

# HOW TO USE THIS PDF FILE

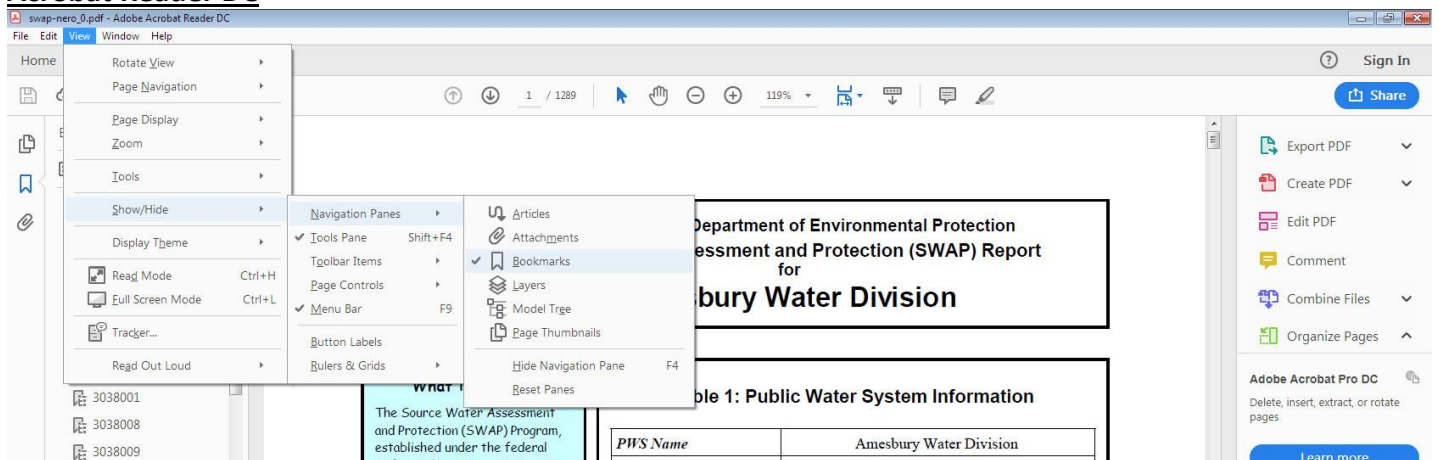

This PDF SWAP report file contains bookmarks which can be used to locate a particular SWAP report (see screenshots below for common PDF programs). The bookmarks are named using the PWS ID # of the public water system.

If you do not know the PWS ID #, you can also perform a search of the document by holding down the “CTRL” (⌘ on Mac) and the “F” key. This will open up the Find functionality. Type the name of the PWS into the textfield provided.

PWS ID Number	3051019

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Adams Fire District

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

## Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water directly to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

*Zone II #: 259*

*Susceptibility: High*

<i>Well Names</i>	<i>Source IDs</i>
Well #2	1004000-02G
Well #3	1004000-03G
Well #4	1004000-04G

Adams is a small, community with a population of approximately 9,500 residents in northwestern Massachusetts. The Hoosic River flows north through the center of town, bisecting the community. The majority of the residential, commercial and industrial development is along the river valley with the remainder of the town consisting of the rolling Berkshire hills, including a portion of the Mount Greylock State Reservation. Adams Fire District maintains three active supply wells located east of Route 8 in the neighboring community of Cheshire. The wells and the recharge area are entirely located in Cheshire. Adams Fire District also maintains the emergency source, Bassett Brook Reservoir and records show an emergency well #1 (which is scheduled to be abandoned); the emergency sources are not addressed in this report. It is recommended that Adams Fire District officially abandon well #1 (Source ID #1004000-01G) as soon as possible. The active wells are located east of Route 8 along the western edge of the Hoosic River and each has a Zone I protective radius of 400-foot.

Bedrock at the well site is mapped as the Kitchen Brook dolomite, a fine-grained massive dolomite with a quartz and calcite-rich region in the upper section. The dolomite contributes to the hardness of the water in the aquifer. The complex bedrock geology of the lowlands and surrounding uplands is mapped as folded and faulted schists, quartzites as well as some marbles and dolomites.

Water from the wells is treated by adding "Calciquest" (blended orthophosphate/polyphosphate compound) to sequester hardness (calcium and magnesium) in the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data are also available on the web at <http://www.epa.gov/safewater/ccr1.html>.

The Zone II for Adams' wells was delineated utilizing geological mapping, conceptual, numerical and analytical modelling and approved by the Department in 1996. Hydrogeological parameters were determined using data collected from an extended duration pumping test conducted while developing well #4 in the 1970's. Please refer to the attached map to view the boundaries of the Zone II.

### Section 2: Land Uses in the Protection Areas

The Adams' wells and Zone II are located within the Town of Cheshire, immediately south of the town line. Cheshire is a small rural community and like Adams, the majority of the development and Town center is along the river valley. The remainder of land in the community is rolling hills of forest, residential and agricultural use. The land uses in the Zone II are primarily a mixture of wetlands, forest agriculture and residential with some limited

commercial development (refer to attached map for details). State Route 8 runs north along the edge of the valley through Cheshire into Adams. Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

## Section 2: Land Uses in the Protection Areas

The Zone I radius for both wells is 400-feet, and is predominantly owned by the Adams Water District although there is a small area coincident with the bike path (Ashuwillatuck Trail) that is owned by the Massachusetts Department of Environmental Management. The trail which transects the Zone I has an intended use of passive (non-motorized) recreation. Although historically the old rail bed was used by snowmobiles, DEM rules prohibit motorized vehicles on the trail.

Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Residential Land Uses
2. Transportation corridors
3. Agricultural activities
4. Hazardous materials storage and use

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Residential Land Uses** – Approximately 20% of the Zone II consists of residential areas. While the town of Adams has municipal sewer, Cheshire does not have public sewers and the entire Zone II is served by on-site septic systems. The most significant concentration of septic systems is at the Pine Valley Mobile Home Park. The mobile home park is currently evaluating how to comply with Title 5 septic system requirements for their facility.

There is no clear count of how many residential homes utilize oil versus gas or whether the oil tanks are above or below grade. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

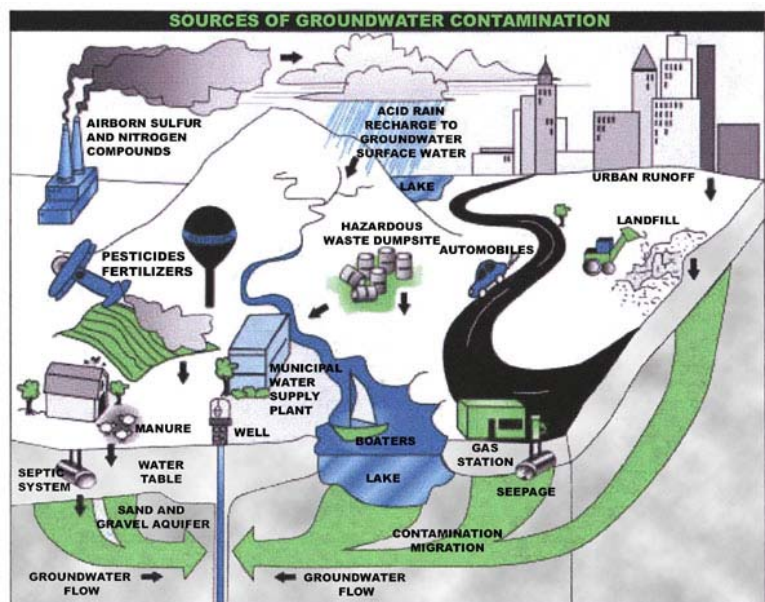

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can also be a potential source of microbial and nitrate contamination.
- **Household Hazardous Materials** - Hazardous materials may include

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

© 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) are potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Inventory residential fuel sources and encourage residents to remove any underground tanks and contain all other tanks.
- ✓ Work with planners to manage new residential developments in the water supply protection areas considering density and management of household hazards.
- ✓ Promote BMPs for stormwater management and pollution controls.

**2. Transportation Corridors** - Route 8 runs along the western border of the Zone II, just west of the wells. Local roads are common throughout the Zone II. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catch basins.

#### Transportation Corridor Recommendations:

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Work with the Town and State to be sure that catch basins are inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff. Request a copy of the State Highway Department’s schedule for catch basin cleaning and supply them with a copy of the Zone II map.
- ✓ Coordinate with local emergency response teams to ensure they are aware of the boundaries of the Zone II so that any spills within the Zone II be effectively contained and you are notified.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren’t yet available, work with town and State officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### Source Protection Decreases Risk

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Agricultural</b>			
Pesticide Storage or Use	Numerous	High	Pesticides: leaks, spills, improper handling, or over-application
Crop Lands, Pasture, Manure storage and management	101.2 acres	High	Dairy farm
Fertilizer Storage or Use	Numerous	Moderate	Fertilizers: leaks, spills, improper handling, or over-application
<b>Commercial</b>			
Sand and Gravel Mining/Washing	2	Moderate	Heavy equipment, fuel storage (AST), clandestine dumping: spills
<b>Residential</b>			
Fuel Oil Storage	Numerous	Moderate	Fuel oil, kerosene: spills, leaks, or improper handling (ASTs/USTs)
Lawn Care / Gardening	Numerous	Moderate	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	Moderate	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Underground Storage Tanks	Numerous	High	Stored materials: spills, leaks, or improper handling
Aboveground Storage Tanks	Numerous	Moderate	Materials stored in tanks: spills, leaks, or improper handling

Activities	Quantity	Threat*	Potential Source of Contamination
Aboveground Storage Tanks	Numerous	Moderate	Petroleum products and hazardous materials: spills, leaks, or improper handling
Floor Drains in Commercial/Industrial Facilities	Numerous	High	An inspection of the Zone II found several non-complaint floor drains in facilities where hazardous materials were stored.

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

**3. Agricultural Activities** – There are several farms with animals and crop lands within or immediately proximal to the Zone II (the Zone III). Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water sources.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Although the dairy farm is outside of the Zone II it is located within the Zone III. Supply the land owners with maps of the Zone II.

**4. Hazardous materials storage and use** — Many small businesses, municipal facilities and industries use hazardous materials, produce hazardous waste products, and/or store quantities of hazardous materials in UST/AST. These include a 10,000 gallon UST at the Cheshire School, and a 1000 gallon UST at the First Baptist Church. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Encourage the Board of Health to work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure “Industrial Floor Drains” for more information. Encourage the Board of Health to enforce the local floor drain regulation.

