Millis

Community Resilience Building Summary of Findings

January 8, 2019

ACKNOWLEDGEMENTS

The project was conducted by the Metropolitan Area Planning Council (MAPC) with funding from Executive Office of Energy and Environmental Affairs Municipal Vulnerability Preparedness (MVP) Planning Grant. This Community Resilience Building workshop is occurring in conjunction with the Town of Millis's Open Space and Recreation Plan (OSRP) as an expanded scope.

Special accolades to Robert Weiss for managing the program and diligence in securing attendee for the workshop, to the Millis Public Library for providing the venue and to all the participants who enthusiastically and diligently worked to create a more resilient Millis.

Millis Existing Conditions

The Town of Millis is a small, suburban industrial town in the Charles River Valley, incorporated in 1885, approximately 30 miles from Boston. First settled in 1658, the town's early economy was based largely on agriculture and grazing and remained a prosperous agricultural town throughout the century. In the next century, the Town's character shifted toward industrial development but has only experience modest population growth over time. Commercial and industrial development as well as critical facilities are clustered and largely located in the center of Town^{1,2} and with nearly 60% of its land area as forest and wetlands, Millis still retains its small-town, rural landscape.

An important defining characteristic of Millis is its rivers and wetlands. The Charles River and its tributary, Bogastow Brook, surround the Town on one-third of its boundary. These are all prone to flooding in severe storms or localized flooding during more frequent, minor storms. The Army Corps of Engineers in the 1970s and 1980s had the foresight to protect several thousand acres of land in the upper Charles River basin for flood protection both locally and regionally down river. However, the increased use of impervious surface and development have presented challenges on stormwater management and preserving water quality in the Town's water bodies. Nonetheless, Millis has taken innovative strides toward protecting its Town from the impacts of climate change. In 2018, the Town implemented a Stormwater Utility and completed an update to the Natural Hazard Mitigation Plan. They also passed the Community Preservation Act in 2006 providing a dedicated source of funding for open space and recreation, affordable housing, and historic preservation. Millis is also a state-designed Green Community. Through and in conjunction with the Municipal Vulnerability Preparedness program, the Town is updating its Open Space and Recreation Plan with a climate change assessment and resilient strategy to prioritize parks, open space, and nature-based solutions toward climate resilience. The Town is well-poised toward implementing resilience strategies to preserve its community through climate change.

Climate Change in Millis

In the last five years, Massachusetts has experienced increasingly more frequent and severe weather events. Record-breaking snowfall in 2015, an extensive and severe drought in 2016, the warmest year on record in 2017, and four Nor'easters in one month and flooding comparable to the Blizzard of 1978 in 2018 are just some examples. Further, the fall of 2018 had the greatest amount of precipitation since 1890 when precipitation was first recorded (Figure 1).³ Climate change is not imminent but affecting the people and cities and towns of the Commonwealth today.

Because of its location in the watershed of the largest river in Massachusetts, the Charles River, precipitation events, drought, and changing precipitation patterns will have an important impact on the community and down-river communities as well. For the Boston area there has been a 10% increase in precipitation over the past 50 years⁴ and a 71% increase in the amount of rain that

Maycock, and B.C. Stewart (eds.)]. U.S. Global Change Research Program, Washington, DC, USA, 1515 pp. doi: 10.7930/NCA4.2018.

Figure 2. Design storm projections for a 10-year, 24-hour storm.

More Large Storm Events

Storm drains built for 1961 standards will be inadquate

9-10 days with precipitation events with greater than one inch of rain or an increase in total precipitation from 45 inches to 48 in the Charles River Basin.⁶ With aged stormwater infrastructure and increases in severity and intensity of precipitation, flooding could have a major impact on the town. With a 1% annual chance flood, 65 households could be displaced creating total property damage of over \$6 million.⁷

Figure 3. Temperature change and projections for days over 90° with two emission scenarios.

⁷ HAZUS model 100-year Flood in Millis, MA. 2018. As described in MAPC. 2018. Town of Millis Natural Hazard Mitigation Plan Update.

⁶ www.Resilientma.org

Global temperatures increased by nearly 2 degrees in the last century⁸ and even small changes in temperature have widespread and significant changes to our climatic system. For example, the northeast has experienced a 10-day increase in the growing season in since 1980.⁹ Due to its 60% tree canopy cover and only 8% impervious surface, urban heat island is not a significant issue for the Town of Millis. There are two current "hot spots" where the temperature is significantly hotter than surrounding areas. These include the Middle School/High School, the Roche Brothers commercial area on route 109/Main Street and the Cliquot Site on Main Street. With climate change, the Town can expect 40-50 days over 90 degrees by mid to late century, a significant increase from the baseline of 7 days today (Figure 3).

Finally, though not a coastal community, sea level rise could have important implications on the future community of Millis if significant loss of coastal land promotes migration to more inland suburban Boston communities such as Millis. With a high emission scenario, Massachusetts could experience between 11-14 inches of sea level rise by 2030, the same amount of sea level rise experienced in the last 100 years.¹⁰ The amount of sea level rise increases to 50-90 inches by mid to late century (Figure 4). Hence, the amount of emission reduction measures we pursue will have a significant impact on the extent to which Millis experiences climate migration.

