Introducing Visano

The Massachusetts Department of Health is pleased to announce an upcoming enhancement to the Massachusetts Prescription Awareness Tool (MassPAT).

On December 9, 2019, all approved MassPAT users will have access to an advanced patient support tool called the Visano Opioid Stewardship Platform (Visano). In addition to the existing MassPAT functionality and the current patient PMP report, Visano will also offer a representation of the data in an interactive format to help physicians, pharmacists and care teams access and more quickly and easily comprehend the data to aid in clinical decisions and provide improved patient safety and outcomes. Visano also provides tools and resources that support patients' needs and connects them to treatment, when appropriate.

With this enhancement, healthcare providers will have access to all of the features and functions of Visano with a consistent look and feel for users who access the solution through the MassPAT web portal. It also enables delivery of Visano within Electronic Health Record (EHR) and Pharmacy Management Systems for those prescribers and dispensers in MA who choose to access Visano through integration within their healthcare IT system.

This guide is intended to provide an overview of the Visano platform that provides a breakdown of each section of the report. In addition to this guide, a brief video overview of Visano can be found [here](#).

Why Visano?

Visano is a platform to help clinicians identify, prevent and manage substance use disorder (SUD). We know that safe prescribing practices must be part of a multi-dimensional response to this public health crisis. It allows prescribers and dispensers to identify patients that may be at risk for prescription drug addiction, and resources that clinicians can utilize to ensure that patients can be provided with the care they need. The Visano platform is user friendly, faster, easily integrated into a patient's electronic medical record and it's interoperable with other states. We view Visano as an important component in our response to the current opioid crisis.

How does Visano work?