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

Other land uses and activities within the Zone II that pose potential threats include the bike path. Although passive recreation poses minimal threat, the use of motorized vehicles poses a more significant threat. Request that DEM enforce their rules for no motorized vehicle access. Monitor activities and report any violations to the DEM. Refer to Table 2 and Appendix 2 for more information about these land uses.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. The final report of the findings of an Underground Injection Control Inspection is included as Attachment E of this report to help identify some potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

**Section 3: Source Water Protection Conclusions and Recommendations**

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Maintain current signs. Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988 if needed.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue monitoring along bike path and non-water supply activities in Zone Is. Request DEM enforce their rules for access.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>NO</b>	The Cheshire "Aquifer Protection District" bylaw meets DEP's wellhead protection requirements. However, the district does not include the Adams' well Zone II.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>NO</b>	Ask Cheshire to bring to Town Meeting a request to expand wellhead protection controls to include Adams' Zone IIs.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Prepare a Wellhead Protection Plan and work with Cheshire to implement.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Establish committee; include representatives from citizens' groups, neighboring communities, and the business community. Propose bylaws for Adam's Zone II.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>Partial</b>	For guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> . Encourage Board of Health to adopt guidelines as a requirement and request guidance on conducting inspections.
Does the PWS provide wellhead protection education?	<b>NO</b>	Work with Cheshire to continue and expand the public education program.

### Current Land Uses and Source Protection:

As with many water supply protection areas, the system's Zone II contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Passing wellhead protection bylaws to protect the land areas near the Cheshire Water Department wells.
- Implementing a Public Education program on wellhead protection.
- Working with the board of Health to pass floor drain regulations.
- Installing fencing to prohibit access to the Zone I.

### Source Protection Recommendations:

To better protect the sources for the future:

- ✓ Work with the Town of Cheshire to bring a proposal to Town Meeting to pass wellhead protection bylaws and request that the Board of Health include floor drain regulations to protect the Zone II for Adams' wells located in Cheshire.
- ✓ Inspect the Zone I and Zone II regularly.
- ✓ Abandon the old, emergency source, #1004000-01G.
- ✓ Request that DEM enforce their rule prohibiting motorized vehicle access on the bike path.
- ✓ Continue to educate residents on ways they can help you to protect drinking water sources.
- ✓ Notify Massachusetts Highway Department regarding the location of the Zone II and coordinate with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Contact farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Develop and implement a Wellhead Protection Plan.

### Resources for Drinking Water Source Protection:

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and

### For More Information

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

### What is a Zone III?

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II.

2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

### Conclusions:

The assessment and protection recommendations in this SWAP report are

provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

### Groundwater Sources Zone II #: 208

*Susceptibility: High*

<i>Well Name</i>	<i>Source ID</i>
Well #1	1008000-01G
Well #2	1008000-02G
Well #3—Brown Well	1008000-03G
Well #4—Baby Carriage Brook	1008000-04G
Well #5	1008000-06G
Well #6	1008000-07G

### Surface Water Sources

*Susceptibility: High*

<i>Reservoir Name</i>	<i>Source ID</i>
Hawley—Hills (Pelham) Reservoir	1008000-01S
Atkins Reservoir	1008000-02S

Amherst is a mid-sized, rural community in western Massachusetts that is the home to the main campus of the University of Massachusetts and two private colleges. The population and consequently the water demands, fluctuate with the academic seasons. The Town of Amherst maintains two main surface water sources (the Atkins Reservoir and the Pelham Reservoir) and five groundwater sources (Wells #1 through #5) to meet their water needs. Wells #4 and #5 are used primarily to meet seasonal high demand. One additional proposed groundwater source (Well #6) has been tested and approved, however since final construction of the pumping and treatment facilities has not been completed, that source is currently not available for use.

The surface water supplies are located in the foothills of the central highlands in the rural communities of Pelham and Shutesbury. The watersheds are underlain primarily by metamorphic bedrock underlain by thin till. Small deposits of sand and gravel are noted in the immediate vicinity of the reservoirs. The Pelham Reservoir is comprised of the Hills and Hawley Reservoirs and a small intake reservoir. Water from the surface water supplies is treated through conventional filtration plants at the Centennial and Atkins Treatment Plants. The plants utilize flocculation, sedimentation and filtration. Chloramination is utilized to disinfect the water, sodium hydroxide is added for pH adjustment, and fluoride is added prior to distribution. The Atkins plant also has ozone and granular activated carbon available for additional treatment as required.

The wells for the Amherst DPW Water Division are located in the Lawrence Swamp/Hop Brook Basin in South Amherst. Each of the wells has a Zone I of 400 feet. The wells utilize water from a confined to semi-confined, sand and gravel aquifer located within a buried, bedrock valley. The bedrock valley, comprised primarily of metamorphic and sedimentary rocks, was deepened by advancing glaciers and later filled in with sand and gravel from the receding glaciers and overlain by silt and clay from glacial Lake Hitchcock and Lake Lawrence some 18,000 years before present. Recent alluvial deposits cover the entire valley area. The confining clay layer is primarily contiguous through the center of the buried valley with the clay layer pinching out toward the edges of

the aquifer allowing significant recharge along the basin boundaries. The wells are of various depths ranging from approximately 57 feet along the valley walls to 168 feet below grade in the center of the valley.

Wells #1, #2, #3 and #5 are located along the perimeter of the basin where the silt and clay units are discontinuous and inter-fingered with sand and gravel deposits resulting in a semi-confined aquifer. This type of aquifer has a high vulnerability to contamination due to the absence of a continuous hydrogeologic barrier (i.e. clay) that can prevent contaminant migration. Wells #4 and #6 are located in the confined portion of the aquifer. This type of aquifer has low vulnerability to contamination due to the presence of the hydrogeologic barrier (i.e. clay) that can prevent contaminant migration. Specific information about the wells is as follows:

The Zone II for these wells was delineated based on conceptual, numerical and analytical modeling with aquifer parameters determined from multiple, extended duration pumping tests. The Zone II was delineated as part of the New Source Approval Process and Water Management Act requirements for the development of Well #6 and increased withdrawal of existing wells. Please refer to the attached map to view the boundaries of the Zone II.

### Glossary Protection Zones

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

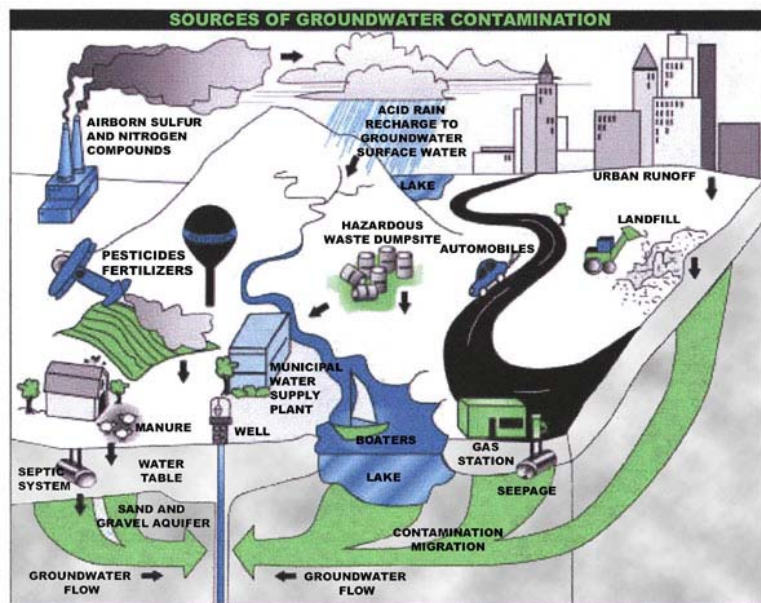

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

For current information on water quality monitoring results and treatment processes, please refer questions to the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The Zone II for Amherst's wells is a mixture of residential, agricultural, and some light commercial and industrial areas (refer to attached map for details). The land uses in the watersheds is rural, low density residential. The most significant threat to the surface water supplies is from natural, microbial threats from beavers. Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Tables of Regulated Facilities and Underground Storage Tanks attached in Appendix B.

### Key Land Uses and Protection Issues include:

1. Nonconforming Zone I
2. Residential land uses
3. Transportation corridors
4. Hazardous materials storage and use
5. Protection Planning
6. Agricultural activities
7. Railroad Right of Way
8. Presence of Beavers in Surface Water Sources

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Nonconforming Zone I** – The Zone I for each of the wells is a 400 foot radius around the wellhead. Massachusetts drinking water

regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. The Zone I for Wells #1 and #2 is not entirely owned by the town. There is a railroad right-of-way and a bike path running through the Zone I, and a portion of the Zone I for Well #1 includes a hayfield. Only water supply activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and contain non water supply activities such as homes and public roads.

#### Zone I Recommendations:

- ✓ Obtain a Right of First Refusal for acquiring the land within the Zone I currently not owned by the town.
- ✓ Consider purchasing the land or acquiring a conservation restriction on the land to minimize potential threats.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non water supply activities out of the Zone I. ✓
- ✓ Contact the property owner to be sure they are aware they are within the Zone I and Zone II of the well. Provide information about BMPs.

