the next few decades. This is what we must do, including a drastic reduction in the number of injuries and deaths resulting from entanglements in fishing gear. This must be accomplished rapidly—there is no time for further delays in extending meaningful protections for these whales if the population is to have a viable chance of recovering. COAST believes we owe it to the whales, who have every right to exist on this earth. But we also believe we owe it to ourselves. We will all benefit if our ocean ecosystems are healthy and thriving.

#### Proposed Fixed Gear Closures and Prohibitions

COAST believes the best and most effective way to protect North Atlantic right whales from entanglements in fishing gear, is to prevent those entanglements from occurring in the first place. These closures will help reduce entanglements, but will likely not eliminate them. Although there are times of the year when right whales are more likely to be found in waters off Massachusetts, right (and other) whales don't operate on human schedules, and do show up in those waters at other times, including some times when they are least expected. So if these whales are in these waters at times other than the proposed closures, they would still be subject to entanglements.

While the proposed measures include the option to extend the trap gear closure if right whales remain present, it is also possible that after leaving the area for some time, a whale, or whales, may return following the closure period. It goes without saying that if the gear is in the water and whales contact that gear, an entanglement may occur... no matter what time of the year it is. DMF should retain the authority, and exercise that authority, to re-close an amply-sized precautionary buffer zone around the area where right whale sightings have been confirmed.

While the proposed commercial trap closure includes all Commonwealth waters, the proposed closure on commercial gillnet does not. It is unclear why this is the case. If any gillnet fishing is being done outside of

the proposed closure area, the proposed measure will not ensure no right whales are entangled in gillnet gear. Therefore, the proposed closure on commercial gillnets should include all Commonwealth waters, and again, following the closure period, DMF should retain the authority to re-close an amply-sized buffer zone around the area where right whale sightings have been confirmed.

The proposed prohibition on commercial fishermen using vessels larger than 29' to fish single lobster traps may help reduce entanglements, but that prohibition should be extended to all commercial and recreational fishermen, as right whales do at times come into near-shore waters and may become entangled. At this time, every single living right whale is critical to the specie's survivability. People who are fishing recreationally are doing so for their pleasure and should not be needlessly threatening the future of right whales. Commercial fishermen should not be doing so either, and should also be prohibited from fishing single traps. There is no doubt that making this change will be difficult financially for some commercial fishermen. They must be offered some form of government assistance or compensation to help them make the changes necessary and so they need not face increased danger themselves.

### Proposed Gear modifications

The use of weaker rope, such as the 1,700 pound breaking strength buoy line being proposed that will allow an entangled whale a better chance of breaking free of at least part of the gear that is entangling it may help reduce some serious injuries and mortalities, but it is not a satisfactory solution to the problem of entanglements. Nor is the 3/8" and 5/16" proposed maximum buoy line diameters for commercial and recreational trap fishermen. These modifications do not guarantee whales will in fact be able to free themselves, nor will they necessarily prevent whales from being injured, having energy resources drained by carrying what gear remains, having their ability to reproduce diminished, or for that matter, dying as a result of that entanglement. Very clearly, right whale calves and juveniles may not have the strength or energy to break free. The same is true for sick or already entangled or otherwise injured whales.

This is not to say these measures should not be tried, but they are far from the best option to reduce injuries and mortalities of right and other whales. The best option is to prevent entanglements from happening in the first place.

### Ropeless Gear

Ropeless fishing would allow for fishing while effectively eliminating the cause of the great majority of entanglements...a win/win/win for fishermen, whales, and for the marine environment we all depend upon. It is already in use by fishermen in various parts of the world, and could and should be further developed so as to achieve even higher success rates. DMF should immediately begin permitting the use of ropeless gear, and it should be exempted from closures for fixed gear that requires rope. DMF (and NOAA Fisheries and others) should also encourage the rapid development and deployment of this technology with generous subsidies and other rewards to commercial fishermen as well as qualified businesses, engineers, scientists, and designers. This should be done without delay. As long as there are vertical lines in the water, whales are at risk of becoming entangled in them. Ropeless gear will get the rope out of the water, allowing the whales to live and the fishermen to fish.

### Gear marking

Until the time when all fishing is done without the use of vertical ropes or other gear that can entangle whales (and other marine life), it is essential that all fishing gear, without exception, be thoroughly, and comprehensively marked so as to clearly indicate the specific fishery, and specific area fished. The ambiguity that has resulted from a lack of sufficient marking on fishing gear has been inappropriately used

by some fisheries to claim they are not responsible for causing entanglements. A lack of evidence does not prove innocence. A requirement for the marking of all gear will shed much needed light on the matter and do away with this ambiguity. It will also allow for a more focused adjustment of gear and practices to further reduce entanglements.

Although the proposed maximum buoy line diameters may help differentiate trap gear from Massachusetts from heavier gear fished offshore and in Canada, this in itself is not enough. All parts of the gear should be clearly marked, and be marked minimally every 30' on rope, so that should a whale become entangled, the gear that entangled it, the location of where that gear was set, and the fishery that gear came from, can readily be identified. This should be done so that even in cases where the gear cannot be recovered, it can still be identified through sightings and photos.

### Other Threats to Right Whales

Entanglements are not the only threat to the continued existence of right whales. Ship strikes are also a very serious threat. Current protections against shipstrikes are obviously inadequate and should be extended to include mandatory (and strictly enforced) speed limits on motorized vessels, including smaller vessels over 25 or 30 feet, which can also injure and kill if they were to strike a whale. DMF should be aware of other threats to right whales, and where feasible, take meaningful action to address those threats. This could be done, for example, by DMF having input on, and limiting or prohibiting, where possible, Navy activities such as the deployment of its sonar or the use of explosives in Massachusetts waters where the resulting sound energy would very likely negatively impact any right whales unlucky enough to be exposed to it.

### Funding to implement protective measures

The measures that can, and must be used to effectively reduce injuries and mortalities of right whales resulting from entanglements will cost money to implement. It will be a significant amount, but minuscule when compared to, for example, the \$2 billion a day this country spends on the Pentagon budget (Costs of War Project, Boston University). COAST believes it is unfair to expect fishermen in small-scale operations to be made to bear all of those costs. NOAA Fisheries and other federal agencies as well as state government should put their money where their mouths are and financially assist fishermen in making the changes that are necessary through subsidies and other means. Doing this would reduce the hardship and dangers fishermen would otherwise face, and likely increase levels of willingness and cooperation in efforts to increase protections that allow for the recovery of the right whale.

### Conclusion

If right whales are to avoid extinction, then every effort must be made to immediately protect the ones that remain. We cannot rely on half-measures that will fail to offer right whales enough protections from entanglements and other threats to their continued existence. To allow for the extinction of this remarkable species would be a great crime...and absolutely unacceptable. Now is the time for the creative implementation of effective measures that will protect these whales and allow for their recovery—not just on paper, but in the real world. Thank you for the opportunity to comment on the proposed regulations.

Sincerely,

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Johanna Finnegan-Topitzer

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Director McKiernan,

North Atlantic right whales, which swim in our Massachusetts' waters, are one of our most at-risk species.

I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Don Ogden  
The Envirop Show  
140 Pine Street  
Florence, MA 01062

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Todd Atkins

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Bonnie Gorman  
222 Rock Island Rd  
Quincy, MA 02169

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

I actually saw a right whale and hope that we can protect them so that they can be seen and NOT hurt by humans.

Thank you,  
Marie

Sincerely,  
Marie Haggerty  
173 Westford Rd  
Tyngsboro, MA 01879

This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. This will go far in ultimately providing a long term solution to this problem.

Again, thank you for your actions thus far, and please consider the addition of a pathway to eventual adoption of ropeless fishing gear.

Sincerely,  
Christine E Linderman

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Judy Stetson  
261 Quissett Ave.  
Woods Hole, MA 02543

Dear Director McKiernan,

As a devout United Methodist, I am heartbroken at the needless suffering of our beautiful fellow creatures. I believe that it is possible to co-exist and work in ways that do not lead to needless suffering, decline, and extinction, but instead lead to abundance and resilience. We need creatures like whales in order to have the healthy ecosystems on which our very lives depend.

I grew up near the ocean in New England, and I have been amazingly blessed to have taken 2 whale watching trips in my life in which I saw these amazing creatures. I am particularly concerned about North Atlantic right whales, an incredible but at-risk species.

I am heartened by your work with the Division of Marine Fisheries in drafting proposed regulations that can help these amazing creatures, and therefore, all of us, survive and thrive.

I write today because it is my understanding that ropeless fishing gear would also go a long way toward preventing the needless suffering and decline of these and other sea creatures. I hope you and the others involved can creatively find ways to develop and implement strategies for ropeless gear, and I also hope you find a way to put this agenda into the proposal.

Best wishes for a healing and hopeful Advent.

Sincerely,  
Tallessyn Grenfell-Lee

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Kate Hermann  
1306 Trapelo Rd.  
Waltham, MA 02451

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Jason Menard  
277 Bay Rd  
Belchertown, MA 01007

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Anne Legene  
69 Welcome St  
Great Barrington, MA 01230

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Heidi Friedman  
88 Munroe St  
Somerville, MA 02143

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Pete LeDoux  
240 Hillcrest Rd  
Marshfield, MA 02050

**CONSERVATION LAW FOUNDATION  
CENTER FOR BIOLOGICAL DIVERSITY \* DEFENDERS OF WILDLIFE  
NATURAL RESOURCES DEFENSE COUNCIL**

December 15, 2020

Daniel McKiernan  
Director  
The Commonwealth of Massachusetts Division of Marine Fisheries  
251 Causeway Street, Suite 400  
Boston, MA 02114  
[marine.fish@mass.gov](mailto:marine.fish@mass.gov)

Re: New Protected Species Regulations Affecting Trap and Gillnet Fishing

Dear Director McKiernan,

On behalf of Conservation Law Foundation, Center for Biological Diversity, Defenders of Wildlife, and the Natural Resources Defense Council, please accept these comments regarding the proposed amendments to regulations at 322 CMR 6.00, 7.00, and 12.00, designed to reduce the risk of North Atlantic right whales becoming entangled in fixed fishing gear.<sup>1</sup>

The species' future is in doubt without immediate action. The National Marine Fisheries Service (NMFS) recently determined that since 2017 alone, fishing gear entanglements and vessel strikes have killed or seriously injured at least 32 right whales and another 13 whales have been found dead from undetermined causes. Recent information indicates the actual number of right whale deaths is higher, averaging 24 whales per year. And in the last decade, the population has decreased by 25 percent—a wholly unsustainable rate of loss. Every individual must be protected to avoid the species' extinction. These new regulations will reduce the risk that right whales will continue to be entangled, seriously injured, and killed in Massachusetts state waters.

The regulations proposed by the Division of Marine Fisheries (MA DMF) are a big step in the right direction given the increasing use of Massachusetts state waters by right whales to seasonally forage in winter and spring. As part of its recent submission to NMFS associated with the upcoming rulemaking to amend the Atlantic Large Whale Take Reduction Plan, MA DMF described the importance of Cape Cod Bay:

Approximately 65% of the known right whale population visits Cape Cod Bay each year. This is the largest known aggregation of North Atlantic right whales in the world. In a single day in April 2017, a total of 179 right whales were observed in Cape Cod Bay. This represents a peak observed density of 10 right whales/cubic mile of water. To put this in perspective, the Gulf of St. Lawrence, an area which hosts large aggregations of right whales in recent years and has been the epicenter of an Unusual Mortality Event since 2017, has only ever reached a known peak density of 0.012 whales per cubic mile of water, in June 2018. This underscores the importance of the Massachusetts Bay

---

<sup>1</sup> November 13, 2020. Notice of Public Comment Period and Public Hearings on New Protected Species Regulations Affecting Trap and Gillnet Fisheries. MA Division of Marine Fisheries. <https://www.mass.gov/service-details/proposed-amendments-to-division-of-marine-fisheries-regulations>.

**CONSERVATION LAW FOUNDATION  
CENTER FOR BIOLOGICAL DIVERSITY \* DEFENDERS OF WILDLIFE  
NATURAL RESOURCES DEFENSE COUNCIL**

Restricted Area (MBRA) as an effective means of eliminating entanglements.<sup>2</sup>

However, recent right whale sightings (2017 to present) demonstrate that right whales frequently use Cape Cod Bay in the shoulder months (January and May).<sup>3</sup> Thus, the current closure between February 1 and April 30 is not sufficient to protect right whales as they transit to and from other important foraging habitats south, east, and north of this area.

As it stands now, the only effective ways to reduce this risk are to: (1) close certain areas at certain times to fixed gear fishing, and (2) reduce the number of vertical lines in the water column when fishing is allowed. **Specifically, we support these proposed Fixed Gear Closures and Trap Gear Restrictions:**

1. Extending the commercial trap/pot closure to all state waters under the jurisdiction of the Commonwealth (322 CMR 12.04, 12.08, & 12.11);
2. Expanding the size of the gillnet closure in Cape Cod Bay to include Gurnet Point and Scituate Harbor (322 CMR 12.04, 12.08, and 12.12);
3. Retaining the authority to extend these two closures, if whales are present (322 CMR 12.04);
4. Closing the recreational trap/pot fishery between Columbus Day and Memorial Day (322 CMR 6.02); and
5. Prohibiting fishing with singles on vessels greater than 29 feet (322 CMR 12.06).

