PERSONS WHO INJECT DRUGS (PWID)

OUTBREAK AMONG PWID

• An outbreak of HIV infection was identified in the northeastern cities of Lawrence and Lowell among persons who inject drugs (PWID), involving 129 individuals diagnosed with HIV infection during January 1, 2015–June 30, 2018. Ninety-four (73%) were diagnosed with HIV infection between 20 and 39 years, 55 (43%) were assigned female at birth (AFAB), and 87 (67%) were white (non-Hispanic). Close to 90% of these individuals also had evidence of hepatitis C exposure at some point.\textsuperscript{i}

• Following an intensive and targeted public health response, the number of HIV infection diagnoses attributed to injection drug use (IDU) in the northeast decreased. However, in early 2019, a new cluster of HIV infection was identified in Boston among PWID who are experiencing or have experienced recent homelessness, renewing concerns about ongoing transmissions among PWID statewide. As of March 1, 2021, a total of 113 cases diagnosed since November 2018 have been investigated and identified as part of the Boston cluster. Emerging trends among those newly diagnosed in the Boston cluster (N=33 cases diagnosed in 2019) include an increase in polysubstance and methamphetamine use.\textsuperscript{ii}

MSM=Male-to-Male Sex; IDU=Injection Drug Use; HTSX=Heterosexual Sex; Pres. HTSX=Presumed Heterosexual Sex; NIR=No Identified Risk

KEY FACT

• After declining by 53% from 2010 (N=66) to 2014 (N=31), the number of reported cases with injection drug use as the primary exposure mode peaked at 116 in 2017 and then decreased to 60 in 2019.
KEY FACT

- Individuals with IDU exposure mode accounted for the largest proportion of deaths among individuals reported with HIV/AIDS. In 2019, 35% of deaths among individuals with HIV/AIDS were among individuals who reported IDU as their mode of exposure and an additional 5% who reported MSM/IDU as their mode of exposure, compared to 11% and 3%, respectively, of 2019 HIV infection diagnoses.

RACE/ETHNICITY

- Sixty-one percent of 269 individuals diagnosed with HIV infection attributed to IDU during 2017–2019 were white (non-Hispanic), 28% were Hispanic/Latino, 9% were black (non-Hispanic), and 2% were of other or unknown race/ethnicity.
- Among 3,673 persons living with HIV infection on 12/31/19 that was attributed to IDU, 42% were Hispanic/Latino, 35% were white (non-Hispanic), 22% were black (non-Hispanic), and 2% were of other or unknown race/ethnicity.
SEX ASSIGNED AT BIRTH

- Sixty-two percent of 269 individuals diagnosed with HIV infection attributed to IDU during 2017 to 2019 were assigned male at birth (AMAB) and 38% were assigned female at birth (AFAB).
- Similarly, 65% of 3,673 persons living with HIV infection on 12/31/19 that was attributed to IDU were AMAB and 35% were AFAB.

FIGURE 4. HIV diagnoses among individuals with IDU exposure mode by sex assigned at birth, Massachusetts 2010–2019

- The number of HIV infection diagnoses with IDU exposure mode among individuals AMAB quadrupled from 19 in 2014 to a peak of 76 in 2017 and then decreased by 53% to 36 in 2019. The number of diagnoses with IDU exposure mode among individuals AFAB more than tripled from 12 in 2014 to 40 in 2017, and then decreased by 40% to 24 in 2019.

SEX ASSIGNED AT BIRTH BY RACE/ETHNICITY

FIGURE 5. Individuals AMAB and diagnosed with HIV infection with IDU exposure mode by race/ethnicity and year of diagnosis, Massachusetts 2010–2019

- From 2010 to 2019, the proportion of individuals AMAB diagnosed with HIV infection with IDU exposure mode who identified as Hispanic/Latino decreased from 49% to 17%.
- During the same time period, the proportion of individuals AMAB diagnosed with HIV infection with IDU exposure mode who identified as white (non-Hispanic) increased from 24% to 61%.
• Seventy-six percent of individuals AFAB diagnosed with HIV infection with IDU exposure mode during 2017 to 2019 were white (non-Hispanic), 15% were Hispanic/Latina, and 6% were black (non-Hispanic), compared to 53%, 36%, and 11% of individuals AMAB, respectively.

• The distribution of individuals AFAB and diagnosed with HIV infection with injection drug use exposure mode remained relatively stable by race/ethnicity from 2010 to 2019.

• Seventy-six percent of individuals AFAB diagnosed with HIV infection with IDU exposure mode during 2017 to 2019 were white (non-Hispanic), 15% were Hispanic/Latina, and 6% were black (non-Hispanic), compared to 53%, 36%, and 11% of individuals AMAB, respectively.
PERSONS WHO INJECT DRUGS

AREA OF RESIDENCE

Among areas with at least five individuals diagnosed with HIV infection attributed to IDU and at least 20 total HIV diagnoses during 2017 to 2019, Lawrence and Lowell had the highest percentages at 45% and 43%, respectively. Both cities were involved in an outbreak of HIV infection among PWID in the northeastern part of the state from 2015 through 2018.

INFORMATION FROM ADDITIONAL DATA SOURCES

**Opioid Statistics**

Opioids include heroin, opioid-based prescription painkillers, and other unspecified opioids that may or may not be injected.

**Opioid-Related Overdose Deaths**

- After reaching a 20-year high of 2,102 in 2016, the number of confirmed and estimated opioid-related overdose deaths in Massachusetts remained relatively stable through 2020, when there were an estimated 2,104 deaths. The opioid-related overdose death rate also remained relatively stable during this time period and was 30.2 per 100,000 in 2020.
• The percentage of confirmed opioid-related overdose deaths with fentanyl present increased from 42% in 2014 to 92% in 2020.

Emergency Medical Services (EMS) Data:
• The percentage of EMS incidents that were considered opioid-related increased on average 14% biannually from 2013 until mid-2016 and then began decreasing 2% bi-annually through the end of 2020. The number of all EMS incidents involving naloxone administration increased on average 17% biannually from 2013 until mid-2016 and then began decreasing 1% bi-annually through the end of 2020. In 2020, the greatest number of suspected opioid-related incidents treated by EMS continued to be among individuals AMAB aged 25-34 years, accounting for 22% of opioid-related incidents with a known age and sex.

Injection Drug Use among Program Participants:
Syringe Services Program (SSP) Participants
• Among 936 clients who received HIV testing at state-funded SSPs in 2020:
  • 64% were men, 35% were women, and 1% were transgender or another gender;
  • 13% were aged 18–24 years, 33% were 25–34 years, 32% were 35–44 years, 17% were 45–54 years, 7% were 55–64 years, 3% were 65 years and older, and 1% were of unknown age;
  • 61% were white (non-Hispanic), 23% were Hispanic/Latino, 12% were black (non-Hispanic), 2% were other or more than one race/ethnicity, and 2% were of unknown race/ethnicity.

Data Source: MDPH, BIDLS, Office of Health Care Planning; data as of 10/11/2021. Please note: the total number of clients is less than previous years due to impact of COVID-19.

Substance Use Disorder Treatment Admissions
• The percentage of clients admitted to state-licensed substance use disorder treatment programs reporting the use of a needle to inject drugs within a year of admission increased from 39% (N=39,372/101,346) in state fiscal year 2011 to 50% (N=48,521/98,033) in state fiscal year 2016, and then decreased to 41% (N=40,045/98,028) in state fiscal year 2020.

• The percentage of admissions to state-licensed substance use disorder treatment programs for heroin use treatment increased from 39% (N=39,611/101,330) of total admissions in state fiscal year 2011 to 54% (53,385/98,057) in state fiscal year 2016, and then decreased to 47% (N=46,122/98,672) in state fiscal year 2020.\(^1\)

• Ninety-one percent of individuals admitted to state-funded substance use disorder treatment programs in fiscal year 2020 who reported needle use within the past year were unemployed (N=31,709/34,980), compared to 72% of those admitted who did not report needle use (N=33,539/46,486); 38% (N=15,124/39,513) were homeless, compared to 21% (N=11,792/57,410) of those who did not report needle use.

\(^1\) Total number of admissions excludes missing/unknown values for each variable and therefore differs depending on the variable.