**2. Residential Land Uses** – Approximately 14% of the Zone II consists of residential areas. The Zone C has about 4% of the land use as residential. From this perspective, residential land uses are more of a potential threat within the Zone II than in the Zone C areas. None of the areas have public sewers; all use septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. There are some residential uses within the Zone A of the reservoirs as well. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include

automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices

### What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal

### Source Protection Decreases Risk

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Protection Zone	Potential Contaminant Sources*
<b>Agricultural</b>				
Dairy Farms	1	Moderate	Zone II	Manure (microbial contaminants): improper handling
Fertilizer Storage or Use	Numerous	Moderate	Zone II	Fertilizers: leaks, spills, improper handling, or over-application
Livestock Operations	4	Moderate	Zone II	Manure (microbial contaminants): improper handling [2 horse farms, 1 emu farm, 1 rabbit farm]
Nurseries	1	Moderate	Zone II	Fertilizers, pesticides, and other chemicals: leaks, spills, improper handling, or over-application [1 Greenhouse]
Pesticide Storage or Use	Numerous	High	Zone II	Pesticides: leaks, spills, improper handling, or over-application
<b>Commercial</b>				
Gas Stations	1	High	Zone II	Automotive fluids and fuels: spills, leaks, or improper handling or storage
Service Stations/ Auto Repair Shops	1	High	Zone II	Automotive fluids and solvents: spills, leaks, or improper handling
Railroad Tracks	1	High	Zone I (Well 1 & 2) Zone II	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills
Sand And Gravel Mining/Washing	1	Moderate	Zone II	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
<b>Industrial</b>				
Fuel Oil Distributors	1	High	Zone II	Fuel oil: spills, leaks, or improper handling or storage
Hazardous Materials Storage and Waste Storage	Numerous	High	Zone II	Hazardous materials: spills, leaks, or improper handling or storage
<b>Miscellaneous</b>				
Aboveground Storage Tanks	Numerous	Moderate	Zone II	Materials stored in tanks: spills, leaks, or improper handling
Aquatic Wildlife	Numerous	Low	Zones A & C	Microbial contaminants
Farm Composting Facilities	1	Low	Zone II	Organic material, animal waste, and runoff: storage and improper handling
Small quantity hazardous waste generators	1	Moderate	Zone II	Hazardous materials and waste: spills, leaks, or improper handling or storage
Stormwater Drains/ Retention Basins	Numerous	Low	Zone C Zone II	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transportation Corridors	Numerous	Moderate	Zone C Zone II	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Underground Storage Tanks	1	High	Zone II	Stored materials: spills, leaks, or improper handling
Very Small Quantity Hazardous Waste Generator	3	Low	Zone II	Hazardous materials and waste: spills, leaks, or improper handling or storage

Land Uses	Quantity	Threat	Protection Zone	Potential Contaminant Sources*
<b>Residential</b>				
Fuel Oil Storage (at residences)	Few	Moderate	Zones C Zone II	Fuel oil: spills, leaks, or improper handling (All USTs in Amherst removed, unknown in Belchertown)
Lawn Care / Gardening	Numerous	Moderate	Zones C Zone II	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	Moderate	Zones C Zone II	Hazardous chemicals: microbial contaminants, and improper disposal

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

**Potential Source of Contamination vs. Actual Contamination**

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

(BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls. Continue catch basin cleaning routines.

**3. Transportation Corridors** - Route 9 runs through part of the Zone II, and local roads are common throughout the Zone II, Zone A and Zone C. The transportation corridors are more heavily traveled in the Zone II than in the Zone C, and are therefore a greater threat in the Zone II; however, it is equally important to use best management practices in both areas. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catch basins.

**Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that

drains discharge stormwater outside of the Zone II.

- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

**4. Hazardous Materials Storage and Use** – A very small percentage (<1%) of the land area within the Zone II is commercial or industrial land uses. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure “Industrial Floor Drains” for more information.

**5. Protection Planning** – Forested land covers 64% of the Zone II and 34% is protected open space for the District. Amherst has worked diligently to pass bylaws that are in compliance water supply protection control regulations 310 CMR 22.21(2), including the floor drain prohibitions. However, Belchertown has

**Top 5 Reasons to Develop a Local Wellhead and Surface Water Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

not passed protective bylaws for the Lawrence Swamp Zone II area.

A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public education and outreach. The development of a successful Wellhead Protection Plan is outlined in five steps in DEP's “Developing a Local Wellhead Protection Plan” (see Appendix A for the full report) as:

- Establish a protection committee or team
- Define the Wellhead Protection Area
- Identify potential sources of contamination
- Protect and manage the wellhead protection area
- Conduct ongoing public education and outreach

Although Amherst has the majority of the components for a Wellhead Protection Plan in place, they do not have a formal plan. Please use the guidance booklet “Developing a Local Wellhead Protection Plan” to help you find what Amherst is missing. Compile the information supplied in the Zone II reports, this and other reports; include copies of maps outlining the Zone II and detail the protection measures in place. Outline a plan to complete any components of the plan not in place with a time line for completion. Submit your written report to the DEP Regional office and/or Boston office for approval.

Amherst is currently working with their consultant to prepare Watershed Protection Plans for the surface water supplies. Amherst owns 25% of the Atkins Reservoir watershed and 38% of the Pelham Reservoir watersheds. Forested land covers 91% of the watershed lands and 38% of the watersheds are protected open space.

#### **Protection Planning Recommendations:**

- ✓ Formalize the Wellhead Protection Plan. Refer to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan" (see Appendix A).
- ✓ Continue to work with Belchertown to adopt protective bylaws and regulations for Lawrence Swamp Zone II. The Department will be instrumental in assisting Amherst in this effort.

**6. Agricultural Activities** – There are several farms on the western edge of the Zone II. Crop and pasture lands make up about 16% of the land use in Zone II, 2% in the Zone C. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

#### **Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.

**7. Railroad Right-of-Way** – The railroad runs through the entire Zone II, and transects the Zone I of wells #1 and #2. Rail corridors that serve passenger and/or freight trains are a potential source of contaminant due to chemicals released during normal use, track maintenance, and accidents. Normal maintenance of a railroad right-of-way can introduce contaminants to a water supply through herbicide application for vegetation control. The over-application or improper handling of herbicides on railroad right-of-way is a potential source of contamination. Leaks or spills of transported chemicals or train/track maintenance

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II.
2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

Land uses within the Zone III are not assessed for SWAP reports unless the source is under the direct influence of groundwater.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

chemicals are also potential sources of contamination to the water supply.

#### **Railroad Right of Way Recommendations:**

- ✓ Review the railroad right-of-way Yearly Operating Plan to ensure Best Management Practices are implemented with regard to vegetation control in the Zone II, and that the utility has accurate information regarding the locations of the wells and the Zone I. Review the maps the utility uses.
- ✓ Work with your local fire department to review emergency response plans. Updates to this plan should include the railroad rights-of-way including coordination with the owner/operator of the track and trains using the right-of-way. Request emergency response teams to coordinate Emergency Response Drills and practice containment of potential contaminants from train accidents within the Zone II, which should attempt to include representatives from the owner/operator of the trains utilizing the right-of-way.

**8. Presence of Aquatic mammals in Surface Water Watershed** – There is evidence and past history of aquatic mammals (beavers and muskrats) living in and near the surface water supplies. Aquatic mammals pose a potential threat of microbial contamination of the source from *Giardia Lamblia* and *Cryptosporidium*, pathogens that are identified in the Surface Water Treatment Rule and Enhanced Surface Water Treatment Rule as posing an unacceptable risk to drinking water.

**Presence of Beavers in Surface Water Sources Recommendations:**

- ✓ Monitor the watershed and reservoirs for the presence of aquatic mammals and their proximity to the intake. Monitor raw water quality and assess potential impacts.

Other land uses and activities within the Zone II that have potential for contamination include auto repair shops, gas stations, large equipment storage, and a greenhouse. Refer to Table 2 and Appendix 2 for more information about these land uses.

As previously noted, the Zone II has a confining clay layer which pinches out toward the edges of the aquifer allowing significant recharge along the basin boundaries. This allows for the majority of the recharge to the aquifer to occur through the Zone III. In this instance, identifying potentially threatening land uses within the Zone III is equally important to those in the Zone II. It would be in the best interest of Amherst Water Division to consider the recommendations outlined in this report for both the Zone II and Zone III areas.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those listed above and below should be used to better protect your water supply.

**Section 3: Source Water Protection Conclusions and Recommendations****Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Implementing a hazardous waste collection plan
- Removing most of the USTs within the Zone II associated with businesses and residences
- Establishing source protection committee and implementation of protection measures.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Continue to educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and watersheds when responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.

**Resources for Drinking Water Source Protection:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more

**For More Information**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I and Zone C</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I/Zone As?	<b>NO</b>	Majority of Zone I and Zone A are owned. Follow and educate land owners about Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Include strategy for additional land acquisition as appropriate.
Is the Zone I and Zone C posted with "Public Drinking Water Supply" or other signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I and watershed regularly inspected?	<b>YES</b>	Continue frequent inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I/Zone A?	<b>YES</b>	Allowable Passive Recreation (Bike Path) within the Zone I of Well #1 and #2. Residential development in Zone A. Continue monitoring non-water supply activities.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21 (2)?	<b>YES</b>	The Town "Aquifer Protection District" bylaw meets DEP's requirements in Amherst. Amherst meets best efforts for wellhead protection in Belchertown. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws and health regulations, and current regulations.
Do neighboring communities protect the Zone II/Zone C areas extending into their communities?	<b>NO</b>	Work with neighboring municipalities to include Zone II/Cs in source protection controls.
<b>Planning</b>		
Does the PWS have Wellhead/Watershed Protection Plans?	<b>YES</b>	Implement the watershed protection plans and formalize your wellhead protection plan. Work with communities where watersheds are located to enhance local protection.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead/watershed protection committee?	<b>YES</b>	Continue committee work. Include representatives from citizens' groups, neighboring communities where watersheds are located and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> .
Does the PWS provide source water protection education?	<b>YES</b>	Continue and expand educational efforts.

**Conclusions:**

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

# Source Water Assessment Program (SWAP) Report

## For

### Ashfield Water District

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

#### SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
April 14, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Ashfield Water District
<i>PWS Address</i>	412 Main Street
<i>City/Town</i>	Ashfield, Massachusetts
<i>PWS ID Number</i>	1013000
<i>Local Contact</i>	Mr. Peter Johnson
<i>Phone Number</i>	413-628-3297

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1013000-01G	332	1,187	High
Well #2	1013000-02G	330	1,158	High

#### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

#### 1. Description of the Water System

Ashfield is a small, rural, agricultural/residential community located in southwestern Franklin County in the foothills of the Berkshire Hills. Ashfield Water District maintains water supply Wells #1 and #2 that provide water to the center of town and the Ashfield Lake area. The District also maintains a surface water reservoir as an emergency source that will not be addressed in this assessment. Some water from the reservoir is directed to an area near the old storage tank, discharging to a channel maintaining a minimum flow in a brook adjacent to Well #1. The wells are both bedrock wells drilled to depths of 400 and 440 feet, respectively, and have approved

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

withdrawal rates of 24.6 and 23.7 gallons per minute based on continuous rate pumping tests. The Zone I and Interim Wellhead Protection Area (IWPA) radii are 332 feet and 1,187, respectively for Well #1 and 330 feet and 1,158, respectively for Well #2. The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA.