Millis is currently challenged with localized flooding in roads, water quality and stormwater management challenges, and loss of electricity during severe storms. However, the Town and its residents are committed to a resilient future and strong community in the face of climate change. Through the Commonwealth of Massachusetts's Municipal Vulnerability Preparedness program, Millis can mitigate the impacts of natural hazard and climate change in a community-based, multidisciplinary approach that ensures its vitality in the years to come.

Community Resilience Building Workshop

Millis received a grant from the Massachusetts Executive Office of Energy and Environmental Affairs to participate in the Commonwealth's Municipal Vulnerability Preparedness (MVP) program. The program provides supports for municipalities to plan and implement key climate resilience actions using a communitybased, multi-disciplinary, participatory planning effort through the Community Resilience Building (CRB) platform.¹¹ The grant also provided funding for an expanded scope to pursue an Open Space and Recreation Plan

(OSRP) with a climate change assessment and resilient strategy. Millis had not completed an OSRP since 1999. Millis contracted with the Metropolitan Area Planning Council (MAPC) to administer the MVP program and the OSRP with the community. The process was guided by a core team that also serves as its Open Space and Recreation Plan Core Team, providing synergy, alignment, and efficiency in both projects.

Participants were identified using guidance from the CRB Workshop Participant Worksheet¹² and MAPC's best practices in ensuring equity in climate adaptation planning.¹³ The Millis Energy Manager led a robust and personalized outreach campaign to invite nearly 50 participants to the workshop. This effort was supported the Town Administrator who also sent out an urgent message to invitees urging them to participate given their expertise and importance of the program. Millis gathered 33 participants across 14 municipal departments, the school, library, health department, Council on Aging, political leaders, and environmental stakeholders. Participants were assigned to small teams in a manner that maximize the diversity of sectors in any one given table. The goal in this method was to enhance different perspectives and identify resiliency opportunities that solved multiple vulnerabilities across sectors.

The Core Team outlined the following objectives for its MVP and CRB participatory planning event:

- 1. Understand connections between ongoing issues, hazard, and local planning and actions in your Community. Define top climate hazards.
- 2. Identify and map vulnerabilities and strengths of people and places, both buildings and natural environment/parks.
- 3. Develop and prioritize actions that reduce vulnerabilities and reinforce Millis strengths.
- 4. Identify opportunities to advance actions that further reduce the impact of hazards and increase climate resilience in Millis.

¹² https://docs.wixstatic.com/ugd/29a871_7f4a484414be4e5f87d1041de9c8524f.pdf

MAPC led and facilitated the workshop with four CRB-trained individuals. MAPC provided an introduction to climate change, climate observations and projections, and overview of the CRB workshop procedures and goals via presentation (Appendix A). Thereafter, participants were then introduced to Millis's climate vulnerability to temperature, precipitation, social vulnerability, natural assets, solutions, and open space via "musical" learning boards. In their assigned small groups, participants rotated to learning stations for guided instruction and discussion on each of the aforementioned topics led by each of the MAPC facilitators. Appendix B contains the learning boards for each of the topics.

Climate change data used to inform Millis's risk and vulnerability came from the following sources:

- (i) the Northeast Climate Science Center,
- (ii) National Oceanic and Atmospheric Administration,
- (iii) Cambridge Climate Change Vulnerability Assessment,
- (iv) The Boston Research Advisory Group,
- (v) Massachusetts Office of Coastal Zone Management, and
- (vi) Blue Hill Observatory and Science Center.
- (vii) Fourth National Climate Assessment 2018
- (viii) Metropolitan Area Planning Council (urban heat island, population projections)
- (ix) American Community Survey
- (x) Town of Millis Natural Hazard Mitigation Plan Update. 2018

Figure 5. Millis small group working map.

Millis Community Resilience Building Workshop Summary of Findings Furthermore, each small team had a table map (Figure 5 and Appendix B) that identified Millis's Critical Infrastructure, 1% Annual Chance Flood, locally identified hazards from the Natural Hazard Mitigation Plan Update and areas of extreme heat.¹⁴

Because the Town of Millis is performing its MVP and OSRP concurrently, CRB participants had the opportunity to learn about the OSRP process, learn about Millis's Parks and Open Space Inventory, and provide feedback on the challenges of Millis's park system and the goals for open space in Millis (Appendix B).

Participants brought a wealth of knowledge and expertise from their respective yet diverse local experiences and fields and engaged in a consensus-building effort that gathered to solve the problem of climate change. After identifying the Town's vulnerabilities and identifying and prioritizing actions in their small groups using the CRB Risk Matrix (Appendix C), the participants reconvened to vote on their overall top priority actions as a large group. The final voting results are in Appendix D.

This report serves to provide a summary of findings from Millis's one-day CRB workshop on January 8, 2019. The prioritized actions in this plan represent a collective and collaborate effort to address climate resiliency and natural hazard mitigation from a community-based participatory approach.