However, given the urgency of the right whale's situation and the critical importance of Massachusetts state waters, we believe MA DMF must implement additional protective measures. **Therefore, we also urge the State to:**

- 1. Extend the trap/pot closure so that it begins on January 1;**
- 2. Develop a trigger for additional closures for those times when right whales aggregate outside of the closure time periods;**
- 3. Extend vessel speed restrictions to all state waters between January 1 and May 15;**
- 4. Require gear markings on all lines every 40 feet; and**
- 5. Require a vessel tracking system on all commercially permitted vessels.**

We do not support weak rope as a long-term solution. *See* 322 CMR 12.02 and 12.06. Although we are fully aware of the academic research supporting a hypothesis that weak rope may decrease the frequency or severity of entanglements, this hypothesis has not been empirically

tested or proven. Although the proposed regulations codifying the requirements for a 1700-lb contrivance and maximum buoy line diameters might eventually be demonstrated to reduce the

**CONSERVATION LAW FOUNDATION  
CENTER FOR BIOLOGICAL DIVERSITY \* DEFENDERS OF WILDLIFE  
NATURAL RESOURCES DEFENSE COUNCIL**

number of adult North Atlantic right whale deaths, entanglements in weak rope or narrow rope will still adversely affect the reproductive success of the species. Moreover, any entanglement is still a prohibited “take” under the ESA. Finally, weak rope affords little protection to other vulnerable marine life such as humpbacks, sea turtles, and young right whales, all of which are federally protected under the Endangered Species Act and/or Marine Mammal Protection Act.

To conclude, we specifically address comments made during the hearings related to on-demand or “ropeless” fishing. We fully support on-demand fishing but given that the technology is still evolving and that the Bay has the highest seasonal density of right whales in the world, we cannot advocate for unrestricted use or expedited permitting until there is a larger conversation about the relative risks associated with such fishing in the Bay. As an interim step, we recommend that MA DMF lead the conversation on next steps for on-demand fisheries in State waters and strongly suggest that these conversations include input from regulators, fishermen, scientists, and conservationists.

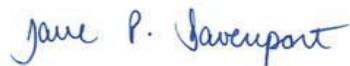

Respectfully submitted this 15th day of December, 2020,

Erica Fuller, Senior Attorney

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

**Subject:** Proposal of Commercial Trap Gear Closure  
**Date:** Tuesday, December 15, 2020 4:44:54 PM

---

**CAUTION:** This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Director McKiernan,

I am opposed to the Proposal of fixed gear February 1 to April 30<sup>th</sup> Trap Closure in Massachusetts State Waters.

Understanding the true effects of the Proposal of fixed gear February 1 – April 30<sup>th</sup> Trap Closure in Massachusetts State Waters. Reality of closing is that it could take up to one month to pull traps out of the water for actual closure for February 1 – April 30<sup>th</sup>. This in return creates extra expenses on both ends (Feb & April) and a loss of more income. Many factors play into this equation that simply can't be predicted. Weather conditions in which allow vessels to go out to pull gear in the month of January. The number of traps each vessel can physically bring gear in and out at a time.

Lobstering as a livelihood is a very difficult way of life. Nothing is written in stone making it very unpredictable. Lobstering is unlike most normal careers. In normal careers, people work a set amount of hours a week to make a living, and or to make a set amount of income. With Lobstering, EVERYTHING depends on the weather, and by weather I simply don't mean it being bright and sunny. I mean, the tides, the wind, and the swells, along with the water temperature. All these variables are different for each individual lobsterman. Due to individual's vessel, availability, manpower and so many other factors, that simply can't be explained in a sentence or two.

Personally, I fish approximately 36 trips From February to April, (approximate break down two weekly trips in February, three weekly trips in March and four weekly trips in April). Again this is an approximation because it truly varies year to year.

I fish Massachusetts Area 2 Southern New England and been fishing there for 40 years. This closure will severely affect my business and the ability to support my family. Massachusetts Area 2 has had more regulations than any other Area in Massachusetts. In the 40 years I have been fishing, State regulations have been put in place with very little consideration to the livelihoods of fishermen. Approximately 20+ years ago we were given trap allocations limiting us to 800 traps. Reducing my traps from 2000 traps down to 800 traps was catastrophic. Regulations were implemented ONLY to Area 2 had a larger gauge size. Over the last 5 years we were given ANOTHER regulation of a 50% trap reduction. Regulations to protect the right whales have been implemented, such as the conversion to non-floating rope was applied to all fixed gear. This regulation although extremely costly at the time was done for the protection of right whales and all other whales. This next proposal of fixed gear trap closure will probably put me and other Area 2 lobster fisherman out of business.

There have been no right whale entanglements in the 40 years that I've been fishing in Area 2 Massachusetts State Waters. We have a good winter and spring fishery. February through April the lobster prices are at their highest. I along with most full time lobstermen that fish Area 2 Massachusetts State waters make approximately

30% of our income in those three months. By going through with this proposal I along with most of these other lobstermen will not be able to survive this closure. Closing Area 2 Massachusetts State Waters will have absolutely no effect on the right whale survival. This proposal is SIMPLY to appease the environmental groups trying to save the whales.

What needs to be understood about this proposal is that this income simply cannot be made up in the other months. Trips cannot be simply added on during the other months. Again, due to regulations that have been previously set forth by the state. Reduction in the amount of traps allowed to be fished and trap tag allocation. Thus making it impossible to simply "make up the lost trips by adding more trips"(i.e. traps need to set for a certain amount of time, before they can be hauled.) The amount of traffic that transpires during the other months, loss of gear due to that traffic, availability of employees, and so many other factors. All of which also includes the unpredictability of weather.

There are around 20–25 full time lobstermen that fish Area 2 Massachusetts State Waters compared to 780 for the entire state of Massachusetts. This closure will do absolutely nothing for the right whales and will probably destroy the livelihood of the few fishermen left in Massachusetts Area 2 lobster fishery. We simply cannot sustain any more regulations or closures.

Think of it this way, what would you do if you were told that you now have to do your job and take an immediate cut in pay of 30%, no questions asked. More than likely you might think about getting another job. The problem here is that we simply can't just go get another job. We have not only our life invested, which includes monetary, and nautical/skills knowledge, but also usually our entire financial portfolio.

Thus this proposal of closing fixed gear for Massachusetts State waters February 1<sup>st</sup> – April 30<sup>th</sup> is simply and completely unreasonable. Especially because the closure will have absolutely no effect on the right whales. There has not been a documented right whale death due to rope entanglement from a Massachusetts Area 2 State Water fisherman.

Area 2 Lobsterman should not have to suffer, be blamed or pay for right whale deaths or rope entanglements. Most documented whale deaths are due to ship strikes, of which regulations have been implemented for ships to regulate their speed.

The only consequence on the implementation of this proposal Commercial Trap Gear Closure February 1-April 30<sup>th</sup> is that Area 2 Lobstermen livelihoods will be destroyed. It will have absolutely no effect on any right whale or any whale for that matter.

Thank you for your attention to this matter.

Dave Magee

Dan ,

After reading into this further , I see that you're finally including the seasonal student permits , as well as , the recreational permits to be further regulated along with us commercial guys.

THANK YOU for That!

I'd like to make a few points regarding some of these proposals. I understand the predicament you are in , its tough to keep all sides happy, but I'm hoping we use a little common sense to adjust these proposals.

- Instead of a maximum vessel length of 29' for vessels to fish singles , why not say no singles outside of 1/2 mile from the beach? We coastal guys fish trawls out in the tide and singles in 15' of water close to the beach (its most efficient this way, and safer) . Also what do you do about buzzards bay and south of the Elizabeth islands where lobster trawls are prohibited ?

My current boat is 28' but my boat that is under construction is 38'(could I be grandfathered?) , I want to continue to fish singles on the beach , this proposal goes through my new boat will be useless and its due here mid January.

- Why not put a temporary moratorium on the seasonal student permits , until more data is collected , or at the very least cut those permits back to 15 traps?

- The off season closure for recreational trap fishing is a great start , but as I've mentioned to you in the past , the commercial guys allocations have been cut back so dramatically , Why not cut the rec permits to 5 traps? I'm not sure of the yearly amount of rec permits issued , but I'm sure cutting the number of traps to 5 will drastically improve the number of vertical lines in the water.

I know that opposing the commercial closure probably won't do much good , but my hope is that maybe tweaking these proposals it will offer up a little compromise between these groups that seem way too far apart at the moment.

Please let me know that this email has been read.

Thank you ,

Director McKiernan and the MA Fisheries Commission,

I write to you not as a commercial lobsterman, but as a sportsman, an environmentalist, a wharf rat, and seafood consumer. I have been following the situation regarding the North Atlantic right whale since the early 2000s. The current state of affairs is tragic. To think that just 10 years ago, this was the promising story about an endangered species on the rebound and in the decade sense we have lost all those gains and the species again on the precipice of extinction.

Unfortunately, this species faces a number of complex challenges that complicate its recovery. It is a migratory species that needs to feed on reliable densities of plankton as it travels. We know that changing oceanographic conditions - likely a byproduct of climate change - are affecting the time-area distribution of plankton. As a result, plankton is less dense in times and areas where the right whales need it. This causes physical stress to the animals by requiring them to travel further to feed and to do so with less nutrition. Additionally, by altering migratory patterns the species is now found in areas ill prepared to regulate and manage the threats posed by vessel strikes and interactions with fixed fishing gear, particularly in areas like the mouth of the St. Lawrence river where there is substantial shipping traffic and high densities of heavy lobster and crab fishing gear.

We down here in Massachusetts have a congested urban coastline, but we are also used to dealing with the right whale and have been leaders for a quarter century. The federal government has established real-time vessel monitoring controls alerting mariners to the presence of these whales to reduce the risk of ship strikes. Similarly, the state and federal government have rules affecting vessel speed in areas where densities are right whales are known to occur. The fishing industry has been required to adopt gear modifications and suffer closures to reduce the entanglement risk. I've seen the Yankee ingenuity of my port's lobstermen first hand, as they work hard to solve the engineering, political, and economic challenges posed by continuing right whale conservation efforts.

I know that the Massachusetts lobster industry has often been a begrudging partner in right whale conservation, but they have been a partner nevertheless. I also think they have some obvious and legitimate frustrations with managing towards potential risk or zero risk, which produces a never ending set of new burdens. However, they are also a unique group of small businessmen. They take conservation seriously and have shown a willingness to help

fix solvable problems. Their livelihood is inexorably tied to their ability to do this and they are acutely aware of that reality. Time after time, these business owners have been required to reconfigure operations, both as a matter of care and a matter of wallet. Too frequently, these adjustments force them to become less efficient and less profitable, and unfortunately, sometimes also less safe.

It's hard not to take begrudging stances and sound off your frustrations when faced with this reality. In fact, many of these lobstermen should be commended for their diplomacy. I'm not sure we'd all be so genuine and reserved if this was our livelihood on the line. I think this is a reality that is obvious along our working waterfronts, but not in our urban areas, leafy suburbs, and college campuses where the NGOs canvass and fund raise. This has created a substantial gulf in understanding what is feasible and what is a death blow to a legacy industry.

Last week, with the aid of some scotch, I listened in to both of your public hearings. This gulf in opinion was evident. I heard the impassioned pleas by conservationists advocating that we must do all we can to save the whales, including going above and beyond the state's proposal. I also heard earnest comments from frustrated fisherman who felt the state's rules to close the Sounds and Buzzards Bay and prohibit single traps were arbitrary and would carry excessive carry the economic burden compared to risk reduction. Lastly, I heard from state officials who seem to be in the crossfire trying to thread a needle among a federal lawsuit and a federal government that has decided that dragging its feet is a political goal rather than a means to accommodate a better solution.

I don't envy your decision making on this. I think most of what is being proposed by the state is doable and sensible. However, I'm not certain there is a real risk reduction benefit to enacting a closure in Buzzards Bay. This is not the Gulf of Maine, the industry in this area is consolidated and the resource is scarce. Losing the winter fishery would impose additional economic hardships with what I assume is negligible risk reduction to a negligible risk. Unfortunately, I think the cold reality is that this fishery will be sacrificed to help obtain the federal take permit so that the fishery north of the Cape may continue.

The comments on the single trap requirements were also interesting. Some Cape Cod fishermen indicated that being forced to trawl up would gravely impact their safety and fishing operations. However, my understanding of the proposal is that "trawl up" can include going to fishing two traps on a string, not having to fish long trawls. I'm uncertain how going from fishing singles to fishing doubles would generate these problems. I wish the fishermen would have been pressed on this a bit more so that the public could have a greater understanding of the problem. Moreover, I wish the timeline for moving forward with the state regulations was less truncated so that this could be given more consideration. However, I expect that similarly to the southern fishery, the single trap fishery is a sacrificial lamb in the federal take permit application.

I know it was not on the agenda and the state made clear that it wanted to avoid discussion of the subject. However, as others have, I must also take the liberty to comment on the elephant in the room that is ropeless fishing.

Many whale advocates, college students, and other assorted idealists commented in favor of a swift transition to ropeless fishing. These calls were aided by folks in the business of selling and profiting from this technology. They argue this is a necessary step to save the whales and that the technology is more advanced than it is. They want to speak it into existence.

The reality is that a transition to ropeless fishing is a pipedream. There are very real economic and practical challenges to implementing such a system. This is a point that both the Conservation Law Foundation and Whale and Dolphin USA made at one of the hearings. Nevertheless the demands persist. It appears that the ropeless advocates also believe the state is covering for the lobster industry and is negligent in its response to the fact that unicorns are real. As you may be able to tell, I find the call for ropeless fishing to be a poor thought out position that is more a feel good fund raising campaign masquerading a legitimate public policy position.

The technology itself is insufficient. Its advocates like to equivocate that this gear is already used in New Zealand and Australia, so obviously it can be used in Massachusetts. This is comparing apples to beef jerky and anyone with any intellectual honesty recognizes this. My understand is that the rock lobster fisheries in New Zealand and Australia have fewer participants, low gear densities, and are zoned off from mobile gear fisheries. This is not the case in Massachusetts. We have nearly 1,000 fishermen fishing in our coastal waters; our gear densities are significant; and we have multiple gear types fishing the same bottom reliant on surface marking requirements to identify fixed gear locations.

Bottomline, this technology does not function with the spatial resolution necessary to work in Massachusetts. I believe a Canadian ropeless fishing technology advocate stated that the technology works when gear is spaced out by about .25 miles. Unless we greatly shrink the lobster fishery, this resolution is insufficient for Massachusetts'.