The wells are located within a bedrock aquifer with relatively thin till covering. The predominant bedrock is mapped as highly contorted schist with granofels, marble or quartz of the Waits Formation. There is no record indicating a confining, protective clay layer or artesian conditions in the vicinity of the wells. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

Water from the Ashfield wells does not require and does not have treatment at this time. However, the District does have the capability to chlorinate water from the wells if it is necessary. For current information on water quality monitoring results, please refer to the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 2 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Zone I ownership**
2. **Transportation corridors**
3. **Residential uses**
4. **Hazardous materials**

The overall ranking of susceptibility to contamination for the system is high based on the presence of at least one land use or activity ranked as high in the Zone I and IWPA of the wells, as seen in Table 2.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridors	Well # 1	Both	Moderate	Limit road salt usage and provide drainage away from wells
Residential use	Well #1	Both	Moderate	Septic and household hazardous materials
Hazardous materials	Well #1	Both	High	Chemicals, lawn equipment and Small Quantity Generator
Livestock operations (noncommercial)	Well #1	Well #1	High	Manure and household hazardous materials

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/den/hrn/dws/](http://www.state.ma.us/den/hrn/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**1. Non-conforming Zone I** – Currently, the water supplier does not own or control the entire Zone I area for Well #1. There is a residence and the associated farm within the Zone I of Well #1. Please note that systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. The water supplier owns or controls through a Conservation Restriction the entire Zone I for Well #2.

### Recommendations:

- ✓ Control access to the wellhead area and make every effort to acquire Zone I control or ownership.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store petroleum products, pesticides, fertilizers or road salt within the Zone I.
- ✓ The Water District should continue to monitor activities at the residence to assure that BMPs are used at the facility. If the facility becomes commercial in nature, consult with the NRCS to determine if assistance is available to mitigate problems if they ever arise. Review potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP).

**2. Residential Land Uses** – The protection areas have a few residences within them. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and at [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

### 3. Transportation Corridors and Utility Right-of-Ways

There are roads located within the Zone I of Well #1 and within the IWPA of both wells. De-icing materials, petroleum chemicals and other debris on roads are picked up by stormwater. Roadways can often be sites for illegal dumping of hazardous or other potentially harmful wastes.

Catch basins and drainage swales transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

contaminants from automotive leaks, maintenance, washing, pesticides and fertilizers or accidental spills.

There is one utility Right-of-Way within the IWPA for Well #1 and within close proximity to the IWPA for Well #2. Continue your current practice of reviewing the Yearly Operational Plan (YOP) of the utility and meet with them to review the locations and maps of their easements for accuracy. Be sure that they contact you regarding changes in maintenance of the right-of-way.

### Transportation Corridor Recommendations:

- ✓ Regularly inspect Zone Is and IWPA's for illegal dumping and spills.
- ✓ Work with local emergency response teams to ensure that any spills within the protection areas can be effectively contained and be sure that team is aware of the protection areas.
- ✓ Where catch basins are installed, work with the municipality or State to have catch basins inspected, maintained, and cleaned on a regular schedule. Regular street sweeping reduces the amount of potential contaminants in runoff. For information on DEP's S. 319 Nonpoint Source Competitive Grants Program and upcoming funding opportunity refer to: <http://www.state.ma.us/dep/brp/mf/mfpubs.htm#wpa>.
- ✓ Storm Drain Stenciling Program - Work with local watershed groups to institute a Storm Drain Stenciling Program. For more information on how to develop a storm drain stenciling program go to <http://www.earthwater-stencils.com>.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. Smaller communities may not have maps available. Work with town officials to investigate mapping options. The NPDES Phase II Stormwater Rule requires some communities to complete stormwater mapping. For additional information, refer to the Stormwater Management Information at <http://www.state.ma.us/dep/brp/ww/wwpubs.htm#storm>.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Work with local officials during their review of the utility right of way Yearly Operating Plans (YOPs) to ensure that water supplies are protected during vegetation control or maintenance of the utility.
- ✓ Review potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Rita Thibodeau, at the local office (Greenfield at 413-772-0384 - e-mail address is [rita.thibodeau@magreenfie.fsc.usda.gov](mailto:rita.thibodeau@magreenfie.fsc.usda.gov)). Review the fact sheet available on line and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Visit DEP's Nonpoint Source Pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**4. Hazardous Materials Storage and Use** – The storage tank and motor control building for the District is located immediately adjacent to Well #1. The building is utilized to store equipment for the District including lawn mowers and associated petroleum products. The company, Harris & Gray Contractors a Small Quantity Generator of hazardous materials is located within the IWPA of Well #2. If hazardous materials are improperly stored, used, or disposed, they become potential sources of

contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground. All petroleum products should be stored away from the well. Any products utilized by the water supplier should be kept in secondary containment to avoid accidental release.

### Hazardous Materials Storage and Use Recommendations:

- ✓ Remove equipment and petroleum products not directly related to supplying water.
- ✓ Provide secondary containment for all products that are required and minimize the amount of product stored on site.
- ✓ Request that the Board of Health adopt a hazardous materials handling regulation.
- ✓ Closely monitor deliveries of chemicals.

Other activities that have been identified in the protection areas were a beaver swamp located topographically downgradient of Well #2 but within the IWPA and farming. Beaver swamps may flood wellhead areas causing a potential threat from bacteria and viruses. Monitor the beaver activity to be sure that the ponding does not encroach on the wellhead. The residential home with a small livestock operation is within the Zone I and IWPA of Well #1. The residence appears to be located topographically downgradient from the wellhead so that runoff is directed away from Well #1. The Water District should monitor activities at the residence to assure that BMPs are used at the facility. If the facility is commercial in nature, consult with the NRCS to determine if assistance is available to mitigate problems if they arise. Review potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Rita Thibodeau, at the local office (Greenfield at 413-772-0384 - e-mail address is [rita.thibodeau@magreenfie.fsc.usda.gov](mailto:rita.thibodeau@magreenfie.fsc.usda.gov)). Review the fact sheet available online at the website <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS for assistance.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Ashfield is commended for its current high level of awareness of activities in the protection area and efforts to secure a conservation restriction for the Zone I of Well #2. Ashfield should continue efforts to protect water supplies by reviewing and adopting the key recommendations above and the following:

#### Priority Recommendations:

- ✓ Review use and storage of hazardous materials stored in the Zone I of Well #1.
- ✓ Work with Ashfield to adopt bylaws/regulations to protect water supplies such as hazardous materials handling regulations, floor drain regulations and water supply protection area Zoning Bylaws.
- ✓ Review the Wellhead Protection Plan prepared in the early 1990s and update the plan as appropriate. Include Town Boards, other water suppliers in Ashfield and local citizens in the protection planning process. Review the attached guidance for wellhead protection planning.

#### Zone I:

- ✓ Prohibit any new non-water supply activities from Zone I.
- ✓ When feasible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Continue to prohibit public access to the well and control building by locking facilities and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any above ground tanks for leaks, etc.
- ✓ If the District intends to continue utilizing the structures in the Zone I for storage of equipment, use BMPs and restrict activities that could pose a threat to the water supply.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction or Memorandum of Understanding (MOU) that would prohibit potentially threatening activities or a Right of First Refusal agreement to purchase the property.
- ✓ Redirect road drainage in the Zone I away from the well.
- ✓ Do not use or store pesticides, fertilizers, petroleum products or road salt within the Zone I.

#### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers and certified operator. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations as appropriate.
- ✓ Incorporate groundwater education into the local school curriculum (K-6 and 7-12 curricula available; contact DEP for copies).
- ✓ Work with your community to ensure that stormwater runoff near Well #1 is directed away from the well and is treated according to DEP guidance.

#### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, refer to <http://www.state.ma.us/dep/bwp/dhm/files/sqgsum.pdf> for the Requirements for Small Quantity Generators.
- ✓ Upgrade any oil/hazardous material storage tanks to incorporate proper containment and safety practices.
- ✓ Concrete pads around wellheads should slope away from the wells and well casings should extend above ground.

- V For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### **Planning:**

- V Work with local officials in Ashfield to develop **Aquifer Protection District Bylaws** and include the IWPA areas for the District wells and other public water supplies wells in Ashfield to assist in improving protection for all PWSs.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Funding:**

The Department's Wellhead and Source Water Protection Grant Programs provide funds to assist public water suppliers in addressing protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the grant programs. Please note: each program year, if funds are available, the Department posts a new Request for Response for the grant program (RFR) at <http://www.mass.gov/portal/index.jsp?pageID=aghome&agid=osd>. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

The Massachusetts Department of Food and Agriculture's Agricultural Environmental Enhancement Program (AEEP) provides funding to farmers to install a variety of water quality protection practices. For more information on the program contact the coordinator, Susan Phinney, at (617) 626-1772, [Susan.Phinney@state.ma.us](mailto:Susan.Phinney@state.ma.us).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Consider reviewing the fact sheet available online and call the local office Amherst 413-253-4350 of the NRCS for assistance at the following website <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Source Water Assessment Program (SWAP) Report

## For

### Sanderson Academy

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
March 29, 2001

**Table 1: Public Water System (PWS) Information**

<i>PWS NAME</i>	<b>Sanderson Academy</b>
<i>PWS Address</i>	<b>808 Cape Street</b>
<i>City/Town</i>	<b>Ashfield, Massachusetts 01330</b>
<i>PWS ID Number</i>	<b>1013001</b>
<i>Local Contact</i>	<b>Principal, Ms. Anne Marie Mislak</b>
<i>Phone Number</i>	<b>413-628-4404</b>

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1013001-01G	255	640	Moderate

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

#### Maintaining Your Good Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## INTRODUCTION

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting or storage, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to you or your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attached Map of the Protection Areas

## 1. DESCRIPTION OF THE WATER SYSTEM

#### Well #1

Sanderson Academy has a total staff and student population of approximately 250 people and is located in a rural setting surrounded primarily by woodland, wetland, rural residential and agricultural land uses. Well 1 is the sole source of water for the school. The well is located on a wooded parcel of land, approximately 700 feet south of Spruce Corner Road and 1,100 feet west of Route 112. A brook and wetland are adjacent to the well with a fire pond approximately 200 feet from the well. The Zone I protective radius for Well #1 is 255 feet and the Interim Wellhead Protection Area (IWPA) radius is 640 feet. The well was developed and tested under the DEP's New Source Approval Process in 1995 at a pumping rate of 10 gallons per minute (gpm). The Zone I and IWPA protective radii are based on the well's approved safe yield of 7.5 gpm (10,800 gallons per day). Please refer to the attached map that shows the Zone I and IWPA.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Well #1 is a 6-inch diameter well drilled to a final depth of 380 feet with steel casing grouted from ground surface to 105 feet below ground; 23 feet into solid bedrock. Bedrock was encountered 83 feet below ground however the drilling logs do not describe the nature of the overburden material drilled through before hitting the bedrock. Bedrock geologic mapping of the area indicates the bedrock is micaceous, quartz/quartzite schist of the Goshen Formation, and that the site is close to the contact between the Goshen and Waits Formation, which is also schist. The pump is set approximately 310 feet below ground. The driller recorded water-bearing zones at 111 feet, 169 feet and 289 feet below ground; under static (non-pumping) condition water freely flowed out of the top of the casing. Following completion of the well, a hole was drilled in the side of the casing to allow the overflow to freely flow out onto the ground. Recently a pitless adapter and casing drain were installed to eliminate the free flowing water onto the ground. The ground around the wellhead was raised and graded away from the casing to eliminate ponding of water near the wellhead. The School has applied for and received a Wellhead Protection Grant from the Department to install a wellhouse and fencing around the wellhead to prevent access and conduct other system modifications.