¹⁴ MAPC uses land surface temperature data during the hottest periods of the summer months in 2016 to ascertain how likely an area may experience the urban heat island effect. We represented the area in Millis that outlines the top fifth percentile of land surface temperature of the 101 communities in Metro Boston.

Summary of Findings

Top Hazards and Vulnerable Areas

The Core Team identified top hazards for the community of Millis prior to the workshop. These hazards were determined by challenges the Town has already experienced from recent events, long-standing issues, and alignment with the Town's Natural Hazard Mitigation Plan Update. These top hazards have already affected stormwater management, road flooding, disruption in services, and risks with downed trees and loss of electricity.

Town of Millis Climate Hazards include:

- Extreme Heat/ Heat Waves
- Inland and Riverine Flooding
- Extreme Cold and Severe Winter Storms (ice storms, tornados, Nor'easters, blizzards)
- Drought/Fire

These hazards pose greater risks in some areas of the Town than others. Table 1 summarizes participants identified areas of significant concern:

Millis Areas of Concern				
Neighborhoods	Society	Infrastructure	Environment	
 Charles River at Route 109 Charles River at Dover Road Causeway Street Area Center of Millis Cliquot Site 	 Senior Citizens Teenagers Veterans Young Students with Disabilities People Living Alone 	 Wells Town Buildings and Schools Septic and Sewer Route 109 Dover Road Bridge Senior Housing, Senior Facilities, Assisted Living Facilities Municipal Information Technology and Servers 	 Wetland Stress to Flooding, Drought, and Toxic Exposure Tree Canopy Loss of Open Space with Development Vector-Borne Disease Environmental Regulations and Industry Growth 	

Table 1. Millis areas of concern, vulnerable to identified hazards.

Current Concerns and Challenges Presented by Hazards

With one third of its boundary being the Charles River and 28% of its area water bodies and wetlands,¹⁵ extreme precipitation and changing precipitation were the source of challenges that Millis faces today and into the future. Inland flooding and stormwater management have been an ongoing challenge for the Town of Millis and climate change projections of more frequent and intense precipitation events raises the concern. Though Millis has significant acreage of natural lands serving as flood storage, extreme changes in precipitation regimes with climate change will stress those systems ultimate reducing their flood storage capacity and increasing the extent of riverine flooding.

Extreme weather events created cause for concern and challenges for the Town's people, technical infrastructure, and drinking water/wastewater infrastructure. Vulnerable populations included seniors, teenagers, veterans, low income individuals and those living alone. Climate change stressors can reduce resident's health, well-being, or financial security with ongoing stressors of flooding, heat, and storms.

Specific Categories of Concerns and Challenges

Inland and Riverine Flooding

Flooding is one of Millis's top category of concern. According to participants, it is widespread with a few areas that are of significant concern, the Causeway, the Route 109 Bridge over the Charles River at the boundary of Millis and Medfield, and the Dover Road Bridge over the Charles River. Participants both in Millis and Medfield in their CRB workshop were concerned about the integrity of the bridge on route 109 and the potential flooding of the Charles River in that area which would dissect an important transportation and emergency access corridor. CRB participants stressed working collaboratively with Medfield and the State to improve the bridge, design the bridge toward climate change projections flood design standards and protect the integrity of the wetlands in that area. Causeway Street is prone to flooding by a tributary to the Charles River. Insufficient culverts, excessive precipitation, and beavers were identified as main concerns in this area.

Though Millis has 1,731 acres of Charles River Natural Valley Storage Area (land owned and/or managed by the Army Corps of Engineers as flood storage land), the wetlands in the Charles River watershed have undergone stress related to changing precipitation regimes. These include the drought of 2016 and the excessive precipitation of 2018-2019 that has left wetlands submerged for approximately six months. This combined with potential toxic contamination from flooding raised concerns about the integrity of the wetlands services and flood storage capacity in the future. With increased stress during extreme changes in precipitation, wetlands could transform to more open water systems, creating a loss of land and further inland flooding.

Stormwater Management

Millis has have been working diligently to comply with National Pollution Discharge Elimination System (NPDES) requirements to reduce non-point source pollution and phosphorous loading into the Charles River and the tributaries feeding it. Stormwater infrastructure capacity remains a top concern for participants. Many participants noted insufficient and undersized culverts, capacity of the stormwater infrastructure to handle extreme precipitation events and the need to create new regulations for stormwater reduction on new development. As costs are increasing for NPDES

¹⁵ 2005 Land Use Data. MAPC

compliance for the Town and the aged stormwater infrastructure that exists, participants noted the importance of natural infiltration to minimize costs and stress to the infrastructure, including incentives and retrofits to achieve more natural infiltration. One participant noted the need to do asset mapping of the existing stormwater infrastructure. Water quality and aquifer contamination from runoff were important concerns.