If overlooked and implemented, there will be conflicts among fishermen and ultimately fisherman safety issues. To summarize a statement made at one of the hearings, any regulation implemented should ensure that our fishermen get home. I 100% agree with this sentiment. If fishermen are setting over each other, then there is added need to handle gear with additional tension on it. This additional load increases the risk of capsizing, of getting caught in gear, and getting injured or worse by snapping lines. It also makes fishermen less efficient, as they have to spend more time handling gear issues.

Additionally, it poses a risk to trawlers or dredge boats that may become snagged on buoy less gear, lose their center of gravity, and capsize. It's not infrequent for fishermen to die because of hang ups or grappling, do we want to increase this risk?

I'm not sure that even the most ardent environmentalist would be willing to take that callous of a position (at least publicly). That's a political loser. Then to implement ropeless it becomes obvious that the state must also discuss downsizing the lobster fleet to reduce gear density and creating user zones to avoid interactions between competing gears.

This will make the razor thin margins facing our working waterfronts even thinner. They'll tell you it's death by 1,000 paper cuts and I wouldn't call them liars. These economic impacts won't just be felt by the lobster industry, they will be felt by the entire working waterfront. The lobster industry is the lifeblood of Massachusetts ports. The lobster fishery supports bait fisheries; the fish mongers who buy their product and the fish houses that sell them fish skins and racks; the gear supply stores and manufacturers that outfit them with traps and ropes; the boatyards and mechanics that service their vessels and engines; the gas stations and ice houses that rely on their commerce; even the truck seal folks get a cut of it. If the lobster industry gets cut at the knees then so does the waterfront.

Then once we scale down the industry and cripple the waterfront, let's talk about the cost of implementing this technology. The state testified at hearing that it would cost more than \$100M to outfit the current MA fishery with ropeless technology. Quick math, that's an initial capital investment of ~\$100,000 per fisherman. That's a staggering investment for small businesses to make in a technology that likely won't work at the resolution it needs to. Moreover, what is the cost of annual maintenance when the gear is lost to storms or gear conflicts? What's the environmental cost to our nearshore waters of more lost gear?

Lastly, to some degree it is a solution in search of a problem. In the past 25-years, MA trap gear has entangled exactly two right whales, and according to the state's testimony at public hearing, these right whales were successfully disentangled. Zero right whale mortalities have been associated with the state's trap fisheries. The risk posed by this gear has been minimized over time through the gear modifications and time-area closures adopted by the state, and the risk will be further minimized through these newly proposed regulations.

We are rapidly approaching a point where we are trying to divide zero and it is now that we seek to impose a costly technological regime shift. Seems indefensible and irresponsible, so it's probably good for fundraising. Stop the Steal; Roadmap to Ropeless - two sides of the same deranged political coin. If the environmentalists want to save the whales and not kill the lobster industry, I'd suggest they focus they set their sites offshore and towards Canada. Look for ways to make the heavy gear fished in these areas less dangerous and address the emerging shipstrike issues.

These problems impeding right whale recovery are trans-national and trans-industry. They are certainly not going to be fixed by this endeavor to impose a ropeless fishing regime in Massachusetts alone. We are at the southernmost point of the commercial fishery for lobster, we represent a small segment of the north Atlantic lobster industry, we boast a family business fleet, we have thoughtful fishermen, a suite of conservation measures not

seen anywhere else, and we have a state with a diverse economy. It's almost as if we are not the problem, but just an easy target ripe for fundraising.

I don't know what your solution is. I know it's not ropeless, but I fear that momentum and sentiment will continue to prevail against common sense. I think your proposals are probably heavy handed in terms of risk-reward to whales, but likely necessary to meet the risk-reward calculation resulting from legal challenges facing the state. It's never ideal to make decisions with a gun to your head. Do what you need to do to keep the wolves at bay and our working waterfronts working. If you can manage to get your federal permit without destroying the waterfront, I'll send the folks at IFAW a lobster dinner.

Cheers,

Ed

This is so hopeful. We just had a humpback death on Norton point on MV.  
Death from gear entanglement. Barbaric. If people were to see this amazing creature in person they would be moved to action. Please continue to fight for more protections.

We are trying to do our part.

Please consider ropeless gear as a way to save right whales from extinction. It has a proven effective rate of 98.4%.

Thank you,

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

The right whale population is dwindling. Scientists estimate that there are only 366 left. NOW is the time to act. We need greater measures in order to save them from extinction! Ropeless fishing gear can help solve the problem of right whale entanglements while helping the fishing industry thrive. This needs to be considered in your draft regulations.

Thank you,  
John Hondrogen, Pelham, MA

## F/V VOYAGER

Todd M. Jesse

December 8, 2020

Dear Director McKiernan,

I would like to submit these comments for the New Protected Species Regulations.

- A different color tracer for Massachusetts waters. A separate one for Cape Cod Bay and a separate one for Nantucket Sound.
- 3/8 line maximum size is good
- A line that breaks at 1700 pounds or the "South Shore Sleeve" is workable
- Since the whales are in the southern part of the bay first maybe the Northern part of the bay could stay open later into February
- A review or sunset date if in case the whale patterns change. Maybe the feed never comes back into the bay. We do not know what the future brings, so a scheduled review would be good.

Respectfully,

Todd M Jesse

Hello this is hunter lees. I hold an area 2 state/fed lobster License along with pot endorsements.

I'm writing in regards to the recent closure that is supposed to take place in February of 2021. I am strongly OPPOSED to this closure. 25% of my income takes place during this closure. I have purchased a newer vessel recently, bought more tags, new gear etc. To close lobstering down in our area would greatly effect myself and others. How many whales have been spotted in area 2 over the last few years? 2020 was hard due to COVID 19 and now to close us down? It seems as if they want to put us out of business. Trap reduction, whale breakaways and more seems not to be good enough. I am 100% against this closure. Families will be effected tremendously.

Thank you and merry Xmas  
Hunter Lees

Please allow lobster fishing in south coast area being considered for shut down. Keep the businesses alive. Right whales will still be protected.

Quotes from lobsterman D. Durr

“ So here is the issue, I have somewhere in the ballpark of 2000 days over 20,000 hours over the last 20 plus years in that little red area. I have never witnessed a right whale in those waters, never. Nor do I know anyone who has. I'm not saying one has never wondered of migration. But if they do we're ready. Reduced vertical lines by trap reductions, whales safe rope, breakaways that create a weak point on vertical lines. We have done what we can and have literally reduced whale entanglement to 0 in this area.

..south coast lobster business can't take this type of economic impact. There are no right whales in these water to save. A closure in this area won't save one whale but it will put people out of business. “

Thanks, Joanne OLeary

**Subject:** Coastal waters closed to lobstermen

**CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.**

As conservationists, southcoast lobstermen have not only met all previous regulations but have worked with the state to help reduce entanglements. Our south coast lobster business can't take this type of economic impact. Depending on the boat this will be a 20-30% reduction in total value and roughly 15-20% of the yearly landings. Already operating on slim margins this will most definitely impact the guys here on the southcoast and put their livelihoods at stake.

Most of the impacted lobstermen have been fishing the affected waters for 20 years. They have reduced vertical lines by trap reductions, whalesafe rope, breakaways that create a weak point on vertical lines. These lobstermen have done what we can and have literally reduced whale entanglement to 0 in this designated area. Typically the migration path brings them just off the southeast corner of Nantucket. There are no right whales in these waters to save. A closure in this area won't save one whale, but it will put people out of business.

Hi Mr. McKiernan,

I was wondering what sort of data is available for right whale migration in the areas of state waters surrounding the southern end of the Elizabeth Islands, South of Martha's Vineyard and around No Mans Land island. I understand these waters are included in a potential closure for commercial lobstering that are about to be closed to. Having spent a lot of time south of the vineyard offshore, I know that I personally have never seen any right whale activity even out at the dump, coxes ledge..the fingers and so on. I frequently fish between Cuttyhunk/Martha's Vineyard and the shipping lanes to the south. I have seen frequently pods of dolphins, but never any right whales. While i am not a commercial fisherman myself, i am friendly with more than a handful of them, whos time on the water far outweigh my own. I don't know of one person in that group, who has seen a right whale in this area.

It seems that this area is just being lumped in with other areas that do have active right whale activity with no real benefit, however a terrible consequence of either putting commercial lobstermen and women on the south coast either out of business or forcing them to go further than necessary.

Is there data supporting right whales being in this location? or is the blanket closure just hte easiest way to do this with the least amount of effort?

With all the work the government has put on the lobstermen (whale safe gear, reduced verticle lines,breakaways, etc) in the off chance that a whale did wander into this area, i would expect the government to spend the time to properly assess if they are actually doing anything beneficial to the whale population with a closure, or if they are just doing what is easy.

I am hoping that this blanket closure will not happen...i am hoping that closures in known right whale habitat will be what is targeted by this possible closure and not something done with a blind stroke of a brush.

Matthew Arguin  
Mattapoisett, MA

**Subject:** proposed fixed gear closures in Mass waters

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Mr McKiernan

It is my belief that the proposal to close 'all' Mass regulated waters to fixed gear fishing seasonally is arbitrary and unnecessary. Although I support all reasonable efforts to protect marine species, the inclusion of the area South of Buzzards Bay/Vineyard Sound/Nomans will have little to no positive impact on Right whale endangerment. I am not a commercial fisherman, but have spent over 40 years working these waters recreationally and have yet to see a Right in this area.

Our commercial fishing industry is in serious trouble, and yes some of that damage was self-inflicted. The commercial lobster fishery has proven to be sustainable and responsive to all of the mandated protection measures, but closing these areas for months at a time will prove a devastating blow to an already pressured industry.

Please consider a revision to the proposal that keeps areas open that are not known as Right whale habitat.

Dear Mr McKiernan

I am writing to express my hope that you will help the declining Right Whale population by enacting stronger regulations to eliminate fishing lines which now entangle these majestic creatures.

There are so many hazards out there that man has created that endanger these animals that we cannot change but here is one that is in our power.

We owe it to them and to our shared environment to strengthen the laws which will eliminate rope lines. They are killing too many of our ocean animals.

I urge you to take strong action in the upcoming opportunity to eliminate this hazard.

Thank you  
Howard Chezar

Dear Dan,

We are writing today to support local lobstermen here in the SouthCoast. These hard workers have already been significantly impacted by the pandemic in 2020 that has put their livelihoods, and that of their families at stake.

Apparently, there's a small area in our neck of the woods where the inshore lobsterman from the SouthCoast fish during the winter/spring months, that is about to be closed during this time of year to protect right whales.

According to a local lobsterman I know, who has somewhere in the ballpark of 2000 days and more than 20,000 hours over the last 20 years in local waters that have been mapped to be closed, they have never witnessed a right whale in those waters, ever, nor does he know others who have. They have also said they have met regulations and are well prepared should the rare sighting/appearance occur.

They have reduced vertical lines by trap reductions, have whale safe rope and breakaways that create a weak point on vertical lines. They have done what they can and have reduced whale entanglement to 0 in this area.

We ask that you reconsider closing these waters during this crucial time that these hard workers need to feed their families and literally, stay afloat.

Thank you and Merry Christmas.

Pam and Bryan Sefrino

The closure in the area planned to protect whales at this time will be devastating to their business....  
Please consider this before taking action, because if the fisherman do ever see these whales they will be ready to not entangle them and fish responsibly.  
Please consider this before you close the area and put more Fisherman out of business...  
Thank you, Joann Gauthier Somerset Ma

Dear DMF Leaders, Scientists, Researchers:

I am reaching out to you as those who appear most closely connected to the proposed policy regulations with regard to protecting the right whale.

Several issues are clear:

- There remain a small number of right whales in North American waters.
- Current fishing equipment – in the form of vertical rope lines across Massachusetts waters - is a primary driver of right whale injury and death.
- There exists modern technological equipment (ropeless gear), used in other countries, including our Canadian neighbors to the north and U.S. fishermen (and women) on the west coast, for addressing the problem caused by lines that entangle the right whales.
- Whales are part of the allure and a boon to tourism in Massachusetts.

I ask, as a concerned citizen of Massachusetts, it is not your job as DMF leaders and professionals to play a frontline role in protecting our waters and the myriad sea life that depend on them? This problem of entanglement will NOT go away without a catalyst to employ alternatives to fishing lines that interfere with sea life mobility.

What a colossal tragedy it would be to witness the extinction of these majestic creatures when there are practical, effective alternatives. When you think of your children, nieces, nephews, perhaps grandchildren, how would you feel knowing they would no longer have the chance to see right whales in Massachusetts waters? How would you feel having them know that on your watch, you didn't do everything you could to ensure right whales did not become extinct?

Extinction is so final - no longer in existence, vanished from the earth, no going back.

I implore you not to be complacent by ensuring new proposed regulations include a pathway for allowing ropeless fishing gear.

I thank you for taking the time to read my email. I wish good health to you and all your loved ones.

Regards,

Lisa D'Annolfo Levey

Director Daniel McKiernan,

The North Atlantic Right Whale is one of the most critically endangered marine animals in the entire world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

These Endangered whales migrating through the waters of the East Coast must navigate a maze of deadly rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

Dear Director McKiernan,

Right whales are endangered and nearly extinct in the northern Atlantic Ocean.

I hope that you will encourage the Department of Marine Fisheries to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species. Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Susan Fernald

Dear DMF,

It has been brought to my attention, as a citizen concerned about the mass extinction of species we are now witnessing at ever accelerating speed, that our planet's wonderful right whales are facing major challenges and assaults that diminish their numbers, decrease their reproductive rate, and endanger their survival. Of particular concern are fishing practices that result in wright whale deaths. Currently, there is a public push to encourage DMF to consider ropeless gear as a way to help save wright whales from extinction. Ropeless gear has a very high success rate at significantly reducing entanglement, injury and death for our right whale population. This is a concern of serious magnitude. It is hoped that DMF will recognize that human impact upon right whales and other precious marine life threatens their very survival. A world without whales would be an unimaginable tragedy. Please move decisively to protect them and insure their survival!