The sanitary seal around the wellhead, the relatively deep overburden and the flowing artesian condition of the well provide some protection from potential surface sources of contamination. However, there is no evidence of a clay layer or significant barrier to contaminants. Bedrock wells drilled in these conditions are considered to be moderately vulnerable to potential contamination from the ground surface.

### Water Quality

The Sanderson Academy well water does not require and does not have treatment at this time. For current information on monitoring results, please contact the Principal, Ms. Anne Marie Mislak listed above.

## 2. DISCUSSION OF LAND USES IN THE PROTECTION AREAS

There are very few land uses and activities within the drinking water supply protection areas that are potential sources of contamination. The school's current operator is diligent in monitoring activities that may pose a threat to the school's water supply. The water source for the school is generally well protected. Please refer to Table 2.

**Table 2: Activities within the Water Supply Protection Areas**

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
School	Agricultural activities	No	Yes	Moderate	Haying and cattle grazing within the IWPA has minimal threat to the water quality provided they are properly managed. Monitor activities.
	School and Recreational Activities	No	Yes	Low	Continue policy of no fertilizer or pesticide usage. Passive recreation.
Highway Department	Covered Municipal Salt Shed	No	No	Moderate	Although the shed is outside of the IWPA, runoff may flow past the well.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Key issues include:

1. Agricultural activities
2. The Town's Salt Shed is topographically upgradient from the well

Currently, there are no non-conforming activities within the Zone I. The overall susceptibility ranking of the well to contamination is moderate, based on the presence of at least one moderate threat land use or activity in the IWPA.

1. **Agricultural activities** – The wet meadow, south and east of the well is hayed and sometimes used for animal grazing. Haying poses minimal threat to the water quality, provided that no fertilizers or soil enhancers are used. Although, animal grazing poses a more significant potential threat, animals are kept outside of the Zone I and surface water drainage from the wet meadow flows away from the well.

✓ **Recommendation** - The school must be diligent in ensuring grazing is kept outside of the Zone I and buffers are maintained along the surface waters to protect water quality.

2. **Town's Salt Shed** – The aerial photograph (map) attached to this report was taken in 1997. Therefore the salt shed does not appear on the photograph. The shed is located south of the well, just outside of the IWPA at the end of the long driveway that does appear on the map.

Although the salt shed is covered and the tarmac is paved, there is no drainage control at the facility. The site visit for the assessment was conducted in the winter, and significant runoff from the site was observed flowing off of the tarmac toward the wetland to the north. The potential threat from the covered salt shed would be minimal provided the runoff from the site is controlled. However, the current conditions pose a potential threat to the well from runoff. Additional concern regarding the facility comes from the potential storage of vehicles or equipment at the facility. Release of hydraulic fluid, fuel or other petroleum products from the loaders and sanders should be monitored and controlled. Careful consideration must be made of the activities conducted within the IWPA and adjacent land that may impact the well.

✓ **Recommendation** - The IWPA provides interim protection for a water supply well but the actual recharge area to the well may be significantly larger or smaller. Therefore, the Town should carefully consider the activities conducted in the vicinity of the well, prohibit those that pose a significant threat to the public water supply and use Best Management Practices and controls for those activities that are allowed in this area.

The Department can offer technical assistance to the Town to determine what types of activities should be prohibited and/or controlled within close proximity to the well and the Best Management Practices that should be employed for those activities that will be allowed.

Other activities noted during the assessment:

A small portion of the school and recreational fields are within the IWPA of the well. Generally, schools pose a moderate threat. However, due to the distance from the well, the fact that no

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### **For More Information:**

Contact Catherine V. Skiba at DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

Copies of this assessment have been provided to the water supplier, town boards, the town library and the local media.

fertilizers or pesticides are used on the lawns, the relatively thick overburden and (static) upward gradient in the aquifer, the recreational activities represent a low potential threat to the well.

There is also low-density, residential use within the vicinity of the school well. In general, normal residential activities pose a low threat to public and private water supplies. The use of best management practices minimizes the potential threats to both private and public wells. Therefore, the Town should encourage and educate Town residents in the judicious use and management of pesticides and petroleum products, maintenance of septic systems and management of animal manure.

Implementing the following recommendations will help minimize the system's susceptibility to contamination.

### **3. PROTECTION RECOMMENDATIONS**

The Sanderson Academy and Town of Ashfield should review and adopt the following recommendations.

#### **Zone I and IWPA:**

- ✓ Secure the wellhead area with a fence.
- ✓ Contain or control all materials that could pose a potential hazard to public water supplies.

- ✓ Control the runoff from the salt shed.
- ✓ Restrict animal grazing to outside of the Zone I and maintain buffers along wetlands and waterways. Attached are several fact sheets regarding pasture and manure management. Although these fact sheets were prepared primarily for family or hobby horse owners, the information is general in applicability.
- ✓ Work with the Selectmen, Board of Health and Planning Board to monitor land uses within and proximal to the IWPA. Refer to the Wellhead Protection Plan guidance and the model bylaws for types of activities that should be prohibited and managed in the vicinity of public or private water supplies.
- ✓ Post drinking water protection area signs at key visibility locations of the Zone I.
- ✓ Keep all non-water supply activities out of the Zone I.
- ✓ Continue to conduct regular inspections of the Zone I and IWPA. Look for illegal dumping and evidence of vandalism.

#### **Training and Education:**

- ✓ Train staff on proper hazardous material use, storage, use, disposal, emergency response, and best management practices. Include custodial staff, groundskeepers, certified operator, and food preparation staff in the training. To learn more, see the hazardous materials guidance manual at [www.dep.state.ma.us/dep/bwp/dhm/dhmpubs.htm](http://www.dep.state.ma.us/dep/bwp/dhm/dhmpubs.htm). Also contact Hilary Eustace of the Massachusetts Office of Technical Assistance at 617-626-1061 or [Hilary.Eustace@state.ma.us](mailto:Hilary.Eustace@state.ma.us).
- ✓ Arrange to have potentially hazardous materials (i.e. floor stripping residuals) disposal available for the school staff, primarily the custodial staff, either through the Town's hazardous waste collection days or through other means. The school may have to register as a Very Small Generator of Hazardous Waste to dispose of small quantities of hazardous materials.
- ✓ Incorporate groundwater education into the school's curriculum (K- Grade 6 curricula available from DEP; DEP can suggest other agencies' curricula as well).

#### **Facilities Management:**

- ✓ Implement standard operating procedures regarding proper storage, handling, use and disposal of potentially hazardous materials.
- ✓ Septic system components should be inspected and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Due to the age of the school it is highly improbable that PCBs are present, however the fluids required in the transformers are oils. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

**Planning:**

- ✓ Work with local officials in Ashfield to assist you in improving and maintaining protection of the school's water supply.
- ✓ It is recommended that the Town consider zoning bylaws to protect the public water supply area for the school. Refer to the Department's model bylaws for examples of activities that should be prohibited within the Wellhead Protection Areas and those that should be restricted or controlled. Utilize BMPs where appropriate.
- ✓ Prepare a Wellhead Protection Plan and Emergency Response Plan to address short-term water shortages, long-term water demands and management. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional, new information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion to promote local drinking water protection measures for all public and private water supplies.

- Draft Land/Associated Contaminants Matrix

**Massachusetts Department of Environmental Protection**  
**Source Water Assessment and Protection (SWAP) Report**  
**for**  
**Athol DPW, Water Division**

### What is SWAP?

The Source Water Assessment Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### **Purpose of this report:**

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

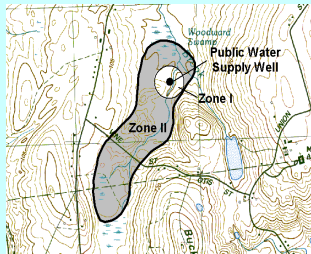

#### **This report includes the following sections:**

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

## Section 1: Description of the Water System

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

#### Zone II #: 469

*Susceptibility:* High

Well Names	Source IDs
South Street Well #1	2015000-01G

#### Zone II #: 406

*Susceptibility:* High

Well Names	Source IDs
Tully Well #1	2015000-02G
Tully Well #2	2015000-03G
Tully Well #3	20154000-04G

The town of Athol gets its water supply from four wells. One well, the South Street well was installed along the Millers Rivers in 1961. The well is located off South Street just southwest of downtown Athol. The well is an 18-inch diameter, gravel packed well installed to a depth of 90 feet below grade. The other three wells, the Tully Brook wellfield are located off Pinedale Street also in the Town of Athol, adjacent to the West Branch of the Tully River. Each well has a Zone I of 400 feet. According to a Bedrock Geologic Map of Massachusetts, the area near the South Street is underlain by massive biotite-plagioclase gneiss, amphibolite and microcline augen gneiss. The area is characterized by extensive kame and kame terrace deposits. These deposits were created by the action of meltwater streams within and beside glacial ice. The study area is composed of predominantly fine-grained, relatively homogeneous soil units. Specifically, the surficial material consists of fill, fine to coarse sand, silt to very fine sand and till. The wells are located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers (i.e. clay) that can prevent contaminant migration. Please refer to the attached map to view the boundaries of the Zone II.

Water from the South Street well is treated through a GAC contactor system consisting of three pressure type carbon contactor vessels. Following carbon treatment, chlorine is added for disinfection, sodium hydroxide is added to adjust the pH, orthophosphate is added for corrosion control, fluoride is also added. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data are also available on the web at <http://www.epa.gov/safewater/ccr1.html>.