Vulnerable Populations

Other major concerns were of the people of Millis, in particular seniors, teenagers, low income individuals, individuals living alone, and veterans. Climate change stressors can reduce their health, well-being, or financial security. CRB participants raised concerns about lack of air conditioning, transportation services, and reduced adaptive capacity to financial pressures from property loss/damage before, during, and after extreme weather events. Seniors have the additional stress of affordability on fixed income in Millis. Currently, housing price is high and supply is low combined with increasing tax and cost of living burdens, CRB participants raised concerns that climate change could displace their senior population.

For community connectivity, participants noted limited communication via cell phones for seniors and limited use of social media for town communications. Further, there is a lack of sufficient programming and facilities for both seniors and teenagers, important for connecting to the Town and to each other. Finally, participants noted an insufficient supply of services for mental health and disabilities, both conditions for which climate change can create extreme challenges. Participants noted the Town needed a mental health clinician during these times of stress.

Drinking Water and Waste Water Systems

The drought of 2016 stressed many municipal drinking water supplies, including Millis's, though supply is not generally a concern, future climate projections could cause stressors to this functioning system. Concerns around drinking water were mostly around flooding and well pump station resiliency. Specifically, participants were concerned of aquifer contamination and/or bacterial exposure during flooding and the viability of pump stations before and after emergencies/extreme weather events with electricity loss.

Residents raised concerns about the capacity of the Charles River Pollution District, the regional wastewater system, as more residents are seeking to connect to sewer. Participants questioned individual septic systems viability in a changing climate. Excessive precipitation raises the water table rendering a more shallow depth to ground water limiting septic leachate area. With less area, there is reduced microbial activity needed to properly filter wastewater potentially releasing fecal coliform and phosphorus into water bodies. With more frequent freeze/thaw cycles with climate change, participants raised concern of the efficacy of mounded septic systems during these conditions.

Information Technology Infrastructure

Many participants noted that the technological and communications infrastructure in Millis's municipal services and facilities are in need of upgrade and replacement. During extreme weather events, electricity loss is common. Participants want to ensure that equipment is functioning for communications, emergency response, and day-to-day operations. Concerns included a need for more radio repeaters for public safety, updating the Town's servers, and creating redundancy in the information technology system. Further, upgrades from copper communications to Voice Over Internet Protocol (VOIP) or fiber optics are needed for more effective communications and operations in the Town.

Tree Canopy and Open Space

Nearly 60% of Millis is covered by tree canopy, making it an important asset and liability to the Town with climate change. Participants had concern about the future tree canopy and forest on both public and private land. With climate change, participants noted that trees will become more stressed from flooding, drought, and overall warming temperatures/longer growing seasons. New tree pests and diseases are a vulnerability for the Town's forests and trees and oaks, maples, ash, and white pine were the identified as trees of concern. One of the most important concern for the Town of Millis for open space was the Charles River Flood Valley Storage protected land. Approximately 1,300 acres of land is under the Army Corp's control or management and participants wanted better communication and collaboration with the Army Corps particularly since the viability of these lands to protect the Town and downstream river cities and towns from climate change is of the utmost importance.

Approximately 30% of its total land area is protected land. Combined with widespread wetlands and floodplains, community growth is limited. Participants recognized nature-based solutions and protected land as a key climate change solutions and resilience strategy, however, some participants wanted to ensure economic and community growth in the Town of Millis. Specifically, ensure that environmental regulations don't impede industry and that growth and land protection are balanced.

Centralized Location of Municipal Facilities

Identified as both a strength and a vulnerability, many municipal facilities such as the school, Town Hall, Library, and Emergency Operations are located in the center of Town. Also located there are the Senior Center, housing authority, and senior housing. In the event of an extreme weather event and/or emergency, all operations are centrally located, however geographically they are vulnerable if an event were to occur there.

Current Strengths and Assets

Millis has a solid foundation of assets, services, people and infrastructure that will serve to enhance its resiliency through our changing climate. CRB participants highlighted and sought to enhance these with best practice resiliency efforts to ensure a vibrant future for their community.

Assets identified by participants are described as follows.

Natural assets and ecosystem services.

Participants identified many of Millis's natural features and open space as an important asset toward its climate resilience. These include vast amounts of contiguous open space, protected flood storage areas, and a widespread tree canopy covering the Town. Millis contains over 2,300 acres of protected parks, open space, and conservation land. The Town also has 1,984 acres of BioMap Core Habitat, most of which is protected, and 2,316 acres of BioMap Critical Natural Landscape.¹⁶ These are

Richardson's Pond, Millis, MA. Photo credit CityData

contiguous tracts of exemplary ecosystems more resilient to climate change stressors and provide important ecosystem services for resilience such as flood control, clean water, clean air, and cooling. Furthermore, participants also highlighted related strengths including the Community Preservation Act for acquiring and protecting more land and updating its Open Space and Recreation Plan, the first time in 20 years. In addition to their ecological and resilience benefits, participants appreciated the recreation and beautification value of Millis's parks and open space as well as the farms in the community not only as added open space, but an important and wellloved community amenity.

Millis also has a prominent tree canopy across the town mitigating the impact of extreme heat, stormwater, and air pollutants from vehicles. The trees in Millis sequester 3,700 tons of carbon/year worth over \$634,000 a year. The trees mitigate 360,000 pounds per year of air pollutants (CO, NO₂, O₃, PM 2.5, SO₂, PM 10) worth \$571,000 a year, and avoid 30 million gallons of runoff a year saving \$270,000 a year in avoided stormwater runoff expenses.¹⁷

Wetlands and water bodies such as the Charles River were important natural assets identified by participants. Though a noted challenge in collaboration, participants appreciated the Charles River Natural Valley Storage area owned and/or managed by the Army Corps of Engineers as important flood storage not only for Millis but also for downriver communities. The wetlands bylaw is strong and water supply is not a significant issue because of these land features. In addition, participants noted Millis has a strong aquifer and want to ensure this natural asset is protected from contamination.

¹⁷ iTree Landscape. Processed on Dec. 2018

¹⁶ <u>http://maps.massgis.state.ma.us/dfg/biomap/pdf/town_core/Millis.pdf</u>

Stormwater Management

Millis has demonstrated strong leadership in addressing one of their most significant challenges, stormwater management. The Town regularly manages stormwater infrastructure such as catch basin cleaning, street sweeping, leaf litter clean, and constructing and maintaining the Town's sewer and drainage systems. In addition, the Town hosts community clean-up days and voted to institute a stormwater utility in November 2017. The Town performed a strong public outreach campaign on stormwater management, best practices, and implementing a utility. Residents receive rebates for pervious surfaces on their property calculated in their stormwater utility. In addition, the Town has provided public information on impervious surface at the parcel level through an online GIS viewer available on its website (Figure 6).

Figure 6. Millis GIS Online Viewer with Stormwater Utility Impervious Area.

Resilient Infrastructure

Millis has invested in new municipal infrastructure that is able to withstand the impacts of climate change and participants stressed that regular maintenance and upgrades will ensure their long-term resilience. New infrastructure in Millis includes the elementary school, a rehabilitated fire station, and a new library which include green and sustainable features. For example, the new library has solar panels and the new elementary school has raingardens and bio-swales. In addition, Millis is a State-designated Green Community implementing energy-reduction retrofits and measures to mitigate its climate impact. Millis also has a water storage tank for periods of short drinking water supply.

Community services

A notable outcome of the CRB workshop is the extent of community services in Town. Participants noted many active civic groups and organizations which community-building programs. These include the churches, the Lions Club, the Garden Club, and the Millis Forum. The Town of Millis funds the food pantry at the church, and the senior center, its newsletter and senior van staffing received accolades by participants. Millis contains many centers for assisted living and senior living which at important benefits to its residents. Most notably, participants mentioned the

positive life experiences at Millis's schools, a mechanism that builds strong community cohesion and a draw for new residents.

Emergency Preparedness

Participants noted the excellent emergency response services in the Town of Millis, important for protecting the community during current winter storms and those projected to be more frequent and extreme with climate change. The Town has emergency response plans for all its buildings and effective emergency communication strategies, including Swift Reach 911. Most importantly, the police have contact names for seniors with medical challenges to further enhance critical emergency response.

Top Recommendations to Improve Resilience

Once participants completed their CRB risk matrices in their small groups, each group built consensus on their top five priority actions from their risk matrices for each of the three categories: infrastructure, society, and environment. Participants then reconvened as a large group to report on their top resiliency actions. These actions were documented and collated on posters. Participants then voted as a large group with stickers on their top three resiliency actions from the collated actions (Figure 7). Appendix D illustrates the voting results. From this exercise, the Millis CRB participants designated the following as their top priority actions, listed in order of importance:

Figure 7. Millis CRB participant voting on the final top priority actions.

<u>Society</u>

- Create heating and cooling centers with communication and transportation for vulnerable populations, especially seniors.
- Build a senior center and youth center together.
- Create youth programs for environmental stewardship and more youth programs for engagement.
- Build a new senior center.
- Build redundancy in emergency communications and IT infrastructure. Seek outside funding.
- Protect students at school from urban heat island and stormwater with innovative design strategies.
- Increase medical facilities, emergency health facilities. Prioritize the Cliquot property for site redevelopment and reduce urban heat island with new development there.
- Connect seniors to Norfolk County Sheriff's Program for cell phones.
- Launch a public education campaign on climate change to seniors.
- Prevent displacement of seniors from increased cost of living and tax burdens.
- Set up appropriate environment in school system for students with disabilities or special needs.
- Increase/diversify communication strategies to seniors.

<u>Infrastructure</u>

- Expand sewer capacity.
- Implement culvert upgrades and stormwater infrastructure repair plan.
- Update backup generators at municipal facilities.
- Maintain energy efficiency of municipal buildings.
- Repair Dover Road and Route 109 bridges to preserve emergency access. Consider climate projections in design.

- Reduce stormwater inflow, manage stormwater runoff, and modify building regulation and education. Manage well contamination from stormwater runoff with private well inspections.
- Increase access to emergency facilities with new facilities and/or transportation.
- Enact higher rates for outdoor watering.