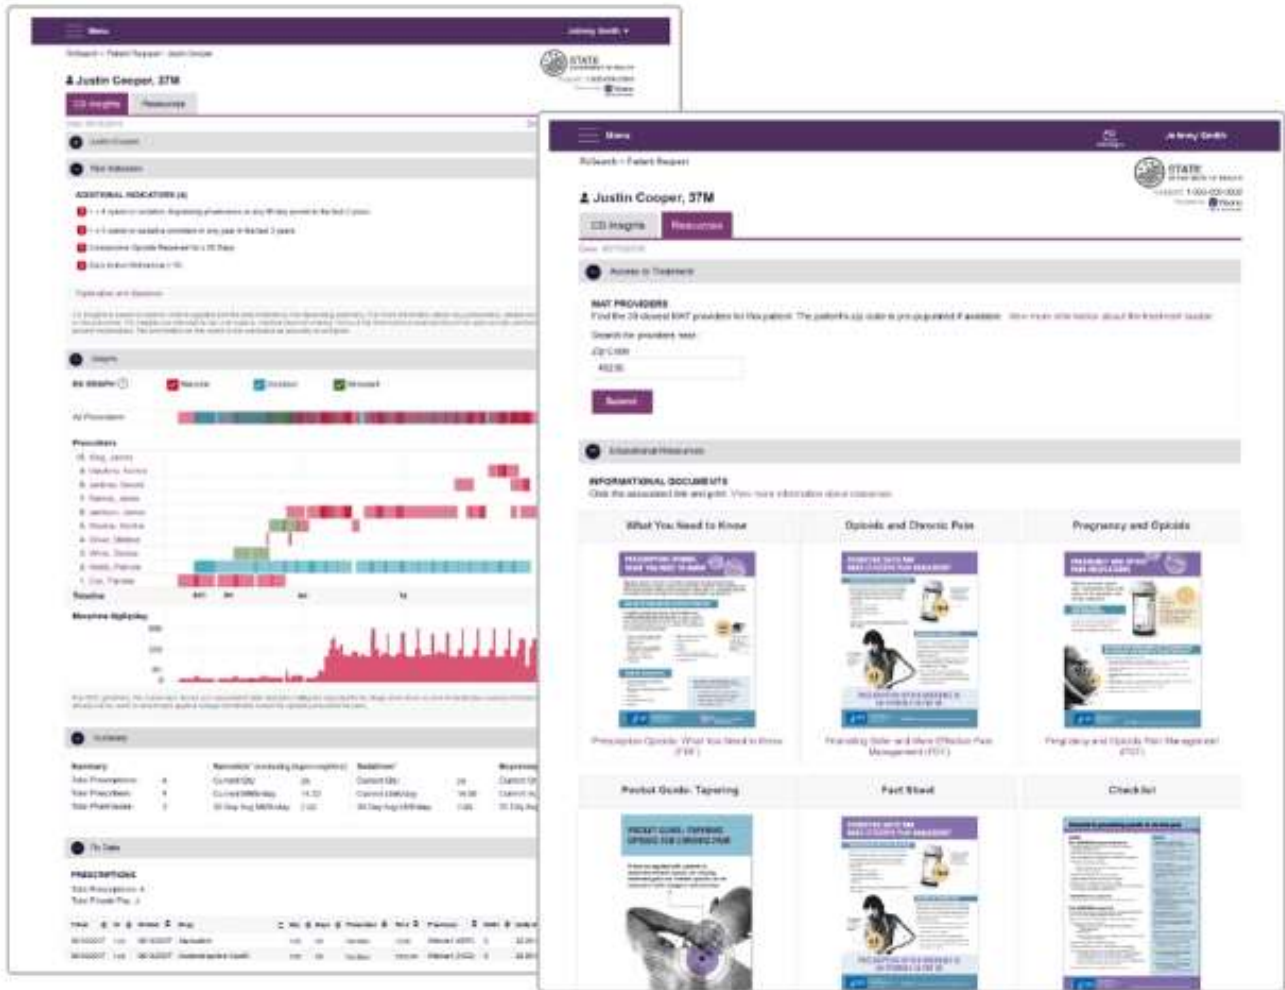

Visano aggregates historical and active prescription data and presents color coded, interactive, visual representations of the data. In addition, the Visano report has a resource tab that includes a Medical Assistance Treatment (MAT) locator, CDC educational resources, and Massachusetts resources, including an opportunity for consultation through the Massachusetts Consultation Service for Treatment of Addiction and Pain (MCSTAP). These resources can be used to help patients in need, at the right time, in a meaningful way, quickly and easily, at the point of care.

Who will have access to the Visano pilot?

Visano would be available to the MassPAT end user whether accessing via the MassPAT web portal or integrated EHR system or pharmacy software.

Visano Layout

Visano is broken out into two separate tabs: CS Insights Report and Resources. CS Insights Report is the default presentation view and is powered by the same PMP data found on our standard report. The Resources tab takes you to a page with MAT, CDC, and Massachusetts resources that can be used for patient care.

Visano helps providers make better-informed decisions when it comes to identifying, preventing, and managing substance use disorders. An overview of each section can be found below.

→ Risk Indicators

ADDITIONAL RISK INDICATORS (2)

-  >= 5 opioid or sedative providers in any year in the last 2 years
-  >= 4 opioid or sedative dispensing pharmacies in any 90 day period in the last 2 years

Explanation and Guidance

This CS Insights report is based on search criteria supplied and the data entered by the dispensing pharmacy. For more information about any prescription, please contact the dispensing pharmacy or the prescriber. CS Insights scores and reports are intended to aid, not replace, medical decision making. None of the information presented should be used as sole justification for providing or refusing to provide medications. The information on this report is not warranted as accurate or complete.

Risk indicators, when applicable for a patient, will be displayed here. When collapsed a summary of how many Additional Risk Indicators (ARIs) will be displayed and expanding this will provide further detail. ARIs within PMP data have been shown to be predictors of adverse outcome, specifically unintentional overdose death. There are currently three PMP based additional risk indicators:

- More than 5 providers in any year (365 days)
- More than 4 pharmacies in any 90-day period
- More than 40 morphine milligram equivalent per day (40 MED) average and more than 100 MME total

A brief explanation of each indicator as well as clinical guidance is available by following the “Explanation and Guidance” link.