Sincerely,

Lloyd T. Williams

Dear Director McKiernan:

As a concerned Massachusetts resident, I fear the North Atlantic right whale may go extinct in my lifetime. North Atlantic right whales are dying due to human actions. The DoMF, alongside NOAA, has the opportunity to make the necessary changes to save this species. I am glad to see our commonwealth is taking necessary steps to ensure the protection and survival of right whales by proposing new regulations for commercial fixed gear fisheries and recreational lobster and crab trap fisheries. Some of the changes I support include:

- Expanded closures for trap fisheries in all of Massachusetts waters.
- A new closed season for the buoyed recreational lobster and crab trap fishery.
- The DoMF retaining the ability to extend these closures based on North Atlantic right whale sightings.
- A marking system that will differentiate the gear that may be lawfully used in Massachusetts from heavier gear that may be used in the offshore exclusive economic zone or Canada.

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

Sincerely,

Eric Fournier

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

Dear Director Daniel McKiernan,

Massachusetts can and should be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. We must take strong action today before collisions with ships and entanglements in fishing gear drive them into extinction.

Fishing is vitally important to the culture and economy of our state and to the livelihoods of many residents. Right whales are beloved, iconic denizens of our waters and of historic importance to the New England economy. But apart from any value to humans, whales deserve to be here as much as we do.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

Please do what is best both for whales while also considering the needs of Massachusetts fishermen. The proposed draft protections for right whales do not do enough to ensure whales' safety. Thank you.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

I urge the Commonwealth to fund subsidies to lobstermen for them to transition to ropeless gear. This gear is expensive and until the costs come down, lobstermen are reluctant to try it. The North Atlantic Right Whales do not have any more time.

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

It seems to me that the DMF has not given proper consideration to alternative fishing methods, including ropeless gear, that would dramatically decrease the danger to right whales. Way too many of these endangered mammals are being unnecessarily injured and killed by the vertical lines currently used. I believe that the protection of this species should be a top priority for DMF and should be treated as such.

Att: Dan McKiernan, I am writing a letter to you in regards to the litigation on the right wales. As a delegate of the Mass Lobstermens Assoc. I am well aware of the pending litigation against the state. I realize you must come up with something to satisfy the judge. Most of your proposals I already use. 600lb breakaway bouy ends 3/8" line, experimental 1700 lb breaking strength endline. I have had some issues with it (unravels,,longevity ?) But it is usable. My biggest issue is with the state closure. I feel as though we have done as much as we possibly can to stop entanglements on our part. If you ultimately decide on a state closure I would like to see some sort of separation for fishermen outside of the Mass Bay restricted area. It is not fair to fishermen north and south of that area to be stopped from setting gear after May 1 if no whales are present in our areas. Sincerely, Paul J Mullen PS I feel as though whatever you decide it will never be enough, litigation will keep coming.

The moment where we lose a species we all cherish has come. Generations will measure us by our actions when we had the technology to save these magnificent creatures but not the will. These creatures have swim the ocean since the dawn of time. We are the only thing between them and silence. I appeal to you to be the voice for sentient creatures who cannot speak, yet tug at our sense of duty to protect.

Ropeless traps work. They save whales lives. We know this to be true. Find a way to enact this legislation while helping the fishermen to afford this burden. They shouldn't have to carry the expense of the transition.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice.

I am asking that you do everything possible to  
Stop this barbaric treatment of these magnificent creatures.  
Richard Norris, MD

I am writing you today to express my deep concern for Right Whales. There are only about 300 still living and rope entanglements represent the greatest threat to causing their extinction. We humans have already caused the extinction of thousands of species in the last 50 years. We must start acting more responsibly or we shall wreak havoc with our environment and our earth.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Daniel McKiernan  
Director  
The Commonwealth of Massachusetts Division of Marine Fisheries  
251 Causeway Street, Suite 400  
Boston, MA 02114  
[marine.fish@mass.gov](mailto:marine.fish@mass.gov)

December 11, 2020

Dear Director McKiernan:

I submit the following comments on behalf of Whale and Dolphin Conservation (WDC) regarding proposed amendments to Division of Marine Fisheries regulations at 322 CMR 6.00, 7.00, and 12.00 designed to reduce risk of entangling, injuring, or killing critically endangered North Atlantic right whales.

I am a long serving member of the Atlantic Large Whale Take Reduction Team and applaud the Massachusetts Division of Marine Fisheries for its consistent efforts in protecting both North Atlantic right whales and its fisheries. WDC is supportive of the measures proposed but requests clarification on the implementation dates for these measures, as only one proposed measure provides a specific date by which it would be enacted. More specific comments on each proposal are offered below.

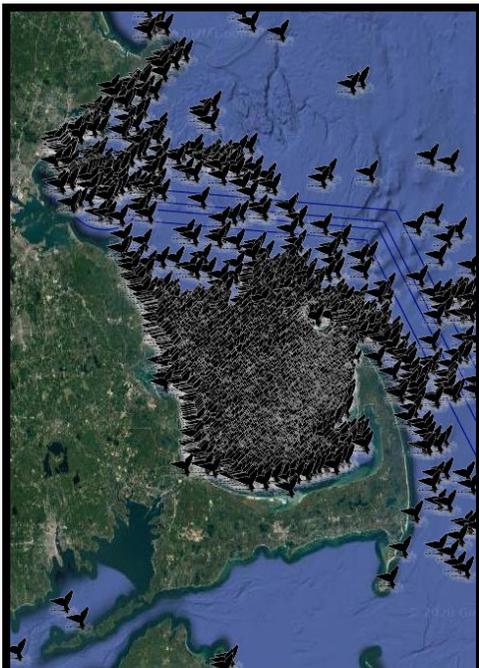

Figure 1 North Atlantic right whale sightings in MA since Jan 1 2015. NOAA SAS <https://apps-nefsc.fisheries.noaa.gov/psb/surveys/MapperiframeWithText.html>

### ***Fixed Gear Closures***

1. 1. Commercial Trap Gear Closure (322 CMR 12.04, 12.08, and 12.11). WDC supports this proposed amendment to increase the area covered by the current Large Whale Seasonal Trap Gear Closure to include all waters of the Commonwealth. A review of North Atlantic right whale sightings over the past five years indicates that right whales have been documented in nearly all areas of MA state waters over the past five years (Figure 1). While entanglements are incidental, their impacts are harmful to both right whales and fisheries. Even for whales who may survive the entanglement event, population level impacts result from sub-lethal effects. The short-term impact of the loss of gear as a result of entanglement is a financial burden to fishers; recorded entanglement-related injuries on right whales can also result in long-term impacts to the fishery from further regulatory measures and restrictions. We therefore support the measure as proposed which is the most conservative and appropriate at this time. We suggest DMF consider modifying the definition of this closure to allow the commercial use of on-demand fishing technology only once it is determined the gear can be implemented safely and effectively.

2. Gillnet Closure in Cape Cod Bay (322 CMR 12.04, 12.08, and 12.12). We acknowledge the additional

protections afforded by the extension of the areas covered by this proposal. We ask DMF to evaluate whether gillnet fishing is occurring during this time frame in other MA state waters and, if so, we

request that that risk be evaluated to determine if this expansion should include additional areas to similarly reduce risk as proposed in the previous expansion for trap/pot fisheries (see 1.)

3. Fixed Gear Closure Extensions (322 CMR 12.04). We support the ability of DMF to retain the regulatory authority to extend fixed gear closures only when necessary. We appreciate that DMF has used its authority to do so based on sound science through dedicated right whale surveys. These extensions have been lifted as soon as right whales have vacated the closed areas, reducing additional burdens on the industry that may be imposed with a permanent extension of the closure dates. Given the proposal to increase the area covered by the closure, we recommend that DMF increase its survey area beyond Cape Cod Bay to cover all waters of the Commonwealth. This ensures the most protective measures are in place for right whales while reducing unnecessary burdens on fisheries by unwarranted closure extensions.
4. Recreational Lobster and Crab Trap Gear Haul-Out Season (322 CMR 6.02). We support the proposed measures limiting recreational lobster and crab pot gear fishing to the time frames outlined. The risk to right whales is from vertical lines in the water which are not exclusive to commercially fished gear. The burden of risk should not be isolated to those whose livelihoods depend on fishing, but should be shared by any users of vertical line in the waters of the Commonwealth.
5. Conch Pot Haul-Out Period (322 CMR 6.12). We support the proposed measure to extend the haul-out period of the conch fishery to April 30 to be consistent with the period covered for other trap/pot fisheries. As stated previously, the risk of entanglement in vertical line is not unique to the target species being fished.

### ***Trap Gear Configuration Modifications and Restrictions***

1. 1,700-lb Breaking Strength Contrivance (322 CMR 12.02 and 12.06). We have previously expressed concerns regarding the efficacy of using 1,700 lb breaking strength rope to reduce serious injury and mortality to right whales, specifically because the data presented in [Knowlton et al. 2015](#) were obtained prior to 2011, before right whales significantly shifted their habitat use; and by the authors' own admission, the breaking strength does not reduce risk of serious injury or mortality to right whales under two years of age. Additionally, reduced breaking strength lines do not reduce entanglement risk or the sub-lethal effects on those whales who become entangled. As such, we support the continued advancement of on-demand gear. However, we acknowledge that on-demand technology remains in development so limiting the strength of rope used in the fishery outside the times of the closure ensures that risk is not increased in the waters of the Commonwealth. As such, we support this measure.
2. Vertical Buoy Line Maximum Diameter for Commercial Trap Gear (322 CMR 12.06). Consistent with our support for the proposed 1,700-lb Breaking Strength Contrivance, we support this measure as it limits rope diameter to what is currently consistently used, therefore ensuring that the impact of an entanglement does not increase.
3. Vertical Buoy Line Maximum Diameter for Recreational Trap Gear (322 CMR 12.06). As stated for the previous two measures, we support this limitation to prevent any potential increases in risk.
4. Prohibition on Single Lobster Traps for Vessels of a Certain Size (322 CMR 12.06). We are not able to quantify the risk reduction of this proposal but agree that this conceptually would reduce vertical line and are therefore supportive. While not stated specifically in the measure, trawls within the Massachusetts State waters must use sinking groundline between the traps, and we ask that be referenced in the language. We do not have information as to why there is a proposed delay for this measure to take effect.

### ***Permitting***

1. Cap on Issuance of Seasonal Lobster Permits (322 CMR 7.01). We are not able to quantify risk reduction by the proposed cap, but agree that a cap on the fishery ensures that risk does not inadvertently increase in the future.

### ***Housekeeping***

We do not oppose any of the four modifications proposed under this section. In addition to these, we request clarification on the current language used for the seasonal gillnet closure. [According to 322CMR 12.04:](#)

(1) Gillnet Closures in Right Whale Critical Habitat and Cape Cod Bay. It is unlawful to fish, store, or abandon gillnets in Critical Habitat **and in waters of Cape Cod Bay west of the Critical Habitat** south of 42° North Latitude during the period January 1st through May 15th. (*emphasis added*).

We are unclear as to what waters are being referenced as “west of the Critical Habitat”. While the 1994 designation for Critical Habitat split within the waters of Cape Cod Bay, the 2016 revision expanded areas covered to include nearly all of the Gulf of Maine including all waters of Cape Cod Bay. We believe the language should be updated to reflect the current definition of critical habitat.

Again, we thank you for the opportunity to comment and for the work of the Massachusetts Division of Marine Fisheries to protect its natural resources and its vibrant commercial fisheries.

Sincerely,

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

December 11, 2020

Dear Director McKiernan,

We submit these comments on behalf of the millions of members and constituents of the Humane Society of the United States (the HSUS) in regard to your request for comments on Proposed amendments to Division of Marine Fisheries regulations at 322 CMR 6.00, 7.00, and 12.00. The proposed amendments seek to reduce seasonal risk of seriously injuring or killing critically endangered North Atlantic right whales while they occupy waters under the jurisdiction of the Commonwealth.<sup>1</sup>

The HSUS has held an appointed seat the National Marine Fisheries Service's (NMFS) Atlantic Large Whale Take Reduction Team (ALWTRT) since its founding in the 1990's. Despite multiple amendments to the federal take reduction plan intended to reduce death and serious injury, right whale continue to die in unsustainable numbers and the species continues to decline.<sup>2</sup> In a presentation to the annual meeting of the Right Whale Consortium, NMFS provided a dire assessment of the abundance and ongoing death rates in right whales, with the decline in female right whales the most marked.<sup>3</sup> It is vital that the Commonwealth act to protect females and their young dependent calves, as right whales have been seen feeding in Massachusetts' waters year-round, with greatest the concentrations found in Cape Cod Bay in the late winter and spring."

---

<sup>1</sup> See annual distributions at NOAA Right Whale Sighting Advisory System at: <https://apps-nefsc.fisheries.noaa.gov/psb/surveys/MapperiframeWithText.html>

<sup>2</sup> NOAA/NMFS 2020. North Atlantic Right Whale in: [U.S. Atlantic and Gulf of Mexico Marine Mammal Stock Assessments, 2019 \(PDF, 479 pages\)](#)

<sup>3</sup> NOAA Fisheries Statement on the Preliminary North Atlantic Right Whale Annual Population Estimate "This year's preliminary estimate is 366 right whales alive as of January 2019. If sustained through peer review, this number would represent a decrease from the estimate reported to the Consortium last year, of 412 right whales alive in January 2018." And "Given the low population numbers (including fewer than 94 breeding females remaining), it is essential that we work together to protect every North Atlantic right whale in order to avoid extinction for this endangered species." Provided to the Atlantic Large Whale Take Reduction Team on 10/26/2020 by Colleen Coogan of NMFS/NERO

The Commonwealth issued a draft of Protected Species Regulations at 322 CMR 6.00, 7.00 and 12.00 Affecting Trap and Gillnet Fishing.<sup>4</sup> We largely agree with the proposed changes, including requirements for trap marking [6.02 (f)]. However, we believe that the dates of the proposed seasonal closure should be of more precautionary duration.

