Mr. Daniel McKiernan

Director

The Commonwealth of Massachusetts Division of Marine Fisheries

251 Causeway Street, Suite 400

Boston, MA 02114

[marine.fish@mass.gov](mailto:marine.fish@mass.gov)

December 18, 2020

Dear Director McKiernan:

On behalf of the Animal Welfare Institute (AWI), I submit the following comments regarding the proposed amendments to the Division of Marine Fisheries regulations at 322 CMR 6.00, 7.00, and 12.00 designed to reduce the risk of entangling, injuring, or killing critically endangered North Atlantic right whales.

As you are aware, entanglement in fishing gear is the primary cause of significant injury and mortality to North Atlantic right whales.<sup>1</sup> The annual documented rate of anthropogenic mortality and serious injury — due to both entanglement in gear and ship strikes — has exceeded the population’s potential biological removal level (PBR) since 1995. Deaths and serious injuries caused by entanglement have been increasing since 2010.<sup>2</sup> The North Atlantic right whale is now considered one of the most critically endangered populations of large whales in the world, with the International Union for Conservation of Nature (IUCN) characterizing the species as being “one step from extinction.”<sup>3</sup>

Scientists from the New England Aquarium recently released a new population estimate for North Atlantic right whales, indicating that the population numbered only 356 by the close of 2019.<sup>4</sup> Even more concerning, these researchers believe that only some 70 breeding females remain in the

---

<sup>3</sup> IUCN (2020) Almost a third of lemurs and North Atlantic Right Whale now Critically Endangered - IUCN Red List. July 9, 2020. Available at <https://www.iucn.org/news/species/202007/almost-a-third-lemurs-and-north-atlantic-right-whale-now-critically-endangered-iucn-red-list>.

<sup>4</sup> New England Aquarium (2020) Statement on North Atlantic right whale population estimate .October 29, 2020. Available at <https://www.neaq.org/about-us/news-media/press-kit/press-releases/statement-on-north-atlantic-right-whale-population-estimate/>

population and that low birth rates coupled with the number of whale deaths “means that there could be no females left in the next 10 to 20 years.”<sup>5</sup>

It is clear that the North Atlantic right whale population cannot sustain any deaths or serious injuries if the survival and ultimate recovery of the species is to be ensured. AWI is therefore appreciative of the proactive efforts being made by the Division of Marine Fisheries to address this critical issue, although we do have comments regarding certain elements of the proposal.

### **Proposed closures**

AWI welcomes the DMF proposals to address right whale entanglement by means of time and area closures; as noted by the Food and Agriculture Organization in its 2018 report on marine mammal bycatch mitigation, “[f]or the most endangered and vulnerable populations, time-area closures are among the most preferred management measures because they remove fishing gear out of harm’s way.”<sup>6</sup> We therefore support the proposed Commercial Trap Gear Closure (322 CMR 12.04, 12.08, and 12.11); the Gillnet Closure in Cape Cod Bay (322 CMR 12.04, 12.08, and 12.12); the Recreational Lobster and Crab Trap Gear Haul-Out Season (322 CMR 6.02) and the Conch Pot Haul-Out Period (322 CMR 6.12).

Our organization is also fully supportive of the proposed Fixed Gear Closure Extensions (322 CMR 12.04). We agree with the Director’s assessment that the ability to extend these closures is necessary if there is a documented presence of right whales in Massachusetts’ waters in order to prevent the entanglement of right whales in commercial trap gear. Given that the timing and distribution of North Atlantic right whales has been changing over the last decade,<sup>7</sup> the need to take into account these temporal and spatial shifts has become increasingly apparent. As you know, this year DMF needed to extend closures for setting of commercial and recreational traps and pots in Cape Cod Bay and portions of the Outer Cape until May 8, 2020.<sup>8</sup>

Regarding the proposed Gillnet Closure in Cape Cod Bay, we note that gillnet gear has accounted for roughly 10 percent of identified fishery-related right whale deaths in the last 20 years.<sup>9</sup> As such, AWI

<sup>9</sup> NMFS, 2000-2018 Right Whale Incident Data (Mar. 19, 2019), [https://archive.fisheries.noaa.gov/garfo/protected/whaletrp/trt/meetings/April%202019/2000-2018\\_right\\_whale\\_incident\\_data\\_3\\_19\\_19v.xlsx](https://archive.fisheries.noaa.gov/garfo/protected/whaletrp/trt/meetings/April%202019/2000-2018_right_whale_incident_data_3_19_19v.xlsx). This includes at least five right whale entanglement cases documented between 2009 and 2013 that NMFS determined were likely caused by gillnets.

requests that DMF ensure that any gillnet fishery operating within the waters of the Commonwealth be considered for similar closures if a spatial/temporal overlap with right whales is determined.

### **Gear Modifications and Restrictions**

AWI supports both the proposed Vertical Buoy Line Maximum Diameter for Commercial Trap Gear (322 CMR 12.06) and the Vertical Buoy Line Maximum Diameter for Recreational Trap Gear (322 CMR 12.06), as larger diameter lines result in higher breaking strengths, which in turn increase entanglement risk and the severity of entanglements for large whales.<sup>10</sup>

With regard to the proposed 1,700-lb Breaking Strength Contrivance (322 CMR 12.02 and 12.06), AWI is concerned that while it is true that weak rope might decrease the severity of entanglement injuries suffered by right whales, this proposal reduces neither the likelihood of entanglement as line is still in the water, nor the sub-lethal impacts of entanglement on whales. Whales who break free from weak link ropes might still carry lines, and as noted by researchers, such whales are both more difficult to locate and disentangle than whales still attached to gear.<sup>11</sup> Further, Knowlton et al. have acknowledged that reduced breaking strength rope does not reduce the risk of serious injury or mortality for right whales who are less than two years old.<sup>12</sup>

As for the proposed Prohibition on Single Lobster Traps for Vessels of a Certain Size (322 CMR 12.06), while AWI acknowledges that this would reduce the number of lines in the water, we note that concerns have been raised that having multiple traps on a single line might lead to other types of entanglement threat. For example, whales that become entangled in lines with multiple pots can become anchored, and if not removed quickly from the gear, they can die due to exhaustion, inability to breathe and even post-release capture myopathy.<sup>13</sup> It has also been posited that the increased weight of multiple traps on a line might lead to more severe injuries and constraints on movements of entangled whales in many cases.<sup>14</sup>

We are supportive of the requirements for trap marking.

### **Ropeless gear**

The sheer volume of endlines and traplines in the water column in right whale habitat, especially for American lobster, poses a significant threat to the survival of the species.<sup>15</sup> As noted by the DMF in

---

<sup>10</sup> FAO (2018).

<sup>11</sup> Moore, M. (2019) How we can all stop killing whales: a proposal to avoid whale entanglement in fishing gear, ICES Journal of Marine Science, Volume 76, Issue 4, July-August 2019, Pages 781–786, <https://doi.org/10.1093/icesjms/fsy194>

<sup>12</sup> Knowlton et al. (2016).

<sup>13</sup> Recht, F. (2019). Long-lining pot gear for whale entanglement benefit? ( i.e. stringing multiple pots together with groundline to reduce the number of vertical lines in the water—with or without ropeless gear). Report to the Pacific States Marine Fisheries Commission. 47 pp.

<sup>14</sup>Werner, T. and McClellan-Press, K. (2017) Global Assessment of Large Whale Entanglement and Bycatch Reduction in Fixed Fishing Gear Final Report. NOAA Award Number: NA15NMF4630357. It was noted, however, that there may be occasions when the added weight could help provide resistance, thus helping the whale to break free.

<sup>15</sup> Boenish R. , Chen Y. (2018) Spatiotemporal dynamics of effective fishing effort in the American lobster (*Homarus americanus*) fishery along the coast of Maine, USA. Fisheries Research, 199: 231–241 and Hayes S. A. , Gardiner S., Garrison L. P., Henry A.

March 2020, “[r]opeless fishing represents another possible means to mitigate acute entanglement risk.”<sup>16</sup> AWI agrees with this, and contends that ropeless, on-demand gear provides the best long-term solution to eliminate right whale entanglement in vertical lines.

This view is also supported by the National Marine Fisheries Service (NMFS), which has acknowledged that this gear “is an emerging option that could alleviate a lot of th[e] risk” of entanglement and that “[t]he ability to use gear retrieval devices that do not require the use of stationary buoy lines in the water column would be a truly game changing development for right whales.”<sup>17</sup> Such gear is being or has been tested in the United States, Australia, Canada, and Scotland, and manufacturers are increasingly developing new ropeless gear options.<sup>18</sup>

AWI welcomes DMF’s March 2020 commitment to permit and promote tests of ropeless fishing in areas and at times that do not have a high risk of conflict with other fisheries,<sup>19</sup> and as long as such experimental testing is done safely and responsibly. While we are aware that concerns have been raised regarding on-demand gear location mechanisms, due to the potential for gear loss and/or fouling of gear by trawlers or scallop dredgers,<sup>20</sup> AWI notes that there have been advancements made in recent years in both GPS and acoustic modem technology that address the concerns raised above, as well as state and federal regulatory requirements.<sup>21</sup>

## **Conclusion**

In addition to the population-level risks posed by entanglement, AWI emphasizes that this is a serious animal welfare issue. Right whales are sentient and social animals, and the fact that individual whales of all ages are being exposed to potential entanglement warrants significant concern. Entanglement not only interferes with swimming and feeding, it can lead to chronic infections, damage to blubber, muscle and bone, and starvation. Suffering can be prolonged, and whales have been known to die weeks or even months after the initial entanglement event.<sup>22</sup>

AWI draws the Division’s attention to the fact that the Marine Mammal Commission has advocated for a far more stringent risk reduction than the 60 percent proposal:

Available at: [www.frontiersin.org/article/10.3389/fvets.2018.00287](http://www.frontiersin.org/article/10.3389/fvets.2018.00287)

*In light of the recent deaths, the Commission believes that NMFS, in meeting its responsibility to reduce right whale mortality and serious injury to below PBR, needs to expand upon the TRT's recommendations. The Commission therefore recommends that NMFS identify a suite of mitigation measures projected to reach the risk reduction target's upper limit (80 percent) for each state or lobster management area (LMA)....<sup>23</sup>*

Further, in expressing its serious concern over the right whale's status, the International Whaling Commission's Scientific Committee has called on the U.S. and Canada to make every effort to reduce human-induced threats, including entanglement in fishing gear, to zero.<sup>24</sup>

Dear Director McKiernan,

Below, please find comments on behalf of Environment Massachusetts and Massachusetts River Alliance on the proposed amendments to the proposed amendments to the Division of Marine Fisheries regulations to reduce right whale entanglements.

Best,  
Michaela Morris

Dear Director McKiernan,

On behalf of Environment Massachusetts and the Massachusetts Rivers Alliance, I submit the following comments regarding the Division of Marine Fisheries' draft regulations to reduce the risk of large whale entanglement in fixed fishing gear.

First, we would like to thank the Massachusetts Division of Marine Fisheries for drafting strong proposed regulations that take bold steps toward protecting right whales from entanglement events and prioritizes ocean health. The rules that the Division of Marine Fisheries drafted pave the way toward a healthy future for the species.

In particular, we would like to thank the Division of Marine Fisheries for the extension of the Feb. 1 – Apr. 30 commercial trap gear closure in Cape Cod Bay to all waters under the jurisdiction of the Commonwealth. We know that entanglements in fishing gear serve as a top threat to right whales, and the best way to prevent these entanglements is by limiting the amount of vertical fishing line that the right whales encounter. These closures achieve a significant reduction in risk, as they remove lines from the water during a time when right whales tend to congregate in Massachusetts coastal ocean.

We also would like to extend our thanks for the extension of the Jan. 1–May 15 gillnet closure in Cape Cod Bay to include additional waters.

Finally, we want to share our full support for the inclusion of language that vests the Commonwealth with the power to extend the time frame of these closures. Taken together, these measures represent the kind of bold action that we need to save this species from extinction.

In the final rule, we believe one addition would make these regulations even stronger: we would like to see the rules include a definition of ropeless fishing gear, followed by language that creates a process that encourages and promotes the adoption of ropeless fishing technology within the broader Massachusetts fishing industry.

To keep our beloved oceans clean and healthy, we must strive to forge a culture that prioritizes the wellbeing of our ocean ecosystems. This work begins with standing up for our most vulnerable species -- the North Atlantic right whale, and we commend the Division of Marine Fisheries for rising to the challenge. The next step to forge a safe, healthy future for the whales is to consider how the Commonwealth can support the widespread development and implementation of ropless fishing gear.

Thank you for all your work.

Best,  
Michaela Morris  
Oceans Associate, Environment Massachusetts

Daniel McKiernan  
Director  
The Commonwealth of Massachusetts Division of Marine Fisheries  
251 Causeway Street, Suite 400  
Boston, MA 02114  
[marine.fish@mass.gov](mailto:marine.fish@mass.gov)

Dear Director McKiernan:

I am submitting the following comments on behalf of Sea Mammal Education Learning Technology Society (SMELTS) regarding proposed amendments to Division of Marine Fisheries regulations at 322 CMR 6.00, 7.00, and 12.00 designed to reduce risk of entangling, injuring, or killing critically endangered North Atlantic right whales.

As the Executive Director of SMELTS I applaud the Massachusetts Division of Marine Fisheries for its consistent efforts in protecting both North Atlantic right whales and its fisheries. Regarding Commercial Trap Gear Closure (322 CMR 12.04, 12.08, and 12.11) SMELTS supports this proposed amendment to increase the area covered by the current Large Whale Seasonal Trap Gear Closure to include all waters of the Commonwealth.

We also recommend that DMF modify the definition of this closure to allow the commercial use of Ropeless/Line Free fishing technology such that; all vendors of ropeless fishing gear can provide equipment to fishermen for evaluation.

SMELTS Lobster Raft™ began fishing its ropeless lobster gear with partner fishermen Rob Martin under a Letter of Authorization from the Department of Massachusetts Fisheries in 2019 and continues into 2020. The Lobster Raft has proved to be a safe and efficient line free fishing system. Collaboration and positive feedback from commercial fishermen, science and regulatory agencies encourages SMELTS to continue developing these new fishing tools. Hundreds of ropeless deployments have been recorded by the Northeast Fisheries Science Center. Fishing for ropeless lobster with Hybrid Trawls in the Gulf of Maine has demonstrated SMELTS lift bag technology as dependable and adaptable in commercial fishing settings. SMELTS understands the challenges of marking ropeless gear virtually and looks forward to working with DMF on solutions to this challenging problem for ropeless fishing. Therefore we are submitting a brief White Paper titled **(SMELTS' Hybrid Trawl Solution for Introduction of Line Free/Ropeless Fishing in Lobster Fisheries)** to describe the system(s) that SMELTS believes should be allowed to be fished in US waters if fishermen so desire.

SMELTS also recommends that as DMF continues the introduction of ropeless gear for lobster trawls, this process be staged using SMELTS' Hybrid Trawl technique and marked with SmartBuoys and be equipped with 1700lb breaking strength active buoy lines.

Again, we thank you for the opportunity to comment and for the work of the Massachusetts Division of Marine Fisheries to protect its natural resources and its vibrant commercial fisheries.

Sincerely, Richard Riels Executive Director SMELTS [info@smelts.org](mailto:info@smelts.org)

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,

CAPE COD COMMERCIAL  
**FISHERMEN'S  
ALLIANCE**

**Small Boats. Big Ideas.**

18 December 2020

Director Daniel McKiernan  
MA Division of Marine Fisheries  
251 Causeway Street  
Suite 400  
Boston, MA 02114

Dear Director McKiernan,

Thank you for the opportunity to comment on the proposed protected species regulations affecting trap and gillnet fishing.

The Cape Cod Commercial Fishermen's Alliance is a member-based, non-profit organization that works to build lasting solutions to protect our ecosystem and the future of our fisheries. The Fishermen's Alliance represents 150 fishing businesses and more than 300 fishing families, making our organization the leading voice for commercial fishermen on Cape Cod. We are deeply invested in the scientific assessments and public policies that impact our communities.

Our fishermen members have been at the forefront of testing and developing gear modifications to reduce the risk of entanglement and potential harm to whales. In pioneering these technologies, fishermen have undertaken financial risk and contributed a significant amount of time and energy into these developments. As with all gear modifications, the industry carries the financial burden in the proposed regulations.

Overall, we support measures to reduce risk of entanglements that reasonably modify fishermen's existing gear and prioritize safety of fishermen. The following are comments specific to the draft regulations.

**Fixed Gear Closures:**

*4. Recreational Lobster and Crab Trap Gear Haul-Out Season (322 CMR 6.02). DMF is proposing to implement a new closed season for buoyed recreational lobster and crab trap gear. The closed season would run from the Tuesday following Columbus Day through the Friday preceding Memorial Day. We support the proposed recreational lobster and crab trap gear haul-out season. We believe this measure will both reduce the risk of untended recreational trap gear becoming "ghost gear," and reduce risk of entanglement in recreational gear.*

---

**BOARD OF DIRECTORS** Nick Muto, *Chairman* • Gwen Holden Kelly, *Treasurer* • Greg Connors, *Vice-Chairman* • Brian Sherin, *Clerk*

---

1566 Main Street, Chatham, MA 02633 (508) 945-2432 info@capecodfishermen.org [www.capecodfishermen.org](http://www.capecodfishermen.org)

### **Trap Gear Configuration Modifications and Restrictions:**

1. *1,700-lb Breaking Strength Contrivance (322 CMR 12.02 and 12.06).* DMF is proposing that all vertical buoy lines break when exposed to 1,700 pounds of pressure. This may be accommodated by fishing buoy lines with a 1,700 pound breaking strength or by rigging the buoy line with a contrivance or multiple contrivances that allows for it to break at that pressure.

2. *Vertical Buoy Line Maximum Diameter for Commercial Trap Gear (322 CMR 12.06).* DMF is proposing that all vertical buoy lines affixed to commercial trap gear have a diameter not greater than 3/8".

We support both the 1,700lb breaking strength contrivance/buoyline and the maximum of 3/8" diameter buoyline. We hope DMF will continue to develop these regulations in consultation with fishermen, and use methods that are readily adaptable to existing fishing gear.

3. *Vertical Buoy Line Maximum Diameter for Recreational Trap Gear (322 CMR 12.06).* DMF is proposing that all vertical buoy lines affixed to recreational lobster and crab trap gear have a diameter not greater than 5/16".

We support a maximum of 5/16" diameter for recreational trap gear.

4. *Prohibition on Single Lobster Traps for Vessels of a Certain Size (322 CMR 12.06).* DMF is proposing to prohibit the fishing of single lobster traps onboard vessels with an overall length of 29' or greater.

These vessels will be required to configure their traps as multi-trap trawls. Vessels with an overall length of less than 29' may continue to fish single lobster traps where authorized; the setting of single lobster traps by any vessel of any size will remain prohibited north of Cape Cod seaward of the three nautical mile line and the Billingsgate exempted area. DMF is proposing that this regulation go into effect on January 1, 2022.

We hope that in establishing a length restriction for prohibiting single trap fishing, DMF continues to see fishermen's safety as highest priority. Our local lobster trawl fleet tends to be greater than 36 feet. We recognize that the proposed regulation length of 29 feet will impact several Outer Cape lobstermen that traditionally fish single traps on vessels under 36 feet. We anticipate DMF carefully examining vessel operations for various length vessels and weighing the risks to fishermen's safety.

Thank you for the opportunity to comment.

Sincerely,

John Pappalardo  
CEO

Dear Director Kiernan,

I understand that a new fishing plan is being proposed and I want to strongly urge you to include ropeless fishing in the plan. Fishing ropes are the cause of many deaths of whales, many of which are endangered. They are wonderful creatures who suffer needlessly at the hands of fishing boats. Please do all you can to alleviate this problem.

Thank you!

To whom it may concern;

I am writing to you today to ask that you consider supporting the use of safe (and sound) ropeless technology. It would be a credit to you if you opened the discussion reinforcing the concept of investing in ropeless tech because it is more viable and the only solution to a growing problem... Namely the extinction of precious marine life (Right Whales in particular).

Thanking you in advance for your consideration,

Yours truly,

Corinne de Langavant

Hello Dan and Jared,

I clearly realize where we are at and how we got here, and fully understand the reasons behind these proposed rules. That being said, I am taking this opportunity to formally go on record expressing my concerns about the negative impacts of these measures.

As you already know, MA Area 2 lobstermen do quite well in the winter months, and this proposed closed season will have significant financial impacts on our annual incomes. Especially since SNE is considered to be depleted, we need all the time we can get to earn a living. The proposed weak contrivances and/or weak rope will also have financial impacts in the form of initial costs and lost gear. The proposed trawling up mandate is potentially dangerous for some fishermen, especially the ones that fish alone. And, this rule would conflict with the antiquated Gosnold no-trawl MA State law that I have been fighting to amend for the past 10 years. Special rope markings are something that fishermen were gladly willing to do to show that we were not the ones harming whales. But, when rope came up in dead whales even without our markings, we still got blamed for it. So, what good are future marking schemes going to do except cause an unnecessary burden for fishermen that clearly doesn't matter anyways.

Lastly, even though not in this proposal, I vehemently oppose the idea of ropeless fishing in its current development! We have a long way to go with funding of this overly expensive system, implementation of ever single ocean going fishing vessel simultaneously implementing this technology at the same time, and existing law amendments. And for the extremely rare possibility of a right whale in Area 2 waters where I fish? Despite the whale people's concerns, not every whale gets caught in every rope. The actual chance of entanglement is quite low, even in high coexistence situations. The actual reasons for pushing ropeless fishing have more to do with financial gain and public perception than actually preventing an entanglement.

Again, I know how we got here. But, the answer should lie in amending the ESA and MMPA. The current language of those laws do not account for a species' upward trends, just a fictitious threshold that we may never get to. And, as the population increases, the co-occurrences will also increase, this inducing more restrictions. It's an unfortunate situation where impacted occupations will never be able to satisfy these laws. We are set up for failure from the start. I encourage our politicians and elected officials to address this issue instead of always the knee jerk reaction of trying to appease these overly restrictive laws every few years.

Thank you,

Jarrett Drake

Dan,

Hello. My name is Mark Mooney and I would like to state that I fully understand the situation regarding the need for action regarding the endangered species act. However the one proposed regulation putting a size limit on boats fishing single traps puts me in a difficult spot, I fish in the outer cape with four foot half round wood frame traps out of a 35 foot boat that was not designed to fish trawls. I understand rules are going to change But the size cutoff would require me to put all new decks in to safely cut the stern out and limit my ability to move gear efficiently. If some change to the singles/size rule is possible it would be greatly appreciated.

you, Mark Mooney

Thank

Dear Mr. Mckirnan,

The right whale is in need of and deserves whatever protection we can offer. Closing lobstering in Massachusetts waters during the winter months may well make a strong contribution to its survival. However, I urge you to give honest consideration to the rationale offered by Dug Dur as he makes a compelling case for modifying the prospective winter/spring closure of lobster grounds in Massachusetts. Please see enclosed map and his comments below.

Thank you. Please stay safe and healthy during the rest of this Covid holiday season.

Sincerely,  
Diane Medvec  
9 Locust St  
Mattapoisett, MA 02739  
508-758-2718

See enclosed map and comments from Dug Dur: "The messy red mark is where the inshore lobsterman from the south coast fish during the winter/spring months. All areas in green are about to be closed by the state. Although the catch isn't at it highest rate, the price during these months is historically high. Depending on the boat this will be a 20-30% reduction in total value and roughly 15-20% of the yearly landings. Already operating on slim margins this will most definitely impact the guys here on the southcoast and put their livelihoods at stake.

The reason for this is to protect right whales. As conservationists we have not only met all previous regulations but we have worked with the state to help reduce entanglements.

So here is the issue. I have somewhere in the ballpark of 2000 days over 20,000 hours over the last 20 plus years in that little red area. I have never witnessed a right whale in those waters, never. Nor do I know anyone who has. I'm not saying one has never wondered off migration. But if they do we're ready. Reduced vertical lines by trap reductions, whales safe rope, breakaways that create a weak point on vertical lines. We have done what we can and have literally reduced whale entanglement to 0 in this area. Typically the migration path brings them just off the southeast corner of Nantucket.

South coast lobster businesses can't take this type of economic impact. There are no right whales in these water to save. A closure in this area won't save one whale but it will put people out of business."

December 18, 2020

Daniel McKiernan  
Director  
Massachusetts Division of Marine Fisheries (DMF)  
251 Causeway Street, Suite 400  
Boston, MA 02114

Re: Comments to DMF regulations

Dear Director McKiernan,

Thank you for the opportunity to provide comments on behalf of the International Fund for Animal Welfare (IFAW) on the proposed amendments to regulations at 322 CMR 6.00 and 12.00 designed to reduce the risks to North Atlantic right whales from entanglement in fishing gear.

As you know, the North Atlantic right whale is in crisis. It is one of the most endangered marine species in the world, with an estimated 356 individuals remaining, many of whom annually feed in and around Massachusetts waters.<sup>1</sup> Since 2017, 12.5% of the known population of right whales have died or are presumed dead – alarming scientists, policymakers, and advocates working to protect the species.<sup>2</sup> IFAW-led research has shown that entanglement in fishing gear is the leading threat to right whales, with nearly 60% of determined causes of death between 2003 and 2019 due to entanglement.<sup>3</sup>

Given these urgent circumstances, we are encouraged that Massachusetts has proposed additional regulations to mitigate entanglement risk to right whales. However, the proposed rules are insufficient and ignore important approaches and opportunities, and we therefore offer the following comments:

1. Massachusetts should provide a viable strategy for ropeless fishing technology in these proposed amendments. Ropeless fishing eliminates the need for fishermen to have vertical buoy rope in the water column except during the final stage of active retrieval, thereby drastically reducing the risk of entanglement to whales. However, currently this much-needed technology is excluded from the regulations. Reducing vertical buoy rope in the water will protect right whales from the risks of entanglement, while allowing fishermen to continue to maintain – and even expand – their access to important fishing areas. Ropeless gear technology is the most effective long-term solution that can reduce the risks of

<sup>3</sup> Sharp, SM., McLellan, WA., Rostein, AM., et al. (2019). Gross and histopathologic diagnoses from North Atlantic right whale *Eubalaena glacialis* mortalities between 2003 and 2018. Inter-Research Science Publisher. Retrieved from <https://www.semanticscholar.org/paper/Gross-and-histopathologic-diagnoses-from-North-2003-Sharp-McLellan/4da1a5202873da9475fa09e0af5b9ebc60297fa5>

entanglement, ensure fishermen can pursue their livelihoods, and protect the marine ecosystem.

2. Specifically, ropeless technology should operate through a permitting process. This legal path for ropeless would incentivize fishermen to use alternative gear that does not harm whales and still allows fishing to continue. Current one-off Letter of Authorizations (LOAs) granting use of non-compliant gear for ropeless experimentation are not long-term solutions. Instead, Massachusetts should incentivize lobstermen, including allowing access to those proposed closed areas where historic seasonal whale density is very low if at all, in a carefully controlled, monitored way.
3. Regarding the implementation of 1700-pound breaking strength rope (i.e., “weak rope”), it will neither protect calves or juveniles from lethal entanglements, nor eliminate the long-term health impacts on adults chronically entangled in gear. Calves and some juveniles are not likely to be able to generate sufficient force to break 1700 lbs. of rope.<sup>4</sup> Chronic entanglement in any line can have sub-lethal impacts on right whales, and is likely a major contributing factor to their reduced reproductive rates in recent years. Only by reducing vertical buoy rope in the water will we make strides to save right whales from extinction.
  - As an example of the inability of weak rope to protect juveniles, and the cascading effect on the future population, we point your attention to the mother of one of the first right whale calves born this season, right whale #4040 “Chimineia.” In April 2011, when she was just four years old, “Chimineia” was sighted entangled in hundreds of feet of line in Cape Cod Bay. As young as she was, “Chimineia” would not have been protected by reduced breaking strength systems. Fortunately, in her case, she was successfully disentangled and able to contribute to population growth, and recently sighted off Georgia with her first calf on December 4, 2020. Massachusetts cannot continue to rely on disentanglement as the solution to the entanglement problem; to protect all right whales that frequent Massachusetts waters, the state must remove all rope from the water column and not just replace it with weak rope.
4. In recent years, right whale deaths in waters off Massachusetts have been documented in April, May, July, August, September, October, and November. These mortality data indicate that the current and proposed seasonal closures alone are not sufficient to protect right whales in Massachusetts state waters.

The International Fund for Animal Welfare (IFAW) is a Massachusetts-based nonprofit organization with experts across the U.S. and around the world. Our Marine Mammal Rescue and Research team, located on Cape Cod, is one of the leaders in right whale mortality investigations and provides on the ground expertise to evaluate causes of death in this critically endangered species. Our campaign to protect and save North Atlantic right whales is founded on our desire to seek out collaborative, pragmatic solutions that bring together diverse stakeholders in pursuit of meaningful change on the water. We have a long history of working with fishermen to understand their concerns and find a sustainable path forward by: facilitating and subsidizing sinking ground line; partnering with fishermen to test, refine, and promote ropeless fishing technology; and working with gear manufacturers to ensure their innovations can come to market. It is with this collective

<sup>4</sup> Knowlton, AR., Robbins, R., Landry S., et al. (2015). Effects of fishing rope strength on the severity of large whale entanglements. *Society for Conservation Biology*. Retrieved from <https://conbio.onlinelibrary.wiley.com/doi/full/10.1111/cobi.12590>

experience that we advocate for the inclusion of ropeless fishing technology in regulations as a present-day reality to save right whales.

Scientists estimate that if recent increases in mortality and low annual calf production (the result of sub-lethal effects from chronic entanglement) continue, the species will become functionally extinct within our lifetimes. Additional substantive measures must be taken now to save this species on the brink of extinction. DMF can help accomplish this by including ropeless as a permitted solution to protect right whales in the current proposed changes to the regulations.

Thank you again for the opportunity to comment and for your and DMF's work on this urgent conservation challenge. IFAW scientists and experts would be pleased to engage with you and your staff in whatever ways would be helpful to you.