Graphs

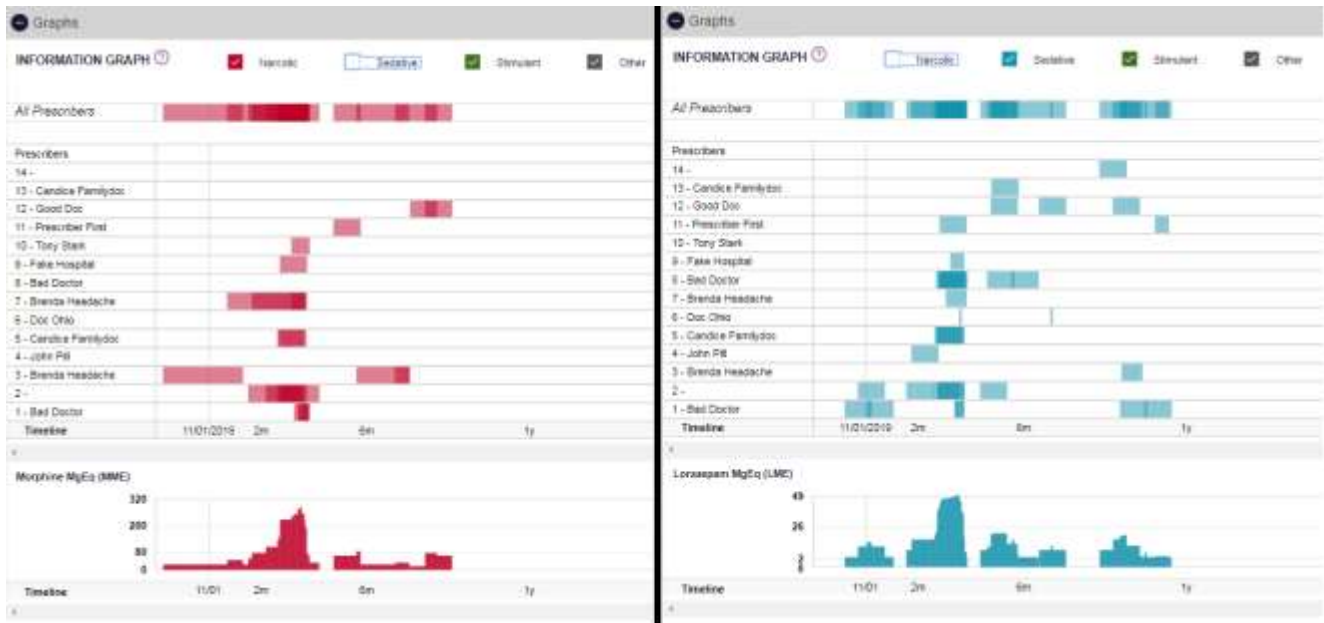

The Graphs section is a key feature of the Visano platform that provides a visual and interactive representation of the PMP data for a particular patient. Users can easily visualize and understand patterns in prescribing and usage behaviors, as well as identify overlapping prescriptions.