### Seasonal Closure to Protect Right Whales

We request that a closure of the proposed area (in addition to the existing area closed seasonally to trap/pot gear) begin on January 1 of each year and extend through at least May 15 unless aerial surveys have verified that there are fewer than 3 right whales remaining in the closed area over a period of at least 5 days, rather than re-opening automatically on April 30 as proposed. The federal prohibitions are based on a longitudinal data base of sightings in Cape Cod Bay that does not always capture the actual use of the Commonwealth's waters.<sup>5</sup> Because right whales often linger in Massachusetts waters, the Commonwealth has, in several years, had to extend the restricted times/ areas; including an extension earlier this year when the presence of right whales required an extension of protections into the month of May.<sup>6</sup> It is important that the dates of the precautionary closure capture the times when right whales have been reliably documented in Cape Cod Bay and coastal waters of Massachusetts. Moreover, we strongly support a proposed amendment of the regulations that would enlarge the area that would be subject to the current Large Whale Seasonal Trap Gear Closure, making it applicable to all waters under jurisdiction of the Commonwealth (i.e. the proposed amendment to 322 CMR 12.04, 12.08, and 12.11). Our organization strongly supports this proposed amendment to increase the area covered by the current Large Whale Seasonal Trap Gear Closure to include all waters of the Commonwealth.

### Additional Measures

We support the Commonwealth having the ability to extend the closure if right whales remain longer than anticipated in Massachusetts state waters (i.e., the proposal for Fixed Gear Closure Extensions in 322 CMR 12.04).

The HSUS also supports the Commonwealth's proposal for a seasonal gillnet closure in Cape Cod Bay (322 CMR 12.04, 12.08, and 12.12).

We also support other aspects of the state's proposal, designed to reduce risk of potentially fatal entanglements. That is, we support the proposed Prohibition on Single Lobster Traps for Vessels of a Certain Size (322 CMR 12.06) and proposals regulating Vertical Buoy Line Maximum Diameter for Commercial Trap Gear (322 CMR 12.06).

---

<sup>4</sup> <https://www.mass.gov/service-details/proposed-amendments-to-division-of-marine-fisheries-regulations>

<sup>5</sup> The National Marine Fisheries Service's regulatory closure of the Cape Cod Bay Restricted Area includes Cape Cod Bay and portions of the Outer Cape. The Massachusetts Restricted Area, is closed for a portion of the year (January 1-April 30)

<sup>6</sup> See for example: Cape Cod Bay Restrictions Extended to Protect Right Whale Calves. Cape and Islands News. April 29, 2020. At: <https://www.capeandislands.org/post/cape-cod-bay-restrictions-extended-protect-right-whale-calves#stream/0>

**THE HUMANE SOCIETY  
OF THE UNITED STATES**

Thank you for taking swift and strong action to protect critically endangered North Atlantic Right whales whose survival relies on their safety while feeding and foraging seasonally in waters of the Commonwealth.

RE: Proposed Regulations Affecting Trap and Gillnet Fishing

Dear Mr. McKiernan,

I attended the December 8<sup>th</sup> zoom hearing regarding the proposed closure of commercial trap gear in all state waters. I understand the State is up against the whale restrictions and is working to help the endangered species. In doing so however, the State's actions are negatively affecting the commercial lobster industry. If the closure takes effect, I will lose out on at least three months' worth of commercial lobster fishing in state waters. Not only will I lose out on that two months' worth of income, but I employ two sternman who will also lose that income.

With all of the past regulations imposed against the lobster fisherman due to the whale issues, our industry has been hit hard and limited in being able to conduct our business. We have already had to adapt our business to protect the whales with such measures as breakaway rope and our MA Lobsterman's Association has spent thousands of dollars in litigation against whale litigation. At some point, human lives and businesses must be prioritized. There is no other fishery that we can work during the three proposed months of closure so we have no ability to make up for that lost work and income.

I urge you to consider the lobster industry and do whatever possible to sustain our businesses.

Sincerely,

*Chad Mahoney*

Dear Director McKiernan:

As a concerned Massachusetts resident, I fear the North Atlantic right whale may go extinct in my lifetime. North Atlantic right whales are dying due to human actions. The DoMF, alongside NOAA, has the opportunity to make the necessary changes to save this species. I am glad to see our commonwealth is taking necessary steps to ensure the protection and survival of right whales by proposing new regulations for commercial fixed gear fisheries and recreational lobster and crab trap fisheries. Some of the changes I support include:

- Expanded closures for trap fisheries in all of Massachusetts waters.
- A new closed season for the buoyed recreational lobster and crab trap fishery.
- The DoMF retaining the ability to extend these closures based on North Atlantic right whale sightings.
- A marking system that will differentiate the gear that may be lawfully used in Massachusetts from heavier gear that may be used in the offshore exclusive economic zone or Canada.

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

Sincerely,

### ***Fixed Gear Closures***

#### ***4 Recreational Lobsters and Crap Trap Gear Haul-Out Season***

*From Labor Day to Memorial Day -The reasoning is that they haul gear on weekends after Labor Day the weather starts to come up so if they can't haul gear on the weekends it will go onto the following weekend and so on and I think this will help with the ghost gear over the winter.*

### ***Trap Gear Modification and Restrictions***

#### ***4 Prohibition on Single Lobster Traps for Vessels of a Certain Size***

*All with overall length of 29' or greater - Proposal if fishing single traps to use breaking strength of 300 pounds this will be way less poundage than proposed. I do not think vessels 29' should be exempt in our area most of the boats that fish for lobsters in our area are under 29' very few boats are over 29' it should be all or nothing. For over 30 years I fished singles and I built a bigger boat for safety reasons due to health problems which is documented handicap and now I will have to hire more people and It will cut into my bottom line which I cannot afford and it would be impossible for me to fish trawls I tried fishing trawls with the bigger boat and got caught in the line and got dragged to the stern luckily it was not a open stern boat. The past eight years have I used these breakaways and gear lost was minimal and gear lost was to fishermen and boats. The state has always been the leader in most Regulations and I feel this is a little overboard.*

Hello Daniel,

My name is Wanda Sisum DVM and I have volunteered with IFAW for years. It was through them that I had a link to your hearing. I was simply wondering if there could ever be state or federal tax incentives to help fishermen switch to ropeless technology in order to offset the cost. Like what we get for using solar panels. Have you thought of tapping MIT students to come up with a tech that wouldn't cost as much yet be functional?

It's great to have the lines break at 1700lbs but my concern is we are going to wind up with a lot more lost gear in the water as whales break these lines, which will also cost the fishermen money. It just seems ropeless is what we should be ultimately striving for.

I'm sure you're very busy so I don't need a reply, just wanted to share my thoughts. Thank you for your efforts.

I am not an expert. I just love the right whales and am pleased when I see them on the cape. I appreciate continued movement toward protecting these whales.

My worry is that whales of all sizes and ages can get entangled and 1700 break ropes might not protect the youngest and/or smallest of whales.

Also, I think that 1700 break ropes **MUST** be studied afterwards if this goes into effect. You **HAVE** to collect data on these ropes to see if the change is actually effective.

I have learned that ropeless fishing is possible and would make an enormous difference in the protection of the whales. This would probably be very expensive for fisherman so maybe there could be incentives and help for impacted fisherman.

But on the other hand, I think that some sort of accountability should be put in place. Maybe all ropes have to be tagged with an ID number or something so that fisherman who's ropes get entangled with a whale are alerted and then we'll know where the lines were placed, etc.

George Conlow

**CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.**

Good morning Dan,

I attended last evening's virtual public hearing and wanted to circle back on comments made regarding the cost and availability of the South Shore sleeve for creating reduced break strength vertical lines. Some mention was made that DFW had obtained some 4000 sleeves recently and I was glad to hear that the sleeves had been provided in a timely fashion (two weeks was what I heard). What I was distressed about was the statement that the sleeves may cost fishermen over \$5 per 6' sleeve. I was called this morning by a lobsterman from the Nahant saying that nobody would buy or use the sleeves at a cost of \$5 per sleeve but would instead simply tie a knot in the line OR splice in a ¼" rope section into their vertical lines. I believe whoever came up with that sort of price was either misinformed OR in the case of the DFW purchase, perhaps the dealer that sold the sleeves may have thought that the Mass government would pay whatever they asked for and was selling the sleeves to you at a substantial profit.

While our company, being a Canadian company and sells only to wholesale distributors, can't set pricing for consumers or sell direct to the fishermen in the Commonwealth, I can assure you that the current wholesale price of the sleeves would allow for a healthy profit margin at the distributor level while keeping the cost per sleeve to the fisherman under \$2.50 even with a keystone markup. I will also add that the sleeves are cut to 6' lengths and that recent studies by Amy Knowlton, et al in 2018 indicated that the sleeves were still effective on 3/8" rope when cut to a 3' length. Doing so would make the sleeve far more affordable with up to 96 sleeves that could be rendered from the stock package. I would advocate that sleeves being used on 5/16" line should not be cut short as that may reduce the grip the sleeve can exert of the smaller diameter ropes when not under tension.

Additionally, while not directly a part of the current regulatory proposal, the elephant in the room with acquiring new gear for the fishery must contain language that addresses gear marking.

Whether it is the red rope, the candy stripe rope, or our rope sleeves being used to identify gear used in state waters, you really should not expect a company or fishermen to spend substantial amount of time and money creating vertical lines to comply with proposed regulations in a very short period of time and then pull the rug out from under them saying that they need to modify the

gear again to accommodate a color change regulation. As a manufacturer, we have limited selection of colored yarns that can be used to make the sleeves and still achieve the desired break strength mandated by state and possibly federal regulators. I suspect that would be the case with the 3 strand rope that Beth Casoni has been involved with acquiring.

Finally, I am somewhat concerned that as a participant in the development of the contrivance used to mitigate whale entanglements, that nobody from the Commonwealth, other than Rob Martin has included Novabraid in any discussions as to how we can work together to have solutions in place when regulations are implemented. The sleeve solution to minimizing whale entanglements has literally been available for 5 years and our efforts to date have included a substantial amount of R&D, public involvement, and interaction with a wide range of industry associations and scientific researchers all at a substantial cost to our company. To be fair, we would not have undertaken any of these initiatives if we didn't strive to offer a solution to keep lobstermen on the water while keeping the whales safe within their habitat. I welcome any opportunity to be included in future discussions and interactions with your agency with regards to providing solutions to the whale entanglement issues at hand.

Respectfully yours,

Chuck Gilchrest

**Subject:** Proposed lobster closure  
**Importance:** High

I am a little confused by the proposed closure of area 2 to winter fishing for lobsters. This is for the most part the only time of the year that small scale state lobstermen from Buzzards Bay area catch lobsters in the inshore fishery. Additionally, interaction with right whales in this area is nearly non-existent. I have several friends who are state licensed commercial lobstermen who fish the winter fishery who will be decimated by this.

I can understand restrictions in area 1 (Cape Cod Bay), as I have seen the whales many times from February until about May 1 both from the air and from the boat. I have never seen a right whale in Buzzards Bay or anywhere near the Elizabeth Island chain or Martha's Vineyard.

The fishery for lobsters in MA is unique, those that fish north of the Cape and Cape Cod Bay start fishing in May/June and haul out in November/December. Whereas, those that fish Buzzards Bay and around the Elizabeth Islands and the Vineyard set gear in November/December and haul the gear out in April/May. If this proposal is accepted, the lobstermen of SE Mass will be out of business for a problem that does not exist.

I am not fishing for lobsters in area 2, but I do recognize when a proposal is unfounded and the damage it can do is severe at time when all fisherman are feeling strains due to COVID-19.

Thank you for your time!!

Have a great day!!

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

[add more here]

**Date:** Tuesday, December 8, 2020 10:42:48 PM

---

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

The following is my public comment on proposed regulations effecting fixed gear fisheries that occur in Massachusetts state water and are regulated by Massachusetts Division of Marine Fisheries. I will keep this as brief as possible since the fine details of each part could be debated extensively and I assume that there are plenty of other comments to read.

Regarding further fixed gear closures: What DMF has been doing (dynamic closures) has been working rather well, lets not add more draconian measures just to appease the myriad of egos who think they know better than everyone else. This (lobstering) is already turning into more of a derby fishery, lets not further compound that. The current dynamic closure seems to work ok, I don't see how more closures will help. DMF has been doing a good job to the best of its ability.

Regarding Recreational Lobster/Crab Fishery Haul Out Season: This should have been in effect decades ago. If the traps are there much after Labor Day they are probably being abandoned. Doesn't Maine have a five trap limit for recreational lobstering? That seems like something we could all have an honest discussion about. Maybe we should consider that.

Conch Pot Haul-Out Period: Does anyone even catch conchs where whales of any type occur in Massachusetts state waters? Why are the 'turtle huggers' so hot to try and limit the conch fishery? Does anyone here even catch conchs in the spring? How about we just let the current conch rules stay the way they are without any further closures, unless the area to be fished is the same as where a lobster haul out period is occurring. Does that make sense to anyone?

1700-lb. Breaking Strength Contrivance and Vertical Line Maximum Diameter for commercial: I personally think this is rather redundant considering that we are already using mandatory 600-lb. breakaways by the buoy. I did test the 1700-lb. breaking strength line and although it is OK. I think we could just simplify this proposed rule with a maximum line diameter rule instead of a lengthy set of regulations involving breaking strength maximums and weak contrivances. If we are forced by the engo machine and NOAA into going the contrivance route, then lets leave all the available options open so we can all use what we think is best. I personally don't want to go with the 'south shore sleeve' option myself, but that may work for other people. Lets leave all options open if we are forced into it, but it would be simpler to just make a maximum diameter vertical line rule. 3/8" for trawls, 5/16" for singles seems reasonable.