## The Commonwealth of Massachusetts

191<sup>st</sup> General Court  
State House, Boston, MA 02133

Director McKiernan at  
251 Causeway Street  
Suite 400, Boston  
MA 02114

December 18, 2020

Director McKiernan,

We are writing to express our thoughts about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales by fixed fishing gear like trap pots and gillnets.

We would first like to applaud the Division for the proposed draft regulations on expanding trap closures to all state waters during the spring. The current closure, which is from February 1- April 30 in the waters north and east of Cape Cod, has helped to prevent entanglements when we have observed a presence of North Atlantic right whales. Extending the time period and adding additional miles to the state closure will help conserve this species. We further appreciate the Massachusetts lobster industry's compliance with these regulations and for their constructive partnership in helping to save right whales. We also ask the Division to consider a permitting pathway for the use ropeless gear in state waters.

The East Coast has over one million vertical lines that marine life like the North Atlantic right whale must navigate through in order to migrate and feed. Right whales migrate to the Commonwealth's waters during the spring and summer months, and encounter ropes from lobster pots and gillnets off and near Cape Cod Bay and Nantucket.

This year, we have seen at least three sub-lethal reported entanglements. Dragon, a 19-year-old female of breeding age, was found in February traveling slowly off the coast of Nantucket with a buoy and particles of rope lodged directly in her mouth. This must have made feeding difficult for her, as Dragon was severely emaciated, and her skin tone was unusually light. An Entanglement Response Team was set out to help her shed the gear, but they were unable to locate her. It is presumed Dragon is dead. Dragon's third calf, a four-year-old male right whale, was spotted off the coast of New Jersey in extremely poor condition, and with large lesions on his body due to rope entanglement. Teams were also unable to help Dragon's son shed the ropes

wrapped around his body. Another male nicknamed Aquarium was spotted off the coast of Massachusetts during an aerial survey in October. Luckily, the Center for Coastal Studies Response Team was able to remove part of the gear, but full disentanglement could not be achieved. It is unknown if these two additional whales have passed.

Scientists, veterinarians, and members of the Marine Entanglement Response Team at the New England Aquarium have documented over 1,500 entanglements of right whales since 1980. The team has seen a significant increase in severe injuries and deaths attributed to entanglements. The Response Team estimates that approximately 85 percent of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. Some right whales have even been entangled as many as eight times in their lives. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

We are encouraged by the draft regulations but worry that right whales still face entanglement risks. For instance, the draft regulations require use of 1700 pound breaking strength rope for vertical fishing lines attached to trap pots; this could still harm neonates and young right whale calves who are not fully developed. This breaking strength rope, colloquially called “weak rope”, is not a long-term solution to the issue of North Atlantic right whale entanglements. Ropeless fishing gear, instead, is ultimately what should be considered by DMF to save this critically endangered species.

Ropeless gear has been used all over the world: it has been used by fishermen in Australia, the UK, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various ropeless gear models, ropeless fishing gear had a 98.4 percent success rate. Seven private companies have devices that can be used by fishermen today, and many of these devices are being used in tests in our state waters today. Ropeless gear has the ability to significantly reduce entanglement threats during the months not applicable to the closure of state waters to recreational and commercial lobster fishing. In 2020, we observed right whales were observed in Massachusetts waters in the summer and fall months, during which there is no closure of federal or state waters. Certainly we appreciate that ropeless gear is costly to implement, particularly for a small boat fishery such as the lobster industry, and that logistical hurdles (e.g. delineation of the location of gear without buoys) will need to be overcome. Nonetheless, implementation of ropeless gear provides the promise of keeping fishermen on the water during the presence of right whales and should be pursued.

While we know that the Division already has the authority to issue ropeless permits on a case-by-case basis, we encourage DMF to outline a ropeless gear permitting pathway to help save both the fishing industry and right whales. Ropeless gear is the technology of the future and a permitting pathway would provide predictability to what the fisheries can expect and harvest

accordingly. Please implement measures that incorporate ropeless gear pilot programs in order to save the Commonwealth's marine mammal, the North Atlantic right whale.

Thank you for your ongoing partnership in this most urgent matter.

# LOBSTERLIFT

Director McKiernan at  
251 Causeway Street  
Suite 400, Boston  
MA 02114

December 18, 2020

Director McKiernan,

My name is Cormac Hondros-McCarthy and I am writing to ask you to implement a pathway for permitting ropeless fishing in MA waters.

Ted Zhu and I started LobsterLift based out of Lowell, MA. We are developing a low cost ropeless device aimed at giving inshore fishers the ability to keep fishing without the worry of having their gear become a cause for the death of a North Atlantic right whale, a species severely wounded.

LobsterLift started at an international oceanic environmental prototype competition in Malaysia, where we first learned about the issue from a professor who also works as a Maine fisherman. He told us about the ongoing protests between the environmental groups and fishers due to the regulations imposed on the fisheries in order to help conserve the North Atlantic right whale population, and other at-risk marine life. We thought we could help, and we were excited to take on the challenge. The concept was born at Conservation X Labs' challenge, and from there we worked on the design, and applied for grants to allow us to leave our full time jobs for the ability to work on something truly inspiring for us. Up until 6 months ago, we worked on evenings, and weekends to bring our concepts closer towards something which could be tested by fishermen, where we could get their valuable feedback. We were then awarded the highly competitive NOAA Bycatch Reduction Engineering Program (BREP) grant in 2020. Things started to move much more quickly, and we have since taken our concept and brought it out into the ocean with an inshore Gloucester, MA fisherman to fish with. Seeing the gear fall off the side of the boat, and return for it a few days later to see it at the surface was an experience I will never forget - right next to the first time I saw a whale in person on my first whale watch.

It takes a lot to change a century old method fishing method, and most fisherman aren't interested in taking part in the change, but today we are asking you to run with us on the journey of switching to ropeless gear. Creating a system to allow fishers to fish with ropeless gear isn't easy, but is necessary if we are going to act fast to reduce the destruction that we have continued to play a major role in with the population of the North Atlantic right whale.

The LobsterLift is designed as a truly ropeless system: it does not use a stored away endline, but instead inflates a balloon to create enough buoyancy to raise the trap from the ocean floor up to the surface. By

designing it this way, we remove a great deal of complexity for the fisher, who would otherwise have to carefully repack or recoil a rope before sending the trap back overboard. You can set a timer for deployment and drop it off the boat--it's as simple as that. Alternatively, you can also have the system fitted with an acoustics system which would allow you to retrieve it on demand. We are working with many acoustics manufacturers, and are just about finished integrating the first one into the LobsterLift.

LobsterLift has been deployed and retrieved over 100 times, and that number will continue to grow exponentially over the coming year as we continue testing. We have had the opportunity to test our device in waters off of Massachusetts, Connecticut, and Georgia . We have proven its reliability at its current phase with a 100% retrieval rate of success. Our system is designed from the start to be low cost: we understand that one of the challenges posed on using pop-up gear is the price tag, and we bear that in mind to make sure we can work tirelessly to help keep fishers on the water while solving the age-old problem of marine entanglements. As we get closer to manufacturing this system at a larger scale, our units will be available for ~\$200 (timer version) to \$400 (acoustic version) each and can be easily fitted to trawls, reducing the overall cost per trap to the fisher.

Director McKiernan, you have the authority to issue permits on an as-needed basis, we request that the Division reconsider its decisions and develop a pathway for permitting ropeless gear in MA waters during these upcoming rule makings. We are working hard to help save a species while keeping fishers on the water. Please take this opportunity to work towards a solution to save the North Atlantic right whales, not against it.

We look forward to your reply, and hope to speak more with you in this matter directly.

Thank you for your time,  
Cormac Hondros-McCarthy & LobsterLift Team

Director McKiernan  
251 Causeway Street  
Suite 400, Boston  
MA 02114

December 18, 2020

Director McKiernan,

We are writing to you today to express our deep concerns for the impending extinction of the Massachusetts state marine mammal, the North Atlantic right whale, which could become unavoidable unless direct action is taken to reduce the risk of entanglement. We, as elected officials, care about the safety and wellbeing of critically endangered North Atlantic right whales and we do our best to make sure all environmental matters, even global issues, are considered locally.

From 2017-2019, 31 right whales have died from avoidable causes, reducing the population to just 366. Right whales are dying at extreme rates due to entanglements: 85 percent of right whales have been entangled at least once in their lifetime, more than half of them have been entangled twice or more. Vertical fishing lines pose a highly lethal threat to the North Atlantic right whale population as they travel over one million miles of vertical lines along the East Coast, including our state waters.

The current draft regulations extend seasonal closures to all Massachusetts state waters from February 1 to April 30. While closures are helpful in the conservation realm, this measure fails to protect right whales that are known to be present off the coast of Massachusetts during summer and fall months and cannot provide protection for right whales for a majority of the year. We recommend the Division include an implementation to fast-track permitting for ropeless technology usage which includes changing existing regulations that require a vertical line and buoy in order to harvest lobster.

Ropeless gear can prevent marine entanglements while reducing the impacts to those who make a living on the water. As the state must develop detailed steps to minimize and mitigate impacts all activities that are impacting the endangered species, ropeless gear needs to be considered by the Division. Ropeless gear works, and has a success rate of 98.4 percent, and has also been used around the world in different fisheries. Ropeless gear devices are currently being used in tests along the East Coast and in Massachusetts waters.

We stand at a critical moment where the North Atlantic right whale could become extinct in our lifetimes. The proposed draft regulations rely on the same outdated fishing technology that has been used for over a century. Now, we have the technology and opportunity to save right whales. We implore you to implement measures that incorporate ropeless gear pilot programs in order to save our iconic state marine mammal.

Thank you.

<https://www.federalregister.gov/documents/2008/10/10/E8-24177/endangered-fish-and-wildlife-final-rule-to-implement-speed-restrictions-to-reduce-the-threat-of-ship>

<http://fisherynation.com/most-likely-carnival-cruise-lines-is-responsible-for-18-right-whale-deaths-in-the-past-3-year-at-which-rate-they-would-soon-be-extinct>

I attend a zoom meeting with the NEAQ presenting a scientist who studied the impact speed that could kill a NARW, who proclaimed no speed is safe. To reroute the shipping lane is the best thing to do. So where have you been hiding this guy? Honestly you must give up attacking the biggest and most responsible fishery in the USA. You guys raced up there with all those fancy inventions and with the spotting planes recorded whale sightings were cruise ships would have been last year if Covid hadn't popped up. Now it should be obvious that I am right. 18+ whales suddenly found floating in what is now called the Shediac Valley. In my opinion they should have rerouted that cruise lane to the east of the Magdalen Islands like that expert of yours suggested at the NEAQ ship strike public zoom meeting. Pat Keliher the Chairman of the DMR who acknowledged that I sent a lot of my data to him said "Jim is right". It's on the tape included here. He also said all you have to do is look north to find where all the deaths have been occurring. Canada doesn't care, "they have other priorities".

Yes. That priority they were talking about was to pay for a multi million dollar brand new unused 2nd cruise ship berthing pier. They needed to keep those cruise ships on time. A dead whale was just another dead squirrel beside the road. Besides you could buy a stuffed whale made in China at a souvenir shop on PEI.

If you can't open it go to MPBN MAINE CALLING WITH JENNIFER ROOKS.

[https://share.icloud.com/photos/0uJpforkkoYmFHRyOkNWXMOxg#Bar\\_Harbor](https://share.icloud.com/photos/0uJpforkkoYmFHRyOkNWXMOxg#Bar_Harbor)

You guys have got to look at this whole picture again on the birthrate and keep in mind the whales were increasing dramatically despite always under the loss of 3.2 whales accidentally taken per year. Since 1980.

There were 150 new juveniles to take care of and teach them

the ropes. Of course there was an uptick in entanglements and ship strikes too. The record year of 9 serious entanglements was set during the largest increase in the population since what? 1700's? Actually one year before the 39 calf year in 2010.

So that is not slowing them down. Whales can get out of being entangled. 87 % show proof of that.

You guys are causing millions of dollars of grief and losing the public's confidence the longer you keep covering for cruise ships and ship strikes in general. The take reduction number should be raised to 3.2 . 7 calves two years ago. 10 born this year. No entanglements this year! But, 2 ship strikes south of the cape. Looks like 12 + could be the number next year.

Not counting the surprise surge Canadian heavy crab gear your data states 5 lobster

entanglement COD in the last 20 years. That is  $\frac{1}{4}$  whale per year. The cruise ships between 2017 and 2019 averaged 6 per year. Why are you going after lobstermen?

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

Re: Proposed Lobster Fishing Regulations

---

As a full time lobster fisherman in the state of Massachusetts I am forwarding concerns regarding the proposed regulations and whale entanglements. It has been my experience that no line entanglements or damage to whales / turtle with current fishing methods being employed in state and federal waters where i fish. I am aware of an entanglement in Cape Cod Bay in 2016 as well as the current closure during the months of Feb through March. While many attribute vertical lines as the main culprit of creating an environment detrimental to the North Atlantic Right Whale it is a shift northward of their primary source of forage and ship strikes.

The changes proposed will create undue hardship not only on fishermen but many ancillary business that participate directly and indirectly in the lobster industry. History shows a willingness on the part of fishermen to adjust current gear, breakaway links, lower breaking tension of rope, and color identified lines to indicate where each fish. To take away or limit a person's ability to fish for a living is going too far. Furthermore it is by no coincidence that in this time of COVID and no cruise ship traffic that no reports of ship strikes of whales has been filed. We don't have the financial resources to lobby as those large conglomerates or shipping lines do but we operate in no less of an important participant in ocean and marine life.

As a member of the fishing community I trust that the challenges faced by fishermen, as well as those that operate in this industry, we are caretakers of the resource and the environment in which they live. It is my hope that an ITP can be obtained and fishing can continue as we are today.

Respectfully,  
John Farrell

December 18, 2020

Dear Director McKiernan,

I am a full-time commercial lobsterman out of Gloucester, Ma. I have been lobstering since I was 8 years old and chose this profession after receiving my education at Maine Maritime. I spent the first part of my career shipping out in winters in order to lobster full time the other portion of the year. After 2 years of this, I began lobstering year-round and have been lobstering full time for the last 12+ years. My wife Tess and I have built a life from me lobstering and she now owns her own shoreside lobster and bait facility.

I am writing to you to express my opposition for the proposed closure of Ma state waters to lobster traps and gillnets from Feb 1- April 30<sup>th</sup>. I understand the DMF is making an effort by developing a Habitat Conservation Plan in order to obtain an ITP from NOAA and this closure will aid in the possibility of NOAA granting this ITP. I do not however agree that this closure will be in anyway effective in saving a right whale and is simply another step closer to crippling a sustainable fishery that has been practicing conservation measures for decades.

Commercial Lobstering in MA is a huge part of many of the seaside communities in the Commonwealth. It is a large economic player not only for the fishermen, their families and their crew but for the fish companies, the bait dealers, the marina owners, the restaurants and more. This is an industry we cannot afford to lose or damage without further proof that these new whale regulations are necessary, and their results will outweigh the damage being done to thousands of Ma residents who rely on commercial fishing to feed their families and pay their mortgages. The DMF has waited to the absolute last second to spring this possible closure on this fishery and it is simply unfair to expect us fishermen to react in such a short amount of time. This year has been hard on everyone with Covid and unstable lobster prices all last Feb-June. The average lobstermen can only take so many obstacles before their profession is no longer going to be sustainable. How can you ask them to no longer fish for 3 months of the year which is a time of year there is not data proving right whales aggregate north of Cape Cod Bay. Why are recreational lobster license holders allowed to fish single pots with 10 vertical lines for a pastime in the summer? We are hardworking fishermen who need this job to keep supporting our families and this closure would be the first blow to slowly breaking down and significantly damaging an industry. I think more time and serious thought need to be put into a decision that will have an effect on so many industry participants including myself.

Thank you for your time.

Best,

Ryan Browne  
F/V Moon Dancer

Good Afternoon:

I would like to share my thoughts about this proposal.

It seems to be a drastic measure to initiate this proposal for a whale that MAY come through this area. There are NO FACTS to back up this closure. It was stated in your webinar. To have a closure of three months will hurt many lobster businesses. Most of the small lobster businesses are barely surviving! Between high expenses and the low selling price. NOT LOBSTERING FOR THREE MONTHS WILL MAKE MANY FAMILIES STRUGGLE!!! We are hard working people who have real families we need to support. The endangered species you should be worried about helping is the Lobstermen/Fisherman. They provide food for the world and risk their lives doing it !

Regards  
Kyle Borges  
Lobsterman

December 18, 2020

Daniel McKiernan, Director  
The Commonwealth of Massachusetts Division of Marine Fisheries  
251 Causeway Street, Suite 400  
Boston, MA 02114  
marine.fish@mass.gov

Dear Director McKiernan,

The Massachusetts Society for the Prevention of Cruelty to Animals submits these comments in response to your request for comments on proposed amendments to Division of Marine Fisheries regulations at 322 CMR 6.00, 7.00, and 12.00. The MSPCA is a national and international leader in animal protection and veterinary medicine. Founded in 1868, we are the second-oldest humane society in the United States. The MSPCA comprises our Animal Care and Adoption Centers, our Advocacy Department, and our Law Enforcement Department. Angell Animal Medical Center is our nonprofit veterinary hospital.

Massachusetts must act to protect the right whale from extinction. Right whales currently number less than 400 individuals and they continue to die in unsustainable numbers. The primary causes of death for right whales are vessel strikes and entanglements; no adult or juvenile right whale has been known to have died of natural causes in roughly the past 15 years. Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. Declines in female right whale numbers are especially concerning, as their survival is crucial to that of the young. Females gestate for a year, and their young nurse for one to two years and stay with their mothers for roughly a decade.

We support the proposed regulatory changes, with the exception of the seasonal closure length of the proposed area, which we suggest be longer: beginning January 1 and extending through at least May 15, rather than beginning February 1 and automatically re-opening on April 30. Right whales frequent Massachusetts waters year-round, with the most found in Cape Cod Bay in the late winter and spring. In recent years Massachusetts has had to extend closure times, including into the month of May.

The right whale is the official state marine mammal of Massachusetts. After having nearly hunted the animal to extinction, and then having brought it back from the brink (it is estimated that there may have been fewer than 100 individuals in 1935), we must not relent in the fight to protect the right whale. Before it is too late, and before the Commonwealth's own official state marine mammal is driven to extinction, we must pass regulatory changes to ensure the survival of this species.

Thank you for taking strong actions to protect this critically endangered animal, and thank you for your consideration of our input and perspective.

Sincerely,

Kara Holmquist  
Director of Advocacy

**CAUTION:** This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

The proposed regulations to protect Right Whales that migrate off our shores are insufficient and do not completely address the issue of entanglements, the leading cause of right whale deaths. 85% of right whales have been [entangled at least once](#) in their lives, and over half of the population has been entangled more than once.

We need to get rope out of the water—and fast. Ropeless fishing gear can help solve the problem of right whale entanglements, while helping the fishing industry thrive. A pathway towards advancing ropeless gear permitting is currently not being considered by DMF in its draft regulations.

**The right whale population is dwindling: scientists estimate that there are only 366 left. Now is the time to act. DMF - we need greater measures in order to save right whales from extinction.**

**Please save these majestic creatures from entanglement and death.**

**Thank you**

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

I am concerned about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

As you know, the primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. These ropes should be eliminated--NOW - if there is to be any possibility that this whale will become extinct. DO THE RIGHT THING by whales, and by our environment. We must take care of our state marine mammal, the North Atlantic right whale. MASSACHUSETTS IS OFTEN IN THE LEAD ON ENVIRONMENTAL ISSUES -- LETS KEEP THAT GOING.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I cannot continue to attend these hearings, write these correspondence, and advocate regularly with the powers that be with the absolute lack of attention to these magnificent creatures. Ropeless gear and better location systems need to be universally used to protect the North Atlantic right whales. These actions have been proposed for decades. How many creatures do we let go before it's too many. How many ecosystems do we destroy before it's too many. When do we understand protecting wildlife and wild places protects us. The destruction of wildlife and wild places is our own destruction. Do what's right. Not what's easy. Take action that will live on forever. It's beyond time. Thank you.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales. As a native of Massachusetts and someone who has personally studied issues relating to right whale entanglements, this issue is of great concern and interest to me.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales. We must do all we can to protect these animals WHILE THERE'S TIME! Since highly successful ropeless gear exists and is being used by other countries, must we be once more behind others in wildlife protection? It's not as if protecting the whales puts an end to fisheries, as so many willfully ignorant people claim.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

More than 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

I live in Truro and have been witnessing the steady decline of the right whale population my whole life. Between entanglements, ship strikes, underwater noise pollution, shifting food sources because of global climate change, I am dismayed by the "too little too late" approach to the decline of this species. I dread the thought that I will be a witness to the extinction of the right whale. I speak for my whole family and all the friends who enjoy whale watching and care about the health of the ocean off our coast.

As others will state in their message to you, the primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

To: The Massachusetts Division of Marine Fisheries

Sub: Massachusetts; Save the Right Whales

With sincere respects,  
Lady and or Gentleman,

I am writing this message to you today, To express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

Today more than in the past ,The primary causes of death for right whales are ship strikes and entanglements: No right whale has died of natural causes in the past 17 years.

The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Why should this be let happen?

As we have laws for the people to follow ; The something should be created stronger for those who weather passing the ocean in any place to trade , or other action should be accountable for leaving those parts they use for fishing.

I believe also that everyone who uses the ocean in any form should go to a class to see and hear what they create when they are not acting responsible in the ; weather work related fishing, or traveling around the ocean .No matter how the go in to the ocean for fun or business .

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles and other ocean species .In the ocean and or around the borders of the ocean.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales.

Lady ,Gentleman; Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water.

Please do create implementing measures that incorporate ropeless gear pilot programs in order to save the right whale.

These oceanic animals and others should be protected; For the sake of the new generations who should have the chance to see them and also because those giant Whales no matter their specie they are the most important access to clean the ocean water as each fish and other species do too.

Please remember we are the ones who should Protect all that was given to us freely from Nature. The greatest Source of the universe for the sake and benefit of every specie on earth, earth and air.

Thank you for your time effort and responsibility to protect yours and our ocean and those special creature that need our help to keep living and swimming in this water ocean world.

Which I call it ;

The Garden of special and unique creatures of the ocean.

From: Self Advocate for many Organizations an specially for the [oceana.org](http://oceana.org), [ocean conservancy.org](http://oceanconservancy.org), [amsc.org.au](http://amsc.org.au)  
For the sake Of saving, The Oceanic Most Precious Creatures.

The earth depends of the ocean water, Humans depend of the the second source of food, and everyone should protect the four most important element and sources; Air, Water, Lands, Forests, and the Ocean. They all support and serve all species on earth.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

Please don't disregard my concerns and comments because of my zip code. I grew up in RI, have relatives in MA, have all sorts of formative memories made in MA from learning to ski on Mt. Tom, working at Camp Jabberwocky on MV, racing on the Charles multiple times, running the Boston Marathon, whale watching on the Cape, etc, and have recently visited MA, including the Cape. New England is forever a part of who I am and its ocean resources are a big part of that.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. It is urgent that we do everything in our power to save right whales from extinction! Once they are gone future generations will never know the majesty of these great mammals.

I have great concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

I am writing to let you know I can no longer stomach watching whale after whale show up entangled in fishing gear. I have given up eating all seafood as I do not want to contribute to these deaths. I understand ship strikes are also a major contributing factor however that seems like it is being mitigated by shipping lanes which will obviously need to be monitored and altered as the climate changes. However after seeing the population plummet to 356 individuals and after seeing the heart wrenching images of entangled whales or even sea turtles, I can no longer eat any seafood until changes are made to make it safe for all marine animals.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

As a longtime resident here on Horseneck Beach (since 1956) I have gone on whale watches several times. You must include ropeless gear pilot programs in these regulations so we won't lose these whales.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales. The DMF draft must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

I join with the Pew Charitable Trusts and the growing number of scientists, engineers, fishermen, and fishery managers in supporting the development of ropeless fishing systems, which represent a promising solution for the pressing problem affecting the North Atlantic right whale: entanglement in fishing gear. With collaboration and commitment from fishermen and decision-makers, these endangered whales and fishing cultures in the U.S. and Canada, can thrive far into the future. Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate.

Draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles. There are only 366 of these precious animals left!

Thank you,

This message is in regard to the proposed regulations that address reduce entanglement risks to right whales.

A primary cause of death of the right whales is rope entanglements. Across the east coast, there are over 1M miles of vertical lines threatening the right whales. These rope lines are a serious risk to the right whale population. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Breakable rope is a good start, but those lines still pose a threat to the right whale calves. Please implement regulations requiring ropeless fishing gear. It is available and widely used around the world. It is the only long term solution to saving the right whales.

We don't want to lose these magnificent animals.

Thank you.

I am greatly concerned by the plight of the North American right whale, whose numbers continue to plummet. After attending NOAA meetings describing entanglement and boat strike issues, and hearing promises from fishery regulators, I believe that the most urgent actions and most stringent regulations are necessary to prevent the extinction of this species.

As you know, no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. I'm writing because I care about right whales, whose population has been decimated and continues to alarmingly decline: their entire population is only a dwindling estimated 366 individuals.

One problem is the use of fishing gear that causes the whales to be entangled and trapped. The current draft regulations considering the use of 1700-lb breakable rope is still a threat to right whale calves and juveniles. Consider passing regulations that require ROPELESS GEAR which can be a win-win solution: the whales don't die needlessly and fishers can be kept on the water: ropeless gear is used all over the world in Canada, Ireland, the West Coast, United Kingdom and Australia, why not use it here to save the right whale, our state mammal, from extinction.

Please, please, please, implement ropeless gear. Time's running out for the right whale. This is your chance to make the world a better place. Thank you.

Hello. I urge you to strengthen the regulations to protect right whales. That includes moving quickly toward ropeless fishing gear. This is a crisis in the water, and you have the opportunity to do something about it.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

North Atlantic right whales cannot afford anymore inaction or insufficient regulations. Without ropeless gear technology, right whales will continue to get entangled and the lobster industry will suffer from fishery closures. Ropeless technology is being developed and utilized across the world successfully. So how, and why, would the DMF fail to include its use in draft regulations? There are only 366 right whales left. 366. If at this moment, we fail to take bold and necessary action in regulating fishing lines, our next generation will only see a right whale in a museum or textbook. If the DMF does not include ropeless technology in new draft regulations, then we will all be complicit in the decimation of a majestic species.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

During the virtual hearing on 12/8/2020, DMF staff commented that 'ropeless fishing' was not on the agenda because issues such as gear conflict avoidance yet had to be resolved. And a fisher commented that gear density in MA is much higher than in NSW Australia, where ropeless fishing both with GTR and acoustic triggers is routinely practiced.

In fact, high-density gear management will not at first be needed even in MA (or ME) because only few fishers are likely to transition to this technology at first. And experimentation by individual fishers in their commercial fishing practice is critical to adapt the technology to local conditions and widespread use. Adequate tools, including for virtual (GPS) gear marking do exist to support early adopters and support safe operation.

I wish to point out here that the South African octopus fishery is now following just such a strategy. The fishery was closed in 2019 due to whale entanglements. Fishers and government quickly came to an agreement to use ropeless technology with timed or acoustic releases. And the fishery has now opened again, so far with no entanglements.

See this article.

[https://urldefense.proofpoint.com/v2/url?u=https-3A\\_\\_www.fishingindustrynewssa.com\\_2020\\_12\\_09\\_the-2Doctopus-2Dfishery-2Dhas-2Da-2Dgripping-2Dstory-2Dto-2Dtell\\_&d=DwIFaQ&c=IDF7oMaPKXpkYvev9V-fVahWL0QWnGCCAfCDz1Bns\\_w&r=Y1CBtQZE17Rj2MeXjOmTypaU2t5pniKda51CF15IQyg&m=dhmSMPGBLfdEPstx\\_iTh\\_gxSRikWM46zSuxhvka7fR8&s=ZcFO7xQH0aR-15QFoHxE8RXrE5fL0zKRNWS-PBCeYo&e=](https://urldefense.proofpoint.com/v2/url?u=https-3A__www.fishingindustrynewssa.com_2020_12_09_the-2Doctopus-2Dfishery-2Dhas-2Da-2Dgripping-2Dstory-2Dto-2Dtell_&d=DwIFaQ&c=IDF7oMaPKXpkYvev9V-fVahWL0QWnGCCAfCDz1Bns_w&r=Y1CBtQZE17Rj2MeXjOmTypaU2t5pniKda51CF15IQyg&m=dhmSMPGBLfdEPstx_iTh_gxSRikWM46zSuxhvka7fR8&s=ZcFO7xQH0aR-15QFoHxE8RXrE5fL0zKRNWS-PBCeYo&e=)

As South Africa is the latest jurisdiction to demonstrate, ropeless technology is ready and commercially viable and is a very effective solution to prevent entanglements while preserving a fishery. Fishers and whale preservation would best be served if DMF allowed ropeless fishing under simple rules such as South Africa's now.

The harm our actions cause so many marine creatures is very troubling; especially the North Atlantic right whales. I am writing to express my grave concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years!! The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at a low 366, is rapidly declining. Right whales could be extinct within our lifetime. This would not only be bad for the whales, but for the whole marine environment of which they are an important part.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This MUST be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used ALL OVER THE WORLD by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF MUST consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water.

Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale. NO more studying. Work with people who know how to do this.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

Proposing regulations to protect right whales that migrate off the MA coast is a step in the right direction.

However, these proposed regulations are insufficient and do not completely address the issue of entanglements, the leading cause of right whale deaths. Ropeless gear isn't rocket science -- we have the ability but lack the will. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

As ropeless gear seems to be a real possibility to help mitigate the loss of right whales in our waters, and it is a viable option for those who fish, I ask that language leading to this technology's eventual deployment be included in the draft regulations now being written.

I ask for the whales and their future survival.

Thank you.

---

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

I am writing to express my serious concerns about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

I was horrified to learn that the primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

The need to mitigate this situation is urgent. Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear because the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

I understand that ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. I urgently ask you to implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

It's been a hard year for so many, I appreciate your work all the more to engage others and then develop sound practices to save the last few remaining right whales in our waters.

As you've heard by now, the proposed regulations likely do not address the entanglement issue adequately. With everything at stake for these last remaining majestic creatures, I am writing to express my concern about these proposed regulations and ask you revisit them by implementing a faster removal of rope from the whales' natural habitat.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in your state waters. I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

We are human beings, not rulers of the earth. Because of all our intelligence, we can either destroy or preserve the incredible diversity of the only planet we have. It's our job. It's our calling. And it's in our own self interest. Without nature we die.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you. Kenneth M. Drucker

Refusing to eat lobster campaign is not good for anyone! I am writing to support the efforts to save the right whales and other marine species from entanglement deaths and harm. There has to be a more humane and efficient method to prevent the wasteful deaths of marine species. Turtle excluders were implemented to protect marine wildlife. Let's do something about this industry now.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. Dear Director McKiernan -

Last year I spoke in RI at a NOAA hearing about the fact that the federal government has had a unit exploring ropeless fishing gear for over two decades now. Unfortunately their latest TRT plan and EIS still contains not a single word about the encouragement, advancement or use of ropeless technology.

Im extremely concerned about the whales - and therefore I support your actions regarding expanding closures. However I am also concerned , as I know you are, about preserving the lobster industry.

Ropeless fishing can be a win-win scenario.

Ropeless fishing is also totally consistent with Massachusetts's' tradition of innovation and technological advancement.

In addition to what you have already proposed I ask that you amend your current regulations that require rope to be used for traps in Massachusetts waters - and - that you talk to the economic development agencies of the state to find ways to promote the ropeless technology so that Massachusetts can lead the way for all states to adopt ropeless gear technology.

Using today's GPS technology that is universal, and the acoustic technology that is employed in the four offshore LNG ports off the coast of Gloucester, we can make this happen and in the process save a species and an important industry.

Thank you.

I'm writing to express my serious concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The reasons are clear enough. But we're at a critical point in our species's history and it's our responsibility as the ones who have devastated the ecological balance of earth to clean it up. If we don't take this more seriously, we'll lose right whales. And our world will never see them again.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the huge and beautiful North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime. THIS MUST NOT HAPPEN!

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Living on the Cape, every summer we take visitors on whale watches. These magnificent creatures are imperiled, and it is through the fault of human activity. We must do our part to keep this ever-dwindling population healthy by mandating ropeless fishing gear which can help solve the problem of right whale entanglements

Consequently, I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

I believe that it would be a grave injustice if the DMF passed regulations for North Atlantic right whales that fail to include the development and implementation of ropeless gear technology. This is the only proven method that drastically reduces right whale entanglement while posing no threat to the lobster industry by replacing the need for seasonal fishery closures. I hope that you will see the obvious and dire need to include ropeless gear in any regulations regarding North Atlantic right whales. Thank you

Right whales have been dying at an alarming pace in the past years, and there are not that many of them left. I encourage you to take any action you can to try to save them now. In a few years it may be too late.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. I am writing to you bc this is very important to me. We need to do more to protect the North Atlantic right whales just like we need to do more to protect biodiversity. We are loosing whales, salmon, orcas, ... the list goes on. We need stronger regulation to do more than protect. We need regulations to allow populations to recover.

I am concerned about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. I don't see how the DMF could omit the potential for ropeless gear technology in drafting regulations to protect the North Atlantic right whales. Other countries such as Canada, have been using ropeless gear technology and has seen its success. The right whales are dying at an alarming rate and I fear we could see their extinction in my lifetime should we fail to implement sufficient protective measures. I hope you will implement a pilot program that showcases ropeless gear. Thank you.

I was horrified to learn there are only 366 North Atlantic right whales left in the world. With entanglement being a lead cause of death for right whales, I am troubled with how the DMF could draft regulations to protect right whales without including the potential of ropeless gear technology. Ropeless gear has proven extremely effective in reducing the risk of entanglement for right whales and will pose no risk to the lobster industry (like seasonal closures does).

I hope you will consider ropeless gear when drafting these new regulations because frankly, the right whales do not have time for inaction.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

Speed limits for shipping work can reduce collisions.  
Accurate surveillance of all shipping and whales is crucial.

Please consider reducing the number of vertical lines and buoys in the water. Fishers can set longer strings of traps on the bottom and use just ONE buoy and vertical line. 20 traps on a string instead of 3 or singles for example. It is the overabundance of lines rising from the bottom that entangle the 2 whales. Lines concentrated in "patches" would be easier for whales to avoid and would leave more open water for them to feed and migrate. Increased surveillance will better identify their "grounds" which should be clear of traffic and fishing gear. Sonic pulse generators tuned to whale hearing frequencies could warn right whales of gear concentrations too.  
Some ideas for actions. Think again. Fishers do not own the seas and all in it. They have to share again.  
Do much more to clear water for these whales before they are all killed.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. I have had a Right Whale license plate for decades, telling everyone on the road we should be doing more to save them. But insufficient action has been taken to save these endangered amazing mammals. We have the chance to do something about it. I am very concerned about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million miles of vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Thank you for taking my comments.

If we are to prevent extinction of the magnificent right whale within a generation, it is time that we abandon the destructive fishing practices of the past and join with others around the world who are using ropeless fishing gear to harvest lobsters. Action must be taken now to avoid a catastrophe.

For the right whale, navigation through the hundreds, if not thousands, of vertical fishing lines off the coast of Massachusetts is comparable to you or me crossing I-93 in downtown Boston at rush-hour (even during the current COVID Pandemic!) We wouldn't stand a chance, and they don't either. With so few right whales living on the planet, their lives cannot be squandered.

The proposed draft regulations that were created to reduce entanglement risks posed to North Atlantic right whales are of concern to me.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. It is not acceptable that today's DMF becomes the group that allowed the right whale to go extinct. It is not acceptable that today's DMF allows right whales to go extinct.

Please require ropeless gear now to prevent the permanent extinction of right whales.

Thank you.

There is no reasonable tradeoff between safety for the right whales and convenience for the lobstermen. Ropeless gear must be required! I can do without eating lobster; but my heart would break if my special Massachusetts license plate, beginning with RW, were to become an anachronism. Please take sensible action.

Thank you.

.....  
Hello, my name is Michael Murphy. I am an environmental scientist working with the EPA to help keep our rivers, oceans, lakes, wetlands, and neighborhoods safe from man-made contaminants in our drinking water and soils. To say that the outlook of this cause is grim would be an understatement, given the continued development and slow-stepped transitions away from chemicals that at one time in human history helped change the nation forever, for better or worse.

I can't say that these findings working in the lab over the past 3+ years have given us a positive outlook, but we are still holding all polluters and municipalities accountable thanks to the ethical and accurate work of our analytical and extractions teams. That being said, a number of marine animals have already been effected by our continued expansion into their territory, using nets, fishing lines, trawling nets of vessels, the use of SONAR to track schools of fish to attain maximum yield, and of course the mounting level of plastics in all of these waters the animals call home. Simply put, we don't belong at sea, and neither does our jetsam. As the saying goes for parks "leave nothing but your footprints."

We have clearly overstepped our boundaries in the oceans already, with a dwindling population of right whales that migrate north and south naturally across the entire Atlantic coast. These whales meet us here in Florida as well, and they are truly a sight to behold. We don't get many visitors as large as them who are so gentle and similar to us in

their mannerisms and family behaviors per pod. They raise families as we do and look out for each other.

I am calling on the State of Massachusetts to take a stand in this catastrophic population drop, as it not only effects your coast, but the coasts of all whom border the Atlantic. Your fishing practices are effecting the entire eastern seaboard of North America. If these whales were to disappear, it will be troublesome

My family and I vacationed for 25 years on Cape Cod. We came every summer because of the natural beauty of the landscape and the incredible wildlife in the area. We also valued the appreciation that the majority of Cape Cod inhabitants demonstrated for their environment and the creatures that make their home here. It's why we chose to retire here full time. However, we now have a large concern about the recent proposed state's measures to reduce the impact of fishery entanglement on right whales, and other marine species. The proposed regulations are simply not enough.

The majestic North Atlantic right whale is at risk of extinction. The primary causes of death for right whales are ship strikes and entanglements. No right whale has died of natural causes in the past 17 years. I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales. The proposed regulations are simply not enough to address the entanglement risks that right whales face in our Massachusetts' waters.

The East Coast has over one million vertical lines that right whales must navigate through in order to feed. This includes Massachusetts state waters. These ropes pose a large threat of entanglement for our state marine mammal, the North Atlantic right whale and therefore increase the likelihood of extinction.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at only 366, is rapidly declining. We could cause and see the extinction of right whales in our lifetime, but we can stop it!

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. Draft regulations would only require using 1700 lb. breakable rope for fishing lines attached to trap pots. This is not enough. Breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles further reducing their numbers and long-term sustainability. To protect the North Atlantic Right Whale this proposal must be revised entirely, and provide for ropeless fishing to become legal in Massachusetts.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. Extensive data indicate ropeless fishing gear has a 98.4 percent success rate, and multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today and keep the fishing industry healthy while protecting sea mammals including the North Atlantic right whale.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping our fisherman and the fishing industry viable. Please implement measures that incorporate ropeless gear pilot programs in order to save the North Atlantic right whale. We can make a difference if we act now.

Thank you.

Please take a hard look at the main cause of harm to right whales. The difficulty of coming up with a practical solution has put off a way to save Right Whales. However inconvenient to industry, large or small, it is the industry that decimates this species. It is time to withdraw the blank check afforded industry where profit had the final say. Those days are over. The time for giving equal or higher value to species and the environment is at hand due to the blatant disregard of those values by profiteers. Time to wake up.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

I am writing to express my concern about the proposed draft regulations created to reduce entanglement risks posed to North Atlantic right whales. Right whales are among the most endangered species of whales in the world all because of human behavior - they were targets of commercial whaling and they now suffer from being struck by ships and tangling in fishing lines. North Atlantic right whales have a long gestation period and a long weaning period - their numbers can be counted in the hundreds today.

The primary causes of death for right whales are ship strikes and entanglements: no right whale has died of natural causes in the past 17 years. The State of MA must act now to save right whales and it can be done while still allowing lobstermen to make a living. Ropeless fishing must be considered in the draft regulations created to reduce entanglement risks posed to North Atlantic right whales. I am deeply concerned that the state is not taking the lead to ensure that both right whales and fishermen survive the next decade.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has been identified as dying of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled twice or more. The population, which is estimated at 366, is rapidly declining. Right whales could be extinct within our lifetime.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Please consider new regulations concerning ropeless gear for harvesting lobster nets. It could save the lives of many of the very few remaining right whales in this area.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Hi

I listened with interest to the debate in your first webinar 2 weeks ago.

It's obvious that you are concerned to take action on this important issue which is absolutely critical for the survival of this species.

However I'm wondering if these proposals go far enough. You explained that there have only been a couple of entanglement cases occurring in this area, but with things at such a critical point surely the stakes are much too high to take ANY avoidable risks? Surely the case for further reducing or even eliminating non-subsistence rope fishing, and accelerating ropeless fishing, is absolutely overwhelming.

Please do the right thing for all future generations.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The right whales were a saving grace for the early settlers because they were easy to catch and get to; hence their name. It now seems they should be renamed wrong whales since they are now almost extinct due to fishing rope entanglements.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

As an environmentalist and wildlife advocate, I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

North Atlantic Right whales are an integral part of our marine biodiversity! Their numbers are plummeting and we must protect them immediately. It would be tragic to see their numbers decline.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. I go to school in MA, but am from NJ and saw today that my Senator Cory Booker spoke out for the North Atlantic whales. I am very proud of Senator Booker and urge the DMF to fight for these creatures by incorporating ropeless gear into their new regulations. These whales have been put at risk and ignored for far too long.

Thank you.

I spend most summers visiting the cape. It's been a destination for my whole family for generations, the highlight of our travels there are whale watches on the dolphin fleet and Portuguese princess out of Provincetown. There are scientifically proven ways to help preserve North Atlantic right whales while still allowing successful fishing. It's imperative that regulation protects the whales' lives as much as it does the lively hood of the fisherman. I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The evidence is in: ropes kill whales. With just 300-odd Right Whales left in the North Atlantic, we need to act. Ropeless lobsterpots and other ropeless fishing systems may be a bit more expensive, but that cost can be passed on to consumers. Or maybe the state can subsidise the cost of the upgrade.

I care about this issue and I vote.

The boilerplate text follows:

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

As a race we humans are able to learn from the past, we need to apply that ability to saving these whales. At a time when we should all be reflecting on our impact on this planet and how we can collectively make a difference. It does not need to be an either or situation, we can effectively meet the needs of the fishermen and save the whales.

I say this as the granddaughter of a fisherman. He relied on the fish in the sea to care for his family at home. He understood that we need to live in harmony with nature.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Dear Director McKiernan, I writing in support of the proposal to implement ropeless gear in the waters off our coast as a way to mitigate the future loss of north atlantic right whales. I can't imagine the arguement made for not putting measures like this in place long befor now while the very existence of a species hangs in the balance and since no explanation was offered at last nights hearing, the right time is now to take this reasonable step toward a sustainable future for the other occupants of this planet. Thank you for your attention to this concern.

Chuck

. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Thank you for your work trying to protect right whales in our waters off the Massachusetts coast. Unfortunately the proposed regulations are not going to achieve their objective without incorporating a pathway for ropeless gear requirements. We cannot allow our right whales to go extinct after decades of efforts to protect them. I moved to Massachusetts in 1995 and remember obtaining a right whale license plate to support their protection - how are they again on the verge of extinction - this is not acceptable.

The technology is available now to advance ropeless fishing thereby saving ocean species & the critical ecosystems that support a flourishing fishing industry and this needs to be included in your regulations in order for the right whale to not accelerate toward extinction.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

I want to give my children, my grandchildren, my great-children a world that has right whales in it. When my daughter was 4, she hung up a drawing of a whale and a note saying "Don't Kill Whales."

I ask that you listen to the wisdom of my child.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

I joined two meetings this week in which the regulations were explained and discussed and listened to questions and public comment on the issues.

I am brand new to this discussion and cannot pretend to be deeply educated on the facts. But I DO know that the possibility of witnessing the extinction of right whales in our lifetime is one that moves me to take action. It is not only the loss of an impressive and historically significant creature that we are facing, but untold ripple effects that would impact the natural systems around those whales.

I am very impressed with the care and thought that has gone into the proposals already on the table. I am also aware that fishermen and women are stretched thin and there's a lobby to protect their livelihoods -- which makes sense.

At the same time, ropeless fishing gear is in use in many areas and is proven to be much more effective at protecting right whales than anything else being proposed. Since it's out there and it works, the state of Massachusetts should be doing everything possible to make it part of our state's fishing infrastructure. ASAP.

Where there's a will, there's a way. Please generate the support for both.

Thank you.

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

I am writing to express my strong support for MA to adopt regulations that require the use of ropeless gear to reduce entanglement risks posed to North Atlantic right whales. Proposed regulations do not do enough to protect right whales. I understand that there are other interests at stake, but I believe that if you adopt a more stringent regulation and then provide incentive and help to fisher people who need it, we will make progress faster than we would were you not to a push forward regulations for ropeless gear.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

We should all pause for thought at the devastating affect of COVID19 on our human lives, caused by our heedless rush to profit without due regard for the environmental buffer that diversity and sustainability offer to us as guardians of our planet. This pandemic is a bell tolling as a warning, as a countdown, that our individual actions matter in the balance of nature, and we are running out of time. Yes there are economic arguments, so let us invest in new and better, green, sustainable economies. Lets support our fishermen in ways that produce a better outcome for all of us that share the planet. We can not continue to use the environment as a free resource and every part connects with another. If we are pushing one part to extinction so we are pushing ourselves to extinction. If we protect the offspring of the right whale so we protect our own offspring. How can 1 million lines be a reasonable situation. Ropeless gear has proven to be successful. Not implementing this protocol will bring certain extinction within our lifetime, another death toll we cannot afford, look around at those who don't heed scientific advice, this is a crisis and your decisions matter.

And so, I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. I, a citizen and tax payer of Massachusetts, a state which has an opportunity and an obligation to be good stewards of the coastline within our borders, am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. This is outrageous, especially when there is a missing solution at our fingertips.

The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime. Extinct is forever, so we must act now to prevent it.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear is a proven solution. It has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

Without right whales we lose our ocean ecosystems, our fish populations and climate change hastens. No fish no fishing industry. Less food for humans. Nylon ropes are killing the whales and polluting our planet. Get on it and stop entanglement now!

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

I, myself, am looking to go into marine biology, because of the amount of harm that is being done to marine life in waters near our country. Hearing that the Massachusetts Division of Marine Fisheries is looking to change how people fish, in order to protect the right whales from entanglement while on their migration track makes me so happy.

I've always found the way that some fishermen fish, with rope or even invisible net is what led me to Pershing a career in marine biology. I want to be able to make a difference to help the lives of marine life.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

This number is astonishing for me, because I did not realize that whales are part of the population of marine life that are being harmed due to fishing equipment that is disregarded and left in the waters or improperly used or placed. Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I want to go into Marine Biology in order to help make a difference in the lives of marine life and having the opportunity to leave a comment in order to have the opinions of others is an amazing feeling. I have always felt that using rope or net to fish is not a fair way to fish. Meaning that the fish or other marine life don't have the opportunity to be able to untangle themselves or get away from them.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

I believe that with this high of a success rate ropeless fishing gear should be used everywhere. There shouldn't be any reason as to why it hasn't been legalized or used on the East Coast, or any other places for that matter. If there has been a proven success rate this high, then there shouldn't be a need to procrastinate and should adjust allow people to use it or legalize it.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

No animal deserves to be tangled in rope or net that is left or even just being used. If there is a safer way to fish, it should be used. Marine life are some of the most harmed animals as of right now. I believe that in order to keep them safe and healthy, large steps such as implementing ropeless gear, need to be taken. Change can not be made until that first step is taken. And that would be to make safer gear for other marine life.

Thank you.

At this period in time when people all over the world are evaluating how to move forward, your work is more important than ever. When considering rules around our marine wildlife, considering their future is critical- there is no "second chance" with all the creatures on our planet- including us and right whales too.

I am concerned about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales. Ropeless gear could be a good step in the right direction given the data around whale losses caused by human activity.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

As a citizen concerned about the health of our oceans and it's creatures, I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. What a sad statement about how little we care about our impact on these majestic creatures! The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in MA state waters. These ropes pose a direct risk to the state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime. I don't want to tell my grandchildren someday that our generation watched as they dies horrible deaths.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today. We must not wait to save this critically endangered species! Action is needed now.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Save the Whales!

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you,

John

Please save the right whales by enacting legislation to reduce and preferably prevent entanglement of these endangered mammals.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales. I grew up on the Cape, and know how treasured these Right Whales are. With only 366 of them left, it is critical that we do everything we can to prevent their extinction. It seems reasonable that we must continue to address this issue on 2 fronts: transition as soon as reasonably possible to ropeless fishing and lobster harvesting As Well As continue to ensure all necessary restrictions to prevent vessel strikes in Massachusetts Bay and the outlined Protected area off our shores.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. The main cause of death for right whales are ship strikes and entanglements. Off the Atlantic coast there are over one million vertical lines that right whales avoid in order to feed, including in Massachusetts waters. These are a deadly risk to the North Atlantic right whale. Over 85% of right whales have been entangled at least once. The population, estimated at 366, is rapidly declining and could be extinct within our lifetime.

Ropeless gear works! It has a 98.4 percent success rate. DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

I am sure you are aware of the dwindling North Atlantic right whale population and the role that entanglement plays in their death.

How is it that you are not including ropeless fishing gear permitting in the current draft regulations? Are you not the Division of Marine Fisheries?

How does exclusion of this permitting support the marine environment and specifically the state marine mammal?

No adult or juvenile right whale has died of natural causes in the past 17 years.

Over 85% of right whales have been entangled in vertical lines at least once.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

The time for debate and procrastination is over. A legitimate alternative is available and must be implemented now to avoid extinction. When the remaining numbers of a species are only in the hundreds that illustrates to me that decisive action is long past due. I would like to think that Massachusetts is an innovative and sympathetic state that would not want to be associated with, and possibly responsible for, the disappearance of such a beloved and majestic species. Please do the right thing.

Thank you.

Kathleen McHendry

Hello,

As a marine mammal veterinarian, scientist, and lifelong conservationist, I am writing to express my significant concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our a critically endangered marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime. We need to be part of the solution, and fast!

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale before it is too late for their species to recover.

Sincerely,

Dept of Marine Fisheries,

Please consider a transition to ropeless gear, replacing the vertical lines which are causing so many tragic entanglements. It would help greatly if you could subsidize the fishermen with this.

Sincerely, Roberta Brunelle

I am writing to express my concern about the proposed regulations created to reduce entanglement of right whales.

I am a life long Cape Codder, though now in my 70's I only live there part of the year and the rest of the time in western Mass. I've always been on the water and fished and hung out with lobster men and trawler guys. We always felt honored somehow when we saw a whale. The thought that anything we could control would harm themselves was always repulsive.

PLEASE: DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales -- whales that will be eradicated without your swift action.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

PLEASE HEAR US! WE MUST TRANSITION TO ROPELESS GEAR NOW OR WE WILL LOSE THE LAST 400 RIGHT WHALES. THEY WILL GO EXTINCT. INACTION IS UNACCEPTABLE, THIS IS IMPORTANT TO EVERYONE, THE WORLD, THE PLANET. WE MUST PRIORITIZE OUR PLANET. IT IS OUR HOME. ROPELESS GEAR IS A VIABLE OPTION.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales. I vigorously object to this needless danger to the North Atlantic Right Whale, who is on the edge of extinction, strictly through human irresponsibility. Have we no hearts for these magnificent wild creatures? We can change our terrible behavior and allow them to live on this planet that does not belong solely to humans. PLEASE do not allow these Right Whales to die off!

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. I am very concerned about the fact that right whales are nearing extinction due in large part to entanglement with ropes set by the fishing industry. Major steps must be taken immediately to stop this potential extinction from happening on our watch.

I'm writing specifically to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales. There are some aspects of the proposed regulations that are useful but there must also be attention to allowing and promoting ropeless fishing gear. I attended the recent virtual hearing on the proposed regulations, and it seemed the ropeless gear issue was simply off the table in terms of these regulations. This is unacceptable. This must happen now, as the right whale population is plummeting.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. Hello!

As a resident of MA for the past five years, I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you,

We are writing to express our concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I have now seen the dire statistics for the very few Right Whales that are left! There is no excuse for continuing with old practices when new ones have been proven effective.

We must reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. Dear Massachusetts Representatives & Senators,

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Please, please save our fellow whale species—we are ONE and we need to be responsible to one another. I for one, don't want to live this life without North Right Atlantic Whales——please, we owe this responsibility to OUR CHILDREN AND GENERATIONS TO COME! Never underestimate the powers you have been selected to represent. Please vote with your Truest Self.

Thank you.

I am writing from Canada and I am deeply concerned about the future of the North Atlantic Right Whale. I grew up in Newfoundland and I love seafood but I am currently boycotting the fishing industry period until the oceans are safe. We MUST choose sustainability over profit and greed.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. It is the responsibility of the government to ensure that our environment is not only sustained, but allowed to thrive. Failing to consider measures that have been proven successful and that are necessary to prevent the extinction of a species constitutes a failure of the government as a whole; if government and the DMF cannot ensure the longevity of the environment it claims to protect, then it has failed the people who have put it in place.

Thank you.

Dear DMF,

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales. To be honest I am devastated over the decline in this whale population and the thought of this animal and potentially others getting entangled and suffering severe injury or suffocation, as well as the fear they must feel is more than I can bear. They have a right to safety and survival as much as a human being does. Once we lose them, there is no going back. Please, please do something and support implementation of ripeness gear.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. Massachusetts should set the example for all states and act quickly to save the magnificent right whales we are lucky to have in our waters.

We're counting on you to not be swayed by corporate interests and to help both the whales and show that ropefree fishing is sustainable.

Thank you.

While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

This is a very important cause for me. I grew up going whale watching and the feeling of seeing a free whale jumping out of the water is something I cannot describe. I want this feeling to be available for generations to come and this is one step I feel is very important.

Thank you.

Gillian Woodman  
Stamford, CT 06902

I am writing as the preservation of endangered species is extremely important to me.

Right whales are a majestic and unique species, and most certainly deserving of our respect and utmost efforts for their protection. These wonderful creatures are facing overwhelming challenges and assaults that diminish their numbers, decrease their reproductive rate, and endanger their survival.

It is incumbent upon us to recognize our human impact upon right whales and other precious marine life that threatens their very survival.

Of particular concern are fishing practices that result in right whale deaths. Currently there is widespread support for the use of ropeless gear as a way to help save right whales from extinction. Ropeless gear has a very high success rate at significantly reducing entanglement, injury and death for our right whale population.

A world without whales would be an unimaginable tragedy.  
Is this the legacy we wish to leave for our children and future generations?  
This cherished marine life legacy belongs to each and every American.

Please move decisively to ensure the survival of this cherished species!

The proposed regulations created to reduce entanglement risks posed to North Atlantic right whales. They are insufficient, and do not address the issue of entanglements.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales. These proposed regulations do not consider existing and mature on-demand fishing systems currently used around the world successfully. The State of California has acted to reduce entanglement occurrences by enacting new legislation that allows the implementation of this ropeless technology.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once. More than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require a vertical buoy rope to be used when harvesting lobster. This law must be revised to allow for ropeless fishing to become legal in Massachusetts. We strongly urge the examination of California legislation that addresses the use of new technology to mitigate whale entanglement incidence. Vertical lines are removed from the water column with the implementation of on-demand fishing gear. With no line, there is no chance of entanglement.

DMF must implement a pathway for permitting ropeless gear. The draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a lethal threat to right whale calves and juveniles.

On-demand gear has been used successfully by fishermen in Australia, United Kingdom, Ireland, Canada, and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. Federal and state regulators have studied ropeless gear to no avail for the past twenty years. Multiple commercial companies have worked with fishers to manufacture gear that is used by fishermen to fish today. The foundational technology in on-demand systems is mature and in use since the mid-1960 era. Other sectors that have extensive operational successes include offshore oil and gas, defense, and oceanographic research.

DMF must implement regulations for on-demand technology to save North Atlantic right whales. Ropeless gear is an established and mature technology providing the only long-term solution to reduce entanglements while keeping fishermen on the water. There will also be reductions in lost equipment that currently negatively the target catch and other non-targeted species.

Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

I care deeply about the ocean and have devoted myself to teaching others about the wonders of marine science. So I have to urge you to take more definitive action to save the North Atlantic right whales. Entanglements need to stop in order to have them not go extinct. Ropeless gear seems like an answer that helps the whales without preventing fishermen from fishing. Closures alone won't be enough to save the species.

“In the short, medium, and long term we need to broaden the efforts that both countries are making to slow vessels down and reduce entanglement risk. Without that, it's too little, too late.”

-Michael Moore ,WHOI Research Scientist

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

\*Please read the following concerning the very doable practice of using ropeless gear, instead of vertical buoy rope used in lobster fishing. There is no reason why right whales, particularly the calves and juveniles, need to be endangered when the solution is clear and right.\*

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

For the past 17 years, no North Atlantic right whales have died from natural causes - ship strikes and gear entanglement are the leading cause of death for these critically endangered cetaceans. The vertical ropes that whales must navigate through pose a potentially deadly risk every day.

Entanglement in fishing gear has affected 85% of the NARW population, and many of these whales have been entangled twice or more. The population, which is estimated at only 366, is rapidly declining and could be extinct within our lifetime if bold action is not taken immediately.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has already been successfully used by fishermen in many countries including Canada, Ireland, and the UK. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while preserving jobs for fishermen. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you for your consideration.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in Massachusetts' waters. These ropes pose a direct risk to the state's marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you for your consideration.

I live in Sag Harbor, an old whaling town which has much in common with your coast and history.

It hurts my heart to know that my great grandchildren probably will never see an elephant, a pangolin or a beautiful whale leaping into the air, not dismissing all the butterflies, bees and birds that are endangered. We will lose so much of the beauty of this earth if we do not stop our invasion of nature.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales. Humans do not have the right to do whatever they want - we must live within the rules and habits of nature if we want to preserve life on this planet. For the species that is supposedly the most intelligent, we act with extreme stupidity and greed. Please update the regulations to remove the ropes that impede the right whales migrations.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

RE: Response to 2021 Proposed Fisheries Regulations and 60 Day Notice of Intent to Bring  
Suit Under ESA

To the Above Parties,

This is a notice from I, Whale Safe USA and its associates, that after the next 60 days or before that we will be prosecuting you in a US District Court to stop your 2021 licensing and regulating fisheries activities in ESA listed designated critical habitat. You are now proposing to adopt in 2021 regulations for the licensing of lobsterpot and gillnet fishing that will INCREASE your ongoing ESA § 9 prohibited taking of ESA Listed Species of whales and sea turtles in the Gulf of Maine. We are going to stop you from doing so by seeking a court order permanently enjoining each of you individually, the current crew of Division of Marine Fisheries employees and members of the Marine Fisheries Advisory Commission from further licensing and regulating lobsterpot and gillnet fishing in United States coastal waters from 2021 and onwards. We will also be seeking an order from the said court forcing you to expend the necessary funds to correct the injury that you have inflicted from 1973 to the current year on the ability of the Northern Right Whale species to recover from its endangered status.

It is an incontrovertible fact that in 2021 endangered whales and sea turtles will be entangled, killed and injured by individuals from their commercial and recreational deployment of fishing gear in the Gulf of Maine under license and complying with regulations adopted by the Division of Marine Fisheries in 2021. These said practices that will result in injuries inflicted on ESA Listed Species by you in 2021 and now they in themselves are constituting prohibited conduct pursuant to the ESA's § 9 take prohibitions without the need for further entanglement of any ESA protected wildlife by you in 2021.

Pursuant to our said prospective prosecution of you and your agents, we make the following claims, inclusively but not exclusively, of fact and law —

1. DMF's proposed licensing and regulating of lobsterpot and gillnet fisheries on its own in 2021 will constitute a prohibited activity under the ESA's § 9 taking prohibition and a continued prohibited taking of ESA Listed Species without any need for it to cause additional entanglements of ESA Listed Species in 2021.
2. The deployment in 2021 of vertical buoy ropes by any of DMF's licensed agents on any day of the year into the ESA listed designated critical habitat for the Northern Right Whale in the Gulf of Maine constitutes on its own a prohibited taking of ESA Listed whales and sea turtles.
3. Since all the 2020 agents of DMF that it licensed to conduct lobsterpot fishing are engaging in prohibited conduct pursuant to in ESA § 9 they cannot lawfully qualify for any fishing license to be issued to them by the DMF in 2021.
4. Your current planned promulgation of further regulations for your licensing and regulation the state's lobsterpot and gillnet fisheries in 2021 will INCREASE the likelihood of your licensed agents further entangling in their fishing gear ESA Listed Species of whales and sea turtles in 2021.
5. Having adopted a policy in the 1990's that the Massachusetts Endangered Species Act will not be enforced to protect ESA Listed Species of Whales and Sea Turtles, the Cooperative Agreement pursuant to ESA § 6 that you afterwards entered into with the National Marine Fisheries Service is unlawful. The monies paid to Massachusetts under this phony agreement since its signing constitutes a fraud on the People of United States by Daniel McKiernan, David Pierce & Kathleen Theoharides and other state employees.
6. The refusal by Kathleen Theoharides to enforce any MEPA review of the DMF's currently proposed fishing regulations for 2021 not only violates MEPA but is intentionally being done to aid and abet DMF employees to prevent enforcement of environmental laws on commercial fishys in order to allow them to kill & injure ESA Listed Species of Whales and Sea Turtles in 2021.
7. Anyone willing to go lobsterpot fishing in state waters in 2021 without using vertical buoy ropes or ground lines should be entitled to a full commercial fishing license over anyone else not willing to do so.
8. The Marine Fisheries Advisory Commission is engaging in prohibited conduct under ESA § 9(g) by directly aiding and abetting the DMF and its licensed agents to engage in the ESA § 9 prohibited conduct of the killing and entangling of ESA Listed Species of whales and sea turtles by their approving by their 2021 adoption of regulations requiring the use of 1700 lb vertical buoy ropes by all licensed agents of the Defendants.
9. Commercial fishermen that are criminals engaging in ESA § 9 prohibited conduct cannot lawfully vote as members of the MFAC since they are only going to affirm the continued ESA prohibited use of VBR.

10. Owing to the DMF's entangling and other ESA § 9 prohibited conduct regarding ESA Listed Species of whales and sea turtles prohibited since 1973 to the present time, the USDC is compelled in 2021 to enjoin the Defendants from any further licensing and regulation of commercial fisheries in ESA listed designated critical habitat for the Right Whale from now into the foreseeable future.

To evade prosecution for your omission and commission of crimes under the ESA since 1973 to the present day, you must —

1. NOT issue any further fishing licenses in 2021 to any holder of a lobsterpot and/or gillnet fishing license in 2020.
2. From 2021 forward ONLY issue licenses to do lobster fishing to individuals who agree not to use vertical buoy ropes or any other kind of unattended rope on their lobster fishing gear.
3. From 2021 forward you will NOT license anyone to engage in fishing using gillnets.

Be advised that Kathleen Theoharides and the rest of you jerks will be individually prosecuted under other state and federal statutes if you continue to act as scofflaws and continue your spree of environmental crimes.

In Peace,

/s/ Richard Maximus Strahan

**CAUTION:** This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Dear Director Mckiernan,

My name is Shane Normand. I am from Gloucester, MA and have spent my entire life on the ocean from working on lobster boats to tuna fishing. I have personally witnessed the extent that lobstermen go through on a daily basis to preserve not only lobsters but all marine life. Currently I work for Cape Ann Lobstermen, a business which relies on the Massachusetts lobster fishery. The proposed amendment of closing state waters from February 1st to April 30th with such short notice would not only be devastating to the commercial lobstermen but it would affect the livelihood of the many shoreside workers that depend on this fishery.

A major issue with this proposed closure is where are the lobstermen supposed to store 800 traps as well as all of the gear that goes with them on such short notice? It is baffling to me that in just over a months time you expect these men to have all of their gear out of the water especially after the year that they have endured. Because of the pandemic the lobster price has just finally made a comeback, and now that they are finally starting to bounce back and make some money you expect them to pull their traps out of the water with very little scientific evidence that the gear is harming whales.

My opinion is that if the DMF wants to reduce vertical lines in the water why don't they do something about the 6000 recreational permits. I fully understand that the income from the recreational permits is extremely helpful for the DMF. But I believe they could offset this income by slightly increasing the cost for a trap tag for the commercial guys. It is astonishing how much recreational gear is left in the water, not only is this gear left in the water at an alarming rate a vast amount of the gear is unmarked and not the correct rope to be using. I have personally seen recreational gear tangled in our lines as we haul. To me it makes a lot more sense to put a limit on recreational fisheries than commercial, the commercial fishermen have their livelihoods at stake.

I think it would be best for the DMF to hold off on making any decisions until some proper research is done. There is not nearly enough scientific evidence to show that this closure would even be beneficial for the whales. It is shocking to me that such a rash decision that affects the livelihoods of so many men and women could be made so abruptly. I fully agree that we need to protect all marine life but I do not believe this closure is the way to go. I want to thank you for your time as well as all you do to keep our Massachusetts fisheries strong.

Best,

Shane Normand  
Manager  
Cape Ann Lobstermen

---

**CAUTION:** This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Mr. Dan McKiernan,

My name is Garrett Loparto. My brother, Jeremy, and I are both second generation OCLMA lobstermen. I am writing to you on the regulation change proposal. As lobstermen, the most conservation minded fishery, we fully support saving the north Atlantic right whales. From 2014 statistics, science has already proved trawls and gillnet ends are way more likely to entangle a whale. Why change?

One very troubling proposal is that any vessel larger than 29ft deal must fish trawls. OCLMA is predominantly comprised of 3 fleets, Provincetown (about 90% single trap fishermen), Nauset (99% singles), and Chatham (about 80%). Previously, the fleets used to fish out of much smaller boats until a few guys with larger vessels, 43ft, trawled up. This created major safety issues. The sea conditions we face, like no other in the state, are dangerous enough. Forcing trawls onto vessels that are unsuitable is asking for a tragedy. I say unsuitable because of safety. When fishing out of a skiff, if you get hung on a trawl, all your gear gets put at its breaking point, your vessel can rapidly roll over. It only takes one wave, and a few seconds. I know this because I started in a skiff, moved to a 33 foot, and would like to eventually fish out of a 43ft boat. We started at the bottom, what we could afford, and invested in a larger vessel, 33ft, as soon as we could. On three different occasions, I ended up over the rail of my small boat. I cut myself out once and my wife got me out the other two times. Putting a size limitation on the boat is ridiculous when to effectively fish trawl you need a 43 ft boat or better. Fishing a small boat around trawls is a death sentence. I know from living it. You cannot compare Outer Cape to Cape Cod Bay (the bath tub) and areas all the way up to north shore, given the sea conditions we face and an inlet that's as mean as can be.

Outer Cape has taken more whale safety measures than anywhere with line markings and most of all, TRAP CUTS. We put measures in place to know if OUR AREA catches a whale. IF our gear did entangle whales, then do something. It is NOT a proven problem in our area. We are talking about a fishery comprised 90% of single trap fishermen, who have built their business solely around a single trap fishery, fishing gear that has never killed a right whale. ANYONE who fishes single traps knows trawls and singles do not mix. Creating new regulations just because Max Strahan and some NGO groups pick on us because we are the little guy is totally unacceptable. Do you see them badgering Maersk? NO, because they have more money than GOD. Let's face the facts, we all know single traps are not the issue and being the small guy that is an easy target is the issue. I speak for my FAMILY, the whole nauset fleet.

Thank you,

Garrett Loparto

my name is David Demski am writing a second time and am in favor of a closure. The latest info you are receiving is not accurate. The guys complaining the most have biggest boats and move gear the fastest saying there losing 50 percent of income is not true we dont start catching until April. These people have conch/fish pot permits but a few never fished for any of those species this year??? Then you have people writing to you from south coast direct seafood the customers who have no stake in the fishery complaining and have no idea what there talking about. The closure happened in area one how many fisherman went out of business in Plymouth and Sandwhich none they adapted to the change and smart fisherman will survive not older lazy fisherman. It a great thing to not only give the bottom a rest from fishing but get the none tagged gear out and ghost gear my only worry would be how is the state going to enforce it especially in the winter?

Dear Mr. McKiernan,

Please accept these comments with regards to the New Protected Species Regulations Affecting Trap and Gillnet fishing. First, the proposed regulations regarding using 1700lb breaking strength rope and contrivances and limiting the diameter of ropes allowed to be used for endlines is a reasonable step that the commercial fishing industry should be able to handle. As is pointed out, there is peer-reviewed research that found that serious injury and mortality to North Atlantic Right Whales (NARW) is reduced by 72% by limiting rope strength to 1700lbs breaking strength.

Second, however, I do not support the broad brushed approach to closing all of Massachusetts State Waters for a 3 month (and possibly longer) period. As a fisherman, we have been told that management decisions are based on the best available science. This proposed rule (decision) is not based on science at all. It is purely being proposed and enacted based on lawsuits and misinformed and agenda-driven environmental organizations. Buzzards Bay (BB) and in between the Elizabethan Islands and Martha's Vineyard (MV) rarely have NARW sightings. And this area is of vital importance to lobstermen during the exact 3 months that are proposed to be closed. As we know, lobsters are only able to be caught on a temporospatial basis. For BB and north of MV, lobsters are able to be commercially trapped during a time that we see the highest prices for them. This adds up to being a very important area and time for commercial lobstermen to make a significant portion of their living.

Through management action after management action, fishermen have been boxed into specific fisheries based on historical effort coinciding with often arbitrary control dates. This has significantly limited a fisherman's abilities to simply switch to another fishery when necessary; whether it be because of regulations, closures, low abundance of species during certain times of year, or conversely high abundance of species during certain times of year. Therefore, an action such as this broad brush approach, not based on science but rather political pressure, will critically hinder the ability of the few remaining full time lobstermen to make a living.

Further, because these lobstermen will still have to fish to try and make up a portion of their income that is being taken away from them, the ones with federal permits will be forced to fish in federal waters during this time. This creates a myriad of problems. Lobstermen from Rhode Island (myself included) fish in federal waters and sometimes get near the Mass State waters line on the federal side. The Mass lobstermen that now have to fish in federal waters will have to compete with the fishermen that are already there which reduces the commercial viability of all operations involved (including non-Mass fishermen). In addition, lobster gear will be aggregated in the federal waters areas near the Mass state line and therefore have a "fencing" affect. This action of closing Mass state waters arbitrarily may possibly have the opposite effect on reducing serious injury and mortality of whales by pushing lobster gear *towards* where NARW *might* actually be during this time. As we know from the sightings data, NARW are not very common to the west of Cuttyhunk and MV but nonetheless, there may actually end up being more lobster gear out in federal waters during this time.

For the sake of the remaining commercial lobstermen in both Mass and RI, I strongly urge you to consider not enacting a broad brush regulation based on fear-mongering, political pressure, and hidden agendas. A more targeted area (as was done originally for Cape Cod Bay) would make more sense and would allow commercial lobstermen who depend on BB, north MV, and Nomans Land to make a living to continue to do so. Thank you

Sincerely,  
Greg Mataronas  
RI Commercial Fisherman

Dear Director McKiernan,

Thank you for this opportunity to address the proposed regulation changes for trap and gillnet fishing in Mass Territorial Waters. I generally support these proposed changes and applaud the Commonwealth for coming up with realistic regulations which can mitigate the potential for losses to protected whales due to Mass territorial fixed gear.

I strongly support the move to limit buoy lines to 3/8" lines or less. This move will have a significant positive impact on limiting mortality on protected whale species. I am a longtime commercial inshore lobsterman, conservation administrator and supporter of reasonable measures to protect marine mammals from human induced mortality. Just last week I investigated the death of a young male humpback whale which died from fixed gear entanglement (<https://vineyardgazette.com/news/2020/12/05/humpback-whale-found-washed-norton-point>). There is no need for these continued whale deaths if we use common sense.

### [The Vineyard Gazette - Martha's Vineyard News | Humpback Whale Found Washed up at Norton Point](#)

The carcass of a North Atlantic humpback whale was discovered on the shore of Norton Point beach by a passerby Friday. The carcass was carried east by a passing storm this weekend and remained in the surf on Monday midday.

[vineyardgazette.com](http://vineyardgazette.com)

The notion that ropeless gear technology is the answer is a misnomer. It is expensive and carries a lot of unanswered questions regarding fixed and mobile gear conflicts, let alone the inevitable issue of conflicts with other fixed gear fishermen. The answer to solving the issue with Right Whale entanglement begins with reducing rope diameters. Whales will encounter this gear but will be able to break the buoy lines which will ultimately save their lives. I have seen too many needless whale deaths in my time as a beach manager and lobsterman. It is time to come up with reasonable solutions which save the whales and save the lobster

industry. It is achievable but will take compromise. I believe your proposed regulations are achievable and responsible.

With thanks and gratitude,  
Chris Kennedy

Hello,

In regards to the proposed changes to the lobster trap fishery that is responsible for a high percentage of Right whale entanglements, I strongly feel that the proposed restrictions to the areas that currently allow lobster traps to be set in is way overdue. These animals are on the brink of extinction, mostly due to entanglements in active and abandoned commercial fishing gear. We need to do all we can to allow the Right whales to live out their lives without continually coming in contact with this gear. A short-term loss of income for the lobster fishery is a small sacrifice to make to ensure these magnificent and sentient beings will be around for future generations to appreciate and enjoy.

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Cheryl Holdren

Dear DMF,

My name is Carl Waitt and I have been a commercial lobsterman since 1985 and a student license before then. After listening to the hearings on both nights this is what I have to say.

From what we have heard the right whales are entangled with heavy lines used in off shore fishing and in used Canadian fishing gear. It makes no

sense to close state waters and leave federal water untouched. Cruise ships, cargo ships, pollution ect... are killing and injuring a lot more whales ect than any in shore lobsterman fishing where the closures are proposed to be.

Over the years I have been put out of the Gill netting because of all the restrictions especially taking away the most profitable months and the regulations never being relaxed. I threw out thousands of dollars worth of Gill nets and concentrated soley on commercial lobstering and slowly that's been getting harder to do over the years.

Why can't the break away lines and links at least be given a shot. It's new and needs to be studied. Ropeless fishing will not work because it would be to congested. Right now four guys can set over one trawl and that's with buoys! The cost of this crazy ropeless fishing would put us out of business, let alone when we get a nor'easter all that gear will be tangled up altogether and be a real horror show to deal with.

If these closures take place we will miss out on the spring fishing which pre COVID can bring prices of \$11.00 per lb. We will not have income to pay our bills and feed our families. Talking to a Canadien lobsterman, I learned that during there closure they get subsidized 800.00 per week and some get even more.

We all love whales , but fixing what is happening to the right whales needs to be shared by all involved! Not just the inshore commercial lobsterman.

Thank you,  
Carl and Gail Waitt

Dear Director McKiernan,

I am writing on behalf of the lobster men who will lose the right to fish single traps under this plan. I realize why it is in the plan. To try to get the take permit that the judge wants a few must be sacrificed for the good of the industry but I ask you to reconsider.

Since the fact is when the whales are here our traps are out of the water so the singles are not a problem. The DMF makes sure that we only set after the wales have left.

We know that every one wants less vertical lines in the water but singles are safer for both fishermen and whales. I have been caught in singles before and I could hold them back until I could get out of it but if it were a trawl I would not be here. A whale has never died from being caught in a single trap but fishermen have died from being caught in trawls.

Along with loosing a way of life the cost will make it hard for some of us to continue in the business. After the cost of line (15,000 to 25,000) we will have to change our boats and hire a crew which will cost us more money. All we are asking for is the right to fish the way we always have.

Bill Souza

# LOBSTERLIFT

Director McKiernan at  
251 Causeway Street  
Suite 400, Boston  
MA 02114

December 18, 2020

Director McKiernan,

My name is Cormac Hondros-McCarthy and I am writing to ask you to implement a pathway for permitting ropeless fishing in MA waters.

Ted Zhu and I started LobsterLift based out of Lowell, MA. We are developing a low cost ropeless device aimed at giving inshore fishers the ability to keep fishing without the worry of having their gear become a cause for the death of a North Atlantic right whale, a species severely wounded.

LobsterLift started at an international oceanic environmental prototype competition in Malaysia, where we first learned about the issue from a professor who also works as a Maine fisherman. He told us about the ongoing protests between the environmental groups and fishers due to the regulations imposed on the fisheries in order to help conserve the North Atlantic right whale population, and other at-risk marine life. We thought we could help, and we were excited to take on the challenge. The concept was born at Conservation X Labs' challenge, and from there we worked on the design, and applied for grants to allow us to leave our full time jobs for the ability to work on something truly inspiring for us. Up until 6 months ago, we worked on evenings, and weekends to bring our concepts closer towards something which could be tested by fishermen, where we could get their valuable feedback. We were then awarded the highly competitive NOAA Bycatch Reduction Engineering Program (BREP) grant in 2020. Things started to move much more quickly, and we have since taken our concept and brought it out into the ocean with an inshore Gloucester, MA fisherman to fish with. Seeing the gear fall off the side of the boat, and return for it a few days later to see it at the surface was an experience I will never forget - right next to the first time I saw a whale in person on my first whale watch.

It takes a lot to change a century old method fishing method, and most fisherman aren't interested in taking part in the change, but today we are asking you to run with us on the journey of switching to ropeless gear. Creating a system to allow fishers to fish with ropeless gear isn't easy, but is necessary if we are going to act fast to reduce the destruction that we have continued to play a major role in with the population of the North Atlantic right whale.

The LobsterLift is designed as a truly ropeless system: it does not use a stored away endline, but instead inflates a balloon to create enough buoyancy to raise the trap from the ocean floor up to the surface. By

designing it this way, we remove a great deal of complexity for the fisher, who would otherwise have to carefully repack or recoil a rope before sending the trap back overboard. You can set a timer for deployment and drop it off the boat--it's as simple as that. Alternatively, you can also have the system fitted with an acoustics system which would allow you to retrieve it on demand. We are working with many acoustics manufacturers, and are just about finished integrating the first one into the LobsterLift.

LobsterLift has been deployed and retrieved over 100 times, and that number will continue to grow exponentially over the coming year as we continue testing. We have had the opportunity to test our device in waters off of Massachusetts, Connecticut, and Georgia . We have proven its reliability at its current phase with a 100% retrieval rate of success. Our system is designed from the start to be low cost: we understand that one of the challenges posed on using pop-up gear is the price tag, and we bear that in mind to make sure we can work tirelessly to help keep fishers on the water while solving the age-old problem of marine entanglements. As we get closer to manufacturing this system at a larger scale, our units will be available for ~\$200 (timer version) to \$400 (acoustic version) each and can be easily fitted to trawls, reducing the overall cost per trap to the fisher.

Director McKiernan, you have the authority to issue permits on an as-needed basis, we request that the Division reconsider its decisions and develop a pathway for permitting ropeless gear in MA waters during these upcoming rule makings. We are working hard to help save a species while keeping fishers on the water. Please take this opportunity to work towards a solution to save the North Atlantic right whales, not against it.

We look forward to your reply, and hope to speak more with you in this matter directly.

Thank you for your time,  
Cormac Hondros-McCarthy & LobsterLift Team

## Massachusetts Lobstermen's Association

8 Otis Place, Scituate, MA 02066

781.545.6984

December 15, 2020

Sent via: [dan.mckiernan@state.ma.us](mailto:dan.mckiernan@state.ma.us)

Director McKiernan  
251 Causeway Street, Suite 400,  
Boston, MA 02114

Dear Director McKiernan,

On behalf of its 1800 members, the Massachusetts Lobstermen's Association (MLA) respectfully submits this letter of comment to the Massachusetts Division of Marine Fisheries (MADMF) on the draft regulations that are designed to reduce the risk of endangered right whales becoming entangled in fixed fishing gear and reduce the potential harm posed by fixed fishing gear if a right whale interacts with it.

The Massachusetts commercial lobster industry is a historic and iconic part of our community in the Commonwealth which is being threatened by more than the right whale litigation. Every day the commercial lobster industry is faced with market uncertainty due to the ongoing right whale litigation as well as the archaic laws that are working against each other all the while burdening the hard working men and women in the commercial lobster industry.

Established in 1963, the MLA is a member-driven organization that accepts and supports the interdependence of species conservation and the members' collective economic interests. The MLA continues to work conscientiously through the management process with the MADMF, Atlantic Large Whale Take Reduction Team, Atlantic States Marine Fisheries and National Marine Fisheries Service to ensure the continued sustainability and profitability of all the resources in which our fishermen are engaged in.

The Massachusetts commercial lobster industry employs thousands of individuals who earn their living on the sea. In 2018, the 712 active MA commercial lobstermen in State Waters (0-3 miles) harvested 10,712,923 lbs. with an ex-vessel value of \$51,957,676.55 and an overall economic

impact to the local economy of 234 million dollars while only fishing approximately 292,000 lobster pots.

Also, there are 75 active MA commercial lobstermen in Federal waters (3-200 miles) harvesting 7,456,237 lbs. with an ex-vessel value of \$36,162,749.00 and an overall economic impact to the local economy of 165 million dollars while only fishing 111,000 lobster pots. The total economic impact of the collective commercial lobster fleet in Massachusetts is 399 million dollars to the local economy.

On April 30, 2020, the court Order given was a death sentence to the commercial lobster industry and fixed gear fisheries, not just in the Commonwealth, but the entire United States of America by putting an unrealistic timeline to acquire the Incidental Take Permit (ITP) mandating that the *“Plaintiff may renew his motion for an injunction..if Defendants have not obtained an Incidental Take Permit within ninety (90) days of this Order.”* (Case 1:19-cv-10639-IT)

The implications of this Order, should the ultimate goal be reached by the Plaintiff, will be the end to the entire fixed gear fisheries as we know it today, and it will all have stemmed from this Order right here in the Commonwealth. We do not want this to be the end of an era when our commercial fishermen are doing more than anyone, anywhere in the world, to save these animals.

On July 29, 2020 Document 211 was file (Commonwealth) Civil Action No. 19-cv-10639-IT - RICHARD MAX STRAHAN, Plaintiff v. SECRETARY, MASSACHUSETTS EXECUTIVE OFFICE OF ENERGY ENVIRONMENTAL AFFAIRS, et al., “Defendants Secretary of the Massachusetts Office of Energy and Environmental Affairs and Director of the Massachusetts Division of Marine Fisheries hereby move for a stay of further proceedings in this case until the process required by the Court’s April 30, 2020, Order is completed.....A stay will promote judicial economy and orderly proceedings, allow the Massachusetts Defendants to devote their scarce resources conservation planning in accordance with the Act, and no party will be prejudiced.” <https://lobstermen.com/wp-content/uploads/2020/08/Mtn-to-Stay.pdf> Max Strahan immediately filed an Opposition to Motion to Stay Further Proceedings on 8/12/2020

In conjunction with these legal proceedings the MLA recognizes that the MADMF staff have been working diligently to acquire the Massachusetts State Waters Lobster Fishery Designation (MA Designation) on the National Oceanic and Atmospheric Administration (NOAA) List of Fisheries separate from the Northeast Lobster Trap Pot Fishery based on the suite of proposed

regulations that have recently been brought out to Public Hearings on December 8<sup>th</sup> and 9<sup>th</sup>. The MA Designation is a critical component to the MADMF acquiring the ITP mandated the Judge.

The MLA encourages the MADMF to highlight all the right whale conservation that the MA lobster fleet has endured over the last several decades. The Massachusetts commercial lobstermen and MLA has been actively engaged in the conservation of right whales for over 30 years and remains committed to staying the course.

### **Timeline**

1935- International ban on hunting whales goes into effect  
1970- North Atlantic Right Whales listed as endangered  
1996- NOAA implements the Large Whale Take Reduction Plan  
1997-MA requirement for “breakaway” features in gillnets and trap/pot buoy lines  
Seasonal ban in Cape Cod Bay for gillnets and on use of floating rope between pots  
1997-Dedicated aerial surveys begin in Cape Cod Bay  
2004 – Year-round ban on floating rope between traps in Cape Cod Bay  
2007 - Year-round ban on use of floating rope between traps statewide  
2014- MA Restricted Area is created – A three-month closure Feb-April to 3,071 sq. miles  
2015 - 3 month (Feb/Apr) closure to all pots/traps in the MA Restricted Area  
2016 – 3 month (Feb/Apr) closure to all pots/traps in the MA Restricted Area  
2017 – 3 month (Feb/Apr) closure to all pots/traps in the MA Restricted Area **PLUS** 4-day extension of the gear closure in Cape Cod Bay  
2018 - 3 month (Feb/Apr) closure to all pots/traps in the MA Restricted Area **PLUS** a 15-day extension of the gear closure and speed restriction (10 mph) for small vessels in Cape Cod Bay  
2019- 3 month (Feb/Apr) closure to all pots/traps in the MA Restricted Area  
2020 - 3 month (Feb/Apr) closure to all pots/traps in the MA Restricted Area, MLA members deploy 700 coils of whale safe 1700lb weak red rope.

It is no secret that MADMF has decades of data to back up the ongoing reduction of the lobster fishery here in Massachusetts with a 100% MANDATORY reporting they can show the downward effort trend for the MA lobster fleet. Currently, in Massachusetts there are less than 750 active lobstermen fishing an average of 480 pots and most of them are fishing 5-30 pot trawls with an estimated 20-25 permits retiring every year.

The MA lobster fishery in 2007 had 1,361 permits and as of 2018 there were 1,081 permits issued and 787 being fished as well as a reduction of 280 lobster permits with no new permits being issued. The commercial lobster industry in Massachusetts deploys approximately 80,000 vertical lines and the numbers are going down as new conservation management comes online in early 2021.

Currently, Massachusetts lobstermen are still reducing effort through the ongoing lobster pot reductions in Lobster Management Area (LMA) LMA 2 and LMA 3 and these real numbers in reduction need to be quantified and given a conservation credit. Today there are approximately 72 active lobstermen in MA LMA 2 and approximately 60 active lobstermen in Outer Cape Cod (OCC), how much further can they be reduced in effort to remain whole when they are continually paying a conservation tax every time a tag is transferred. It should also be noted that; every transfer in LMA 2, LMA 3 and OCC there is also a 10% conservation lobster pot tax which also equates to even a further reduction in effort.

## **New Protected Species Regulations Affecting Trap and Gillnet Fishing**

### **Fixed Gear Closures**

#### **1. Commercial Trap Gear Closure (322 CMR 12.04, 12.08, and 12.11).**

The MLA does **NOT SUPPORT** the DMF's proposal to extend the existing February 1 – April 30 Large Whale Seasonal Trap Gear Closure (north and east of Cape Cod) to all waters under the jurisdiction of the Commonwealth. The commercial lobstermen here in the Commonwealth are already doing more than any other state to protect right whales.

The proposed closure will negatively impact the Southern New England (SNE) state waters fleet as these are the months when they land the largest portion of their catch. In SNE this closure is unwarranted as their effort has been reduced drastically, minimal sightings in state waters with no high aggregations of right whales. This is also true for the waters north of the MA Restricted Area where there are minimal sightings in state waters and no high aggregations of right whales.

This proposed closure will have a negative economic impact on the Commonwealths' commercial lobstermen's ability to support their families. Should the state implement this closure, unemployment must be made available to the entire commercial lobster fleet and their crew alike. There are not many people that can afford a loss of income (shutdown) for 3 months and an additional loss of 2 months on either end (setting/removing) that could survive.

Furthermore, should the State move forward with this regulation and the fleet be mandated to remove their gear by Feb. 1<sup>st</sup>, there needs to be as much notice given to the fleet as quickly as possible so to avoid jams at the docks with densely populated harbors. We are asking for discretion and leeway with gear removal as the weather is getting worse and the days are getting shorter.

## **Trap Gear Configuration Modifications and Restrictions**

### **1. 1,700-lb Breaking Strength Contrivance (322 CMR 12.02 and 12.06).**

The MLA understands the need for a reasonable amount of the 1700lb. weak contrivance and does **NOT SUPPORT** any more weak contrivances than what the federal plan will impose. The commercial lobstermen here in the Commonwealth will yet again be doing more than the rest of the

lobster fishery and the weak contrivances for the vertical buoy lines needs to be in line with the federal plan. Many MLA members fish both state and federal waters and these requirements need to line up so they can move in and out of state waters into federal waters without changing out their entire endline.

### **2. Vertical Buoy Line Maximum Diameter for Commercial Trap Gear (322 CMR 12.06).**

The MLA **SUPPORTS** the DMF's proposal that all vertical buoy lines affixed to commercial trap gear have a diameter not greater than 3/8". (Vertical Buoy) On March 6, 2020, the MADMF submitted the Commonwealths conservation proposal to reach the 60% conservation target set forth by the Atlantic Large Whale Take Reduction Team and National Marine Fisheries Service (NMFS). This proposal was taken out to Public Hearings for input from the industry and will further aid in the right whale's recovery. A conservation measure that is noteworthy is the prohibition on the use of any lines greater than 3/8" for vertical lines in state waters, which was supported by the MLA.

The MLA and Lobster Foundation of Massachusetts (LFoM) were granted a Massachusetts Environmental Trust grant to develop a 3/8" 1700lb weaker whale safer red rope which will be deployed this fishing season for field testing. The ropes 1700lb breaking strength basis came from the New England Aquariums Study *Effects of fishing rope strength on the severity of large whale entanglements* by Amy Knowlton et. al. where they "found entangled in tested rope strengths below 7.56 kN or 1700 lbsf, implementation of RBS ropes would likely reduce the probability of mortality and suffering" Kowlton et.al. As of July 2, 2020 the LFoM has distributed 700 plus coils of the 1700lb whale safer red rope to be field tested this year.

In November 2020, the LFoM received a grant to further their efforts on developing the 3/8" 1700lb whale safer red rope. After several communications with NMFS on creating an identifying mark for this rope, so that law enforcement can easily identify the rope as the 1700lb whale safer red rope, the rope manufacturers have come up with a candy-cane rope which is

distinct enough. The LFoM will be distributing the 1700lb whale safer candy-cane rope in early 2021 to be field tested.

**3. Line Maximum Diameter for Recreational Trap Gear (322 CMR 12.06).**

The MLA **SUPPORTS** the DMF's proposal that all vertical buoy lines affixed to recreational lobster and crab trap gear have a diameter not greater than 5/16".

**4. Prohibition on Single Lobster Traps for Vessels of a Certain Size (322 CMR 12.06).**

The MLA does **NOT SUPPORT** a broad brush approach to the DMF's proposal prohibiting the fishing of single lobster traps onboard vessels with an overall length of 29' or greater.

The MLA requests that any commercial lobsterman currently fishing singles that is 65 years or older be grandfathered in and allowed to fish singles at their current effort and upon transfer this permit would be restricted to trawls.

These commercial lobstermen that are 65 years or older fishing single do it for a multitude of reason; safety, they fish alone, physical limitation and safety. Yes, safety is there twice because safety is number one, two, three and so on.

We do not want any commercial lobsterman to be put in harm's way and for those commercial lobstermen currently fishing singles there should be a phase in period (learning curve) that allows individuals transitioning to trawls time to safely learn how to fish as trawl fishing is completely different than singles fishing. Also, the significant economics of reconfiguring their gear will need to be absorbed over time.

The MLA also requests that the state do a 5-year review on the efficacy of any new regulations along with a sunset clause. The ecosystem is continually changing along with the right whales' behavior which is shifting north and the sightings are dwindling here in the Commonwealth.

**Ropeless Fishing is NOT REAL**

While ropeless was not on the list of proposed right whale conservation measures, it did take up a lot of time on the questions and comments section of the hearings.

The Massachusetts Lobstermen's Association **DOES NOT SUPPORT** ropeless technology.

Today, there is a lot of misperception on what can and can not be done in the commercial lobster fishery when it comes to the use of Ropeless fishing. Over the last 5 years or so, there has been a major effort to make it mandatory for the commercial lobstermen and fixed gear fishermen to transition over to ropeless gear to further save the right whales. Furthermore, this gear transition to ropeless is being pushed for year round implementation when it's not needed as the 3-month closure is in effect when the right whales are present.

The sheer magnitude of the economic undertaking would be well over 150 million dollars to outfit the commercial lobster industry here in the Commonwealth the first year. The individual cost would be an estimated \$190,000 per fishermen to outfit their gear to go fishing. Not to mention there is an average of 10% gear loss each year and this would have to be replaced year in and year out and the gear loss would likely increase dramatically as the technology has yet to be tested on large scale multi disciplined fisheries. This transition would take hundreds of millions of dollars and decades to implement and outfit every commercial fishing vessel that is on the water.

The unintended consequences of gear conflicts between traditional and ropeless gear in the fisheries would be grave if not thought through to the end. Fixed gear commercial fishing and the mobile gear industry do not fish in one hypothetical box for a species and this is where the gear conflicts would be catastrophic given that the technology is not readily available nor do individual brands talk to each other.

Here is a scenario for comparison when technologies do not communicate with each other; What would happen if AT & T, Verizon, Singular, Sprint, and Metro PCS cellphones did not communicate with each other? The consumers would have to carry several phones to stay connected. This is the same for the ropeless technology; they do not communicate with each other; Desert Star, Edge Tech, Lobster Lift, Smelts and more, do not interact with each other so each commercial fisherman would have to have multiple boxes, screens, and transducers on their vessel to see where all the gear is on the bottom.

## **Marine Mammal Protection Act**

“Congress enacted the Marine Mammal Protection Act (MMPA) in 1972, due in part to the high level of dolphin mortality in the eastern tropical Pacific tuna fishery (estimated at more than 400,000 animals per year in the late 1960s).”

[https://www.everycrsreport.com/reports/RL30120.html#\\_Toc229466607](https://www.everycrsreport.com/reports/RL30120.html#_Toc229466607) *The MMPA has morphed so radically from its original charge to stave off the loss of 400,000 dolphins per year to becoming the nails in the coffin for every fixed gear fisherman in America. The MMPA was reauthorized in 1994, 26 years ago, and needs to be revamped to be a law that is sensible and attainable. Not a law that vilifies or demonizes our law abiding commercial fishermen when the real problem lies out of the United States of Americas jurisdiction.*

The MMPA shifted all marine mammal management authority to the federal government and from our experience at the Atlantic Large Whale Take Reduction Team meeting in 2019, the process failed even while consensus was nearly reached and this process has been broken by Maines consensus withdrawal 5 months later.

## **Endangered Species Act**

*“The Endangered Species Act (ESA) in 1973, it recognized that our rich natural heritage is of “esthetic, ecological, educational, recreational, and scientific value to our Nation and its people.” It further expressed concern that many of our nation's native plants and animals were in danger of becoming extinct”* The commercial lobstermen here in the Commonwealth fish under the strictest conservation management rules anywhere in the world and yet they are still bearing the brunt of ALL the litigation rulings with no end in sight because of the ESA.

Currently, when the right whales visit the coast of Massachusetts from February through April they are free to feed without incident. The ESA has continually worked against the commercial lobstermen for decades now even though they have been doing everything that has been asked of them to do, even the implementation of a 3-month closure to over 3,071 square miles. Should the Commonwealth impose the statewide closure this would mean the loss of 10,554 square miles.

As we navigate through these uncharted waters without knowing what the feasibility is for the State to acquire an Incidental Take Permit we remain hopeful that ALL the elected officials will continue to fight on behalf of the hard working men and women in the commercial lobster industry and fixed gear fisheries. These laws are archaic and the process is broken and need to be

fixed today before it destroys the iconic and historic commercial lobster fishery here in the Commonwealth.

While the Massachusetts commercial lobster industry remains in the crosshairs of the ongoing right whale litigation and conservation with no end in sight when all we need to do is make smart and reasonable changes to the ESA and MMPA that will help both the right whales thrive and commercial lobstermen survive.

In closing, our commercial lobstermen deserve to know that their state is going to fight for them to save their industry not only for today, but for future generations to come. The cooperation put forth by the commercial fishing industry is a true testament that we can collectively work together with managers to reduce the potential risk for entanglements with large whales in fishing gear all the while preserving the viable and historic commercial lobster fishery here in the Commonwealth.

The Massachusetts Lobstermen's Association members thank you for the opportunity to comment.

Sincerely,

*Beth Casoni*

Director Daniel J. McKiernan  
The Commonwealth of Massachusetts Division of Marine Fisheries  
251 Causeway Street, Suite 400  
Boston, MA 02114  
[marine.fish@mass.gov](mailto:marine.fish@mass.gov)

December 17, 2020

Dear Director McKiernan:

I am writing on behalf of Marine Resources Council regarding proposed amendments to Division of Marine Fisheries regulations at 322 CMR 6.00, 7.00, and 12.00 to reduce the risk of injury and death to North Atlantic right whales due to fishing gear entanglement.

I have worked with North Atlantic right whales in their southeast U.S. calving ground for more than twenty years and I recently participated in a ropeless gear trial for NOAA with at least six ropeless gear devices. I appreciate your efforts to protect right whales while also considering the ramifications to your local fishermen. MRC is supportive of the measures proposed and offers specifics to each section of the draft regulations below.

## **Fixed Gear Closures**

### **1. Commercial Trap Gear Closure (322 CMR 12.04, 12.08, and 12.11).**

Marine Resources Council (MRC) agrees that since North Atlantic right whales have occupied most waters of the Commonwealth of Massachusetts over the last five years (NOAA-NEFSC), it is necessary to expand the current fixed gear closure to all MA waters to reduce entanglements.

However, after having personally operated at least six of the available ropeless fishing devices, I firmly believe that an exception must be made for those fishermen willing to allow ropeless researchers aboard their vessel to further the technology. Additionally, they should be able to keep their catch. While it is currently illegal to fish ropelessly because requirements stipulate that a vertical rope must be attached to gear, a path needs to be paved to allow fishermen who are sustainably fishing with whale-safe gear to be able to use this technology year round, and especially during fishery closures. In order to promote the responsible use of ropeless gear and to contribute much needed feedback to ropeless gear manufacturers, allowing ropeless gear use during the closure would be a great incentive, and is ideal. You have an opportunity to help forge a path towards fishermen and scientists working together more. It's happening now, but it needs to happen more. I have personally participated in gear trials with a success rate of more than 98% over

multiple devices. It works. It's time to get it in the hands of the fishermen. Ropeless gear, or pop-up gear, is the only reliable way to remove vertical lines from the water and eliminate entanglement risk to North Atlantic right whales. Reduction in vertical lines is a step. Elimination of vertical lines is a solution.

**2. Gillnet Closure in Cape Cod Bay (322 CMR 12.04, 12.08, 12.12)**

MRC supports this measure. However, is restricting the closure only to Cape Cod Bay (CCB) enough to protect right whales from gillnet entanglements? Why is this not proposed for all of MA state waters like the fixed gear closure? I recognize the need to be conservative for fishermen and the risk to right whales must be weighed against economic losses in the fishery. Please assess whether it makes sense to limit this closure only to Cape Cod Bay. If right whales are present in nearly all of MA waters (NOAA/NEFSC), why is this closure limited to CCB? If it is because gillnet fishing doesn't exist in other MA waters, then please disregard this statement and consider this measure fully supported.

**3. Fixed Gear Closure Extensions (322 CMR 12.04)**

While MRC supports the proposed use of authority to extend fixed gear closures, I also believe it should be open to shortening the time period at a later date if scientific data eventually supports it. Climate change is shifting the right whales' zooplankton food source and if right whales find a new feeding area, then it stands to reason that the shortening of closures could possibly take place if there is evidence that the area is no longer being used as a right whale critical habitat. While unlikely for decades, this is still a consideration. Fishermen should not be restricted to closures if there is eventually no longer supporting evidence that right whales are using that habitat area. The language in this section of the proposal could be modified to simply include 'extend or shorten' or 'modify' the fixed gear closure timeframe instead of just extending it.

**4. Recreational Lobster and Crab Trap Gear Haul-Out Season (322 CMR 6.02)**

MRC supports this proposal. Recreational and commercial lobster and crab fishermen all use vertical lines. It is the vertical lines that need to come out of the water, no matter who is using them.

**5. Conch Pot Haul-Out Period (322 CMR 6.12)**

MRC supports this proposed haul-out period, not only for the time extension to April 30<sup>th</sup>, but as well as for the reason stated above (#4). Not only does it not matter if the target species is being fished commercially or recreationally, but the target species shouldn't matter, either. If the traps use vertical lines, fishing with them should be restricted based on what sound science has to offer.

**Trap Gear Configuration Modifications and Restrictions**

**1. 1700-lb Breaking Strength Contrivance (322 CMR 12.02 and 12.06)**

While MRC supports the use of 1700-lb breaking strength rope as an improvement to what is being used now, there is no evidence that supports the fact that a right whale calf or juvenile would be able to escape an entanglement in this rope, which is still concerning. I believe interspersed contrivances of 600-lb breaking strength to accommodate the reduced physical strength of sub-adult right whales is one way of ensuring that they might also be able to escape an entanglement. While this is a good start, it still allows for vertical rope in the water column and the risk of entanglement still exists. The only way to prevent right whale entanglements is to remove the vertical ropes, even during non-closure periods. There are long-term physical effects to right whales

(especially females), that remain long after entangling gear is gone. Prevention is the key. This is will help in the short-term, but will not eliminate right whale entanglements in the long-term.

**2. Vertical Buoy Line Maximum Diameter for Commercial Trap Gear (322 CMR 12.06)**

MRC supports this proposal.

**3. Vertical Buoy Line Maximum Diameter for Recreational Trap Gear (322 CMR 12.06)**

MRC supports this proposal.

**4. Prohibition on Single Lobster Traps for Vessel of a Certain Size (322 CMR 12.06)**

MRC supports this proposal, as it reduces the number of vertical lines in the water column.

However, I do not have any information on safety issues that trawls might pose to fishermen on 29' vessels as opposed to fishing single pots. If there are reasonable safety concerns posed by fishermen during the public comment period that relate to fishing trawls specifically on smaller vessels, it is understandable that the vessel length in this proposal might be modified. If there is no evidence that fishing trawls on a 29' vessel is any riskier to fishermen than fishing single pots, then 29' is an acceptable vessel length for this proposal.

**Permitting**

**1. Cap on Issuance of Seasonal Lobster Permits (322 CMR 7.01)**

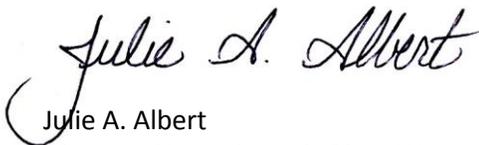

While I do not understand how this will help prevent right whale entanglements, MRC supports this proposal.

**Housekeeping**

MRC supports the proposals here for editing to ensure the reflection of 'the DMF's current approach to managing protected species', consolidate regulations, revise maps, and improve the readability of the regulations.

Thank you for conducting the public hearings on December 8<sup>th</sup> and 9<sup>th</sup>. I attended one of them. I appreciated the opportunity to listen in on the call and to be given the opportunity to make comments during the call and in writing. Most of all, I appreciate what you're doing to set an example for others on moving forward on prevention of entanglements of North Atlantic right whales. They are predicted to be biologically extinct by 2040. That's only 19 years away. They are out of time. I am hoping that your actions here prove that entanglements CAN be reduced, and that others will follow your lead so entanglements can be eliminated altogether.

Sincerely,

Julie A. Albert

**RE: New Protected Species Regulations Affecting Trap and Gillnet Fishing; proposed amendments to 322 CMR 6.00, 7.00, and 12.00.**

Dear Director McKiernan,

Public Employees for Environmental Responsibility (PEER) is writing to offer comments on the proposed regulations intended to reduce entanglement risks to the North Atlantic right whale (*Eubalaena glacialis*). PEER has been involved with the plight of the right whales for decades, and we are dismayed to see the population plummeting to the point where the International Union for Conservation of Nature (IUCN) recently listed them as the only large whale species to be critically endangered. We believe that the regulations proposed are a good start, but they do not go far enough. Our specific comments are set forth below.

**Background.** The primary cause of death for right whales are human-caused vessel strikes and entanglements. From 2003 to 2018, 70 right whale mortalities were documented, and scientists were able to determine cause of death for 43 of these; 57.9% of these deaths were attributable to entanglements.<sup>1</sup> Moreover, researchers concluded:

Overall prevalence of NARW entanglement mortalities increased from 21% (1970-2002) to 51% during this study period. This demonstrates that despite mitigation efforts, entanglements and vessel strikes continue to inflict profound physical trauma and suffering on individual NARWs. These cumulative mortalities are also unsustainable at the population level, so urgent and aggressive intervention is needed to end anthropogenic mortality in this critically endangered species.<sup>2</sup>

---

<sup>1</sup> <https://www.int-res.com/abstracts/dao/v135/n1/p1-31/>

<sup>2</sup> Id.

East Coast fisheries result in roughly one million vertical lines that right whales must navigate through in order to feed and migrate. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale. Over 85% of right whales have been entangled at least once, and 60% has been entangled more than once.<sup>3</sup> The population, currently estimated to be 366, is on the verge of being functionally extinct.

In 2017, increased mortalities resulted in declaration of an Unusual Mortality Event (UME) for the right whale.<sup>4</sup> At the December 8, 2020 public hearing on these proposed regulations, you explained that there are two forces at play addressing this UME: 1) the Atlantic Large Whale Take Reduction Team; and 2) the April, 2020 District Court decision that ordered the Commonwealth of Massachusetts to obtain an incidental take permit from the National Oceanographic and Atmospheric Administration (NOAA) to cover unauthorized takes of right whales from entanglements in fishing gear in Massachusetts waters.

**Proposed regulations.** In response, the DMF is proposing to issue regulations that purportedly reduce the risk of endangered right whales becoming entangled in fixed fishing gear, and reduce the potential harm posed by fixed fishing gear if a right whale interacts with it. The proposed regulations include:

- **Fixed Gear Closures** (extend the existing February 1 – April 30 Large Whale Seasonal Trap Gear Closure (north and east of Cape Cod) to all Massachusetts waters);
- **Gillnet Closure in Cape Cod Bay** (extend the existing January 1 – May 15 gillnet closure in Cape Cod Bay to include those waters shoreward of 70°30' W longitude between 42°00' N latitude (Gurnet Point) and 42°12' N latitude (Scituate Harbor);
- **Fixed Gear Closure Extensions** (retain the regulatory authority to extend the described fixed gear closures upon the documented presence of right whales in Massachusetts waters);
- **Recreational Lobster and Crab Trap Gear Haul-Out Season** (implement a new closed season for buoyed recreational lobster and crab trap gear from the Tuesday following Columbus Day through the Friday preceding Memorial Day);
- **Conch Pot Haul-Out Period** (extend the existing December 15 – April 14 conch pot haul-out period through April 30).
- **Trap Gear Configuration Modifications and Restrictions** (all vertical buoy lines break when exposed to 1,700 pounds of pressure; all vertical buoy lines affixed to commercial trap gear have a diameter not greater than 3/8"; all vertical buoy lines affixed to recreational lobster and crab trap gear have a diameter not greater than 5/16"; prohibit the fishing of single lobster traps onboard vessels with an overall length of 29' or greater);
- **Cap on permits** (a cap on issuance of seasonal lobster permits for students at 150 permits).

---

<sup>3</sup> <https://www.fisheries.noaa.gov/feature-story/north-atlantic-right-whales-and-dangers-vessel-strikes-and-entanglement>

<sup>4</sup> <https://www.fisheries.noaa.gov/national/marine-life-distress/2017-2020-north-atlantic-right-whale-unusual-mortality-event>

DMF gave additional information at the public hearing, including:

- DMF issued 6,482 non-commercial licenses in 2020;
- There are approximately 800 lobster fishers in state waters, and 1,000 recreational lobster fishers;
- Closing the recreational season allows environmental police the ability to retrieve abandoned gear (roughly half the abandoned gear found is from recreational permit holders);
- Scientists found that 1,700 pounds of breaking strength can reduce the severity of entanglement injuries by 72% (although juvenile whales and calves cannot escape from ropes even with 1,700 pound breaking strength);
- Requiring recreational lobster and crab gear to use lines that do not exceed 5/16” will be “de facto gear marking,” as larger diameter rope would therefore be known to come outside of Massachusetts waters;
- “Zero” entanglements have been traced back to the Massachusetts lobster fishery over the past six years; and
- The regulations will be enforced because the gear modifications are “inspectable” and “recognizable” (when asked if the Massachusetts Environmental Police would actually haul and inspect the gear, DMF responded that they are “expecting compliance with the industry.”)

**“De facto” gear marking is not enough.** It is currently impossible to determine where a particular whale gets entangled due to the fact that there is no enforced requirement for gear marking. In fact, NOAA states that:

Attributing gear from entanglement events to a specific fishery and geographic location is difficult. There are multiple factors that confound identifying discrete locations where entanglements occur. Whales can travel long distances carrying gear, and the moment of entanglement is rarely observed—even more rarely than sighting an entangled whale (compared with the estimated entanglement rates). There are few fishery observers on trap/pot fisheries, particularly state trap/pot fisheries. Entangling gear is not often recovered, and when it is, few identifying characteristics remain.

The Atlantic Large Whale Take Reduction Team has spent many meetings and years grappling with this problem. NOAA Fisheries introduced the concept of gear marking in 1998 under the Atlantic Large Whale Take Reduction Plan. The gear marking strategy is continually updated, most recently in 2015, in hopes of determining where the highest risk of entanglement occurs.

Despite the current gear marking requirements, gear recovered from whales does not usually have these marks. This may mean the whale was entangled in an area where gear marking was not required, that line itself needs to be marked differently for more effective identification, the requirement does not apply in all the right areas, or that people are not marking their gear. Through the Team process, we are exploring ways to refine gear marking to help address these important questions.

These measures provide no immediate relief from entanglement now. We certainly should pursue improvements in gear marking for the future, but we also need to reduce entanglement risks to right whales now in areas where we know whales and gear overlap.<sup>5</sup>

Scientists estimate that between 20% and 40% of right whale deaths are never observed,<sup>6</sup> which means that entanglement may be a bigger problem than we know. Regardless, we do know that right whales are dying at an unprecedented rate from entanglement in fishing gear, and that sublethal entanglement impacts are also devastating the species. In order to determine *where* the right whales are getting entangled, and in which gear, we need explicit and enforced gear marking. “De facto” gear marking is not enough, particularly when enforcement of the gear changes rely so heavily on voluntary compliance by the industry. In addition, to say that “zero” entanglements have been traced back to the Massachusetts lobster fishery over the past six years is misleading. The reason we cannot trace entanglements to particular locations and fisheries is because there are no strong, enforced gear marking requirements. We therefore urge the DMF to require obvious and specific gear marking requirements (such as all Massachusetts lobster gear requiring a specific color of rope), and enforce those requirements.

**Closures are helpful, but are not enough by themselves.** As NOAA states, “closures, while likely very effective regionally, may not be enough. Each vertical line out there has some potential to cause an entanglement. With a 26% annual entanglement rate in a population of just over 400 animals, this translates to about 100 entanglements per year, which is significant for such a small population.”<sup>7</sup> They also state that “there is no place within the fished area along the East Coast of North America for which entanglement risk is zero.”<sup>8</sup>

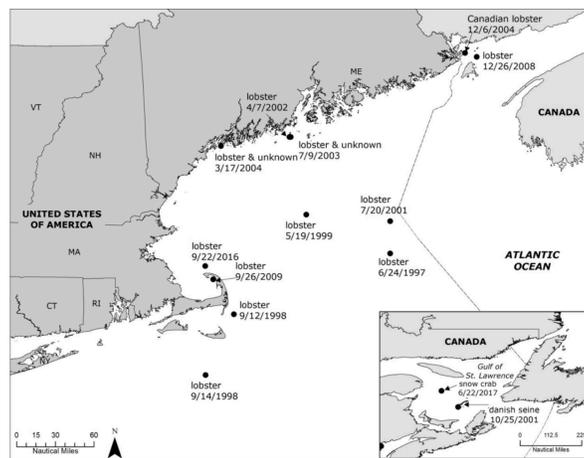

Fig 5. Right whale entanglements from 1997 through 2017 for which the set location and type of gear are known, and gear was recovered from a whale.

<sup>5</sup> <https://www.fisheries.noaa.gov/new-england-mid-atlantic/marine-mammal-protection/right-whales-and-entanglements-more-how-noaa#where-entanglements-and-whales-occur>

<sup>8</sup> Id.

Moreover, the closure proposed south of the Cape coinciding with the Cape Cod Bay closure is necessary, but not sufficient. There are now whales south of the islands, and changing climate and food sources appears to be resulting in right whales regularly in these areas in November and December, so additional protection is warranted. This could be achieved by a closure in Massachusetts waters south of the Cape for November and December, or by using the dynamic closure approaches similar to that the Canadians have taken,<sup>9</sup> using triggers from acoustic or visual detections. Of course, this would require appropriate monitoring regimes to be in place, if this route is chosen instead of a longer closure.

**Gillnetting should be subject to all the same regulation as trap/pot fisheries.** Gillnetting also entangles whales, and as such, should be subject to the same regulation as the other fisheries. Given the inability to assign entanglements to either locations or fisheries, the precautionary principle dictates that we treat all fisheries the same.

**Effort reduction must be considered.** Since every vertical line in the water is a risk for this critically endangered species, removing some of these lines will reduce this risk. As such, PEER recommends reducing or eliminating recreational permits; providing funding for retraining fishers interested in moving to another occupation, and for those permits to be removed from the fishery permanently.

**Ropeless gear must be included.** DMF's failure to include a path for ropeless gear in the new regulations is unacceptable. The 1,700 pound breakable rope for fishing lines still poses a threat to juvenile whales, calves, and – as DMF itself concedes – only reduces the severity of entanglement injuries by 72%. This does not mean that entanglements would be *reduced* by 72%, but rather, that the severity of the entanglements would be reduced. Since sublethal entanglements are a large factor in the decline of right whale populations, this provision does not obviate the need for ropeless gear.

Ropeless gear is being used by fishermen in Australia, United Kingdom, Ireland, Canada and on the west coast of the United States. At the Right Whale Consortium this year, PEER heard New England lobstermen testify that ropeless gear does work, and that the few failures they observed were from human error. Ropeless gear is the *only* technology that would allow the right whales and the fisheries to survive. It is a rare situation where we can have a win-win situation, and DMF should do everything in their power to encourage the use of this technology.

**Conclusion.** PEER appreciates DMF's efforts to reduce right whale entanglements. We agree that the proposed closures are necessary, but they do not go far enough. Moreover, we need enforced gear marking in order to determine where whales are getting entangled. Finally, gillnetting should also be subject to similar regulations, and effort reduction and ropeless gear must be included. Extinction is a choice, and choosing to allow the North Atlantic right whale to go extinct is unacceptable. As such, DMF must increase its efforts to prevent entanglements in Massachusetts waters.

December 18, 2020

Daniel McKiernan  
Director  
The Commonwealth of Massachusetts Division of Marine Fisheries  
251 Causeway Street, Suite 400  
Boston, MA 02114

**RE: Public Comment on New Protected Species Regulations Affecting Trap and Gillnet Fishing (proposed amendments to regulations at 322 CMR 6.00 and 12.00).**

Dear Mr. McKiernan,

In response to the *Public Comment on New Protected Species Regulations Affecting Trap and Gillnet Fishing*, the New England Aquarium (Aquarium) is pleased to submit this comment for consideration by the Commonwealth of Massachusetts Division of Marine Fisheries (MA DMF).

The Aquarium appreciates this opportunity to provide specific comments on the proposed rules and to continue to work closely with the team at MA DMF to inform and implement changes that will prevent North Atlantic right whales (NARW) from going extinct. The Aquarium recognizes the challenges faced by MA DMF in balancing fishing interests with the need to reduce the risk of entanglements in fishing gear to NARWs in Massachusetts state waters. Overall, the proposed rules represent a strong, good-faith effort to reduce that risk, and the Aquarium thanks MA DMF for working diligently on behalf of its fisheries and the NARW.

Scientists at the Aquarium have been researching NARWs for more than forty years with the goal of preventing this species from going extinct. In addition, representatives from the Aquarium have served on the Atlantic Large Whale Take Reduction Team since it was formed in 1997. The Aquarium is pleased to see that the published research our scientists have conducted was used to inform aspects of these measures.

The Aquarium supports the proposed measures and offers specific comments on each proposal below.

### **Fixed Gear Closures**

#### *1. Commercial Trap Gear Closure*

The Aquarium fully supports the proposed amendment to include all Massachusetts state waters in the Large Whale Seasonal Trap Gear Closure.

## *2. Gillnet Closure in Cape Cod Bay*

The Aquarium supports the proposed gillnet closure in Cape Cod Bay and requests that the MA DMF consider extending the closure to all Massachusetts state waters similar to the provisions proposed for commercial trap gear. In addition, the proposed rules currently do not specify that gillnet gear be required to use 1,700-pound breaking strength rope. This requirement should be consistent for all fixed gear in state waters, including gillnet gear.

## *3. Conch Pot Fishery*

The Aquarium supports the proposal to extend the haul-out period of the conch pot fishery to April 30.

## *4. Recreational Fishery*

The Aquarium supports the proposal to expand the closure to the recreational fishery.

## *5. Dynamic Closures*

In addition to the closures outlined in the proposed rules, the Aquarium would like to point out that there are areas in MA state waters that are becoming increasingly important habitat for NARWs at times of year other than the closed periods. NARWs are currently detected intermittently by acoustic sensors south of Martha's Vineyard<sup>1</sup> and on Cox's Ledge<sup>2</sup>. Previous deployments of acoustic sensors in the same general area<sup>3</sup> demonstrate the presence of NARWs there, particularly in November and December (outside of the Seasonal Trap Gear Closure). The Aquarium recommends incorporating acoustic detections of NARW into management decisions to account for and adapt to ongoing NARW temporal and spatial changes. NARW distribution, movements, and presence of feeding aggregations will likely continue to shift in the future as a result of climate change.

One way to incorporate these detections into management measures is through dynamic closures, rather than requiring complete closures in certain areas such as south of Martha's Vineyard and on Cox's Ledge. The processes to institute these have been developed by the Canadian Department of Fisheries and Oceans for the Gulf of St. Lawrence snow crab fishery in response to detections of NARWs<sup>4,5</sup>. The scientific underpinnings for using

<sup>5</sup> <https://www.dfo-mpo.gc.ca/fisheries-peches/commercial-commerciale/atl-arc/narw-bnan/index-eng.html>

acoustic detections to institute dynamic spatial closures are outlined in two recent papers, led by Dr. Mark Baumgartner at the Woods Hole Oceanographic Institution<sup>6,7</sup>.

## *6. Risk Reduction*

The Aquarium notes that, during the public meetings on December 8 and 9, 2020, comments were made about simply moving gear into the U.S. Exclusive Economic Zone to avoid the closures and other restrictions in state waters once these rules are finalized. The Aquarium strongly discourages this strategy, as it will reduce the effectiveness of the strong steps Massachusetts has proposed to reduce the risk of entanglements in fishing gear to NARWs.

### **Trap Gear Restrictions**

#### *1. Buoy Line Breaking Strength*

The Aquarium supports the provision requiring all commercial trap fishermen to use buoy lines with 1,700 pound breaking strength (lbf). We recognize that that 1,700 lbf ropes will not eliminate entanglements, but should reduce the risk of an entanglement becoming complex and potentially lethal. We consider 1,700 lbf ropes an interim measure to be used until such time as ropeless fishing is a feasible option that could be broadly implemented. Monitoring the effectiveness of 1,700 lbf ropes in reducing impacts to all large whales will be critical in the near-term as ropeless technology continues to improve.

Collaborative work between scientists at the Aquarium, the South Shore Lobster Fishermen's Association, and other fishermen has shown that 1,700 lb sleeved ropes can be fished in waters up to 300 feet without needing to reconfigure the bottom gear<sup>8</sup>. Additional work is continuing to simulate tensions when hauling gear of different configurations and in different weather conditions and also evaluating scenarios where a whale becomes entangled in the gear. Initial findings suggest that the tension on the rope will reach the 1,700 lb breaking strength threshold just below the impact point where the whale first encounters the gear. This finding suggests that multiple weak points in an endline will be the most effective at reducing the amount of trailing gear that might be left on a whale by breaking close to the impact point and perhaps allowing the remaining gear to be more easily shed.

Based on these findings, the Aquarium recommends that for buoy lines that use contrivances or weak inserts MA DMF require that the contrivances be integrated every 40 feet to reduce the amount of trailing gear remaining on a whale and allow that gear to be more easily shed by the whale. We also recommend that 1700 lb breaking strength ropes be marked appropriately to differentiate them from non-weak ropes or ropes using contrivances, which will help support

<sup>6</sup> <https://besjournals.onlinelibrary.wiley.com/doi/pdf/10.1111/2041-210X.13244>

<sup>7</sup> [https://www.frontiersin.org/articles/10.3389/fmars.2020.00100/full?utm\\_source=S-TWT&utm\\_medium=SNET&utm\\_campaign=ECO\\_FMARS\\_XXXXXXX\\_auto-dlvrit](https://www.frontiersin.org/articles/10.3389/fmars.2020.00100/full?utm_source=S-TWT&utm_medium=SNET&utm_campaign=ECO_FMARS_XXXXXXX_auto-dlvrit)

<sup>8</sup> Knowlton, A.R., Malloy, R. Jr., Kraus, S.D., and Werner, T.B. (2018). Development and Evaluation of Reduced Breaking Strength Rope to Reduce Large Whale Entanglement Severity. Report to MA Executive Office of Energy and Environmental Affairs. 66 pp.

enforcement efforts. Furthermore, we strongly encourage that any contrivance allowed by these rules be required to go through stringent testing to ensure that it breaks as anticipated and is appropriately designed to pass through baleen.

Comments were made during the December 8 and 9, 2020, public meetings and elsewhere that 1,700 lb ropes will not help juvenile NARWs. The Aquarium would like to provide clarifying remarks about our research. The Knowlton et al. (2016) paper<sup>9</sup> compared estimated rope strength versus new rope strength for all cases. In 28% of the cases, the estimated rope strength was below 1,700 lbs, but the authors noted that using estimated rope strengths had some issues as it was not always known how long the rope had been on the entangled whale and subject to degradation or how long it had been in storage, which could also lead to degradation. The authors therefore opted to focus on new rope strength as the metric for our analyses. New rope strength that involved entangled juveniles of ~6 months to 2 years old was found to be in the 2,000-4,000 lb. range whereas all adults were in ropes greater than 4,000 lb breaking strength. Therefore, the data suggest the 1,700 lb breaking strength rope recommendation would reduce the threat of high risk entanglements for most—if not all—entangled juvenile right whales except perhaps neonates and young calves, whose body length and strength may be more akin to minke whales, the one large whale species found in new rope strengths below 1700 lbs. These findings were independently corroborated in a paper by Arthur et al. (2015)<sup>10</sup>. The authors looked at the force output of different cetacean species based on a variety of anatomical measurements and found that all large whales evaluated, except for some minke whales, had an estimated force output above 2,248 lbs (10 kilonewtons).

## *2. Maximum Buoy Line Diameter*

The Aquarium supports the proposal to limit buoy line diameters for both commercial and recreational trap fisheries.

## *3. Prohibition on Single Traps*

The Aquarium supports the proposal prohibiting fishing single traps as a way to reduce the number of vertical lines in the water column.

## *4. Ropeless fishing gear*

The Aquarium recognizes the reasons why ropeless fishing gear is not considered in these proposed rules, but encourages MA DMF to establish a way forward for introducing ropeless technologies in state waters in the future. The Aquarium supports efforts to improve the

<sup>9</sup> Knowlton, A.R., Robbins, J., Landry, S., McKenna, H.A., Kraus, S.D. and Werner, T.B. (2016), Effects of fishing rope strength on the severity of large whale entanglements. *Conservation Biology*, 30: 318-328. <https://conbio.onlinelibrary.wiley.com/doi/10.1111/cobi.12590>

<sup>10</sup> Arthur, L.H., Mclellan, W.A., Piscitelli, M.A., Rommel, S.A., Woodward, B.L., Winn, J.P., Potter, C.W. and Ann Pabst, D. (2015), Estimating maximal force output of cetaceans using axial locomotor muscle morphology. *Mar Mam Sci*, 31: 1401-1426. <https://doi.org/10.1111/mms.12230>

technology and identify areas in state waters to test the technology in collaboration with fishermen.

We look forward to working closely with MA DMF to identify additional measures that will not only benefit NARWs, but also the fishery. Options for gear modifications will continue to evolve and improve as we learn more about what does or does not work for the whales and for the fishermen. It will take close collaboration between MA DMF, the industry, and scientists to monitor the feasibility and effectiveness of gear changes and closures to achieve the overall goal of mitigating entanglements in the years ahead. In the near term, we encourage the Commonwealth to consider ways to differentiate lobster (or other products) caught in state waters under these rules in an effort to create a potential market preference for buyers.

We also look forward to reviewing proposed rule changes that will reduce risk to endangered leatherback sea turtles from entanglements in MA state waters.

As a final note, while it was mentioned during the public hearings on December 8 and 9, 2020, the Aquarium recommends that MA DMF specify the implementation dates in the final rule.

In closing, the Aquarium thanks MA DMF for their diligent and thoughtful effort to propose strong rules to reduce the risk of entanglements to NARWs in Massachusetts state waters. We hope that the leadership shown here in the Commonwealth is modeled by others in the region and by the federal government.

Sincerely,

Dear Director McKiernan:

As a concerned Massachusetts resident, I fear the North Atlantic right whale may go extinct in my lifetime. North Atlantic right whales are dying due to human actions. The DoMF, alongside NOAA, has the opportunity to make the necessary changes to save this species. I am glad to see our commonwealth is taking necessary steps to ensure the protection and survival of right whales by proposing new regulations for commercial fixed gear fisheries and recreational lobster and crab trap fisheries. Some of the changes I support include:

- Expanded closures for trap fisheries in all of Massachusetts waters.
- A new closed season for the buoyed recreational lobster and crab trap fishery.
- The DoMF retaining the ability to extend these closures based on North Atlantic right whale sightings.
- A marking system that will differentiate the gear that may be lawfully used in Massachusetts from heavier gear that may be used in the offshore exclusive economic zone or Canada.

I strongly encourage the DoMF to develop a plan for a full transition to ropeless technology in commercial trap fisheries as quickly and responsibly as possible. Removing vertical lines from the water is the only way to fully prevent entanglements and save this species.

Thank you for the opportunity to comment on enhanced protections for the North Atlantic right whale. It is my hope that my suggestions will be considered in this process and that the DoMF continues to prioritize right whale protections.

Sincerely,

Jennifer Hoen

**CAUTION:** This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Dear Daniel McKiernan,

My name is Brock Bobisink and my fiancé's name is Faye Anderson. Together we own the 35 foot FV Loon Cry situated in Aunt Lydias Cove in Chatham, Massachusetts. We fish OCLMA state waters from Nauset Inlet to South Truro inside state waters.

We strongly oppose making vessels larger than 29 feet fishing having to fish trawl rather than fishing single pots.

We strongly oppose single pot vessels being forced to fish trawl in OCLMA Outer Cape state waters.

We recommend exclusion for single pot vessels over 29 feet from having to fish trawl in OCLMA Outer Cape waters.

More than 1/2 of the Outer Cape permit holders that fish our area are fishing single pots. Single pot fisherman would be forced into economic hardship by having to make gear and vessel alterations to accommodate trawl.

We are already forced to have our gear out of the water when the right whales are in our area. We have 600lb break away buoys & are now adding 1700lb breaking line.....trawl is just going to kill small business owners not help right whales.

Since purchasing our business four years ago we had to spend over \$60,000 on gear and \$120,000 on a boat upgrade. We started the business with a 30 foot boat -1 foot larger than the 29 foot allowable length proposed for singles. These gear and boat investments enhanced our single pot business. Lobster gear is also highly customized. These modifications were a necessity as we couldn't continue to operate out of the smaller 30 foot boat.

If forced to fish trawl our gear would need to be completely replaced, a modification would not be possible. Boat modifications would also be necessary and costly. These modifications would cost upwards of \$100,000. The cost of new gear, boat modification, and the money already spend on developing the business to where it stands would be financially crippling.

Inclement weather on the backside create unique and challenging weather conditions not seen in Cape Cod Bay or Nantucket Sound or other lobster areas where singles are traditionally fished. Boats operating in OCLMA Outer Cape waters must routinely pass through Nauset Harbor, Chatham Harbor, or Race Point. These are no places for small boats. These places are all affected by dynamic conditions such as breaking waves, fog, large tides, and wind when we fished our 30 foot boat transiting to and from the fishing grounds 15 miles away crossing a bar with breaking seas, often over loaded, we blew a sigh of relief upon reentry in the harbor

because we were simply pushing it in a 30 foot boat. We purchased the bigger boat to fish more safely and efficiently as a family.

Our business plan has been designed around being able to work with my family & single traps. By fishing singles I am able to take my fiance or son as crew most of the time. It also allows me the option to fish by myself or take last minute crew with little or no experience. I am able to do this because it is alot less dangerous in the single pot fishery. There is less chance for entanglement and being dragged overboard. My lobster gear is very heavy and my wife or young son may not be able to handle it efficiently as trawl. Affording to pay another full time crew member is not possible within our finances. I also believe my fishing efficiency would be greatly decreased by switching to trawl as well. It has already been scientifically proven that singles out-fish trawl. With only 470 trap tags, it would be necessary to purchase more trap tags just to land the same amount of product. Trap tags are very costly and hard to come adding to the hardships. Having to fish trawl would be financially crippling to our business.

I feel that my sentiments are probably mirrored by other Outer Cape fisherman who also fish single pots. This fishery was developed over 100 years. The outer Cape has already given up trap tag reductions and area closures. To change all of our gear to trawls would be disasterous and non-beneficial to all fishermen involved. We would lose more gear and create conflict amongst ourselves in a tight area that is aggressively fished, where we barely work around each other without conflict. We police ourselves in a manner that works. Lobstermen are constantly forced into new regulations even though we are the major conservationists. These new proposed regulations would prove disastrous and fatal for our small business and family. How can we make capital investments when rules are constantly changing due to an animal with a migrational pattern we have no control over? We need more real data on these whales. I worry that small businesses like myself will be pushed into fishing smaller boats to keep operating in the same manner which creates dangerous situations. Perhaps they will simply be forced out or even worse have to hire outside help. The single pot fishery has traditionally been family operated. We are a vital part of the Cape Cod economy. We are also some of the last producers left on Cape Cod and we don't want to see this tradition and livelihood become a thing of the past.

Thank you for you time  
Sincerely Brock & Faye

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Dear DMF,

My name is Carl Waitt and I have been a commercial lobsterman since 1985 and a student license before then. After listening to the hearings on both nights this is what I have to say.

From what we have heard the right whales are entangled with heavy lines used in off shore fishing and in used Canadian fishing gear. It makes no sense to close state waters and leave federal water untouched. Cruise ships, cargo ships, pollution ect... are killing and injuring a lot more whales ect than any in shore lobsterman fishing where the closures are proposed to be.

Over the years I have been put out of the Gill netting because of all the restrictions especially taking away the most profitable months and the regulations never being relaxed. I threw out thousands of dollars worth of Gill nets and concentrated solely on commercial lobstering and slowly that's been getting harder to do over the years.

Why can't the break away lines and links at least be given a shot. It's new and needs to be studied. Ropeless fishing will not work because it would be too congested. Right now four guys can set over one trawl and that's with buoys! The cost of this crazy ropeless fishing would put us out of business, let alone when we get a nor'easter all that gear will be tangled up altogether and be a real horror show to deal with.

If these closures take place we will miss out on the spring fishing which pre COVID can bring prices of \$11.00 per lb. We will not have income to pay our bills and feed our families. Talking to a Canadian lobsterman, I learned that during their closure they get subsidized 800.00 per week and some get even more.

We all love whales, but fixing what is happening to the right whales needs to be shared by all involved! Not just the inshore commercial lobsterman.

Thank you,  
Carl and Gail Waitt

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Hello Dan,

I am writing to let you know that I am opposed to the new regulations being set for lobstering. This will have a very negative impact on not only the fishermen but also the economy in this area. Lobster is a very big part of this area at restaurants and also for family dinners. There is nothing better than eating something that has been caught locally. Considering New Bedford is the largest fishing industry in the country we should have local seafood available year round.

The months that lobstering will be closed will be detrimental to the livelihood of the fisherman. With multiple men and women on each boat there will be many families that will not be able to financially survive months without working. Some of them fishing is all they know and it will be a challenge to find temporary work that will compare to the pay they make on the boats. Please take into consideration the negative impacts this decision has on this area and the hard working Men and women involved. I agree with protecting the environment and keeping all animals protected but in this area that is being closed the whales are not present and have no positive impact on this area. There is so much more to lose by closing this area than there is to gain.

Thank you  
Jen Nobrega

December 18, 2020

Massachusetts Division of Marine Fisheries  
251 Causeway Street  
Boston, MA 02114

Attn: Director Daniel McKiernan

**Re: Proposed Amendments to 322 CMR 6.00, 7.00 and 12.00**

Dear Director McKiernan:

We represent the Massachusetts Lobstermen's Survival Fund (the "Fund"), which is a group of Massachusetts commercial lobstermen and stakeholders in the Massachusetts commercial lobster fishery. Its purposes include working for the economic survival of lobstermen, and its efforts at this time are mainly focused on showing the general public, the courts, and regulators that coastal lobstering with traditional trap gear and vertical buoy lines is sustainable and safe for the northern right whale. On behalf of the Fund, we respectfully submit these comments for the Massachusetts Division of Marine Fisheries' ("Mass DMF") review and consideration.

**1. The Proposed Rule is a product of Federal Overreach and not Science.**

As a threshold matter, we note that the Mass DMF likely finds itself between a rock and a hard place at this time, as do the lobstermen. Presently, there are two [2] pending Endangered Species Act ("ESA") lawsuits in the United States District Courts in Boston and Washington, D.C. initiated by environmentalists that substantially threaten the very existence of a Massachusetts commercial lobster fishery. If those environmentalists successfully prosecute those matters, then Massachusetts lobstermen could be out of work in both state and federal waters as early as June 2021:

- **Washington DC Case (NOAA ITS).** The Washington case concerns the National Oceanic and Atmospheric Administration's ("NOAA") failure to include an Incidental Take Statement ("ITS") concerning northern right whales in its

---

FARRELL SMITH O'CONNELL AARSHEIM APRANS LLP

Offices in Massachusetts and Rhode Island

27 Congress Street, Suite 109, Salem, MA 01970  
T: 978-744-8918 | F: 978-666-0383 | fsfirm.com

biological opinion. The judge has ordered that biological opinion vacated unless NOAA remedies this regulatory deficiency by May 31, 2021.

- **Massachusetts Case (Mass DMF ITP).** The judge in the Massachusetts case has found a likelihood of success on the merits that licensing vertical buoy lines in Massachusetts waters will likely cause a “taking” of a northern right whale in violation of the ESA. She has ordered Mass DMF to apply for an Incidental Take Permit (“ITP”) from NOAA pursuant to Section 10 of the ESA. The trial is scheduled for June 2021.<sup>1</sup>

NOAA’s issuing both the ITS and ITP is governed under more or less the same standard. The NOAA scientists will need to opine that the federal and state plans will have no more than a negligible impact on the northern right whale.

It appears that the proposed rule we are talking about today is tailored toward obtaining the court-ordered ITP and satisfying NOAA and the U.S. District Court. It does not appear to be a product of Mass DMF’s independent scientific judgment.

The problem presented by the ongoing right whale litigation is that it creates a “tail wagging the dog” scenario whereby Mass DMF is hamstrung in its deliberation process and cannot effectively do its job as a state agency. Citizen and industry participation in the rulemaking process, a right guaranteed by the Massachusetts Constitution and the Massachusetts Administrative Procedure Act, is likewise rendered effectively meaningless because the Mass DMF must create rules to the satisfaction of NOAA regulators on account of a Federal Court second guessing the Mass DMF’s management of the lobster fishery. In the opinion of the Fund, this is an unlawful commandeering of the Mass DMF by the federal government and a federal overreach that deprives Massachusetts lobster permit holders and other stakeholders of their property without due process.

At the present time, indeed, not a single Massachusetts lobsterman or industry group is an active party in the Massachusetts case, which has been initiated by a New Hampshire environmentalist. The judge in that case may regulate Massachusetts state law from the bench to the whims of foreigners without a single lobsterman or Massachusetts citizen being heard. The Fund has recently moved to intervene in the Massachusetts action to ensure Massachusetts lobstermen have a voice in that case and to fight back against this Kafkaesque and likely unconstitutional sleight of hand.

While the Fund appreciates that Mass DMF did not choose to be in this scenario, the Fund must object to any rulemaking that is not based on a genuine and free agency deliberation and rulemaking process required by Mass DMF’s enabling act, the Massachusetts Constitution and the Massachusetts Administrative Procedure Act. The very fact that Mass DMF’s hands appear to be tied by definition means that there cannot be free agency deliberation and a legitimate public process. Massachusetts citizens and Massachusetts lobstermen are deprived of

---

<sup>1</sup> There is similar right whale litigation pending in the U.S. District Court in Portland, Maine.

these basic procedures and rights to regulate the sovereign waters and public trust of the Commonwealth.

What adds insult to injury is that the Mass DMF has been a pioneer in issuing comprehensive and progressive protections for the northern right whale that are unmatched in any other jurisdiction. It is undisputed that Massachusetts presently has in place the most protective and innovative fixed gear protections for this species. Obviously, the Mass DMF did not implement its existing plan for the Massachusetts lobster fishery if its scientists and experts believed that it would likely result in a taking under the ESA. Black letter agency law requires deference to the Mass DMF's existing plan and agency decision. A Federal Judge in Boston, who admittedly is not a trained environmental scientist in any degree, has improperly replaced the scientific opinion of Mass DMF with her own, based on unverified and unfalsifiable paper submissions. Rather than create a remedy, the Court has required Mass DMF to obtain NOAA's approval. This is a *de facto* federal takeover of the Massachusetts state lobster fishery, and this rulemaking process cannot be genuine or anything more than veneer because Mass DMF must serve its federal master regardless of public input.

NOAA, evidently, is the last place to look for results on this issue. That agency, indeed, has not obeyed its own ESA regulations since 2014 with respect to right whales. As a direct and proximate result of NOAA's malfeasance, the entire federal lobster fishery is in jeopardy. It is unconscionable that Mass DMF, who arguably has been the most responsible regulator with respect to northern right whales, must seek permission from NOAA to ratify its very well reasoned and sustainable fishery that has worked for years without a single right whale entanglement since 2016 and without any morbid entanglement or serious injury at any time. The present estimate appears to be that NOAA will drag issuance of the ITP for approximately two [2] years, which sets Mass DMF for potential failure at the forthcoming June 2021 trial for no fault of the Mass DMF or Massachusetts lobstermen.

The situation is clearly untenable. Mass DMF is recommending changes to its rules previously found to be perfectly reasonable based on its own scientific judgment. These changes are not based on Mass DMF's scientific judgment, but on creating an appearance that will hopefully meet the approval of NOAA regulators. This is without question arbitrary and capricious, and such is not the intended design of our Massachusetts state agencies. This court ordered federal takeover of the Mass DMF contravenes basic rights of Massachusetts citizens and the basic ideas of sovereignty over Massachusetts waters. We therefore object to and cannot support the proposed rule in principle.

## **2. Massachusetts Coastal Gear is Safe and Sustainable.**

The narrative that Northeast coastal lobster gear is a threat to right whales is simply false. The real human threats to right whales (ship strikes and the unregulated Canadian snow crab fishery) are not attainable targets for regulators. Lobstermen, on the other hand and much like the northern right whale 150 years ago, have unfortunately become easy targets to create the appearance that regulators are protecting this critical species. This has resulted in serious misinformation and unfair assumptions within the general public, and the public relations

campaign that vertical buoy lines are dangerous is not based on hard evidence. As a result, the real threats to the northern right whale are ignored and remedial measures are largely ineffective.

The evidence shows that the current state and federal regulations are working. Since the right whale Take Reduction Plan was amended in 2009 and 2015, there has been a strong downward trend in the incidence of entanglement cases involving U.S. lobster gear. Prior to 2010, there were seven such entanglements, only one of which was attributed to Massachusetts gear. There has only been one known entanglement in U.S. lobster gear nationwide since 2010. That entanglement, occurring in September 2016, did not result in the serious injury or death to a northern right whale. Accordingly, U.S. lobster gear entanglements are exceptionally rare events. When it has occurred, it did not result in serious death or injury. Entanglements have been made even rarer on account of comprehensive and reasonable efforts to mitigate and virtually eliminate U.S. lobster gear entanglements since 2009. *There is no evidence that a right whale has ever died or become seriously injured as a result of entanglement in Massachusetts lobster gear or the coastal lobster gear of any other state.*

The evidence shows that right whale entanglements are not attributable to the Massachusetts coastal lobster fishery or the coastal lobster fishery of any other state. Since 2010, larger diameter ropes of ½" or greater represented 79% of the gear removed from entangled whales. Almost all coastal lobstermen fish in state waters with smaller diameter ropes. The gear diameter suggests that the entanglement problem is primarily within the Canadian snow crab fishery. This makes sense and explains the recent increase in entanglement because northern right whales have recently emigrated to feeding grounds in the Gulf of St. Lawrence on account of climate change. Any existing entanglement problem is clearly not a Massachusetts coastal lobstering problem. Further restrictions on the Massachusetts lobster fishery, therefore, are unnecessary at this time. Moreover, the existing federal and state regulations and public relations campaign targeted almost exclusively on U.S. coastal lobstering, do not effectively address the real problem and more whales will die as a result of these misguided efforts and misallocation of regulatory attention.

Critical information is omitted or ignored, which significantly impacts the understanding of human causes of serious injury to northern right whales. The evidence shows that gillnet gear and netting play a much larger role in entanglement cases. Further, there has been insufficient investigation to a pronounced increase in observations of unknown gear, particularly the increase in cases since 2015 with no gear present. This leaves significant unanswered questions about the responsibility of unregulated Canadian fisheries for right whale entanglements. Consequently, environmental advocates and regulators erroneously overstate the share properly attributable to the Northeast lobster fishery and downplay the role of other gears in right whale serious injury and mortality.

The data shows that gillnet and netting gear were the most prevalent gear (other than Canadian snow crab gear) and the Northeast lobster fishery were the least prevalent in right whale entanglements. This finding means that any conservation target to restrict commercial lobstering in coastal waters is unsupported by the best available data, and any package of remedial measures designed to meet it cannot credibly generate the conservation benefits anticipated.

As a result of the blatant misinformation, the public has erroneously assumed that all entanglements result from the commercial lobster fishery. The evidence, however, unequivocally shows that entanglements in coastal lobster gear are exceptionally rare. The power of the public relations campaign against the lobstermen is substantial and it has actually reversed the way many people think about science and evidence. As of today, lobstermen appear to be faced with the impossible task of “proving a negative,” *i.e.* showing that all entanglements are *not* lobster gear. This is a logical impossibility. It is assumed, without evidence, that all “unknown entanglements” are lobster entanglements and lobstermen are unfairly adjudged guilty before even walking into the courtroom. Such assumptions are irrational and unscientific, and for some, unfairly assuming that lobstermen are the culprit has almost become a religion. Enacting rulemaking based on such religious thinking, of course, is arbitrary and capricious.

To be effective, conservation measures must be based on data concerning all known risks to the northern right whale and must accurately reflect the risk posed by each threat. The unfair and unscientific focus on the U.S. coastal lobster fishery without considering the best available data from all fisheries guarantees ineffective and hollow policy. NOAA data from 2010-2018 reveals that NOAA scientists estimate the following human causes attributable to northern right whale serious injury and death:

Cause	Percent
U.S. and Canadian vessel strikes	48%
Canadian Snow Crab Fishery	31%
Gillnet and netting gear	13%
Unknown trap/pot gear	4%
U.S. trap/pot gear	4%

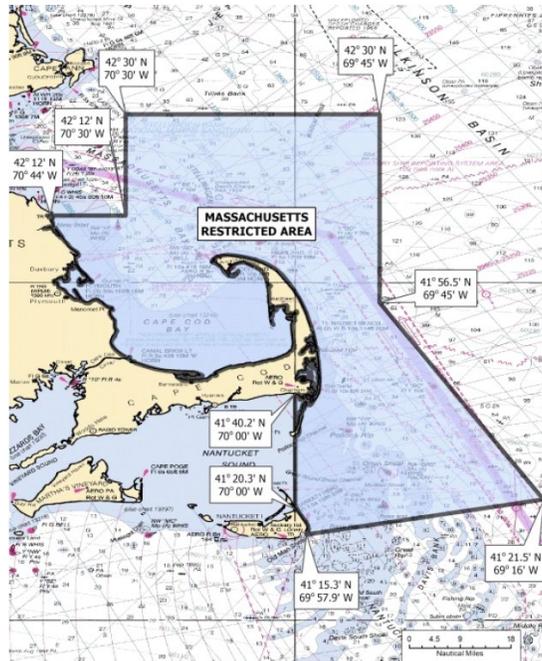

The above figures are what NOAA estimates, but again, there are *no known cases of right whale serious injury or death involving Northeast lobster gear.*

The Massachusetts Lobstermen's Survival Fund is committed to the protection of the northern right whale. In a way, lobstermen and right whales have a symbiotic relationship. As right whales near extinction, it appears that environmentalists and the misinformed seek to unfairly take the lobstermen down with them. The fates have entwined whales and lobstermen together and it is for this reason why lobstermen are committed to protecting this critical species. This is why we cannot responsibly support the proposed regulations. The further restrictions will accomplish nothing and will create the dangerous false assumption that appropriate measures are in place to protect right whales. Meanwhile, the whales will continue to be run over by ships and entangled in the heavy snow crab gear outside Mass DMF's jurisdiction.

### **3. Expanding the Closed Area is Unnecessary.**

Of the only two [2] lobster gear entanglements in Massachusetts state waters, both were set within Cape Cod Bay, which is known to have a seasonal aggregation of northern right whales. Right whales, though sporadically sighted outside of this location, are generally not known to aggregate in other areas of the Commonwealth.

Based on over twenty [20] years of aerial studies, and in collaboration with NOAA, the Mass DMF has established the Large Whale Trap/Pot Gear Closure Area (the "Closed Area"). This Closed Area is established based on where whales are known to aggregate:

As there is no evidence of an entanglement or whale aggregation occurring anywhere outside of this Closed Area at any time, expanding the Closed Area to all of Massachusetts waters is not based on any substantial evidence and is arbitrary and capricious. Such a drastic closure, again, appears to be an appeasement to the very unscientific and religious assumption that lobster gear is the primary cause of whale entanglements. The evidence shows that this assumption cannot be true.

#### **4. Ropeless Gear Does not Work.**

The concept that ropeless gear is a workable alternative is the product of ivory towered and magical thinking. This idea has been around for more than a decade, yet no one has been able to successfully commercially develop this product. Even those who are trying to develop and promote ropeless gear will admit the product is not ready for the commercial market. The product literally has never worked and it has not been working for more than a decade.

Requiring commercial lobstermen to use this theoretical method to harvest will place all commercial lobstermen out of business. The gear is too expensive and the technology will be rife with bugs and issues that are largely unknown at this time (as all new technologies and theoretical methods run in to such problems when tested in the real world). Known problems with ropeless gear today are as follows:

- Ropeless gear, tested even under benign marine conditions (flat bottom, minimal current/tide) have a high failure rate. This cannot work in the harsh conditions of the North Atlantic.
- There is no reliable method to deploy and retrieve the gear. Gear loss will be high and lost gear will litter the ocean bottom, adversely affecting marine species.
- Draggers will not be able to know where ropeless gear is set, and the gear will be lost to draggers.
- Ropeless gear would require an allocation of ocean floor dedicated to this system, which violates the Magnuson Stevens Fishery Conservation and Management Act (requiring efficient use of nation's fishery resources).
- Again, the gear is just too expensive to be commercially viable.

The undersigned is not aware of a single experienced commercial lobsterman who supports the implementation of ropeless gear or who has successfully utilized such a system.

The Massachusetts Lobstermen's Survival Fund accordingly supports the proposed rulemaking insofar as it does not require the implementation of ropeless gear.

### **CONCLUSION**

For the foregoing reasons, the Massachusetts Lobstermen's Survival Fund respectfully opposes the proposed changes to 322 CMR 6.00, 7.00 and 12.00, but supports Mass DMF's refusing to implement ropeless gear fishing. Further restrictions to protect the northern right whale are unnecessary and unhelpful. Because they create an appearance of conservation, while not actually addressing the real problem at all, these restrictions likely result in the serious injury and death of more right whales.

Very truly yours,

Olaf Aprans

Boston, MA 02114

**Re: Comment on New Protected Species Regulations Affecting Trap and Gillnet Fishing (Nov. 13, 2020)**

Dear Mr. McKiernan:

Oceana, the world's largest international advocacy organization dedicated solely to ocean conservation, appreciates the opportunity to comment on the proposed amendments to Massachusetts regulations to protect North Atlantic right whales ("NARWs").<sup>1</sup> Among other things, the proposed changes to Massachusetts regulations will: 1) extend the existing Large Whale Seasonal Trap Gear Closure to all waters under the jurisdiction of the Commonwealth, 2) extend the existing gillnet closure in Cape Cod Bay, 3) retain regulatory authority to extend fixed gear closures based on documented presence of right whales in Massachusetts waters, and 4) require all vertical buoy lines break when exposed to 1,700 pounds of pressure.<sup>2</sup> Because the Commonwealth is authorizing its state waters fisheries without an incidental take permit and must obtain one immediately, additional protective measures are desperately needed and should be approved. Oceana applauds Massachusetts' prompt response to the need for action on these issues but calls on the Commonwealth to take this opportunity to strengthen the proposed changes and provide necessary protection that is informed by the best available science to protect all NARWs, adults, juveniles and calves, that swim in the waters of the Commonwealth.