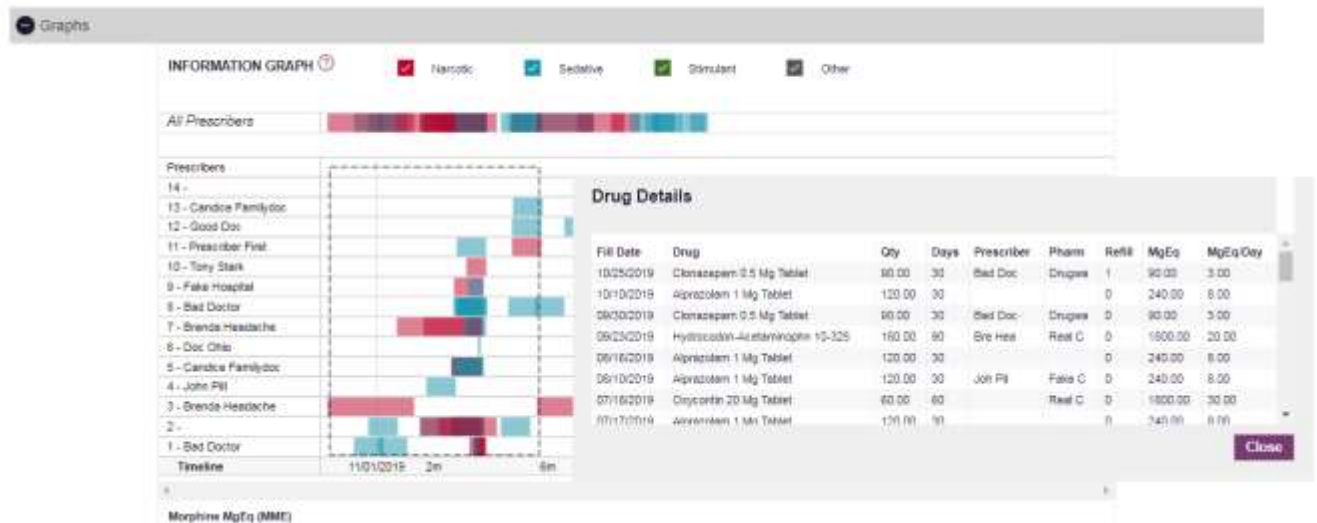

Providers are listed on the left, and color-coded prescriptions are graphed in reverse time order. Clicking on any of the color shaded areas will provide information on the prescriptions that comprise that time period while clicking on any of the prescribers on the left-hand side will give prescriber details including address information.

Morphine Milligram Equivalent (MME) and Lorazepam Milligram Equivalent (LME) graphs can be found towards the bottom and the amounts for each will vary in accordance with the calculated amount for that time period. Information about the LME can be found under the Menu bar at the top of the report.

At the top of the Graphs section are checkboxes that provide the ability to filter by the prescription types of Narcotic, Sedative, Stimulant, or Other. Unchecking the Sedative data removes the LME chart while unchecking the Narcotic data removes the MME chart.

Users can select individual data points or hold and drag their mouse around an area on the graph to see details about the prescriptions in that time period:

*Per CDC guidance, the MME conversion factors prescribed or provided as part of the medication-assisted treatment for opioid use disorder should not be used to benchmark against dosage thresholds meant for opioid prescribed for pain. Buprenorphine products have no agreed upon morphine equivalency, and as partial opioid agonists, are not expected to be associated with overdose risk in the same dose-dependent manner as doses for full agonist opioids. MME = morphine milligram equivalents. LME = Lorazepam milligram equivalents. mg = dose in milligrams.

Providers					
Total Providers: 14					
Name	Address	City	State	Zipcode	Phone
Tony Stork	123 Fake Street	Boston	MA	02122	-
Cardice Familydoc					

Pharmacies					
Total Pharmacies: 16					
Name	Address	City	State	Zipcode	Phone
Fake Pharm (3326)	123 Fake St	Boston	MA	02115	(617) 555-5555
Real Chain Store 2 (3750)	987 Orange Rd	Grove City	OH	43123	-

At the end of the report you'll find the prescription data that makes up the Visano report. This is the same information available on the classic MassPAT report and is provided by pharmacies on a daily basis via the PMP Clearinghouse.

Resources

MAT, MA pain management and SUD resources, and CDC Resources are accessible from the header by clicking on the Resources tab.

Access to Treatment

The Access to Treatment sub-header allows users to Medication-Assisted Treatment (MAT) providers for this patient. Entering the patient's zip code, which is pre-populated if available, and clicking Submit will provide the 30 closest MAT providers:
