

Further problems with additional guideline 3 on forbidding shading of one square foot by more than 50% without regard to agricultural productivity.

First, as mentioned in my earlier comment, AG PV on poles or tables can be placed behind or between rows and mulched beneath the poles or tables, as in apiary or tree farm.

Second, it is possible to install poles or tables on the north side of permanent rows or raised beds. The AG PV on the north side would cast zero shadow on the productive land or row crops mulched or not.

The advantage of placing poles on the north side at the edge of the space between rows is that it both enables easy passage by tractors and other machinery and has zero shading of the crop land.

Cows and other animals in pasture clearly appreciate the occasional shade and semi shelter from elements provided by AG PV poles. Happy cows and still productive pasture.