Vertical Line Maximum Diameter For Recreational: I agree. 5/16" or smaller

Prohibition on Single Lobster Traps for Vessels of A Certain Size: This is highly discriminatory and will cause further consolidation in the industry. Fishing singles evens a competitive playing field for people with smaller boats or people who fish alone. We have seen a lot of over capitalization in the industry with money flowing in from other places than fishing. Allowing the greediest, best funded people to take over is not ok. Also, competition for bottom is already ugly. It will be way worse if everyone is trying to cram trawls into the same 8 depth contours. Frankly, anyone who wants to fish singles, which are proven by all available science to be much safer for whales and always have lower diameter buoy lines, should be allowed. If you want a maximum size vessel for singles, lets go with what ever Jeffery Souza's new vessel length is, 45' I believe. That would leave plenty of leeway for everyone. It is going to be a complete horror show if everyone goes to trawls in the coastal lobster fishery. People should be allowed to fish the gear configuration that they deem reasonable, singles or trawls. I personally think multiple traps fished on

one buoy line also will have a lot of issues. I fish singles and trawls.

Cap on Seasonal (student) Lobster Permits: That seems reasonable given the data related to it and the fact that the permits turn over in reasonable amounts of time.

Ropeless fishing: It is not going to work. Not because we (fishermen) are all resistant to it, but because it will not work. The end result is really expensive ghost gear, and (maybe) retrieval by the use of a grapple. The technology isn't there, and the people pushing the technology are either clueless, or chasing grant money and dollar signs. I personally am deeply convinced that Desert Star Systems and Woods Hole group are up to forcing vessel monitoring upon us, and that this push is backed by powerful egos, who most likely have skin in the game and money to gain by it being shoved down our throats. Woods Hole Group is partnered with Desert Star Systems to build hopeless fishing technology. Despite their best efforts to create a fairy tale that ropeless fishing will work great, that we all want it, and that we will save money by using it, those are all false statements made on purpose. Even the eco-terrorist Richard "Max" Strahan says the right whales will go extinct if there are zero vertical lines in the whole Atlantic, so what are really we debating here. We (fishermen) have all bent over backwards to do our part, and made great results (600-lb. Breakaways). I think all fishermen see themselves as stewards of the ocean, much more than engo employees for that matter. But we have limits, and ropeless fishing is it. Anyone (fisherman) who is saying they want ropeless fishing must be getting paid to say it. My spell check keeps changing ropeless to hopeless. That seems pretty astute.

I will have more comments after I watch the meetings.

Thank You,

Brendan Adams

Dear Mr. McKiernan -

Thank you for your efforts to protect Right Whales. The proposed regulations are insufficient and do not completely address the issue of entanglements, the leading cause of right whale deaths. 85% of right whales have been entangled at least once in their lives, and over half of the population has been entangled more than once. We need to get rope out of the water—and fast. Ropeless fishing gear can help solve the problem of right whale entanglements, while helping the fishing industry thrive. A pathway towards advancing ropeless gear permitting is currently not being considered by DMF in its draft regulations.

Thank you.

Dear Director McKiernan,

As a marine animal rescue volunteer for Mystic Aquarium, I am thrilled and humbled every time I have the privilege of participating in a rescue. As you know, Right whales are in danger from boat strikes, nets and ropes. I agree that our intrepid fisherpeople need to make their living from gathering fish but they should not be using methods dangerous to creatures for which they are not gathering. Let's remove the methods that are dangerous - not just to Right whales but to all species in our beloved Atlantic. Dolphins, sea turtles, mahi mahi and many others are killed by these abandoned materials for no reason other than carelessness. Let's build a more responsible culture where leaving any kind of line (fishing line, ropes, nets, the whole range) in or near the ocean and carelessly striking a marine animal are crimes that are actively enforced. Maybe nets etc should have tracking devices on them? A decrease in speed limits would make spotting animals under the surface a lot easier. There have to be other fishing towns that can supply other modern ideas which have brought success, which can be used here. Let's not lose one more endangered animal.

Thank you.

Shannon Kelley

Dan,

I am amazed and perplexed by your comments about ropeless fishing technology. I would like to meet with you and discuss our Ropeless system with you. Our system is commercially available and addresses the problem of set over and gear conflicts with mobile fishing gear. For just \$25 anyone on the water with a cell phone and our Trap Tracker application can virtually see where our ropeless gear has been set. There is a group pushing the false narrative that marking gear at the surface is not good enough but that is just not accurate. We have test results that shows in fact, ropeless gear does not move during storms like buoyed gear would move.

You are promoting the use of weak rope/links when as far as I know, there is no scientific data that weak rope would even work. Has anyone done a test on a right whale to determine how they pull when entangled on a trap? From what I know that 1700 Lb. number was interpolated from what a navy dolphin can pull.

Weak links if they actually worked will still leave thousands of traps on the bottom ghost fishing.

Best Regards,

Dear Director Daniel McKiernan,

I attended the public hearing tonight and I'm just a retired physical therapist who doesn't understand the ins and outs of fishing gear, after visiting <https://ropelessforrightwhales.com/>, I just want to add my voice to encourage ropeless gear because it seems like that type of gear is less harmful to whales. Thanks and have a nice day.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Good Evening Dan. I hope all is well in your world. This is Eric Knowles, out on Cape Cod. As a Nauset fisherman I'm sure you realize our position with singles. I am sure the findings of the ASMFC meeting in the winter of 2014 , or 2015 when we first really fought the single/trawl issue have been brought to light ? The findings showed trawl and gillnet to be over 80 % of entanglements with singles being in the single digits percentage wise. I understand that decreasing the occurrence of incidental takes could help, but switching to a manner of fishing that is more deadly seems to undercut the goal. I know we are in a tight spot with this and maybe we have to give them what they want to allow us to fish this year, BUT...If the end result is about the whales and not personal agenda then the facts have already spoken in regards to singles , haven't they?

Sincerely,  
Eric Knowles

P.S. Thanks for your service over the years. You've been nothing but helpful in our fight.

To whom it may concern,

I am writing from Maine today with my concern on your proposed fishing regulations concerning the whales. I feel this is a waste of my time as if you as experts cannot see the damage of your own work I'm not sure I can help you. The stats are there, the answer to fish safely without harm is there with a great alternative but yet you take the money train? The harmful way? The destructive long term way? I guess I'm just a dumb lady that grew up with a Dad that was Coast Guard/ Navy for 17 years and world tours across the seas and saw it all-Nope , let's leave this to the experts- be those people please and reconsider.

Thank You and Praying you'll prove me wrong and do the right thing for all Gods creatures. Sincerely  
Bonnie Frank

During these economic times, how can MA consider closing lobstering on the South Coast?

Small businesses in these communities will go out of business if this goes into effect.

Please reconsider at tonight's hearing.

Dear Director Daniel McKiernan:

I am a retired marine scientist and grassroots environmental activist living on Cape Cod. I have been engaged in the NOAA Fisheries GARFO (Greater Atlantic Regional Fisheries Office) dialog on large whale mortalities from entanglements in American lobster pot gear (i.e. Unusual Mortality Event under the Marine Mammal Protection Act). I attended a public hearing in Bourne, Ma. on the plan proposed by the Atlantic Large Whale Take Reduction Team to reduce North Atlantic large whale mortalities below one per year. Marine Mammal ENGOs challenged this plan in court and I gather that NOAA Fisheries will have to conduct an EIS (Environmental Impact Statement) as part of a new plan to reduce mortalities. Many of these NARW mortalities occur in the Gulf of Maine/St. Lawrence and further offshore in deeper waters as the NARWs and American lobster shift their distribution in space and time as inshore waters respond to climate change; increased ocean noise; incompatible uses of ocean space (wind farms; large transportation vessels; US Navy training); etc.

Even though I was impressed at the Bourne meeting on the actions taken in Massachusetts state jurisdictional waters (0-3 miles) by Ma. DMF and lobster fishing organizations (which are expanded in these proposed regulations on trap and gill net fishing effects on protected species), it is hard to evaluate their adequacy in light of Marine Mammal ENGO Lawsuit/NOAA Fisheries EIS on their NARW Management Plan. Added to this uncertainty is the Bureau of Ocean Energy Management Supplemental EIS on the Vineyard Wind 1 project in which the cumulative environmental impact assessment of the 20 wind farms to be built between North Carolina and New England between now and 2030 indicated potential negative effects on NARWs and fisheries management. During my time at the Northeast Fisheries Science Center- Woods Hole Laboratory, I served as Recreational Fisheries Coordinator; was a member of the New England Fishery Management Council's Habitat Plan Development Team which helped develop Omnibus Habitat Amendment 2 (released in 2018); served on a Task Force on Reauthorization of the MMPA in the mid-1990's and participated in the EMaX carbon flow model for the Northeast Continental Shelf Ecosystem.

The recent NOAA Fisheries 2020 State of the Ecosystem Report for the Mid-Atlantic and New England regions pointed out that climate change effects on the marine pelagic ecosystem would effect both Living Marine and Protected Resources management/conservation. The changes in the Gulf of of Maine (which includes Cape Cod Bay) illustrates some of the consequence of rapid warming in the surface waters from Spring through the Fall on both the plankton at the base of the food chain (microbial and grazing food chains) and top down changes in predation/competition as predators and their prey shift in space and time. I would hope that the Ma. DMF and its constituents develop some type of adaptive, ecosystems-based management approach to address

these complex changes in the ecosystem that supports both NARWs and American lobster pot fishing. In recent years, periodic benthic anoxia events in the bottom waters of Cape Cod Bay have killed lobsters in their pots. This anoxia is likely due to a combination of nitrogen enrichment; increased ocean acidity and warming waters and shifts in ocean circulation. This has led to a complex, dynamic ecosystem with non-linear interactions which runs contrary to the assumptions of the Northeast Atlantic Regional Ecosystem conceptual model (steady state ecosystem which is at equilibrium with environmental/human stressors).

Since I retired in 2009, I don't know what types of monitoring programs and NARW research efforts have been put in place to reduce mortalities from entanglements in lobster pot gear. The long term solution is obviously ropeless lobster gear, but I don't know if this is ready to be implemented in a cost effective fashion by the American lobstermen/women fishing in state jurisdictional waters. A team of scientists from Rutgers University; University of Rhode Island and the Woods Hole Oceanographic Institution are exploring the effects off of Atlantic City, NJ on NARWs. The NOAA Fisheries GARFO Protected Species Office has developed some new management tools (i.e. scenario analysis) to help convert monitoring and scientific studies of NARWs/lobster fishing into information useful for resource managers and their constituents. I have no idea what capability Ma. DMF has in this area for converting monitoring/scientific research data into useful information to support their proposed regulations on how trap and gill net fishing effects protective species conservation. When I chaired two Fishery/Ecosystem monitoring Task Forces at the NEFSC, we faced the challenge of being data rich, but information poor when it came to supporting a, EbM for managing lobster fishing and conserving NARWs.

Given the limited resources (\$ and people) available to the Ma. DMF, I would recommend forming partnerships with other entities: Gulf of Maine Council on the Marine Environment; academic researchers; ENGOS and marine conservation entities; fishing organizations to find out changes in the distribution of NARWs/lobster fishing hot spots; the NOAA Fisheries Protected Species scientists/regulators; other Federal entities (BOEM and US Navy) ; etc.). Since the NARW population is down to 360 (?) animals or a hundred below their recovery target, we face an existential crisis which requires input from a variety of sources to reduce NARW mortality from lobster gear entanglements below one animal per year and increasing the calving rate of mature females, so that the population starts to rebuild once again. Thus in my view the proposed regulations are a step in the right direction, but may not be adequate to restore the population of critically endangered species like the NARW. It could help Humpback and Sperm whales which are also suffering as part of the UME crisis.

Thanks for your consideration of these comments.

Dr. David D. Dow  
East Falmouth, Ma.

**From:** [Chris Ecklund](#)  
**To:** [Fish, Marine \(FWE\)](#)  
**Subject:** Help us Save The North Atlantic right whale  
**Date:** Tuesday, December 8, 2020 10:01:44 AM

---

**CAUTION:** This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

My family and I vacationed for 25 years on Cape Cod. We came every summer because of the natural beauty of the landscape and the incredible wildlife in the area. We also valued the appreciation that the majority of Cape Cod inhabitants demonstrated for their environment and the creatures that make their home here. It's why we chose to retire here full time. However, we now have a large concern about the recent proposed state's measures to reduce the impact of fishery entanglement on right whales, and other marine species. They are not sufficient to have the impact necessary to save the North Atlantic right whale.

The majestic North Atlantic right whale is at risk of extinction. The primary causes of death for right whales are ship strikes and entanglements. *No right whale has died of natural causes in the past 17 years.* I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales. The proposed regulations are simply not enough to address the entanglement risks that right whales face in our Massachusetts' waters.

The East Coast has over one million vertical lines that right whales must navigate through in order to feed. This includes Massachusetts state waters. These ropes pose a large threat of entanglement for our state marine mammal, the North Atlantic right whale and therefore increase the likelihood of extinction.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at only 366, is rapidly declining. We could cause and see the extinction of right whales in our lifetime, but we can stop it!

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. Draft regulations would only require using 1700 lb. breakable rope for fishing lines attached to trap pots. This is not enough. Breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles further reducing their numbers and long-term sustainability. To protect the North Atlantic Right Whale this proposal must be revised entirely, and provide for ropeless fishing to become legal in Massachusetts.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. Extensive data indicate ropeless fishing gear has a 98.4 percent success rate, and multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today and keep the fishing industry healthy while protecting sea mammals including the North Atlantic right whale.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping our fisherman and the fishing industry viable. Please implement measures that incorporate ropeless gear pilot programs in order to save the North Atlantic right whale. We can make a difference if we act now.

Thank you.