Environment

- Balance nature-based resilience solutions with economic growth to ensure Millis remains a vibrant community in the face of climate change.
- Prevent wetland contamination with stormwater management.
- Enhance communication with Army Corps of Engineers in cooperation with the State on Charles River Natural Valley Storage Areas.
- Enact a public education program on water resources and use-reduction of chemicals and toxics.
- Encourage smart growth development.
- Maintain natural assets and trees, especially from disease.
- Create a tree bylaw to manage and protect trees on private property.
- Complete a drought management plan.
- Launch a public education campaign on minimizing exposure to vector-borne diseases.

Table 2 summarizes participant's recommended actions for climate resiliency and their priority ranking/timeframe by small group and category in order of importance.

Table	Category	Action Items Priority Time		Time	Table
					Priority
Green	Environment	Create a tree bylaw and/or incentives to replace Trees	High	Long	Yes
Green	Environment	Implement Green Infrastructure	High	Ongoing	
Red	Environment	Enhance communications with Army Corps in cooperation with the State and State Representative	High	Short	Yes
Red	Environment	Promote best practices and public information on stormwater runoff/ pollution risk to wetlands.	High	Short	Yes
Red	Environment	Perform study to maximize revenue out of limited land supply. Understand best practices.	High	Ongoing	Yes
Red	Environment	Add security fence. Monitor. Add public information.	High	Short	
Yellow	Environment	How are parks, open space, and gardens maintained? Is there adequate funding for maintenance? What are the expenses?	High	Short/On going	Yes
Yellow	Environment	Maintenance of dead trees.	High	Short/On going	Yes
Yellow	Environment	Drought management plan for drinking water supply.	High	Ongoing	Yes
Yellow	Environment	Engage in stormwater runoff management to prevent contamination.	High	Ongoing	Yes
Green	Infrastructure	Add generators and Electric Vehicle Charging Stations	High	Short	Yes
Green	Infrastructure	Need to reach seniors (via mail and phone). Improved notification system	High	Ongoing	
Green	Infrastructure	Assess condition of roads and bridges. Implement improvements	High	Ongoing	
Green	Infrastructure	New Senior Center location an better transportation	High	Long/On going	
Green	Infrastructure	Plan for new school	High	Low

CRB Workshop Participants

MAPC provided a modified CRB participant worksheet to the Core Team who built an invitation list of nearly 50 potential attendees. This included elected officials, municipal department managers, emergency response, four appointed committees, religious organizations, regional environmental organizations, the business community, and political leaders. In addition, Millis broadened the invitation to residents of Millis via social media and flyer postings at municipal buildings around town. Table 3 lists the CRB participants and their affiliation.

- Everyone is an expert; respect others' point of view.
- Respect limited time.
- Please work to complete the worksheet and tasks. Your input is important!
- Please turn off your cell phone.

Appendix B – Climate Change Posters and Maps

Climate Change in Millis: Temperature

Global Temperatures have risen nearly $\mathbf{2}^\circ$ over the last century.

The warmest years on record are from 2014 to 2018 where preliminary evidence suggest 2018 is the warmest year on record. 2016 brought the worst drought in MA since the 1960s. Even a small increase in temperature has a major impact on glacial melting and changing weather patterns. For example, since 1960, the Northeast US has increased its growing season by 10 days.

Millis could have nearly 50 days with temperatures above 90° by 2090. If so, aur climate in Massachusetts will shift toward a climate more like Georgia or Alabama by the end of the century. Areas in Millis with estensive asphalt and buildings capture and hold heat creating hatter days than the surrounding areas, the urban heat island effect. Estense heat can cause physical and psychological health challenges particularly for those under five, over 65, and with chronic medical constitues

Millis has trees that improve heat, air quality, stormwater, and health and is at low risk urban heat island effect. Trees in Millis cover nearly 59% of the town. Trees and vegetation cool temperatures by 20.45° F in comparison to unshaded/ developed areas by aroviding shade and through evanotransatiret.

Trees also capture carbon, stormwater runoff, and air pollutants, especially from vehicle emissions. This chart describes the financial and environmental benefits of the existing tree canopy for avoided stormwater, carbon sequestration, and air pollution.

Millis Tree Canopy	Carbon Sequestration	Avoided Runoff	Air Pollution Mitigation
Amount	3,7000 tons carbon/year	30 million gallons/year	360,000 lbs. pollutants/yr.
Value	\$633,878/year	\$270,000 in avoided stormwater management costs.	\$570,716/ year

Building Characteristics

Building Damages

Population Needs

Value of Damages

There has been a 10% increase in precipitation in Boston area since 1970. In the last 50 years, precipitation in the Northeast US increased 71% in the amount of rain that falls in the top 1% of storm events. However, increased temperatures may cause increase incidence of drought during the summer months.

More precipitation will risk Millis's rivers, stormwater infrastructure, and public health.