Oceana agrees with the proposed amendments to better protect NARWs from the threat of fishing entanglements through expanded time-area management in all state waters during a key whale aggregation season. Oceana also supports action to empower the Commonwealth to react to the presence of right whales in Massachusetts' waters when NARWs do not follow expected abundance patterns with management measures that consider real-time or near real-time presence

---

<sup>1</sup> Commonwealth of Massachusetts, Division of Marine Fisheries, *Public Hearing Notice- New Protected Species Regulations Affecting Trap and Gillnet Fishing (Nov. 13, 2020)*, <https://www.mass.gov/doc/111320-public-hearing-notice-on-new-protected-species-regulations-affecting-trap-and-gillnet/download>

<sup>2</sup> *Id.*

information to modify or extend time-area management. This proposed action is similar to the highly effective measures put in place by the Canadian government in recent years that resulted in zero observed NARW deaths in Canadian waters in 2020.<sup>3</sup> The positive outcomes from Canada's strategy should be duplicated in Massachusetts. We encourage the Commonwealth to strengthen and approve the proposed amendments so that Massachusetts can serve as a model of NARW conservation for the rest of the Atlantic states.

Oceana does not, however, support the proposed requirement to use weak rope, line inserts, sleeves, or other contrivances ("weak rope") that theoretically allow NARWs to break free from entanglements in this or any rulemaking, including the upcoming Atlantic large Whale Take reduction Team ("ALWTRT") rule from the National Marine Fisheries Service. The reliance on weak rope is flawed in two ways that make it unsuitable for use in regulation.

First, the use of weak rope is expected to reduce entanglements of *adult* NARWs that can produce enough power to separate the weak rope. Weak rope has not been proven to be effective for juveniles and calves and cannot be part of a comprehensive risk management plan.<sup>4</sup> Protecting all life stages is critical for the species' recovery. Therefore, any management strategy must provide protection for each life stage to effectively meet conservation goals and cannot be focused on benefits to just one life stage.

Second, while reducing mortality and significant injury by using weak rope will minimize entanglement under the MMPA requirements,<sup>5</sup> the Commonwealth has multiple obligations for the conservation of NARWs in its requirement to obtain an incidental take permit. The permit cannot and should not ignore the more stringent state and federal Endangered Species Act requirement to avoid entanglements as a "take" to protect endangered NARWs.<sup>6</sup> Weak rope will do nothing to reduce the "take" of listed NARWs under the state and federal Endangered Species Act, as they will nonetheless have interactions with gear that qualify as a "take," because the entanglement and break event will cause harm to the individual whale.<sup>7</sup> Oceana recognizes that weak rope is central to the strategy adopted by the ALWTRT and disagrees with the Commonwealth's reliance on ALWTRT decision-making as rationale to support weak rope requirements in the current proposal.

---

<sup>3</sup> No reported deaths, entanglements for North Atlantic right whales this year. CBC News September 24, 2020. <https://www.cbc.ca/news/canada/new-brunswick/good-year-right-whale-1.5736180>

<sup>4</sup> Arthur LH, McLellan WA, Piscitelli MA, Rommel SA, Woodward BL, Winn JP, Potter CW, Pabst DA. 2015. Estimating maximal force output of cetaceans using axial locomotor muscle morphology. *Marine Mammal Science* May 6, 2015.

<sup>5</sup> 16 U.S.C. §§ 1361 et seq.

<sup>6</sup> NARWs are protected under the Massachusetts Endangered Species Act ("MESA"), Mass. Gen. L. Ch. 131A; 321 C.M.R. 10.90, which prohibits their take. 321 C.M.R. 10.04 "Take" means "to harass, harm, pursue, hunt, shoot, hound, kill, trap, capture, collect, process, disrupt the nesting, breeding, feeding or migratory activity or attempt to engage in any such conduct, or to assist such conduct." 321 C.M.R. 10.02. "Take," as defined under the federal Endangered Species Act, means "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." 16 U.S.C § 1531 (3)(19).

<sup>7</sup> *Id.*

Oceana has argued against the use of weak rope in its scoping comments on the federal rulemaking and repeats that opposition here.<sup>8</sup> Weak rope is not a sufficient measure to reduce Endangered Species Act takes and the Massachusetts Division of Marine Fisheries (“DMF”) must find additional means to reduce risk by implementing other management measures that avoid interactions.

Although Oceana is generally supportive of the proposals to expand time-area management to reduce entanglement risk in Massachusetts waters, Oceana offers the following two recommendations on the proposed time-area management revisions:

**1. The Massachusetts DMF must include clearly defined and objective criteria for the Director’s extension and expansion of time-area management measure.**

In the rapidly changing waters of the Gulf of Maine, reactive and responsive management will be a critical part of risk minimization for both fishing gear entanglement and vessel strikes. To its credit, the Commonwealth already includes the authority of the Director to modify both fishing and vessel speed regulations based on the “(d)irector's assessment of the documented presence of the North Atlantic right whale in Massachusetts waters.”<sup>9</sup> Oceana remains concerned, however, that the declaratory process is based solely on the discretion of the Director. Oceana repeats its 2019 recommendation that the declaratory process must be based on clearly defined and objective criteria.<sup>10</sup> The final rule extending this authority should list these objective and transparent criteria including density and duration of NARW aggregations within the management area that will trigger an extension or modification of the current management area or season. Doing so will remove ambiguity and political pressure from the process and create a stable, open response mechanism for the Commonwealth, the affected industries, and concerned stakeholders. Canada uses a similar objective process to effectively set and adjust NARW regulations and this model should be replicated in Massachusetts.<sup>11</sup>

**2. The Massachusetts DMF must expand the list of affected fisheries to include *all* fisheries with vertical lines in state waters.**

During the December 8, 2020 public hearing, an audience member highlighted that additional fixed gears, such as anchored bottom longlines, may be used in state waters with vertical lines but are not restricted by the current proposal. If the intent of this rule is to minimize vertical lines and not traps, pots or nets themselves, the Massachusetts DMF should amend its proposed rules to include *all* gears that increase risk of vertical line entanglement in state waters. This amendment could be done through an expanded list of fisheries or a simple prohibition on vertical lines, regardless of gear or fishery.

### **Conclusion**

Oceana thanks you for considering these comments. Oceana and its staff in the United States and Canada are committed to the conservation of NARWs throughout their range and look forward to working with the Commonwealth to achieve this important goal. Massachusetts' leadership in enacting protections for NARWs at the state level is inspiring and desperately needed at this time. Oceana supports these efforts.

To whom this may concern. Attention outer Cape state waters single trap. My name is Nick O'Toole owner operator fishing vessel Zachary T length 31 feet outer Cape state only territory Nauset to Truro ..This letter is directed towards the concerns I have and many other permit holders in OCLMA about the new proposed rules for the single pot fishery. I'm going to explain some of the dangers and difficulties that the 29 foot rule that seriously needs to be re-thought... (Area) you may not know this but the backside of Cape Cod is a very dynamic area compared to many other state water lobster areas in Massachusetts. We are not in a bay or a sound which most of the time are quite tranquil compared to OCLMA which on a daily basis consists of wind fog large seas strong tides and hurricane swells. Speaking the truth I would not Lobster off the backside of Cape Cod in a vessel smaller than 29 feet it's far too dangerous, all vessels fishing OCLMA must either cross race point rip or like myself travel around Monomoy point or most vessels cross Nauset inlet or the Chatham Inlet, all these places have to be traveled through twice a day to go lobstering and all have the tendency to try sink your boat ./Breaking waves tides and fog. These elements is why most of the boats in our area are greater than 29 feet./Gear/ when I started lobstering we set the business up to haul single pots. We had no issues one summer I even hauled gear by myself every trip, you can do that with singles they are safe. As a purchased more tags and Traps we started rigging eight pot trawls thinking it would be quicker and easier to haul but quickly found out it's extremely dangerous compared to single pot . First example I brought my good friend 17-year-old son who wanted a job lobstering, Bad idea don't ever bring someone lobstering to haul and set trawls back that have no experience, I was very lucky he didn't set himself overboard twice that day. I realize that day fishing trawls you can't go unless you have experience crew. The same summer 2018 two different vessels in our area both had crew get their foot caught in trawl setting And were pulled to the bottom in 70 feet of water luckily both were wearing knives and manage to cut them selves free, they both had blown eardrum's and water in lungs but luckily they didn't drown and lucky they had fast acting captains For the last two seasons I've hired one of my best friends who Has hauled and set hundreds of eight pot trawls with me without incident until November 5, 2020 that changed , we were setting back in weather conditions 4 the 6 foot seas 20 kn of wind my third crew started yelling whoa whoa whoa and Jason had got his foot tangled in ground line pinned in corner of Boat, two seconds away from being shot out of the stern and down with trawl in 130 feet of water thank God I heard Billy and put Boat in Full reverse and was able to untangle his foot. What I'm getting at is these trawls Are very dangerous and it only takes one time. Illuminating single pots from OCLMA Will most likely cause crew deaths. Like I said earlier my boat is 31 feet in my opinion is it's really too small for trawls , where single pots can be safely deployed. One other point is our area is very congested and trawl set on top of trawl is extremely dangerous and most likely will be happening on a regular basis. OCLMA needs a exemption from this rule or Mark my word, there's going to be loss of life. We all know lobstering is dangerous but the safest way to Lobster in OCLMA is single pots and that's why it has been that way for generations  
thank you Nick O'Toole

**RE: Comments on Proposed Amendments to Regulations Designed to Reduce the Risk of Right Whale Entanglement in Fixed Fishing Gear and to Reduce the Harm Posed by Entanglements**

Dear Mr. McKiernan,

We are writing on behalf of The Pew Charitable Trusts, Blue Planet Strategies, and Bennett Nickerson Environmental Consulting to comment on the Massachusetts Division of Marine Fisheries' (Division) proposed amendments to regulations at 322 CMR 6.00, 7.00, and 12.00, designed to reduce the risk of right whale entanglement in fixed fishing gear and reduce the potential harm posed by entanglements if they occur.

We support the core parts of many of the proposed measures, in particular the seasonal closure of Massachusetts waters. This closure recognizes the urgency of the situation for the North Atlantic right whale and the need for immediate and meaningful action to save the species from extinction. It recognizes that taking immediate steps to separate vertical lines in the water column from right whales when they are present is fundamental to their survival. As discussed further below, the proposed changes to closures must be improved to encourage the development of "ropeless" fishing gear – gear that is capable of fishing without the use of vertical buoy lines in the water column. Further, equally robust conservation measures are needed in federal and other state waters, especially in Maine where the majority of the lobster fishery is based. We appreciate that Massachusetts has taken this step and has set a precedent for proposals that other states, as well as the U.S. federal government, can follow. Unfortunately, without complimentary measures in other jurisdictions, there is effectively no possibility for Massachusetts to receive incidental take authorization.

As you know, the North Atlantic right whale is critically endangered and needs immediate help from state and federal governments in order to recover. The greatest threat to right whales in U.S. waters is entanglement in fishing gear. The latest statistics are grim. Since the National Marine Fisheries Service (NMFS) declared the Unusual Mortality Event (UME) for the right whale in 2017 there have been a total of 32 known confirmed right whale deaths from human interactions, specifically from entanglements and ship strikes – NMFS attributes 8 of those deaths to entanglement. In addition, 13 whales are known to have suffered serious injuries – 12 of these are attributed to entanglement. NMFS presumes these whales have died or will die from

their injuries, bringing the total number of confirmed or presumed dead right whales to 45 since the UME began in 2017. Of the 20 mortalities and serious injuries in the UME found in U.S. waters, 15 are attributable to entanglement. It is important to consider that these deaths represent only the known deaths of right whales – NMFS estimates the actual number of right whale deaths may be as much as 60 percent higher, which would be approximately 72 mortalities since the 2017 UME began. Further, while not all entanglements result in death or what is classified as serious injury, science shows that the effects of chronic entanglement are known to negatively impact the ability of right whales to survive and reproduce.

The most recent population estimates suggest that the right whale population is even lower than originally thought with fewer than 366 living North Atlantic right whales, and only an estimated 82 reproductively active females. According to calculations made as part of the 2018 stock assessment, which was based on 2016 population estimates, the potential biological removal (“PBR”) for right whales from entanglement, ship strike and all other human interactions, in both the U.S. state and federal waters and Canada per year, was 0.9. This PBR was used by NOAA and the Atlantic Large Whale Take Reduction Team (TRT) in 2019 to develop risk reduction targets and recommended conservation measures for meeting those targets in all New England trap/pot fisheries. The 2019 stock assessment takes into account additional right whale deaths and other updated scientific information, resulting in an even lower PBR of 0.8. Thus, the allowable number of right whales that can be taken incidentally in any jurisdiction, including Massachusetts, from any cause, remains effectively zero. Despite this, an October 26, 2020 communication from NOAA to the TRT stated that since “the population peaked at 481 in 2011, after accounting for 103 births, roughly 218 North Atlantic right whales have died of presumed [entanglements and ship strikes]—this is a rate of roughly 24 whale deaths per year.” There is no question that immediate and significant changes to protect right whales are required. We recognize that Massachusetts is taking leadership through these proposals to make the kinds of changes to fisheries operations that will reduce risk of entanglement in its state waters.

### **Required Analysis**

Currently, the fishery operates illegally in Massachusetts state waters because there is no legal biological opinion and incidental take statement, thus no takes of right whales are authorized. To ensure that the proposed rules meet the standards for receiving an Incidental Take Permit (ITP) from the federal government, the Division must complete analysis showing that the take of right whales in Massachusetts will be reduced to levels effectively equal to zero. This analysis must be based on the most recent commercial and scientific information available, some of which is referenced above, including an updated PBR and level of estimated risk reduction, so that the Division and NOAA Fisheries can determine whether the proposed measures would qualify Massachusetts fisheries for an ITP.

### **Required Action by Neighboring States and the Federal Government**

Neither the federal government nor other New England states have developed comprehensive rules that will reduce the incidental take of right whales to levels that will meet PBR and other statutory requirements. However, right whales move in and out of Massachusetts waters

therefore the Commonwealth should formally request that the federal government, Maine, New Hampshire, Rhode Island, and potentially other states develop and implement strong complementary measures that are necessary to achieve the overall required reduction in take. Because of the urgency of the situation, this request should include a recommendation by the Commonwealth that the federal government use emergency authority available under federal law to immediately close some parts of federal waters to vertical line gear (for example, as outlined in The Pew Charitable Trusts June 18, 2020 Petition for Interim and Permanent Rulemaking, attached). As noted, although Massachusetts has proposed strong measures, without risk reduction in neighboring jurisdictions, it is unlikely that Massachusetts will be able to meet the thresholds necessary to receive an ITP.

### **Fixed Gear Closures and Ropeless Fishing Gear:**

1. Large Whale Seasonal Trap Gear. We support the expansion of the Large Whale Seasonal Trap Gear Closure from the existing closure north and east of Cape Cod from February 1 – April 30 to include all waters under the jurisdiction of the Commonwealth. We encourage the Division to continue to rigorously monitor whale activity in state waters and adjust the dates of this closure as appropriate, with particular attention to the beginning of the closure in January if right whales are present. As noted in more detail below, the new rules should allow for the use of ropeless fishing gear within closed areas with carefully designed and monitored conditions.
2. Conch Pot Fishery. We also support including the Conch Pot Fishery in the Large Whale Seasonal Trap Gear Closure with adjustment to the haul-out period to coincide with the April 30 trap closure, or the date as adjusted due to the presence of whales.
3. Recreational Lobster and Crab Trap Fishery. Similarly, we support the proposed new closed season for the Recreational Lobster and Crab Trap Fishery from the Tuesday after Columbus Day to the Friday before Memorial Day, or as adjusted due to the presence of whales.
4. Ropeless Fishing Gear. The proposed rules do not address ropeless fishing gear, thus Massachusetts regulations would continue to effectively prohibit the use of such gear except in cases where an exempted fishing permit (EFP) and/or letter of authorization (LOA) is issued. In order to facilitate and encourage the adoption of ropeless gear, so that lobster fishermen can fish in areas closed to vertical lines, the proposed rules should be amended to include a ropeless gear definition. The Division should develop programs that will encourage ropeless fishing in both open and closed areas, but testing in closures should only be done under carefully controlled conditions through EFPs and LOAs. For example, ropeless fishing within a closure could be limited or restricted in areas where whale density is high. We believe that allowing controlled and carefully regulated use of ropeless gear will allow for the sustainable coexistence of trap/pot gear and North Atlantic right whales, as well as many other marine mammals.

The Division stated during public hearings that gear conflict remains a primary challenge to ropeless fishing. As the Division is aware, efforts are underway to address gear conflict through fishing trials with gear marking technology, as well as a forthcoming gear marking workshop that will be held in early 2021 to discuss and agree upon a universal method to mark buoyless gear and reduce gear conflict associated with ropeless fishing. We encourage the Division to take an active role in these discussions and contribute to the development of gear marking solutions.

We also recognize that experimental ropeless fishing inside closed areas could result in additional risk to right whales from groundlines and vessel traffic. This risk is not well defined and should be evaluated under the noted conditions, and within the larger context of the importance of ropeless gear development throughout the fishery, where the reduction in risk from the removal of vertical lines would be substantial. Careful access to closed areas is important for providing efficient fishing opportunities for Massachusetts fishermen in order to help offset the economic burden from extended closures. Additional measures could be implemented to limit the number of vessels in a closure. For example, fishing vessel access could be prioritized while other vessel traffic is limited, and changes could be made to vessel traffic routes. A recent paper out of Dalhousie University concluded that for small vessels at least, a combination of speed restrictions and crew posted to watch for surfacing whales may be an effective way to reduce the incidence of whale injury and mortality from vessel strikes.<sup>1</sup> The Division has already reduced vessel speeds in critical state waters as part of the Small Vessel Speed Restricted Area and should continue to evaluate when and where to reduce vessel speeds.

### **Trap Gear Restrictions:**

5. Weak Rope and Maximum Buoy Line Diameter. We support implementation of these measures, however, they are not solutions that prevent right whale entanglement or eliminate takes. Additional research is required to assess the degree to which they could help an entangled whale free itself and reduce the seriousness of injuries. We recognize, however, that the changes are relatively easy to incorporate and might be helpful as a mitigation measure to reduce the seriousness of the injuries to right whales and other animals during the transition to ropeless fishing. If implemented, weak links must be carefully monitored to ensure they work as intended, e.g., that the weak links are included at the correct places throughout the line, and do not result in the use of additional line which could increase the risk to right whales. We also encourage the Division to consider requiring the use of weak rope in groundlines as well as vertical buoy lines, which could also be used as part of some ropeless gear configurations.

Thank you for the opportunity to comment on the proposed regulations designed to reduce the risk of right whale entanglement and reduce the potential harm posed by entanglements if they

---

<sup>1</sup> Kelley, et. al., Marine Mammal Science, *Assessing the lethality of ship strikes on whales using simple biophysical models*, Oct. 2020

occur. The proposed regulations are a significant step in the right direction and demonstrate the Division's recognition that immediate and robust protections for right whales must be implemented. If strengthened and combined with actions to speed the transition to ropeless fishing systems, in our view there is no question that trap/pot fishing can sustainably coexist in the same waters as right whales.

Sincerely,

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

Director McKiernan,

I am a commercial lobsterman fishing out of Rockport. I have been owner/operator for 19+ years and have worked hard to build my business from a 20' open skiff with a 126 traps 19 years ago to now, a full operation with a federal permit and a newly built boat. In other words, I am invested for the long run. I have a few comments after listening to the public meeting from Tuesday, Dec 8th:

1) I think if DMF is going to cap student permits and create a hardship for Commercial permits there should also be a cap on recreational permits, not just a shortened season. You said it yourself that these people abandon gear and from my experience, not only do they abandon gear in masses, they don't properly mark it so enforcement would be hard to tell whose gear is abandoned and they do not understand whale safe gear. I've had rec pots tangled with me and they're using heavy braided dock line with no trap markings. Rec guys have no respect for the investment we commercial guys put into this fishery and do not care about the whale issue. Capping the trap permits and explaining why will bring awareness to this whale issue for rec fishers, might even promote more dive permits since that harvest is whale safe. Your presentation said you have over 6000 rec permits, which at \$60 per is a lot of income for DMF and I know you do ventless work from that. What I would propose is that you increase the cost of the commercial lobster permit renewed yearly. I would propose \$600 which in the grand scheme is nothing compared to how much switching over gear is going to cost. As a comparison, I have a New Hampshire landing permit that costs me \$500 a year just to land, never mind make a solid living. A condition of the permit increase would be that the permit fees or increased fees are used to support the lobster fishery specifically. That might be for the ventless survey or other research or bycatch reduction. I would also support an increase to \$2.00 a tag for our trap tags. Maine does this and the funds are directed to enforcement of the fishery.

2) I've always wanted better enforcement from the EPOs. I think they're a joke but DMF seems to not have much say there. I would hope there will be a better showing of enforcement because of the whale issues but the real problem is bad eggs all around. If you're the guy taking illegal lobsters, you're also the guy who probably isn't following the other rules because you don't care about the fishery. The guy taking shorts and v-notches isn't morally invested in fishery. He doesn't care about the future of the lobster stock and if he's not concerned about the fishery itself, he won't be bothered with this whale issue either. Right now it is critical that lobstermen follow the rules to prevent entanglements and since EPOs don't seem to care I would ask DMF to impose a 1 year suspension of a lobster permit for any major fisheries violation and take it indefinitely for multiple offenses. This follows suit with Maine, New Hampshire and Rhode Island. Often times DMF and the Court's Judges seem sympathetic to the violators. I don't care about the judges or the thief who profits off my conservation, I care about the future of this fishery and I feel that it's time DMF took a more stern approach with gross violations just like our neighbouring States. MA has been the most proactive state when

it comes to large whale protections, it's time that DMF at least get to the same level of permit prosecution as these states which will help in these whale protections by holding these offenders accountable and showing the rest of the fleet that if the rules aren't followed, lobster or whale related, DMF will take action. Support a system that lets the serious fishermen stay invested in this fishery.

3) I'm not completely on board with the full state waters closure from Feb 1 - April 30. I understand this is big showing from MA to get the ITP but I can't say I agree with whether it's valid. Right whales focus in Cape Cod Bay and Mass Bay but their transiting pattern can change after that as they go north. That time of year the catch is low but the price is higher, sometimes going to \$10-\$11/lb. A lot of state guys hang up anyway until May but for the ones that don't, that's a huge loss with not a lot of reasoning behind it (no entanglements in the northern MA waters). You also have not left any time for these guys to make arrangements for storage. I am totally opposed to wet storage and there's a part of me that is happy about this but I can't look a northern guy in the face and say there's a good reason for it. Average trap storage, if you can even find a place to put 800 traps, is \$2-3/trap. That's a big ask for these smaller inshore guys and seriously, it's even harder to find that space. Not everyone has a home with a yard or a yard big enough to put them in, some Towns have By-laws that will not allow storage of fishing gear in yards and then there's the enormous task of getting them out of the water with usually smaller boats for the inshore fleet. You made the comment in the meeting that you would even recommend these guys start bringing in gear now. Truthfully, that's callous of you. We've had a shit year where prices are bouncing back from Covid and we're getting \$5.25/lb and you want them to bring in their gear because you gave them 1.5 months notice? Could you find a home in 1.5 months and throw down \$1600 knowing that you would have no means to pay for it after that? 1.5 months? Although I agree with the path your taking to get the ITP, I don't agree with this. What I would recommend is a compromise: any MA waters outside of the already enforced Mass Bay closure, you would allow 400 traps to remain out during this time Feb-Apr and reassess next year - earlier than 1.5 months notice, if you are going to require all 800 traps to be pulled. This will give guys time to find better storage for their gear, be able to go out and haul something if the price is right, DMF can say they've reduced it by 50% for those months, guys can incorporate their businesses to plan on collecting unemployment for next year, and DMF is not giving away too much right away as they have in the past. Give NOAA 400 traps, don't give them 800 for this new closure. Call it restricted access not a full closure.

4) Your presentation didn't mention speed restrictions but your draft language includes it. The way it's worded it sounds like you intend to allow exemption to the 10kt rule for boats 65' and larger. I am so absolutely opposed to this exemption because it's not in the true nature of the conservation you say you're trying to achieve. Any boat in those MA restricted waters should follow the 10kt rule, especially larger vessels with less stopping power and less maneuverability. What these whale lovers don't realize is that the worst offenders are the whale watch boats run by the New England Aquarium and other vessels like BHC ferries and merchant shipping. This is not an assumption, it's something I've seen time and time again through my AIS system. We may have a target on our back for entanglements but vessel strikes pose a more serious threat in our waters and should be addressed to the same degree that the lobster fishery is. Truthfully if you mean to close down all of state waters to fishermen in the interest of whale conservation, why are you not willing to do the same by imposing a 10kt speed restriction on all vessels for the same time period? You're willing to hurt small businesses but not large companies?

5) I know this meeting was not about Ropeless fishing but when that time comes, give far more notice and weigh-in from fishermen than you did with this meeting. And I don't mean the MLA. There is a substantial amount of us, mainly northern MA guys that do not agree with the way MLA has handled some of this whale stuff - slow to play, no comments on the first federal proposals, limited incorporation of the northern voice, ect. It's good that DMF is involved in a ropeless study but they're cramming this down our throats and we need a strong voice. I gave my peace about it during your meeting but I have far more to say about it and its role in the future of this fishery.

Thank you for your consideration of my comments and your time in reading them.

Sincerely,  
Steve Budrow

December 17, 2020

Dear Director McKiernan,

I am writing to you not only as a shoreside business owner who relies on the Massachusetts lobster fishery but also as the wife of a commercial lobsterman as well as a seafood consumer who lives in the Commonwealth. I am deeply concerned about the proposed closure of state waters from Feb 1-April 30th as it will not only affect me personally but many of the boats I do business with as well as my employees. I am a woman owned business and my employees are more than 50% minorities with families whom they all support. This closure would be devastating to not only the fishermen themselves but also the shoreside facilities the lobster industry supports. I find it mind boggling you would expect a fulltime lobsterman with one month's notice to have the means and time to bring in his 800 traps he has fished for most of his life and never had to land all his gear. The average fulltime lobstermen do not have a yard or storage space that will hold 800 lobster traps. It is extremely unfair to expect someone to stop their line of work with one month's notice due to a decision the state is making based on very little scientific evidence.

There simply is not data showing high aggregation of right whales North of Cape Cod Bay during the months of the proposed closure, so I am confused as to what this is going to accomplish. It is going to cause a major disruption in many fishermen's lives and accomplish very little. I understand the state is trying to work towards NOAA issuing an ITP but I do not think the state needs to take such extreme measures without the proper research and data sets in such a short timeframe. It feels as though this decision was extremely rushed and once it passes there is no going back. You are asking your fishermen to give up a piece of their profession and have many wondering what is next?

I think it is in the best interest of all the stakeholders that this decision will affect if the DMF holds off on closing all state waters to lobster fishing from Feb 1-April 30th until further research is done and more stakeholder outreach is conducted and analyzed. I agree changes need to be made to keep our lobstermen fishing while providing additional protection to the right whales, but I do not feel this closure is the correct form of protection they need and

truthfully, I do not think it is going to make any difference or appease NOAA. Massachusetts has already given more than any other state in the fight to save right whales and I would hope we could take the time to hear from NOAA and react in an appropriate fashion that will work the best for everyone involved. I know everyone is never going to be happy and this is part of life but as always, the lobstermen/fisherman are getting the short end of the stick with very little warning and consideration. This is one step closer to rope less fishing which is 100% not feasible or economical for this industry as it currently stands.

Thank you for your time and hard work to try and keep the fisheries strong in Massachusetts.

Best Regards,  
Tessa Browne  
Owner  
Cape Ann Lobstermen

**Subject:** public comment on single trap fishery in OCLMA  
**Date:** Thursday, December 17, 2020 10:34:46 PM

---

**CAUTION:** This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

My name is Jeremy Loparto, second generation Outer Cape Lobster Management Area permit holder. In regards to public comment on regulation change to lobster gear, I am writing to you on behalf of myself and many others from the OCLMA. We strongly oppose limiting single traps to vessels only under 29'. Primarily a single trap area, I will briefly explain how different the OCLMA is from the rest of the state.

As many know, the OCLMA is a very small portion of the states lobster permits. This small group of permit holders is compromised all with unique situations. Trap allocations are all different numbers based on cuts many years ago. So few allocation rights are available to purchase is why the price is as high as \$500 per trap tag. As well, many of these permit holders were forced to give up their federal permits due to trap tag transfer restrictions. Historically any OCLMA permit holder would agree our fishery is formed out of three fleets, Provincetown, Nauset, and Chatham. Mostly all single trap fishermen. An exception is some chatham boats which fish federal historically because they have to travel twice as far to get to the same depth in the southern waters.

Single traps have always been the primary way to fish in the OCLMA going back to the first fishermen in the area. Single traps provide the safest way to fish, especially if you have a smaller allocated permit and can't hire a crew. Singles also provide less gear conflict with the majority of permit holders in state waters. Trawls and singles simply don't mix well. Trawls have to be set very far apart due to extreme danger and risk of being entangled in another trawl. When two trawls become entangled you are essentially forcing your vessel and equipment beyond safe operating limits. The biggest risk for a small boat hauling singles around trawls is this exact factor. You risk capsizing, serious injury or death from exceeded operating limits.

Strictly judging vessel size to safely fish trawls is very inaccurate and a bad conclusion. Safely fishing trawls you need to have gear very well spaced. We don't have this opportunity in the OCLMA being in such a small area. Area 1 Federal permits are for sale with automatic 800 tag allocation everyday. But the OCLMA Federal permits are not available to us because of history rulings and tag transfer restrictions. We are unable to expand and safely space trawls apart if we were to all switch. Fishing trawls safely also requires a boat designed to do so, and a crew. A vessel size of over 29' is simply meaningless to fish trawls without extensive modifications. Some absolutely needed modifications could include rope locker, stronger davit, reinforced wash rails, snatch block, hauler motor, hydraulic pump, hydraulic clutch, is just a start.