Dear Director McKiernan:

As a concerned Massachusetts resident, I fear the North Atlantic right whale may go extinct in my lifetime. North Atlantic right whales are dying due to human actions. The DoMF, alongside NOAA, has the opportunity to make the necessary changes to save this species. I am glad to see our commonwealth is taking necessary steps to ensure the protection and survival of right whales by proposing new regulations for commercial fixed gear fisheries and recreational lobster and crab trap fisheries. Some of the changes I support include:

- Expanded closures for trap fisheries in all of Massachusetts waters.
- A new closed season for the buoyed recreational lobster and crab trap fishery.
- The DoMF retaining the ability to extend these closures based on North Atlantic right whale sightings.
- A marking system that will differentiate the gear that may be lawfully used in Massachusetts from heavier gear that may be used in the offshore exclusive economic zone or Canada.

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

Sincerely,

Samantha Greene

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

Dear Director McKiernan:

As a concerned Massachusetts resident, I fear the North Atlantic right whale may go extinct in my lifetime. North Atlantic right whales are dying due to human actions. The DoMF, alongside NOAA, has the opportunity to make the necessary changes to save this species. I am glad to see our commonwealth is taking necessary steps to ensure the protection and survival of right whales by proposing new regulations for commercial fixed gear fisheries and recreational lobster and crab trap fisheries. Some of the changes I support include:

- Expanded closures for trap fisheries in all of Massachusetts waters.
- A new closed season for the buoyed recreational lobster and crab trap fishery.
- The DoMF retaining the ability to extend these closures based on North Atlantic right whale sightings.
- A marking system that will differentiate the gear that may be lawfully used in Massachusetts from heavier gear that may be used in the offshore exclusive economic zone or Canada.

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

Sincerely,

Attention:  
Daniel McKiernan

Dear Mr. McKiernan,

Re: Recreational Lobster and Crab Trap Gear Haul-Out Season

I am writing to protest the late opening of the recreational lobster season.

I spent many years as a commercial fisherman on Martha's Vineyard and have fished for lobsters recreationally for fifty years in the waters around the north shore of the island, as well as in the Nomans Island area. As a rule, I begin fishing my ten traps in early April and haul out in late August or early September when the lobsters become scarce and the autumn storms ramp up. I have found that the fishing in April is far better than anything past the first of September.

I don't believe that all Commonwealth waters need to be treated the same. In all the years that I have been fishing, I have never seen a whale of any kind in 15 to 20 feet of water, close to shore, where my traps are located.

If you must set haul-out dates, I urge you to consider setting the closed season dates to September 15 to April 15. The April 15 date is close to the existing Large Whale Seasonal Trap Gear Closure opening. The September 15 date is beyond the date that most recreational fishermen have hauled out and it accomplishes the goal of allowing time to identify and remove abandoned gear.

Thank you for your consideration.

Sincerely yours,

David B. Tilton Sr

Hello Mass Fish,

Per whale and dolphin conservation there is an alarm at the gate!

- \* Fewer than 360 Right Whales remain
- \* 26 whales have died since 4/17
- \* The species is in decline
- \* No calves were reported during the 2018 calving seasons
- \* The leading cause of death are entanglements in fishing gear and vessel strikes

The recovery of large whales is one of the key elements to combating climate change and saving our children's future. Emerging research has shown that whales act as ecosystem engineers and provide much needed nutrients to phytoplankton. Phytoplankton creates at least 50% of our oxygen. Whales also sequester hundreds of thousands of tons of carbon and provide base for the marine food web leading to abundant fish stock.

We have a moral obligation to leave this planet in better condition for future generations.

Sincerely,  
David

To Whom it May Concern:

I am a veterinarian living and practicing in Massachusetts and I spend a couple weeks each summer vacationing on Cape Cod with my husband and 3 kids. Each year we head out of Provincetown on a whale watch with the Center for Coastal Studies and we become thoroughly captivated by the whales and their peaceful beauty. We are deeply concerned about increasing protection for right whales in particular because their numbers are declining. I want my children to be able to bring their own children to see the whales some day.

So I am writing to express our family's deep concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Good morning-

As a teacher, I am always looking for a way to grow and learn. I have an especially fond memory of working with my nephew on a "research" project. He was 11 at the time and had been assigned the task of learning about a species of concern. He had chosen the Right Whale.

As I recall, we connected with work that was being led by the New England Aquarium. He was excited by the prospect of emailing questions to them.

Since I was a very small part of his project, I do not know what became of his effort. But I do know that his excitement was genuine- to have found an organization that was working to help the Right Whale; to protect the population and educate a population.

Now, more than a decade later, my home state of Massachusetts has the same opportunity- to right a terrible wrong- entangled Right Whales.

In my nephew's lifetime, in only a decade, we have LOST more whales, then gained.

Please.

Right this wrong!

Use your common sense-

The Right Whale is our collective responsibility generation to generation.

Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Dear DMF People,

We don't have much time to save the right whales unless we address the issue of entanglements, the leading cause of their deaths.

Please let's get as much rope out of the water as we can.

Please consider this issue in your draft regulations. We must figure out a quick path to ropeless gear as soon as possible!

We have no time to waste to save the right whales.

Sincerely,

Rebecca

For the Division's consideration as a public comment,

As a Newton Wellesley baby, I've always taken pride in my Massachusetts heritage, given the Commonwealth's efforts to lead the way in respecting the dignity and lives of all. Yet these efforts are threatened with the current draft regulations proposed by the Division of Marine Fisheries today. I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

To Daniel McKiernan,

We oppose the proposed regulation changes 322 CMR 12.06; that would restrict single lobster trap fishing by vessels 29 ft or larger. Many responsible captains on Cape Cod would be put out of business.

Also right whales are not present in Cape Cod Bay during lobstering season as shown by aerial imaging.

Keep these Cape Cod families in business please.

Sincerely,

Eileen and Steve Hall

As caretakers of our planet, we have a social and moral responsibility to maintain and preserve it. Whales play an essential part in the sustaining and preserving of our environment and all its species, including humans. Whales provide at least half of the oxygen we breathe. They combat climate change by cycling carbon from the atmosphere and they sustain fish stocks to name a few. Whales' importance cannot be overstated. With about 400 right whales left in existence, time is of the essence to act now to save the species. Please help save the Atlantic Right Whales. They are our future

I oppose the proposal which would prohibit fishing single Lobster Traps for Vessels of a Certain Size (29 feet or larger) (322 CMR 12.06).

It is not right to force someone out of the fishery because the size of the boat they fish on is a few feet longer than the boats fishing around them. Further, there are no right whales in Cape Cod Bay during the open lobster season (aerial surveys prove this). This proposal makes no sense for this area.

Sincerely,

Sarah L. Roughneen

Dear Director McKiernan,

The proposed regulations are insufficient and do not completely address the issue of entanglements, the leading cause of right whale deaths. 85% of right whales have been entangled at least once in their lives, and over half of the population has been entangled more than once. This is horrifying, and should not be allowed to continue.

We need to get rope out of the water as soon as possible. Ropeless fishing gear can help solve the problem of right whale entanglements, while helping the fishing industry thrive. A pathway towards advancing ropeless gear permitting is currently not being considered by DMF in its draft regulations. I urge you to address this issue in the finalization of the regulations now under consideration for final approval.

Respectfully,  
Gwendolyn Speeth

My name is David Demski permit number 007023 fished area 2 for years full time only job. I have supported a closure for years to give eco system a rest and get lost gear retrieved from the bottom more importantly get traps without tags confiscated. I question how you will enforce this??? Fisherman will use short lines, small bouys and haul at slack tide most do this now in Gosnold and fish 2 miles from shore instead of three and law has never really been done. The EPO'S have a huge hurdle to cross cause lots of area to cover in the state especially in winter with little man power/knowledge.

Director Daniel McKiernan,

I oppose the proposal that would prohibit fishing single Lobster Traps for Vessels of 29 feet or larger (322 CMR 12.06). If the captain fishes alone, setting trawls by himself, it would be too dangerous and labor intensive. This rule is senseless as there are no right whales in the bay during the summer lobster season which starts in the spring after the state has performed aerial surveys and determined that the right whales have left the bay to continue their northern migration to Canada. The right whale entanglements that everyone wants to eliminate occur primarily in the offshore fisheries between Florida and Canada with the Canadian snow crab fishery being a known problem. It isn't right to force someone out of the fishery just because the size of the boat they fish on is a few feet longer than the boats fishing around them. There are no right whales in Cape Cod Bay during the open lobster season (aerial surveys prove this) so this proposal makes no sense for this area.

Thank you,  
Dan and Danielle Marquardt  
120 Shore Drive, Dennis, Ma

Hello Daniel

I am a recreational fisherman that is on the water as early as possible in the Spring and one of the last boats to pull out in the Fall. One of the things I love the most about early season boating is that Salem Sound is relatively uncrowded until Memorial Day weekend. And late season boating also has the benefits of limited crowds.

I am against proposal 322 CMR 6.02 that will limit my ability to set my lobster traps in Salem Sound.

I understand the need to clear lobster gear from areas frequented by right whales. But this proposal does not adequately address the areas frequented by right whales.

Thank you

Matthew

I oppose the restriction of recreational lobster fishing (322CMR 6.02) with the closure shortly after Columbus Day. If you wanted to make it coincide with Thanksgiving, that would be more acceptable. There is still active fishing time through October in inshore waters, and with the waters warming catch into mid November is occurring.

Dear Director McKiernan,

I am writing to submit my comment related to the new proposed regulations for protected species.

I understand the hardship that these new regulations may place on fixed gear fishermen, yet my understanding is that there are much harsher proposals out there for consideration. Given the federal requirements to protect endangered species, these regulations seem reasonable and a better alternative to some of the ideas being floated out there (including no vertical lines).

In terms of the impact to recreations fishermen like myself, mid-late October and early November is one of the best times we have for recreational lobstering. However, I am happy to absorb this limitation if it is believed that it will positively impact the goal of protecting endangered species.

Thank you for allowing this public comment, and an even larger thank you for the hard work and dedication that you and your entire staff offer towards protecting the amazing public resources all of us who enjoy and earn our living from.

Sincerely,

**Subject:** Time is Running Out to Help Save Right Whales

There are less than 366 North Atlantic right whales left. Take action today to help save them.

**Help Us Save Right Whales in MA: Act NOW**

Image

## **Tell Massachusetts to Save Right Whales**

The Massachusetts Division of Marine Fisheries just released draft regulations to protect right whales that migrate off our coast. These proposed regulations are insufficient and do not completely address the issue of entanglements, the leading cause of right whale deaths. 85% of right whales have been entangled at least once in their lives, and over half of the population has been entangled more than once.

We need to get rope out of the water—and fast. Ropeless fishing gear can help solve the problem of right whale entanglements, while helping the fishing industry thrive. A pathway towards advancing ropeless gear permitting is currently not being considered by DMF in its draft regulations.

**The Massachusetts Division of Marine Fisheries is also accepting comments on the draft regulations until 12/18. Submit a comment to DMF today and share your thoughts. We don't have time to waste to save right whales.**

SEND COMMENTS

Image

Image

## Attend a Public Hearing

The right whale population is dwindling: scientists estimate that there are only 366 left.  
Now is the time to act.

**Sign up to attend a hearing and tell DMF that we need greater measures in order to save right whales from extinction.**

As a subsistence lobster fisherman I strongly oppose a seasonal restriction on Recreational lobstering.

No logical argument can be made that curtailing the season for "recreational lobster fishing" can contribute to the protection of endangered Right Whales. While recreational lobstering can occur out to 3 miles me and other local families in my Northshore community NEVER fish that far out, but stay inside the local rivers and sounds.

I motion that you strike this idea from the proposed legislation

Dear Director McKiernan:

As a concerned Massachusetts resident, I fear the North Atlantic right whale may go extinct in my lifetime. North Atlantic right whales are dying due to human actions. The DoMF, alongside NOAA, has the opportunity to make the necessary changes to save this species. I am glad to see our commonwealth is taking necessary steps to ensure the protection and survival of right whales by proposing new regulations for commercial fixed gear fisheries and recreational lobster and crab trap fisheries. Some of the changes I support include:

- Expanded closures for trap fisheries in all of Massachusetts waters.
- A new closed season for the buoyed recreational lobster and crab trap fishery.
- The DoMF retaining the ability to extend these closures based on North Atlantic right whale sightings.
- A marking system that will differentiate the gear that may be lawfully used in Massachusetts from heavier gear that may be used in the offshore exclusive economic zone or Canada.

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

Sincerely,

ELLEN KILLAM  
23 Broadleaf St

Dear Director McKiernan:

As a concerned Massachusetts resident, I fear the North Atlantic right whale may go extinct in my lifetime. North Atlantic right whales are dying due to human actions. The DoMF, alongside NOAA, has the opportunity to make the necessary changes to save this species. I am glad to see our commonwealth is taking necessary steps to ensure the protection and survival of right whales by proposing new regulations for commercial fixed gear fisheries and recreational lobster and crab trap fisheries. Some of the changes I support include:

- Expanded closures for trap fisheries in all of Massachusetts waters.
- A new closed season for the buoyed recreational lobster and crab trap fishery.
- The DoMF retaining the ability to extend these closures based on North Atlantic right whale sightings.
- A marking system that will differentiate the gear that may be lawfully used in Massachusetts from heavier gear that may be used in the offshore exclusive economic zone or Canada.

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

Sincerely,

Kathleen Byrnes  
2 Cutler Rd  
Paxton, MA 01612

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

Human-caused injuries and death are taking their toll on already declining populations, pushing these irreplaceable animals closer to extinction.

A mere 411 or so critically endangered North Atlantic right whales remain on our planet. It is of paramount importance that we do everything in our power to ensure the future survival of these majestic beings before it is too late.