Climate Change including more frequent and intense storms are likely to cause more flooding events, which can increase stormwater runoff from impervious surfaces (such as roots, houses, casphalt, and other buildings) can increase or introduce new pollution to our water, both rivers and drinking water. Increased precipitation can also averwhelm the design capacity of the existing stormwater systems, causing localized flooding. Phosphorus runoff into the Charles River and its tributaries is the greatest concern for the Town of AUIIs in addition to comply with the Clean Water Act and its Municipal Separate Storm Sever System Parmit issued by the EPA.

Potentially toxic, Blue-Green Algae Bloom in the Charles Piver crusted primarily by Physiohorus runof

Climate Change in Millis: People

Who is most at risk from climate change impacts?

Social vulnerability refers to social, economic, demographic, or health factors that may make some people less able to adapt to or recover from climate change impacts or extreme weather events. Climate resilience strategies should prioritize first helping those at greatest risk.

Households in Poverty 4.79/6^{± 4%} Huseholds in Mills that are below poverty level Households thet earn poverty-level incomes are more susceptible to themail shocks tripgered by extreme weather.

operations that earn provery level months are more scapiblic to financial shocks triggered by extreme weather, hich can cause long-lasting financial insecurity and can take it hard to secure safe shelter, sufficient food, and defial area. A four-person household earning less than 24,563 is below poverty level.

People who have difficulty adapting to, preparing for, or recovering from extreme weather events: Characteristics such as income, language, and household status can cause people to be more at risk to climate change. For example, lowincome people and families may have greater financial shocks after extreme weather events if their homes are damaged, if their work transportation is impaired by weather; if their medical needs are not met due to loss of transportation or financial shocks.

People in social isolation, such as individuals living alone, single-parent households, or individuals with limited English-speaking abilities, can limit access to critical information, city resources, and social support systems.

People with Health Conditions People who are already in poor health are more likely to be harmed by both

Massachusetts Asthma Hospitalizations People who have certain health conditions: These may indude older adults, very young children, prognant women, people with disabilities, and/or people with chronic medical conditions. They may be more physically vulnerable to extreme head and poor air quality caused by dimate change, individuals with mobility constraints, such as people with disabilities and seniors, may need additional assistance with emergency response

People Who Work Outside

eople who primarily work outside, uch as parcel delivery people, onstruction workers, or farmers, may e at added risk from extra exposure to igh heat and poor air quality.

People who live or work in vulnerable locations such as areas with historic and projected flooding, areas prone to heat islands and extreme heat, and neighborhoods prone to powe outages. Outdoor workers, first responders, and those working in hot indoor environments are also whearable.

Climate Change in Millis: Natural Assets Millis Open Space and Recreation Plan

Climate Change in Millis: Solutions

What are your solutions for a healthy, vibrant, livable Millis through climate change?

As a member of the Millis community, you are all the experts. This workshop is seeking your input to protect the people and places of Millis most vulnerable to climate change. Below are some examples from plans that have addressed climate change and extreme weather events combined with some possible solutions. These can be used to help think of new climate resilience action items for Millis with this workshop.

Mitigation Measure	Priority 2018 Plan	Time Frame (2018-2023)
DROUGHT/ BRUSH FIRE RELATED HAZARDS		
Acquire ATVs to fight remote brush fires	High	2019
Cart Path Restoration	High	2019
Water Main Installation Causeway Street to Boggastowe Meadow	Low	2022
75- foot required setback regulation	Medium	2019
Public Education on Fire Prevention	High	2019
Investigate separate metering for outdoor watering	Medium	2018-2019
EXTREME TEMPERATURES		
Investigate cooling and warming centers, upgrades to serve the community. Install a generator.	Medium	2019
Public education on cooling centers and warming centers.	High	2019
Site Design to increase tree plantings near buildings, increase the percentage of trees used in parking areas, and along public ways.	High	2018-2023
EXTREME WEATHER EVENTS RELATED HAZARDS (TORNADOS, HURRICANES, NOR'E/ STORMS)	ASTERS, BLIZZA	RDS, ICE
Institute tree trimming program and collaborate with utilities.	Medium	2020
Increase the size of the salt shed.	Medium	2021
Evaluate public buildings to withstand snow loads.	Medium	2020
FLOODING		
Farm and Pleasant Street-Beaver Control	High	2018-2023
Dover Road Mitigation- Levy on the abutting Maple Swamp, repair culvert under route 109	High	2018-2019
Dover Rd. Mitigation-Floodgate on the upstream dam	High	2018-2020
Protection of Open Space-Acquire open space off Main Street, Tresca property, make recommendations on completing an OSR?	Medium	2018-2023
Update Open Space and Recreation Plan	High	2019-2020
Revisions to Development Bylaws and Regulations	Medium	2018-2023
Drainage Improvement/Detention Basin Village and Birch Street. Repave the road in 2018	High	2019-2020
Island Road-Road elevation and Culvert Enlargement	Low	2022
Larch Road-Road Elevation and Culvert Enlargement	Medium	2022
Water-Related Public Education on non-point pollution- Create a stormwater Enterprise fund for education and outreach to public	Medium	2018-2023
CLIMATE CHANGE		
Implement Municipal Vulnerability Preparedness plan.	High	2019-2023
MULTI-HAZARDS/ EMERGENCY MANAGEMENT		
Emergency Communication for intra-operability especially with Police, Fire, and DPW. Upgrade from copper to fiber for radio repeaters, Upgraded from analog to digital.	High	2019