## Section 2: Land Uses in the Protection Areas

The Zone IIs for Athol is a mixture of residential, commercial, and light industrial land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Inappropriate activities in Zone I
2. Residential land uses
3. Transportation corridors
4. Hazardous materials storage and use
5. Oil or hazardous material contamination sites
6. Comprehensive wellhead protection planning

The overall ranking of susceptibility to contamination for the system is high, for all the wells, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Inappropriate Activities in Zone Is** – The Zone I for each of the wells is a 400 foot radius around the wellhead. Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Of the four (4) Zone Is for the wells, only one of the Zone Is (01G) is owned or controlled by the public water system. Only water supply activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and contain non water supply activities such as homes and public roads. The following non water supply activities occur in the Zone Is of the system wells:

**Zone I: South Street Well 2015000-01G** - The well has been in operation since the early 1960s. The Zone 1 contains a pond, where fishing and boating occur.

**Zone 1: Tully Wells 02G, 03G & 04G**– The owner does not own or control the Zone 1s for these wells. These wells are located adjacent to Tully Brook where fishing occur.

#### Zone I Recommendations:

- ✓ To the extent possible, remove all non water supply activities from the Zone Is to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such

as water supply chemicals and maintenance chemicals.

- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non water supply activities out of the Zone I.

**2. Residential Land Uses** – Approximately 35% of the Zone IIs consist of residential areas. Only some of the areas have public sewers, so all homes use septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

2A and Route 32 run through the Zone IIs. Local roads are common throughout the Zone IIs. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catchbasins.

#### Transportation Corridor Recommendations:

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

#### 4. Hazardous Materials Storage and Use –

Approximately thirteen (13) percent of the land area within the Zone II is commercial or industrial

(Continued on page 7)

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### Source Protection Decreases Risk

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Activities	Quantity	Zone 11 #	Threat*	Potential Source of Contamination
<b>Commercial</b>				
Car/Truck/Bus Washes	2	469	L	Vehicle wash water, soaps, oils, greases, metals, and salts: improper management
Body Shops	2	469	H	Vehicle paints, solvents, and primer products: improper management
Gas Stations	4	469	H	Automotive fluids and fuels: spills, leaks, or improper handling or storage
Service Stations/ Auto Repair Shops	3	469	H	Automotive fluids and solvents: spills, leaks, or improper handling
Boat Yards/Builders		469	H	Fuels, paints, and solvents: spills, leaks, or improper handling
Cemeteries	2	469	M	Over-application of pesticides: leaks, spills, improper handling; historic embalming fluids
Dry Cleaners	1	469	H	Solvents and wastes: spills, leaks, or improper handling
Funeral Homes	2	469	L	Hazardous chemicals: spills, leaks, or improper handling
Laundromats	1	469	L	Wash water: improper management
Medical Facilities	1	469	M	Biological, chemical, and radioactive wastes: spills, leaks, or improper handling or storage
Photo Processors	1	469	H	Photographic chemicals: spills, leaks, or improper handling or storage
Printer And Blueprint Shops	3	469	M	Printing inks and chemicals: spills, leaks, or improper handling or storage
Railroad Tracks And Yards	---	469	H	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or
Repair Shops (Engine, Appliances,	1	469	H	Engine fluids, lubricants, and solvents: spills, leaks, or improper handling or storage
Research Laboratories	1	469	M	Laboratory chemicals and wastes: spills, leaks, or improper handling or storage

Activities	Quantity	Zone II #	Threat*	Potential Source of Contamination
<b>Industrial</b>				
Chemical Manufacture Or Storage	4	469	H	Chemicals and process wastes: spills, leaks, or improper handling or storage
Electroplaters	1	469	H	Solvents and other chemicals: spills, leaks, or improper handling or storage
Hazardous Materials Storage	1	469	H	Hazardous materials: spills, leaks, or improper handling or storage
Industry/Industrial Parks	1	469	H	Industrial chemicals and metals: spills, leaks, or improper handling or storage
Jewelry or Metalplating	1	469	H	Solvents, other chemicals, and process wastes: spills, leaks, or improper handling or storage
Machine/Metalworking Shops	4	469	H	Solvents and metal tailings: spills, leaks, or improper handling
Metal and Drum Cleaning/Reconditioning	2	469	H	Residual chemicals in used drums and solvents: spills, leaks, or improper handling or storage
<b>Residential</b>				
Fuel Oil Storage (at residences)	Several		M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Several		M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	8		M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>				
Aboveground Storage Tanks	5		M	Materials stored in tanks: spills, leaks, or improper handling
Aquatic Wildlife	---		L	Microbial contaminants
Fishing			L	Fuel and other chemical spills, microbial contaminants
Large Quantity Hazardous Waste	3		H	Hazardous materials and waste: spills, leaks, or improper handling or storage
NPDES Locations	1		L	Hazardous material and wastes: improper disposal
Oil or Hazardous Material Sites	4		--	Tier Classified Oil or Hazardous Materials Sites are not ranked due to their site-specific character. Individual sites are identified
Road And Maintenance Depots	1		M	Deicing materials, automotive fluids, fuel storage, and other chemicals: spills, leaks, or improper handling or storage
Schools, Colleges, and Universities	1		M	Fuel oil, laboratory, art, photographic, machine shop, and other chemicals: spills, leaks, or improper handling or storage
Small quantity hazardous waste generators	3		M	Hazardous materials and waste: spills, leaks, or improper handling or storage

land uses. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure “Industrial Floor Drains” for more information.

**5. Presence of Oil or Hazardous Material Contamination Sites** – The Zone II contains DEP Tier Classified Oil and/or Hazardous Material Release Sites indicated on the map as Release Tracking Numbers 2-12490, 2-10498, 2-10902, 2-13107. Refer to the attached map and Appendix 3 for more information.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.

**6. Autobody shop** — Chemicals such as paints and thinners are used in the nearby auto body shop. Water from the auto repair shop flows into a floor drain located in the shop.

**Recommendations:**

- ✓ The owner of the autobody shop should be made aware of the location of the source of drinking water.
- ✓ Work with the autobody shop to ensure that Best Management Practices are used for the storage, use, and disposal of all paints and solvents.
- ✓ Contact the UIC coordinator for the Central Region Office of the Department

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

for additional technical assistance (Kurt Jacobson Tele. # 508.767.2731).

**7. Septic system**– Septic systems for residential homes lie within the IWPA of the water supply. A neighbor’s septic system and the septic system for the condominium building are located within the IWPA. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the water supply.

**Recommendations:**

- ✓ The neighbors should be made aware of the location of the source of drinking water.
- ✓ The residents should be instructed to participate with the Town of Leicester in its household hazardous waste collection to discard of spent chemicals.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.

Other land uses and activities within the Zone II that have include auto repair shops, gas stations, Machine shops, Residential fuel oil storage, Septic

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>YES</b>	Continue monitoring non-water supply activities in Zone Is.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>YES</b>	The Town "Aquifer Protection District" bylaw meets DEP's best efforts for wellhead protection. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws and health regulations, and current regulations.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>NO</b>	Work with neighboring municipalities to include Zone IIs in their wellhead protection controls.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>YES</b>	Develop a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>YES</b>	Establish committee; include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>YES</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>YES</b>	Aim additional efforts at commercial, industrial and municipal uses within the Zone II.

systemsPrinter and Blueprint Shops, Dry Cleaners, Gas Stations, Bodyshops, Service Stations/Autobody Repair Shops, Golf Courses and an Elementary school. Refer to Table 2 and Appendix 2 for more information about these land uses.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### Section 3: Source Water Protection Conclusions and Recommendations

#### Current Land Uses and Source Protection:

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- The implementation of land site use questionnaire for builders applying for building permits.

#### Source Protection Recommendations:

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water

#### For More Information

Contact Anita Wolovick in DEP's Wilmington Office at (978) 661-7768 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

- supplies.
- ✓ Develop and implement a Wellhead Protection Plan.

#### Conclusions:

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

#### What is a Zone III?

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Snow Dump	1	All	M	Melt water containing de-icing and other chemicals from roads and parking lots: improper handling
Stormwater Drains/ Catch basins	Several	All	L	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Schools, Colleges, and Universities	1	469	M	Fuel oil, laboratory, art, photographic, machine shop, and other chemicals: spills, leaks, or improper handling or storage
Small quantity hazardous waste generators	3	All	M	Hazardous materials and waste: spills, leaks, or improper handling or storage
Snow Dump	1	469	M	Melt water containing de-icing and other chemicals from roads and parking lots: improper handling
Transmission Line Rights-of-Way - Type:	1	406	L	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors	2	All	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Utility Substation Transformers	1	406	L	Chemicals and other materials including PCBs: spills, leaks, or improper handling
Very Small Quantity Hazardous Waste Generator	9	All	L	Hazardous materials and waste: spills, leaks, or improper handling or storage
Wastewater Treatment Plant/Collection Facility/	1	406	M	Treatment chemicals or equipment maintenance materials: improper handling or storage; wastewater: improper

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitelist.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
2-0013707	223 MAIN ST	ATHOL	Oil and Hazardous Material
2-0013017	SANDERS ST	ATHOL	Oil

2-0010902	11 EXCHANGE ST	ATHOL	Oil and Hazardous Material
2-0010498	243 MAIN ST	ATHOL	Oil

For more location information, please see the attached map. The map lists the release sites by RTN.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report For BECKET SPRING

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 3, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Becket Spring
<i>PWS Address</i>	557 Main Street
<i>City/Town</i>	Becket, Massachusetts
<i>PWS ID Number</i>	1022001

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I (feet)</i>	<i>Zone II</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1 Spring	122001-01G	271	Refer to the map	Moderate	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and a Contribution Area or Zone II. The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The Contribution Area is the larger area that is likely to contribute water to the spring. Refer to **Figure 1** on page 2 for an example of a Zone I and Contribution Area.

The Contribution Area of Zone II is the primary recharge area for the aquifer and the spring source. This area was defined by hydrogeologic study conducted for the MA DEP SWAP program by the USGS. The Zone II was approved by DEP. Refer to the attached map to determine the land within your Zone II.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Contribution Area (Zone II). Please see the enclosed map for your well's Zone I and Zone II areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source Protection  
Area for Well #1 Spring  
(1022001-01G)**

Zone I = 271 ft.  
Refer to map for the  
Contribution Area

## What is a Protection Area?

A spring's water supply protection area is the land around the spring where protection activities should be focused. Each spring has a Zone I protective area and a contribution area (Zone II).