Many of the OCLMA vessels are over 29' because we experience much harsher ocean conditions. The severe difference is not comparable to Cape Cod Bay or other inshore state areas. Captains that have fished singles in this unique area their whole career would take a crippling blow if required to switch to trawls. Gear changes, vessel modifications, and hiring more crew when you can't afford it is a uphill battle many won't be able to overcome. Proposed changes would also make permit values plummet. Fishermen in the later years of their careers would no longer be able to sell a business for its true value. Younger fishermen who recently bought into the OCLMA would be left with a business worth substantially less then they

paid for. I hope my supporting comments help understand the importance of single traps in the OCLMA, and how devastating it would be to take these away. Everyone supports making the fishery safer for right whales, but single traps have never hurt them or caused a deaths we found out from the studies 6 years ago. We are a very small amount of permit holders in the OCLMA that wish to continue to fish single traps. If singles continue to be permitted it should not matter if you are 29' or bigger. Taking this away would create extreme conflict and hardship. I hope you strongly consider an exemption, or additional safety measures to allow everyone to continue fishing singles.

Sincerely,

Jeremy Loparto

Director McKiernan

MASS DMF

251 Causeway Street, Suite 400,

Boston, MA 02114

Dear Dan,

Under the provisions of M.G.L. c. 30A, and pursuant to the authorities found at M.G.L. c. 130 §§ 2, 17(10), 17A, 80 and 104, the proposed Mass DMF regulations are a step in the right direction. However, it is unclear that the parlous status of the North Atlantic right whale species allows such incremental steps, which seem to be focused more on the ongoing legal ping pong, than a home run. They are also limited to Mass waters, when there is a far broader problem at hand. Vessel and rope trauma risk is present wherever North Atlantic right whales go. Which is essentially the Continental shelf between Florida and Newfoundland.

Introducing weak rope will reduce entanglement mortality and morbidity to some degree, but it will not eliminate them.

I understand that Mass DMF has funding from the National Fish and Wildlife Foundation to investigate the 'ropeless' option, widespread use of which will have a far more lasting impact in reducing mortality, and equally importantly, the health and hence reproductive success of live animals. This is excellent. For ropeless systems to be practical and sufficient, there needs to be urgent and aggressive work to solve its current shortfalls (and solutions): user safety, cost (massive government subsidy), efficiency (development), conflicts with other fishing gear (universal virtual gear position marking and communication), and not yet legal in commercial use in the NW Atlantic (make it legal). It has to be widespread in US and Canada, Federal and State waters wherever right whales go.

Thus for two reasons the MASS lobster fishery is being penalized unfairly.

1. The weak rope 'solution' is not much more than the weak link fiasco. It will put the state waters fishery through another round of gear-tinkering hell, and will come up short.
2. Asking them to go through with this while other areas where North Atlantic right whales come and go, but do not have to is illogical and unreasonable.

Michael Moore

Woods Hole Oceanographic Institution

Opinions my own.

**From:** [VRC Rods](#)  
**To:** [Fish, Marine \(FWE\)](#)  
**Subject:** Regulations to protect right Whales  
**Date:** Friday, December 18, 2020 11:06:04 AM

---

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales. I don't want to rehash statistics you already know, but just a friendly reminder about what is truly at stake. I understand that lobster fishing creates jobs and food sources, but the Right Whale also is part of a large ecotourism that produces a much broader income base for businesses on the east coast. Cap Cod and the Islands, Cape Ann, and Boston all thrive with tourism, and the whales are a large part of that. On a human level, we owe it to these animals to give them a better chance to survive within our invasive practices. After all, we are the ones trying to benefit on what we can harvest from the ocean, why do we have to destroy irreplaceable things to do it? As the superior beings, we know that there are solutions to every problem, with Rope-less technology at least being one of them. Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts. DMF must implement a pathway for permitting ropeless gear, which is at least a logical step to take. With the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots, it would still pose a threat to right whale calves and juveniles, let's at least provide a legal option.

We are one of the most advanced and wealthiest countries on the planet, certainly we can progress in an appropriate manner.

Regards,

Bruce Vetre

Good Afternoon:

I would like to share my thoughts about this proposal.

I have been lobstering for over 25 years in the Buzzards Bay and Vineyard Sound. I have only seen 2 or 3 whales in these area during my years of fishing. I have never heard of any entangled whale in the Buzzards Bay or Vineyard Sound, It seems to be a drastic measure to initiate this proposal for a whale that MAY come through this area. There are NO facts to back up this closure. It was stated in your our webinar. To have a closure of three months will hurt many lobster businesses. Most of the small lobstermen are barely surviving, between high expenses and the low selling price. Not lobstering for three months will make many families struggle. We are real people and real families. We are hard working dedicated people that have passion to provide excellent food for public consumption, which is a basic need for the world.

Lobstering has been a vital fishery for hundreds of years. With this proposal this will put many lobstermen in unnecessary hardship. When is this going to end? When we are out of business?

The endanger species you should be helping is the lobstermen/fishermen. They provide food for the world, and risk their life daily.

I hope this does not fall on deaf ears. We struggling everyday. Our way of life and the future of lobstering is in jeopardy.

Regard

Henry Borges  
Lobsterman

**From:** [Heilman, Jorie B](#)

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

I care deeply about the ocean and have devoted myself to teaching others about the wonders of marine science. So I have to urge you to take more definitive action to save the North Atlantic right whales. Entanglements need to stop in order to have them not go extinct. Ropeless gear seems like an answer that helps the whales without preventing fishermen from fishing. Closures alone won't be enough to save the species.

“In the short, medium, and long term we need to broaden the efforts that both countries are making to slow vessels down and reduce entanglement risk. Without that, it's too little, too late.”

-Michael Moore ,WHOI Research Scientist

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.  
Jorie

I've been fishing out of Hull Ma. for a long, long time, I've never cseen a tangled whale, never. I do believe it happens, but not nearly as much as people say, ship strikes are the biggest problem the poor whale faces, and you know it, so do all the others, putting the lobsterman out of business is easy for you all to do, to much money in shipping to stop them, we all know, money talks. Taking food off the tables of hundreds of fisherman & woman is not the solution, and you know it, especially when the country is in the shape its in, redirect the shipping during whale migration, keep those huge monsters away from the whales. thank you, John Redman, fisherman.

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

My name is David Demski writing to you a second time on the single trap issue>I disagree on limiting the size of vessel hauling single traps. This fishery is self regulated our traps are close to shore from April to September and most bring gear home I have for 40 years. There are so few fishing single traps now not sure what the gain is? less vertical lines? By going to trawl fishing especially Gosnold you will have more vertical line cause roughly 12 to 15 more fisherman who were scared to fish singles are going to bomb the area and wipe out the breeding stock that's been there since the single law was enacted and without a closure trawls will be there year round especially in the winter not being tended and catching wild life that will end up dying, there is too much greed in our industry today conch pots 50 feet long fishing 300 traps with three men?? 50 foot lobster boats as well fishing traps without tags to make ends meet. There needs to be more enforcement to the laws we have now but think a closure is a good way to eliminate some of the negativity in the lobster industry if you're a good fisherman on your game not over extended you can make a living in 9 months.

Dear DMF Director Dan Kiernan,

I am writing to express my strong support for the immediate transition to the use of acoustic "ropeless" trap technology with no end lines that snarl whales!

Along with ship strikes, vertical and ghost ropes have been decimating our North Atlantic right whale species. We CAN lift awareness of how new tech and evolving maritime law WILL protect such timeless ocean creatures. We WILL steward these lives entrusted to us.

Sincerely,

Phil daRosa - Owner/Engineer

Hello Director McKiernan. I am the product line manager for Teledyne Marine's Benthos product line that consists of subsea communication, recovery, and positioning products and systems. Allow me to make some comments regarding the public discussion on Regulations Affecting Trap and Gillnet Fishing that is referenced on your website, <https://www.mass.gov/service-details/proposed-amendments-to-division-of-marine-fisheries-regulations>.

Teledyne Marine has been working in the Ropeless Fishing technology arena for several years. Along with our partners, we have developed, tested, and demonstrated several systems that would allow for deployment, identification, tracking, and recovery of lobster traps and trawl lines using acoustic modem technology. A conceptual overview, which included some short video clips from actual test runs, was presented (virtually) recently at the Ropeless Consortium by our VP of Sales & Marketing, Dan Shropshire. His 10 minute long presentation can be viewed at the following location:

<https://drive.google.com/drive/folders/12mC5SuO4ovBInYHNQO8X5tbEgiKboVA>

Please let me know if you have any trouble downloading from this site and I can send you the video file directly.

To summarize, using products and technology that are available today, it is possible to use subsea wireless acoustic communication to replace the vertical lines presently used to mark and retrieve lobster or crab traps.

I am available if you wish to discuss this in more detail, or if you require further information.

Thank you and regards, Carl

**Subject:** Trap Fishing comment Attn: Director Mckiernan  
**Date:** Friday, December 18, 2020 2:28:27 PM

---

**CAUTION:** This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Hello Director Mckiernan,

My name is Michael Terrenzi, I am a lifetime resident of Massachusetts. I am a 35 year commercial fisherman. I have owned my current vessel the Kelly J Doc. # 686039 for 22 years. I have fished in the conch pot fishery for 12 years and I would like to make a few comments in response to the DMF E-mail I received on 11/13/20.

-Concerning the conch trap haul-out period being extended through April 30: I do not see this as being a problem, but maybe we can get these two weeks back in December. So, in a warmer fall year like this one; we could go a little longer. In a year like this one the conch fishing does not shut off until after the 15th of December.

-Concerning the limiting of the student lobster permits: My daughter Anna is a National Honor Society Graduate of Nauset High School. She is a full-time environmental engineering student at the University of Vermont. She has had to leave school and work remotely the last two semesters due to the pandemic. After next semester this will represent 75 percent of her college career thus far will have been done remotely. (she is in her second year) I am concerned that she and her generation will miss out on the kind of in person experiences attending an engineering program at a school like UVM means to offer. As a result she is also starved for some safe outdoor activities. She has recently expressed interest in getting a student lobster permit. I would like to help her with this and hope this opportunity will remain available to her and her younger brother, now and in the future. So I am opposed to limiting this opportunity for our students at this time. I hope if these permits are limited someday that they will still be available to children of commercial fishermen.

Thank you for hearing my comments,

Michael Terrenzi

I attended your last town meeting and did not feel that you actually answered the important questions. My main one is - Why is your plan faster and cheaper than a system without rope that is doing fine elsewhere? Your reply was cost and study and unsure how to mark them. Your proposal appeared as expensive and both were about a year and a half of study. If your way fails we lose time, money and whales. If ropeless fails you lose just time and money. Marking them I'd assume would be the same as others working well. If spending on studying ropeless while trying yours why not vice - versa. Would only make sense to take approach of least resistance at the cost of an animals extinction? You are fish and game the care people of them? Would love a reply on this if you have time, tried at town hall but never got to me. Thank you

Sincerely Bonnie Frank

Director McKiernan

251 Causeway Street, Suite 400

Boston, MA 02114

Dear Director McKiernan,

On behalf of the Massachusetts Conch Association, (MCA) we respectfully submit this letter of comment to the Massachusetts Division of Marine Fisheries (MADMF), regarding the draft regulations that are designed to reduce the risk of endangered right whales becoming entangled in fixed fishing gear and reduce the potential harm posed by fixed fishing gear if a right whale interacts with it.

The MCA, a 501 (c) (6) was established in May, 2019 by concerned fishermen to support and protect the interests of the conch fishery in Massachusetts and to work to ensure the future sustainability and profitability of the fishery. The conch fishery is already facing extreme measures for the size regulations for conch and it could shut down an iconic and profitable fishery here in the Commonwealth. It is difficult to understand how the conch fishery is a danger to the right whale.

The conch fishery takes place in bays, rivers and shoal water depths where rights whales do not transit. The conch fishery is not a year-round fishery. An extension of a 15 - day period at the beginning of the conch fishing season with an already over-regulated fishery is unreasonable.

The MCA does **NOT SUPPORT** the DMF's proposal to extend the opening of the conch fishing season by 15 days.

The MCA does **NOT SUPPORT** the DMF's proposal prohibiting the fishing of single lobster traps onboard vessels with an overall length of 29' or greater. In the event that this regulation applies to the conch fishery in the future the MCA does **NOT SUPPORT** it.

The conch fishery has had a negative impact due to the Covid-19 pandemic with less demand and lower prices. While some of the conch fishermen and dealers received monetary assistance from the CARES ACT a good majority did not qualify for the funding.

In closing, the MCA would like to express our position on rope-less fishing. While rope-less was not on the list of proposed right whale conservation measures, it did take up a lot of time on the questions and comments section of the public hearings.

The MCA **DOES NOT SUPPORT** rope-less technology. There is a lot of misperception when it comes to the use of rope-less fishing. Over the last 5 years there has been a major push to make it mandatory for the commercial lobster fishermen and the fixed gear fishermen to transition over to rope-less gear to further save the right whales. This gear transition to rope-less is being pushed for year-round implementation. The magnitude of the economic undertaking would be well over millions of dollars to outfit the commercial fishing industry here in the Commonwealth just in the first year.

The individual cost would be an estimated \$190,000 per fisherman to outfit their gear to go fishing. There is an average of 10% gear loss each year and this would have to be replaced year after year. The gear loss would likely increase dramatically as the technology has yet to be tested on large scale multi-disciplined fisheries. This transition will take hundreds of dollars, decades to implement and outfit every commercial fishing vessel that is on the ocean.

The lack of buoys on the ends of fixed gear would cause lots of chaos among fixed gear fishermen and mobile gear fishermen.

The commercial conch fishing industry deserves to know that their state is going to be on their side to save the commercial fishing industry not only for today, but for future generations to come.

The Massachusetts Conch Association members thank you for the opportunity to comment on these regulation proposals.

Sincerely,

MCA Board of Directors

Dear Director McKiernan, my name is Joseph Gallagher, and I am writing you in regards to the proposed state water closure for fixed gear. I am a lobsterman down on the south shore, in Weymouth, I've been one for 28 years. Throughout this time I have fished in Boston harbor and on the South Shore I have never seen a right whale in state waters.

We as Massachusetts coastal lobsterman have been asked to do more than any other lobstermen on the East Coast. We have used breakaways and we have marked our bouy lines accordingly. We have also dealt with closures in federal waters to protect the right whales. I feel that this closure is just one more step and putting us out of business permanently. How much more can we be expected to do and survive as fisherman. I ask that you do whatever is in your power to please stop this from happening. I feel if we give in to this measure then in the future they will come back for even more restrictions on us. That has been the way it is gone for the last 10 years, the more we give the more they want to take, and we are now at the breaking point. Please do what you can to allow us to keep fishing, no more closures please.

Thank you, Joseph Gallagher

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Tim Eddy  
44 Cushing St  
Ashburnham, MA 01430

**From:** [Jake Herman](#)  
**To:** [Fish, Marine \(FWE\)](#)  
**Subject:** Draft Regulations to Protect Right Whales  
**Date:** Wednesday, December 16, 2020 9:46:11 PM

---

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

Dear Director McKiernan,

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Kind regards,  
Jake

**From:** [Sally Orme](#)

---

**CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.**

Dear Director McKiernan,

As a Massachusetts resident I strongly value both our fishing industry and the long-term survival of the very threatened Right Whale population. I applaud the DMF for its proposed amendments to the Protected Species Regulations.

What is missing from the proposed regulations, however, is the inclusion of a proposal for phasing in ropeless gear which is the most effective method of protecting whales from fishing/trap lines. From Pew Charitable Trusts:

Ropeless fishing systems are an opportunity for lobster and crab fishermen to continue operating in areas where right whales are present without further endangering these marine mammals. Investment in ropeless fishing now could lead to a future in which the lobster and crab industries use a mix of traditional and ropeless gear to sustain their economically and culturally valuable industry, leverage technology to collect important data, and protect whales.

I strongly encourage the DMF to include language in the proposed regulations that encourages the use of ropeless fishing gear.

Thank you,

Dear Director Daniel McKiernan,

Massachusetts can be a leader in the fight to save the North Atlantic right whale.

With less than 400 individuals remaining, the North Atlantic right whale is one of the most critically endangered marine animals in the world. Entanglement in fishing gear and collisions with ships are pushing the species towards extinction. We must take strong action today before it's too late to save them.

North Atlantic right whales migrating through the waters of the East Coast must navigate a maze of deadly vertical rope. Ropeless fishing gear can be the solution that we need to save right whales and keep fishermen on the water.

A viable pathway for permitting ropeless fishing gear should be included in the new proposed regulations in order to fully address the issue of entanglement. Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

Removing vertical buoy rope from the water and providing a permitting structure for fishermen to legally utilize 21st century technology is the only long-term solution to reduce the entanglement risk to right whales while ensuring a sustainable future for Massachusetts fishing communities.

**Subject:** Public Comment on New Protected Species Regulations Affecting Trap and Gillnet Fishing  
**Date:** Thursday, December 17, 2020 12:39:22 AM

---

**CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.**

Dear Director McKiernan,

Thank you for the opportunity to comment on the proposed amendments to regulations at 322 CMR 6.00 and 12.00. I am a Master of Public Policy student at UMass Dartmouth and a former New England Aquarium Right Whale Festival volunteer.

As a citizen who is concerned about this critically endangered species, I would strongly encourage the Division of Marine Fisheries to implement all proposed regulatory changes to protect North Atlantic Right Whales, including gillnet and trap gear closures, closures for recreational lobster and crab trap gear, and modifications to vertical buoy lines to reduce the likelihood of entanglements.

As a policy student, I understand that DMF must navigate complex legal and regulatory requirements while also facilitating collaborative solutions that find a middle ground between the often-competing interests of conservationists and lobstermen. I hope that you will continue to work with all stakeholders to address the need for rapid, iterative, and evidence-based responses to protect right whales against the very real threat of extinction.

Thank you for your time,

Randolph Pfaff  
Master of Public Policy Student  
University of Massachusetts Dartmouth

**Subject:** Response to last week's virtual public hearings on right whales  
**Date:** Thursday, December 17, 2020 11:52:06 AM

---

**CAUTION:** This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

To Whom it May Concern:

I listened to the virtual public hearings on Dec. 8th and 9th about what the Massachusetts state government s proposing to do to help the critically endangered Atlantic right whale population. I was struck by how the ropeless solution was given short shrift. I understand this proposed solution has technological problems at the moment that make it hard for one fisherman to know where his neighbor's buoys are and that implementing it for all fishermen would be expensive. But I've been told by other environmentalists that ropeless solutions do work in different places such as California. Isn't is possible to re-consider them? Could the state put more resources into finding a way to make ropeless solutions possible here in Massachussets by seeing how they have worked elsewhere, rather than dismissing them out of hand as too expensive and not "ready for prime time," as one person commented during one of the hearings?

Please count me as one of the state's residents who wishes to see ropeless solutions take hold here in Massachusetts.

Sincerely,

Bryan L. Tucker  
resident of Boston

To: Mr. Dan Kiernan  
Director of MA Division of Marine Fisheries

**Re: Dec 8/9**

**Virtual Public Hearings:  
New Protected Species Regulations Affecting Trap and Gillnet Fishing**

Dear Mr. Kiernan,

Thank you and staff for holding these New Protected Species Regulations hearings last week. You all did a lot of patient reading, slide-showing, and explaining of proposals! I also want to thank you for being patient with the “ropeless traps” enthusiasts who were cluttering up the CHAT feature, prior to either the question or comment period beginning.

That said, I concur with the young college student’s comment the second night, as to DMF’s creating an *appearance* of discouraging commentary on **ropeless tech** being part of the hearings. Yes, you mentioned as an aside, that the hearings were not *about them*. *But you may have made an* announcement as to ropeless tech being pursued and in current development, if not by MA DMF, then by private and nonprofits both, and why it could not be in the draft proposals per se. (I certainly suspect its great expense and need for further research and funding, are the reasons.)

Overall, you guys did a great job explaining the expanded closure areas and expanded closed seasons of lobster trap and pot fishing (if perhaps read a bit fast, without the tech ability to keep a map up at all times, or at least returning to it during the question and comment period).

I am an ocean swim coach, lifeguard, past certified PADI Divemaster, as well as a co-curator of ocean films at an arts center. It is very clear to me that while these proposed changes certainly would cut down on the incidences of right whales and other marine life being entangled in rope and reducing injury, they simple are too little, too late. Due to the extent to which the right whale population has been decimated by ship strikes in past years, and now more by trap ropes/gear which these new steps will only partly eliminate, **these proposals do not sufficiently eliminate the entanglement risk altogether— which needs being done!**

It might seem OK if such proposals were preliminary steps to ropeless fishing... but they were not presented as such. ***Ropeless fishing’s goal and transitioning need to be in further DMF plans, research and hearings, for DMF to have widespread community transparency that you are doing ALL THINGS NECESSARY to eliminate any and all risk ropes are to right whales and marine life.***

In the end, current proposals (which may have sufficed some years ago) are not at all

sufficient to preserving our iconic and endangered right whale community, and preventing death and injury to other marine life. Such manmade and plastic materials do not belong in a clean ocean anyway.

Yours, for our ocean planet, in Peace—  
Bob

---

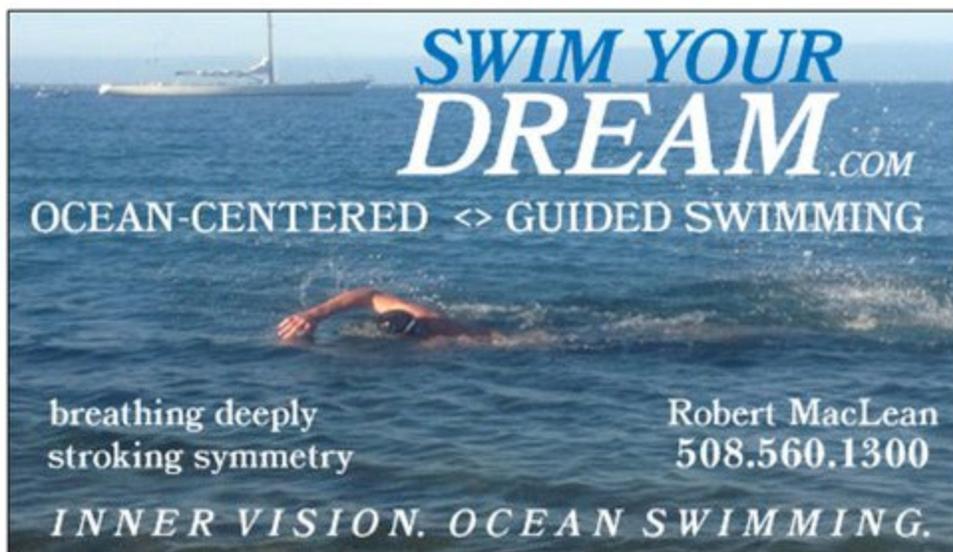

Note: To members of Martha's Vineyard community active as shellfish farmers and/or conservation-minded creators; please consider weighing in this comment period which ends Dec 18, at 5pm. The shallows where shellfish are cultivated are not hospitable (deep enough) for whales anyway, therefor, highly doubtful that when/if ropeless tech is brought NMF law for lobster/pot traps, it would affect any ocean farming of shellfish and seaweed using rope.

For a report on lawsuit prompting these DMF hearings last week to develop an environmental plan in order to apply for an Incidental Take Permit, plus how National Marine Fisheries Service violated the Endangered Species Act, see this article:

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Dear Director Daniel McKiernan,

I am a cellist and teacher who lives in Boston, and I am concerned about our oceans and about the mass extinction of thousands of species that humans are causing. We need to do everything in our power to protect the remaining 366 right whales. I attended both of your hearings last week and thank you for holding them. I raised my virtual hand, but there was so much interest that I didn't have a chance to ask my questions. They are:

1. Does the study recommending 1700 lb breakable rope consider young whales? Surely the young are not strong enough to break 1700 pounds.
2. What about ropeless gear (which I'd heard a little about)?

After the hearings, I read more. I now believe that ropeless gear is the best answer, the most courageous, and the most prudent, upholding values we **need** for our own survival. What is in fact at issue here is the overall biological stability of a world. As leaders, will we think short term or long term? "The late Quarternary Extinction wants YOU," David Quammen writes. "The main cause was habitat loss and the agent of that loss was the killer-primate *Homo sapiens*, now itself extinct. *Sapiens* unaccountably violated the first rule of a successful parasite: moderation. *Sapiens* was suicidally rapacious."

The population of right whales is rapidly declining. No adult or juvenile right whale has died of natural causes in the past 17 years. This is in our hands, here is our chance!

From what I've learned, 1,700 lb breakable rope is not good enough to protect the young. We can't gamble on this dwindling population or on our ideals.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

Ropeless gear has been used all over the world by fishermen in Australia, the United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

I am strongly opposed to the recent proposal of a gear restriction “closure” for the entire State of Mass coastal waters. The adverse effects of a closure is not only to the men fishing in these waters but also the small communities that we support fuel, bait, marine supply’s, shipyards, restaurants and countless other small businesses we support. The science says that there has been no interactions in our area Area2 SNE ever. If there were interactions with whales in our area I could understand but with there only being 2 interactions over the past 11 years and one in the last 10 in Area 1 north of the Cape is insane. You yourself said that the whales will move north as spring time moves along. We as a small fishery of less than 30 fishermen have bit the bullet bought back a fishery that in your own words was never coming back or just short of a disaster and finally we’re starting to benefit from all we’ve done and now shutting us down in one of our most profitable times is ludicrous !!!! The amount of line in the water at that time of year is minimal at best most likely less than 1000 end lines if you made gosnold a trawl zone. The amount of fishermen left in state waters area 2 need this time of year to survive were not like area 1 that have no fishery that time of year. This is a wrong that needs to be righted I’ve been lobstering on my own since 1992 and been going with my family since 1979 . I could never have imagined a shut down and now here it is . We’ve gone through a industry funded buyback, a tough time where lobsters were depleted do to shell disease and an oil spill and yet we’re still fishing when most thought we would go out of business. I myself have invested hundreds of thousands of dollars to make a living for myself and 2 other families off my boat and to be shut down for at minimum of 4 months when all is said and done it will be closer to 5 months is incomprehensible. We as a small fishery can’t take another hit like this it’s a dagger to the heart. We’ve done all you asked 600# breakaways , sinking ground lines , and red tracers in the line to show of an entanglement happened where it came from yet it’s never enough. WE NEED THIS TO FEED OUR FAMILIES please don’t shut us down .

Thank You : Tom Tomkiewicz F/V Intimidator

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

I write today to urge you to include language that implements a pathway for the development and implementation of ropeless fishing gear. We know that the best way to prevent entanglements is to remove rope from the water, and the development and adoption of ropeless gear will provide a long term solution to this problem.

Sincerely,  
Kelly Carlson

Massachusetts Division of Marine Fisheries

RE: Do everything you can to save North Atlantic right whales

null

Dear Director McKiernan,

As a resident of Massachusetts, where the ocean forms an integral part of our state identity, keeping our beaches, coasts, and marine species and habitats healthy matters deeply to me. North Atlantic right whales, which swim in Massachusetts' waters, are one of our most at-risk species.

First, I'd like to thank you and the Division of Marine Fisheries for drafting a strong proposed rule. In particular, I was glad to see the inclusion of more seasonal closures to fishing during the time of year that right whales are likely to be in the area. This is the type of bold action we'll need to save these whales.

Hey Marine Fisheries Folks,

Just checking to see if my commercial renewal permit was sent out. As of today I have not received it. Friends have already received their commercial permits. I usually get mine before they do, hence my email.

My Permit Number is 150502.

Hope you can help.

Thanks,

Daniel McKiernan

Director, Department of Marine Fisheries

250 Causeway Street, Suite 400

Boston, MA 02114

I am writing in support of stricter regulations to address the issue of marine mammal entanglement. The North Atlantic Right Whale population is dwindling, with injuries and death resulting from entanglement in fishing gear as these amazing creatures feed in and pass through the waters off Massachusetts. The loss of even one right whale reduces the chance that this species will survive. Although the proposed DMF regulations are a good first step, they do not go far enough. We in Massachusetts have an opportunity to protect the remaining numbers of North Atlantic Right Whales by considering the adoption of rope-less fishing gear regulations.

Living in a coastal town that relies on the fisheries, I am acutely aware of the concerns of the lobster industry about the financial impact of stricter regulations on their livelihood. However, the warming of the oceans, especially the Gulf of Maine, is a greater threat to the Massachusetts lobster industry long-term than a modification in fishing gear regulations.

Thank you for your consideration.

Peggy Sagan

CAUTION: This email originated from a sender outside of the Commonwealth of Massachusetts mail system. Do not click on links or open attachments unless you recognize the sender and know the content is safe.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

Marie Horan  
, We need to save the right whales from extinction!

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.

I am writing to express my concern about the proposed regulations created to reduce entanglement risks posed to North Atlantic right whales.

The primary causes of death for right whales are vessel strikes and entanglements: no adult or juvenile right whale has died of natural causes in the past 17 years. The East Coast has over one million vertical lines that right whales must navigate through in order to feed, including in our state waters. These ropes pose a direct risk to our state marine mammal, the North Atlantic right whale.

Over 85% of right whales have been entangled at least once, and more than half of the population has been entangled at least twice. The population, which is estimated at 366, is rapidly declining and could be extinct within our lifetime.

Current enforced regulations require vertical buoy rope to be used when harvesting lobster. This must be revised entirely, in order for ropeless fishing to become legal in Massachusetts.

DMF must implement a pathway for permitting ropeless gear, as the draft regulations that consider using 1700 lb. breakable rope for fishing lines attached to trap pots would still pose a threat to right whale calves and juveniles.

Ropeless gear has been used all over the world by fishermen in Australia, United Kingdom, Ireland, Canada and on the West Coast. During a data analysis of over 1,000 deployments of various models, ropeless fishing gear had a 98.4 percent success rate. While federal and state regulators have been studying ropeless gear to no avail for the past twenty years, multiple companies have worked with fishermen to manufacture gear that can be used by fishermen to fish today.

DMF must consider ropeless gear to save North Atlantic right whales. Ropeless gear is the technology of the future and the only long-term solution to reduce entanglements while keeping fishermen on the water. Please implement measures that incorporate ropeless gear pilot programs in order to save the right whale.

Thank you.
