Short-beaked Beaksedge  
*Rhynchospora nitens*  
(Vahl) A. Gray

State Status: **Threatened**  
Federal Status: **None**

**DESCRIPTION:** Short-beaked Beaksedge  
(*Rhynchospora nitens*) is a tufted annual species in the Sedge family (Cyperaceae). In Massachusetts, plants are typically short, often under 15 cm tall. The leaves are linear, proximally flattened, and 1 to 5 mm wide. The flowering stem (or culm) is nearly rounded and many ribbed. Terminal and axillary umbel-like inflorescences are comprised of 1 to 5 diffuse flower clusters on glabrous stalks subtended by leafy bracts. Spikelets are many-flowered, dark brown to nearly black, ovoid, and 3 to 7 mm long. Achenes (dry, one-seeded fruits) are likely shed close to the parent plants. The seeds are long-lived and require drying and exposure of moist pond shore substrate for successful germination. Short-beaked Beaksedge was formerly placed within the genus *Psilocarya* by some botanists.

**AIDS TO IDENTIFICATION:** The spikelets of Short-beaked Beaksedge are many-flowered and subtended by spirally imbricate one-nerved scales (~ 3 mm). The achenes are slightly wider than long, 0.7 to 1.3 mm, and become dark brown or nearly black once mature. At the top of the achene is a very short and rather broad “horn” or tubercle, 0.1 to 0.3 mm tall. The achene has a strongly...
ridged surface characterized by wavy rows of vertical raised cells.

SIMILAR SPECIES: Short-beaked Beaksedge is similar in appearance and often confused with Long-beaked Beaksedge (Rhynchospora scirpoidea), a species that is listed as Special Concern in Massachusetts. Both species are found in coastal plain pond habitats. The tubercle of Long-beaked Beaksedge is somewhat triangular in shape and is almost as long as the achene. The achene of Long-beaked Beaksedge has raised pale margins and is rather weakly ridged in comparison with the strongly ridged achene of Short-beaked Beaksedge.

POPULATION STATUS IN MASSACHUSETTS: Short-beaked Beaksedge is listed under the Massachusetts Endangered Species Act as Threatened. All listed species are protected from killing, collecting, possessing, or sale, and from activities that would destroy habitat and thus directly or indirectly cause mortality or disrupt critical behaviors. Short-beaked Beaksedge occurs in Plymouth and Barnstable Counties; extant populations are small, consisting of a few hundred plants or fewer.

RANGE: Short-beaked Beaksedge is found from southeastern Massachusetts to Florida and eastern Texas. It is disjunct to Michigan and considered extirpated in Indiana. Short-beaked Beaksedge is considered rare throughout much of its range.

HABITAT: Short-beaked Beaksedge is an obligate wetland species found on the moist sandy shores of shallow freshwater coastal plain ponds. These ponds are highly acidic and water levels naturally rise and fall in relation to seasonal and yearly changes in the water table. Seeds of Short-beaked Beaksedge require a period of drying and exposure to germinate and may remain dormant in the soil seed bank for many years until conditions are appropriate for germination.

Typical associates of Short-beaked Beaksedge include Canadian St. John’s-wort (Hypericum canadense), Dwarf St. John’s-wort (H. mutilum), Spatulate-leaved Sundew (Drosera intermedia), Northern Meadow-beauty (Rhexia virginica), Warty Panic-grass (Panicum verrucosum), Pondshore Flatsedge (Cyperus dentatus), Autumn Fimbry (Fimbristyris autumnalis), Reticulate Nut-sedge (Scleria reticularis), and Long-beaked Beaksedge (Rhynchospora scirpoidea).

THREATS AND MANAGEMENT RECOMMENDATIONS: Artificial withdrawal of water and other changes in ground and surface water hydrology may alter the specialized cycle of flooding and drawdown required by Short-beaked Beaksedge. Extant populations should be monitored to gain a better understanding of population dynamics, cycles of flooding and drawdown, and current threats. Sites that supported Short-beaked Beaksedge historically should also be surveyed periodically, as this species may persist in the seed bank for many years until drawdown conditions are suitable for germination. Short-beaked Beaksedge may be damaged by off-road vehicles, raking and clearing of shoreline vegetation for beach use, loss of habitat for storage of boats, and conversion of wetland habitats for cranberry cultivation. These activities should be prohibited in coastal plain pondshore habitats. Best management practices should be implemented to prevent or reduce nutrient enrichment from lawn fertilizers, faulty septic systems, and flocks of grazing ducks or geese. Monitoring for invasive species is needed for early detection and control. All active management of rare plant populations (including invasive species removal) is subject to review under the Massachusetts Endangered Species Act, and should be planned in close consultation with the Massachusetts Natural Heritage & Endangered Species Program.

RECOMMENDATIONS:
- Extant populations should be monitored to gain a better understanding of population dynamics, cycles of flooding and drawdown, and current threats.
- Sites that supported Short-beaked Beaksedge historically should also be surveyed periodically, as this species may persist in the seed bank for many years until drawdown conditions are suitable for germination.
- Short-beaked Beaksedge may be damaged by off-road vehicles, raking and clearing of shoreline vegetation for beach use, loss of habitat for storage of boats, and conversion of wetland habitats for cranberry cultivation.
- These activities should be prohibited in coastal plain pondshore habitats.
- Monitoring for invasive species is needed for early detection and control.
- Best management practices should be implemented to prevent or reduce nutrient enrichment from lawn fertilizers, faulty septic systems, and flocks of grazing ducks or geese.
- Monitoring for invasive species is needed for early detection and control.
- All active management of rare plant populations (including invasive species removal) is subject to review under the Massachusetts Endangered Species Act, and should be planned in close consultation with the Massachusetts Natural Heritage & Endangered Species Program.

A Species of Greatest Conservation Need in the Massachusetts State Wildlife Action Plan

Please allow the Natural Heritage & Endangered Species Program to continue to conserve the biodiversity of Massachusetts with a contribution for ‘endangered wildlife conservation’ on your state income tax form, as these donations comprise a significant portion of our operating budget.