## How was my Well's Susceptibility Determined?

Your spring's **moderate** susceptibility to potential microbial threats is based on the septic system components within the Zone II contribution area. The **moderate** susceptibility to potential non-microbial threats is based on the local road and residence within the Zone II contribution area.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

## Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
BONNY RIGG INN

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 18, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Bonny Rigg Inn
<i>PWS Address</i>	71 Chester Rd
<i>City/Town</i>	Becket, Massachusetts
<i>PWS ID Number</i>	1022004

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1022004-01G	100	414	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1022004-01G)**

Zone I = 100 ft.  
IWPA = 414 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and the IWPA. The **high** susceptibility to potential non-microbial threats is based on the fuel oil storage tanks, local roads and parking within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
CAMP WATITOH

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 10, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Camp Watitoh
<i>PWS Address</i>	State Route 8
<i>City/Town</i>	Becket, Massachusetts
<i>PWS ID Number</i>	1022006

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1022009-01G	239	587	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #  
1 (1022006-01G)**

Zone I = 239 ft.  
IWPA = 587 ft.

### How Was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components and leachfields within the Zone I and the IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and vehicle parking within the Zone I and above ground fuel oil storage within the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Reports, water quality data, Sanitary Survey and other sources of information. DEP has not verified the accuracy of the information submitted by you with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Becket/Washington School

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 31, 2003

**Table 1: Public Water System (PWS) Information**

<i><b>Well Name</b></i>	<i><b>Source ID#</b></i>	<i><b>Zone I (in feet)</b></i>	<i><b>IWPA</b></i>	<i><b>Source Susceptibility</b></i>
Well #2	1022011-02G	158	454	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses in the Protection Areas
3. Protection Recommendations
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Becket/Washington School is a small, rural school with a total student and staff population of approximately 245 people per day, located on the corner of Main Street and Maple Road in the town of Becket, Massachusetts. The school is located between Yokum Brook to the west and a steep embankment to the southeast. The school is located just south of the confluence of Yokum Brook and the West Branch of the Westfield River. Becket is a residential, recreational community situated in the Berkshire Hills in eastern Berkshire County. The Town of Becket does not have

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The Zone II** The primary recharge area defined by a hydrogeologic study.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

municipal water or sewer; therefore, the school operates a single public water supply well and disposes of wastewater through an on-site septic system. The school uses propane as a heating fuel and has storage tanks adjacent to the school. Recently, the school underwent an expansion that included the replacement of the original school Well #1 (01G) with Well #2 (02G). There was little information regarding the depth or construction of 01G. That well is believed to have been the original shallow dug well for the site that had been a hotel built in the late 1880s. The well was located beneath the loading dock of the school. The original school was constructed in 1940 with an addition built in 1980 with the most recent addition completed in 2002. The new school Well #2 (02G), is a 6-inch diameter, 395-foot deep bedrock well that is located approximately 125 feet from the addition to the school building. The well casing is finished above grade and is located near the school playground. The Department agreed upon the location of the replacement source after the school was unable to secure land for a well conforming to Zone I requirements. Well #1 is to be abandoned as a water source and decommissioned; that source has been designated as an emergency source and Well #1 will not be discussed further in this report.

The Zone I is the protective area immediately surrounding the source and is assumed to contribute recharge to the source. The Zone I for individual wells is a circle centered on the well with a radius ranging from 100 to 400 feet based on the approved withdrawal rate from the well. An Interim Wellhead Protection Area (IWPA) is a primary recharge area designated for a groundwater source when the Zone II has not yet been delineated. The actual recharge area for a well may be significantly larger or smaller than the IWPA. The Zone I and IWPA protective radii for Well #1 are 158 feet and 454 feet, respectively. The protective radii for the well were based on an approved withdrawal rate determined through a pumping test as part of the New Source Approval Process. As previously noted, the school was recently expanded and the original well replaced. The fuel oil UST was removed (the heating system was converted to propane) and the septic system was upgraded; the leachfield is located across the street, outside of the protection areas.

Geologic mapping and field observations indicate the school is located in the Berkshire uplands with thin till overburden covering the bedrock. Sand and gravel deposits are mapped just north of the school in the Westfield River valley, but drilling logs and observations of bedrock outcrops confirm thin overburden at the site. Drilling indicated a relatively thin layer (13 feet) of sandy loam, most likely alluvium over fractured bedrock. Sound bedrock was encountered at approximately 25 feet below grade. The bedrock structure is mapped as a complex series of folds and faults

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-	-	Contact DEP prior to conducting any work in Zone I or expanding the system/facility.
Septic system components	Yes	Yes	Moderate	Maintain septic systems.
Transportation corridors and school parking	No	Yes	Moderate	Control the use of deicers and coordinate with emergency response personnel. Monitor for leaks and spills near the well.
School	Yes	Yes	Moderate	Use BMPs for school facilities.
Residential	No	Yes	Moderate	Provide information on BMPs.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

with bedrock mapped as various metamorphic rocks of the Taconic-Berkshire Zone. The bedrock in the immediate vicinity of the school is mapped as Tyringham Gneiss. There is no evidence of a continuous confining, clay layer or a thick till layer in the immediate vicinity of the well. Wells located in these conditions are considered to be located in aquifers with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from activities on the ground surface. Please refer to the attached map of the Zone I and IWPA.

The water from the well is not treated prior to distribution. The DEP requires public water suppliers to regularly monitor the quality of the water. For current information on monitoring results and treatment, please refer questions to the Public Water System contact person listed above in Table 1 for the most recent information. Drinking water monitoring reporting data is also available at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html), the EPA's website for Envirofacts.

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

## 2. Discussion of Land Uses in the Protection Areas

There are some land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **School/Institutional facilities;**
3. **Residential; and**
4. **Transportation corridor/parking.**

The overall ranking of susceptibility to contamination for the system is moderate, based on the presence of at least one moderate threat land use or activity in the IWPA of the well, as seen in Table 2.

**1. Non-conforming Zone I** – Well #1 has a non-conforming Zone I with respect to ownership and activities within the Zone I. There is a play structure within the Zone I of Well #1 however, the DEP may allow some passive recreation and other non-threatening activities within the Zone I. The DEP approved this replacement source with a non-conforming Zone I as part of the school upgrade and improvement to replace a more vulnerable shallow well. There are also non-conforming activities in the Zone I, such as part of a tennis court and the school.

### Recommendations:

- ✓ Continue to work toward prohibiting/limiting activities in close proximity to the well and using BMPs to protect the water supplies.
- ✓ Do not allow any additional non-conforming activities within Zone I. Inspect the well cap regularly to ensure the security of the cap and that there is no standing water at the well.
- ✓ Monitor the runoff from the parking area and roadways to ensure there is no runoff directed toward the well.
- ✓ If Well #1 has not been decommissioned yet, contact the Springfield Regional office of the DEP for assistance.

**2. School/Residential and Institutional use**– The school facilities, several residential properties, a church and the library are within the Zone I or IWPA of the well. Elementary schools and these institutional facilities generally use only household hazardous materials and the recommendations for small schools are similar to those for residents. There are state and federal controls on some activities and products used at schools to promote “healthy schools”. Potential exists for contamination of the well by onsite use of cleaning materials, petroleum from lawn equipment, fertilizers, and pesticides. Storm drains in the parking areas or the roads and residences drain directly into the ground or to the brook. If managed

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

Copies of this assessment have been made available to the public water supplier and town boards.

improperly, activities associated with residences and the school can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, petroleum products for home equipment and lawn maintenance equipment and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they could be a potential source of microbial contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at the following MADEP website <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

#### School/Institutional and Residential Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and online at [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), the MA DEP website which provides BMPs for common residential issues.
- ✓ Continue the use and maintenance of BMPs for activities within close proximity to the well.
- ✓ Continue to prohibit the use of pesticides or fertilizers within the Zone I of the well. Consider the use of Integrated Pest Management to minimize the use of pesticides and nutrients in fertilizers.
- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields across the street. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.

- ✓ Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Review your emergency response plan regarding accidental releases within the area. Ensuring that emergency responders in town are aware of the locations of your resource areas.
- ✓ Refer to the Massachusetts Public Health Association's Healthy Schools website at the following website [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html) for additional information
- ✓ Prepare a policy and a plan for maintenance operation regarding the boiler. DEP recommends that you require your boiler maintenance contractor to use containment and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should also be responsible for the off-site disposal of any boiler blow down generated during maintenance.

**6. Transportation corridor and parking** – The parking areas for the school as well as Main Street and Maple Street are within the IWPA of the well. Most of these activities are topographically downgradient of the well. Accidents and normal

use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets.

**Recommendations:**

- V Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they are aware of the location of your well.

### **3. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will reduce the source's susceptibility to contamination. The School is commended for utilizing propane as a fuel source and working to provide a more protective source at the school. The DEP encourages continued diligence in monitoring activities within and near protection areas. The water supplier should review and adopt the key recommendations above.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the program fact sheet. If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS in Pittsfield at 413-443-6867 ext. 3 or assistance. This may be appropriate for the local Highway Department.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
YMCA CAMP BECKET

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 3, 2004

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	YMCA Camp Becket
<i>PWS Address</i>	48 Hamilton Rd
<i>City/Town</i>	Becket, Massachusetts
<i>PWS ID Number</i>	1022019

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1 Infirmary Well	1022019-01G	190	489	High	Moderate
Well #2 Kitchen Well	1022019-02G	235	578	High	High

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
Infirmary Well (1022019-  
01G)**

Zone I = 190 ft.  
IWPA = 489 ft.

## How was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic system components within the Zone Is / IWPA's. The **high** susceptibility to potential non-microbial threats for Well #2 is based on the local roads, parking, and maintenance garage within the Zone I and/or the IWPA. The **moderate** susceptibility to potential non-microbial threats for Well #1 is based on the absence of local roads, parking, or other threats within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your 2000 Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report For Kushi Institute

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 4, 2001

East Well	02G	135	438	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas
5. Appendix

## 1. Description of the Water System

The 2 wells for the facility are located near the driveway, northeast of the dormitory. West well has a Zone I of 165 feet and an Interim Wellhead Protection Area (IWPA) of 460 feet. East well has a Zone I of 135 feet and an IWPA of 438 feet. The two wells are within close proximity to one another, approximately 35 feet apart. The public water system for the facility also includes the Mountain Spring 1022027-03G, an emergency source that is currently disconnected from the system and not included in this report. The IWPAs provide an interim protection area for water supply wells when the actual recharge areas have not been delineated. The actual recharge areas to the wells may be significantly larger or smaller than the IWPAs.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

USGS mapping shows the area as till over bedrock, with the structural geology mapped as complex folds and faults of gneissic formations. The wells are located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone Is and IWPAs. The well serving the facility has no treatment at this time. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1.