Therefore, I call on you to support any and all legislation that will enhance protections for the North Atlantic right whale and ensure their continued presence in Massachusetts waters.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

Sincerely,

Dear Director McKiernan:

As a concerned Massachusetts resident, I fear the North Atlantic right whale may go extinct in my lifetime. North Atlantic right whales are dying due to human actions. The DoMF, alongside NOAA, has the opportunity to make the necessary changes to save this species. I am glad to see our commonwealth is taking necessary steps to ensure the protection and survival of right whales by proposing new regulations for commercial fixed gear fisheries and recreational lobster and crab trap fisheries. Some of the changes I support include:

- ? Expanded closures for trap fisheries in all of Massachusetts waters.
- ? A new closed season for the buoyed recreational lobster and crab trap fishery.
- ? The DoMF retaining the ability to extend these closures based on North Atlantic right whale sightings.
- ? A marking system that will differentiate the gear that may be lawfully used in Massachusetts from heavier gear that may be used in the offshore exclusive economic zone or Canada.

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

Sincerely,

linda lewison  
79 boardley rd  
sandwich, MA 02563

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

We are now at a critical crossroad. We know the extreme state of vulnerability of the North Atlantic right whale species is in. We can not ignore the problems they face any longer. We are responsible for the tremendous decline in their populations and we have the ability to put plans in place to protect these whales. We have a moral and ethical responsibility as well.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

Sincerely,

Dear Director McKiernan:

As a concerned Massachusetts resident, I fear the North Atlantic right whale may go extinct in my lifetime. North Atlantic right whales are dying due to human actions. The DoMF, alongside NOAA, has the opportunity to make the necessary changes to save this species. I am glad to see our commonwealth is taking necessary steps to ensure the protection and survival of right whales by proposing new regulations for commercial fixed gear fisheries and recreational lobster and crab trap fisheries. Some of the changes I support include:

- ? Expanded closures for trap fisheries in all of Massachusetts waters.
- ? A new closed season for the buoyed recreational lobster and crab trap fishery.
- ? The DoMF retaining the ability to extend these closures based on North Atlantic right whale sightings.
- ? A marking system that will differentiate the gear that may be lawfully used in Massachusetts from heavier gear that may be used in the offshore exclusive economic zone or Canada.

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

Sincerely,

Steve Ollove  
105 Gregory Island Road  
South Hamilton, MA 01982

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

This species is very special, as all our whales are. It has been on the brink of extinction since whaling began, since it was the "right" whale to hunt for human purposes. It deserves to have safe waters to live and breed in and that requires human intervention for the good of this species.

We owe it to this whale to survive and thrive and with your help to transition to ROPELESS fishing gear, it has a chance.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

- ? The DoMF retaining the ability to extend these closures based on North Atlantic right whale sightings.
- ? A marking system that will differentiate the gear that may be lawfully used in Massachusetts from heavier gear that may be used in the offshore exclusive economic zone or Canada.

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

Sincerely,

Kristin Masefield

Dear Director McKiernan:

As a concerned Massachusetts resident, I fear the North Atlantic right whale may go extinct in my lifetime. North Atlantic right whales are dying due to human actions. The DoMF, alongside NOAA, has the opportunity to make the necessary changes to save this species. I am glad to see our commonwealth is taking necessary steps to ensure the protection and survival of right whales by proposing new regulations for commercial fixed gear fisheries and recreational lobster and crab trap fisheries. Some of the changes I support include:

- ? Expanded closures for trap fisheries in all of Massachusetts waters.
- ? A new closed season for the buoyed recreational lobster and crab trap fishery.
- ? The DoMF retaining the ability to extend these closures based on North Atlantic right whale sightings.
- ? A marking system that will differentiate the gear that may be lawfully used in Massachusetts from heavier gear that may be used in the offshore exclusive economic zone or Canada.

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

**Subject:** New Protected Species Regulations Affecting Trap and Gillnet Fishing Comments  
**Date:** Wednesday, December 2, 2020 1:30:27 PM

---

Attn Director Daniel McKiernan,

Your public comment e-mail sent on Nov 13<sup>th</sup> states the draft regulations are to “reduce the risk of entanglement.” Your Memo of Nov 13<sup>th</sup> states “only affect right whale conservation.” Understandably that is of great concern, but to include All of Massachusetts waters in these new regulations is unreasonable. According to NOAA, the North Atlantic Right Whale migratory routes and calving ground is south of Block Island, and the feeding area is mainly Cape Cod Bay including the waters north and eastward. I recreational lobster in Buzzards Bay, in 30’ or less of water, and sometimes in one of the back bays, all not close to the feeding grounds or route.

My comments on Recreational Lobster and Crab Trap Gear Haul-Out Season (322 CMR 6.02)

The season is short enough already, to shorten it even more is unnecessary, add a couple more weeks and make the haul-out season from Nov 15<sup>th</sup> - April 30<sup>th</sup>, this will allow DMF and MEP time to identify and remove lost or abandoned recreational trap gear.

Another option would be to follow the commercial trap gear closure periods of February 1 - April 30<sup>th</sup>.

To assist DMF and MEP, they could partner with the “locals” to assist them in reporting of abandoned gear they encounter. This could be done with education and outreach, via a link on their websites, advertisements, or inserts in the renewal notification for non-commercial lobster permits.

Comments on Vertical Buoy Line Maximum Diameter for Recreational Trap Gear (322 CMR 12.06)

The overview of the draft regulations for maximum line diameter does not offer any reasoning other than identification, it does not make sense and it is an undue cost to change the size of the buoy line for identification. I suggest deleting the requirement.

A commercial fisherman is required to mark only the Lic # on the buoy, a

recreational fisherman is required to have an “N” preceding the Lic # and then a sequential number (from 0-9) on the buoy, more than enough information to determine a pot owner without pulling the pot from the water to observe the line.

If the smaller line diameter change is meant to have a lower breaking strength, recreational requirements require a 600 lb. weak link in the line, about 3 times lower than the breaking strength of the buoy line.

As it is, my buoy line is routinely caught in the rocks and only after 1 season, I can see the wear and tear on the line. Over time, using 5/16” line, it will wear and break prematurely. Again, I only fish in Buzzards Bay, I think that recreational fisherman fish their gear in coastal waters and not in off shore waters used by migratory whales.

Thank you

R

**CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.**

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

To whom it may concern

I am against the seasonal closure in all commonwealth waters. This will just give more leverage to a seasonal closure in northern A1 federal waters. Please look into the economic impact if those federal waters would be lost. Jefferys ledge in the winter is a big part of our income so please do your research. I am for a endline less than 3/8 and a breaking point in the upper 1/3 of endline. I also would like to see a freeze on all new permit transfers and set up student license to coastal permit program similar to Maine. In my opinion we are allowing in too many new entrants who have more money than experience.

Director McKiernan,

Having fished lobsters in Cape Cod Bay since I was a boy with my father in a skiff using wooden buoys, wooden traps and pegging lobsters with wooden pegs I have seen many changes to the fishery. As many of these changes have been for the good, I must oppose the single trap prohibition for vessels of a certain size as this would put us out of the fishery. I often fish alone when there is no crew available so trawls would be too dangerous and labor intensive to continue. We fish inside the Billingsgate exempted area where there are no right whales (thanks to the aerial surveys that follow the whales as they exit Cape Cod Bay in the spring) so this prohibition makes no sense for this area.

Sincerely,

Jim & John King

Comments:

As a current recreational lobsterman, I fish my traps in the harbor through mid November and haul out Thanksgiving weekend.

As a former commercial lobsterman and father, I would love for my sons to have the opportunity to make money and gain appreciation for the marine environment. Limiting student lobster licenses is a slippery slope. How many current student lobster licenses are there? Are we limiting our next generation in the fishery?

Is the boat size and trap trawl requirement meant for only commercial fishermen? Fishing trawls as sport does not always make sense. (I fish two trap trawls just to not loose gear though).

Thank you,

John Herrick

Attention Director Daniel McKiernan

On behalf of David Tilton, I have attached a letter concerning the proposed Recreational Lobster and Crab Trap Gear Haul-Out Season.  
Lynne Silva

**From:** [David R Grace](#)  
**To:** [Fish, Marine \(FWE\)](#)  
**Subject:** Recreational Lobster closed season  
**Date:** Tuesday, November 17, 2020 7:51:30 AM

---

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

I oppose the following proposed regulation:

4. Recreational Lobster and Crab Trap Gear Haul-Out Season (322 CMR 6.02). DMF is proposing to implement a new closed season for buoyed recreational lobster and crab trap gear. The closed season would run from the Tuesday following Columbus Day through the Friday preceding Memorial Day.

While few citizens fish recreationally through the winter, some do, and the amount of traps in the water is inconsequential to the vast amount of commercial traps in the water. A recreational lobster person should not be forced to stop feeding their family while commercial fishing is allowed. A compromise would be to close the fishery for December-March.

Thanks

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Okay folks. Massachusetts is the home of innovation. The technology for ropeless gear already exists and is in use. Please address this in your regulations to reduce entanglement risks posed to North Atlantic right whales.

Whales are dying and while closures are helpful we can't keep doing the same thing and expect a different result.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

Dear Director McKiernan,

I am writing to express my support for all proposed regulations outlined in the recent email regarding increased protections for right whales. The proposed changes are reasonable and grounded in science and crucial for protecting this highly endangered species.

Sincerely,  
Mark Begley

Saturday, December 5, 2020

To: Director McKiernan  
Massachusetts Division of Marine Fisheries

North Atlantic Right Whales are rapidly approaching extinction. These sentient mammals tragically now number only in the mid 300's. One major cause of their demise is entanglement in the ropes that connect buoys on the surface of the ocean to their corresponding lobster and crab traps on the ocean floor. In fact 85% of Right Whales bear the scars of entanglement by these thick ropes. A remedy for this is to replace this type of trap with Ropeless fishing traps. These utilize GPS technology for location and identification. The other remedy would be to close the waters to lobster fishing, but this would harm the fishermen and therefore is not the preferred choice.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

**Subject:** public comment of 1,700-lb Breaking Strength Contrivance (322 CMR 12.02 and 12.06)  
**Date:** Wednesday, December 9, 2020 7:57:03 PM

---

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Hello,

I wanted to comment on the above proposed breaking strength rule. As per the quoted text below, I simply wanted to point out the typo (or what I believe to be) on the second mention of 1,700. The second sentence below states seventeen thousand pound - just wanted to make sure that the rule is not enacted with that value.

"DMF is proposing that all vertical buoy lines break when exposed to 1,700 pounds of pressure. This may be accommodated by fishing buoy lines with a **1.7000** pound breaking strength or by rigging the buoy line with a contrivance or multiple contrivances that allows for it to break at that pressure."

Regards,

These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Hi Dan, thanks for taking my question about line diameter. i would like to suggest keeping the line diameter for recreational traps at 3/8 the same as the proposal for the commercial traps. For inshore, recreational traps and commercial traps are side by side (commercial traps as singles). If the proposals are to limit whale entanglements I think that both types of trap lines should be the same. Smaller line diameters could also result in more ghost traps as these line could be more prone to breakoffs. I would also suggest moving the open season for recreational fishing to May 15th-Sept 15th. With global warming we have seen many more fall storms and since most recreational fisherman are closer to shore moving the date to Sept 15th might reduce the amount of traps lost to such storms in the fall thus reducing ghost traps.

Thanks for your time,  
Bill Lach

Dear Director McKiernan,

My name is Maya Sze, and I am a student at Tufts University and an Oceans Intern with Environment Massachusetts. I have loved the ocean for as long as I can remember. One of my most powerful memories was during my childhood, when my family went on a whale watch. As I scanned the horizon, a large tail lifted above the waves just yards from our boat. It was my first time seeing a whale in its natural habitat, and it's a sight I'll never forget. Whenever I reflect on why I love the ocean, that majestic image always comes to mind.

One of my favorite whale species is the North Atlantic Right Whale. It swims right off the coast where I live, and it never ceases to amaze me the strong bonds mothers form with their calves. Mothers use unique whispering tones to communicate with calves, facilitating this incredible bond.

It was incredibly saddening to learn that scientists recently estimated 366 left, which means we can only afford about one non-natural right whale death per year to avoid extinction. Tragically, in the past three years alone, humans were responsible for some 32 deaths, with vessel strikes and fishing gear entanglements ranking as top causes.

To prevent deaths like these and to save this amazing species, we need bold protective policy. Your proposed rule is a big step in the right direction. In particular, I support the expansion of closures to vertical line fishing throughout all Massachusetts waters from Feb. 1 – Apr. 30. With no vertical line in the water during these times, the risk of right whale entanglement is very much reduced.

In your final rule, I advocate for one revision. The Division of Marine Fisheries should include language that implements a pathway for the development and implementation of ropeless fishing gear. The draft regulations, which consider using 1700 lb. breakable rope for fishing lines attached to trap pots, would still pose a threat to right whale calves and juveniles. I'd like to finish by thanking the Division of Marine Fisheries for being a leader in saving right whales. I think that, if the DMF includes language about

ropeless fishing gear, these rules are a big step toward giving this special species a fighting chance.

We are on the brink of losing the North Atlantic right whale forever; before it's too late, we must act now by taking steps to prevent more right whale entanglements. I once again thank you for being a leader on this issue, ask you to make that revision, and thank you for allowing me to comment.

Best,

Maya Sze

Hello DMF,

Please believe the science. Studies have shown ropeless gear is ~95% effective in preventing entanglements. Science/technology is one of the hallmarks that makes the United States the greatest country in the world.

We have learned a terrible lesson when we ignore science with COVID. Please do not make the same mistake with the right whales who cannot advocate for themselves.

Thank you,

The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, [ropeless fishing gear had a 98.4 percent success rate](#). While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Hello,

I think it is very important for you to consider ropeless gear as a necessity to preserve our right whale population. I hope that you consider supporting this as the way forward, especially with MA becoming a hotter spot for right whale

Good evening,

I write to urge you to make the change to ropeless gear. This will have a huge impact. Are the difficulties and disruptions in making this change worth the extinction of an entire species of whale?

Best,  
Emily Vetter

Hello,

Ropeless gear has a proven effect rate of 98.4% and can help prevent right whale entanglements. Please save these beautiful right whales from extinction. Right whales have been entangled at least once in their lifetime. Please ban rope fishing gear .

Concerned citizen,

Jo-Ann Ferreira

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.