MILLIS

Critical Infrastructure

Infrastructure will be at risk to damage from flooding, and loss of function due to power outages. Increasing large rainfail events may subject roads, bridges, dams and buildings to more frequent or severe flooding. Area shift don't flood today may become vulnerable. FEMA flood zones reflect only current conditions, although the 2% (500-year) flood zones may indicate where future flooding will occur. FEMA flood zones erflect only capture stormwater flooding. That is, flooding that exceeds the capacity of current stormdrains and culverts. We don't currently have models that project where future flooding from larger rain events will occur. Power outages affecting infrastructure and communications may become model share frequent as result of high energy demand during heat waves. Winter outages could be caused by ice storms if warning results in temperatures hovering around freezing. The potential for more intense hurricanes could cause outages due to failing trees. Finally, buildings, noadways, and railways can be stressed by extreme heat. Heat can cause damage to expansion joints on bridges and highways, and may cause roadways to deteriorate more rapidly.

Appendix D-Top Priority Actions Voting Results

Action	Voting Count
So	iety
Create heating and cooling centers with communication and transportation for vulnerable populations, especially seniors.	
Build senior center and youth center together.	
Create youth programs for environmental stewardship and more youth programs for engagement.	$\bullet \bullet \bullet \bullet \bullet$
Build a new senior center.	
Build redundancy in emergency communications and IT infrastructure. Seek outside funding.	
Protect students at school from urban heat island and stormwater with innovative design strategies.	
Increase medical facilities, emergency health facilities. Prioritize Cliquot property for site and reduce urban heat island with new development there.	• •
Connect Seniors to Norfolk County Sheriff's Program for cell phones.	• •
Launch public education campaign on climate change to seniors.	•
Prevent displacement of seniors. Displacement caused by stormwater utility.	
Set up appropriate environment in school system for students with disabilities or special needs.	
Increase/diversify communication strategies to seniors.	
Infras	tructure
Update backup generators at municipal facilities.	$\bullet \bullet $
Protect Energy Efficiency of municipal buildings.	$\bullet \bullet \bullet \bullet \bullet \bullet \bullet \bullet \bullet \bullet$
Repair Dover Road and Route 109 bridges to preserve emergency access. Consider climate projections in design.	

Reduce Stormwater Inflow, manage stormwater runoff, and modify building regulation and education. Manage well contamination from stormwater runoff with private well inspections.	$\bullet \bullet \bullet \bullet \bullet \bullet$
Implement culvert upgrades and repair plan.	$\bullet \bullet \bullet \bullet \bullet \bullet \bullet$
Increase access to emergency facilities with new facilities and/or transportation.	$\bullet \bullet \bullet \bullet \bullet$
Expand sewer capacity.	
Higher rates for outdoor watering.	
Environment	
Balance nature-based resilience solutions with economic growth to ensure Millis remains a vibrant community in the face of climate change.	
Prevent wetland contamination with stormwater management.	•••••
Enhance Communication with Army Corps of Engineers in cooperation with State on Charles River Natural Valley Storage Areas.	
Public education program on water resources and use-reduction of chemicals and toxics.	••
Encourage smart growth development	
Maintain natural assets and trees, especially from disease.	••
Create a tree bylaw to manage and protect trees on private property.	••
Complete a drought management plan.	
Launch a public education campaign on minimizing exposure to vector-borne diseases.	

Appendix E-Public Listening Session

PLEASE JOIN US FOR A

COMMUNITY MEETING

TO DISCUSS

MILLIS OPEN SPACE AND RECREATION AND MUNICIPAL VULNERABILITY PREPAREDNESS PLANS

DATE:	THURSDAY, MAY 9th
TIME:	7:30 to 9:00PM
LOCATION:	TOWN HALL BOARD OF SELECTMEN ROOM (229) 900 MAIN STREET

IF YOU HAVEN'T YET PARTICIPATED IN THE ONLINE COMMUNITY SURVEY, TAKE IT HERE:

http://bit.ly/MillisOpenSpaceSurvey

If you need special assistance or translation services, please contact MAPC at (617) 933-0760 or jfiala@mapc.org

Please join us to participate in updating the Town's Open Space and Recreation Plan!

The Open Space and Recreation Plan will assess the community's park and recreation assets and needs to determine the Town's key challenges and priorities for the next seven years. The Town of Millis last prepared an Open Space and Recreation Plan in 1999.

The town is working with the Metropolitan Area Planning Council (MAPC) to update the plan. At this meeting, MAPC will present the draft Open Space and Recreation Plan and draft Municipal Vulnerability Preparedness Plan and invite your input and feedback to improve the draft documents.