At the time this report was prepared, the well water for Kushi Institute does not require and does not have treatment. The DEP requires public water suppliers to monitor the quality of the water. For current monitoring results, please refer questions to the local contact identified in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Nonconforming Activities in Zone Is;**
2. **Confirmed Hazardous Materials/Oil Release Sites;**
3. **Aboveground Storage Tanks (ASTs) With Heating Oil;**
4. **Floor drains in boiler rooms;**
5. **Septic system in IWPA; and**
6. **Improper storage of household hazardous materials.**

The overall ranking of susceptibility to contamination for the well is high, based on the presence of many moderate threat land uses or activities in the IWPA, as seen in Table 2.

**1. Zone Is** – Currently, the wells do not meet DEP's restrictions, which only allow water supply related activities in Zone Is. The West and East wells' Zone I contain a 22-room dormitory, driveways and waste transfer stations (dumpsters). Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems. Kushi reportedly has relocated the dumpsters further away from the wells.

#### Recommendations:

- ✓ Since Kushi Institute owns much of the land in the surrounding area. Consider installing a well in a location away from the facility.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Fuel Storage - Above Ground	No	Both wells	High	Oil tanks should be at 110% containment
Waste Transfer Stations	Both wells	Both wells	Moderate	Relocate dumpsters outside of the Zone I
Confirmed hazardous materials/oil release sites (2) - (tank overfills)	No	Both wells	**	RTN 1-0012103 and 1-0012229, Tier 1B; See Appendix A
Floor Drains in boiler room	Both wells	Both wells	Moderate	Bring the floor drains into compliance with Department Regulations
Septic System	Both wells	Both wells	Moderate	See septic systems brochure in the appendix
Storage of household hazardous materials	No	Both wells	Moderate	Provide secondary containment; do not store in area of basement with dirt floor
Parking lot, driveways & private access roads	No	Both wells	Moderate	Limit road salt usage and provide drainage away from wells

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/). \*\* - See Appendix A.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

- ✓ Do not use or store pesticides, fertilizers, petroleum products (including equipment that use petroleum) or road salt within the Zone I.

**2. Confirmed Oil Release Site** - The IWPA's of both wells contain DEP Bureau of Waste Site Cleanup Tier 1B Classified Oil and/or Hazardous Material Release sites indicated on the map as Release Tracking Numbers 1-0012103 and 1-0012229. The releases of oil were discovered after the filling of ASTs in November 1997 and March 1998 respectively. Contaminated soil was removed from both sites. For further information on the status of both of these spills, please contact the DEP-Bureau of Waste Site Cleanup at 413-784-1100. For information regarding the location of the site refer to the attached map. Appendix A includes additional information regarding the Massachusetts Contingency Plan (MCP) and where additional information is available.

### Recommendation:

- ✓ Comply with the requirements of the MCP process and continue monitoring as prescribed by DEP.

**3. Aboveground Storage Tank (AST)** – There are three ASTs located within the IWPA's containing heating oil. If managed improperly, Aboveground Storage Tanks can be a potential source of contamination due to leaks or spills of the chemicals they store. None of the tanks have containment.

### Recommendations:

- ✓ Aboveground storage tanks in your IWPA should be located on an impermeable surface and contained in an area large enough to hold 110% of the liquid volume, should a spill occur.
- ✓ Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices. Any modifications to the AST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs. Diligently monitor the delivery of oil.

**4. Floor Drain in boiler room** - Floor drains in an area that contains hazardous materials must be sealed or discharged to a tight tank or a sewer. It is not known whether the floor drain in the boiler room discharges to a dry well or the septic system. The floor drain must therefore either be sealed or connected to a tight tank since there is no sanitary sewer available.

### Recommendations:

- 3 Bring the floor drains into compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - \* Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207).
  - \* Interim Actions: cease using the floor drains.
- ✓ Install a containment structure around the ASTs to contain 110% of the tank volume near the boiler to protect from any potential oil leaks caused by overfill or tank failure.

**5. Septic System in IWPA's** – Within the IWPA's of both wells are three leach fields; two are in use and one is disconnected from the system. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste.

### Recommendations:

- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Western Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

- ✓ Avoid septic tank cleaners, especially those with acids and solvents.

**6. Improper storage of hazardous household materials** – Paint, wood stains and varnishes, and used oil were found stored on open shelves in small basement room with a gravel and dirt floor.

#### Recommendations:

- ✓ Store in area with a sealed floor and within stable, enclosed cabinets.
- ✓ Provide secondary containment for storage of potentially hazardous items.

Other issues noted during the site visit were lawn maintenance equipment and gasoline being stored within the Zone I behind the dormitory. These should be contained and removed from the Zone I.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Kushi Institute should review and adopt the key recommendations above and the following:

#### Priority Recommendations:

- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Seal the floor drains in the boiler rooms or provide a tight tank. (See attachment)
- ✓ Provide proper storage and containment for ASTs and hazardous materials.

#### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Protect the well by using secure well caps and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism; check any above ground tanks for leaks, etc.
- ✓ Redirect road and parking lot drainage in the Zone I away from well.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Consider upgrading to propane gas for an alternate fuel or back-up power source.

#### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations such as parking areas.

#### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, refer to <http://www.state.ma.us/dep/bwp/dhm/files/sqgsum.pdf>.
- ✓ Eliminate non-sanitary wastewater discharges to on-site septic systems. Instead, in

areas using hazardous materials, discharge drains to a tight tank or seal floor drains.

- ✓ Remove hazardous materials from rooms or store them in a contained area.
- ✓ Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ Concrete or earthen collars around wellheads should slope away from well and the well casing should extend above ground.

#### Planning:

- ✓ Work with local officials in Becket to include the IWPA's of Kushi Institute in Aquifer Protection District Bylaws.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.

- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
LANE FARM ROAD

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 13, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Lane Farm Road
<i>PWS Address</i>	Lane Farm Road
<i>City/Town</i>	Becket, Massachusetts
<i>PWS ID Number</i>	1022029

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Lane Farm Road Well	1022029-01G	100	408	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for LANE  
FARM ROAD WELL  
(1022029-01G)**

Zone I = 100 ft.  
IWPA = 408 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on buildings and access road and parking within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
BECKET TOWN HALL

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Becket Town Hall
<i>PWS Address</i>	557 Main St
<i>City/Town</i>	Becket, Massachusetts
<i>PWS ID Number</i>	1022030

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1022030-01G	100	409	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1022030-01G)**

Zone I = 100 ft.  
IWPA = 409 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **high** susceptibility to potential non-microbial threats is based on the underground fuel oil storage tank in the IWPA. Moderate threats are parking and local roads within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Belchertown Water District**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i><b>PWS Name</b></i>	Belchertown Water District
<i><b>PWS Address</b></i>	206 Jabish St., PO Box 801
<i><b>City/Town</b></i>	Belchertown
<i><b>PWS ID Number</b></i>	1024000
<i><b>Local Contact</b></i>	Mr. Timothy Lofland
<i><b>Phone Number</b></i>	413-323-6987

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

## Section 1: Description of the Water System

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Groundwater Sources

#### *Zone II #: 208*

*Susceptibility: High*

<i>Well Name</i>	<i>Source ID</i>
Daigle Well	1024000-05G

#### *Zone II #: 112*

*Susceptibility: High*

<i>Source Name:</i>	<i>Source ID</i>
Jabish Brook Well #1	1024000-01G
Jabish Brook Well #2	1024000-02G
Jabish Brook Well #3	1024000-03G
Jabish Brook Well #4	1024000-04G

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

Belchertown Water District supply consists of by five groundwater sources: Jabish Brook wells #1, 2, 3, and 4 (1024000-01G, 02G, 03G, and 04G), and Daigle well (1024000-05G). Each well has a Zone I radius of 400 feet. The Jabish Brook wells are located off Johnson Road, east of the center of town. These wells are equipped with submersible pumps and are manifolded together to produce a cumulative yield of 324,000 gallons per day (gpd) with a pumping capacity of 355 gallons per minute (gpm). Well #1 is 16 x 24-inch gravel-packed, 38 foot deep well. Wells 2, 3, and 4 are all 8 x 12-inch gravel packed wells, with depths of 40, 39, and 38 feet respectively. The Daigle well is located off of Federal Street in the northwest section of town. It is a 12 x 18-inch, gravel-packed well with a well screen set to 89 feet to 104 feet below grade, and has an approved yield of 1.3 millions of gallons per day (mgd). The Jabish Brook Wellfield (1024000-06G) is an emergency source and is not addressed in this report, however 06G is proximal to wells 1, 2, 3 and 4.

The Daigle well utilizes water from a confined sand and gravel aquifer, upgradient and in the same formation as the Amherst water supply wells. The bedrock valley was deepened by advancing glaciers and later filled with sand and gravel overlain by silt and clay from glacial Lake Hitchcock and Lake Lawrence some 18,000 years before present. The confining clay layer is primarily contiguous through the center of the buried valley with the clay layer pinching out toward the edges of the aquifer allowing significant recharge along the basin boundaries. The Zone II for this well includes the perimeter of the basin where the silt and clay units are discontinuous and inter-fingered with sand and gravel deposits resulting in a semi-confined recharge area. The Zone II was delineated as required under the Department's New Source Approval Process and was based on conceptual, numerical and analytical modeling of the aquifer. Please refer to the attached map to view the boundaries of the Zone II.

The Jabish Brook wells utilize a different aquifer, and have a different Zone II. These wells are located in a complex depositional environment of outwash deposits and ice-channel sediments exhibiting distinct layers of sand and gravel. This aquifer is semi-confined, with only a partial confining layer of clay or silt.

Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The District is conducting a pilot study on corrosion control using sodium carbonate on the water pumped from the Daigle and Jabish Brook wells. The chemical is injected directly into the discharge line to the distribution system. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data are also available on the web at <http://www.epa.gov/safewater/ccr1.html>.

### For More Information

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

## Section 2: Land Uses in the Protection Areas

The Zone IIs for Belchertown's wells is a mixture of residential, agricultural,

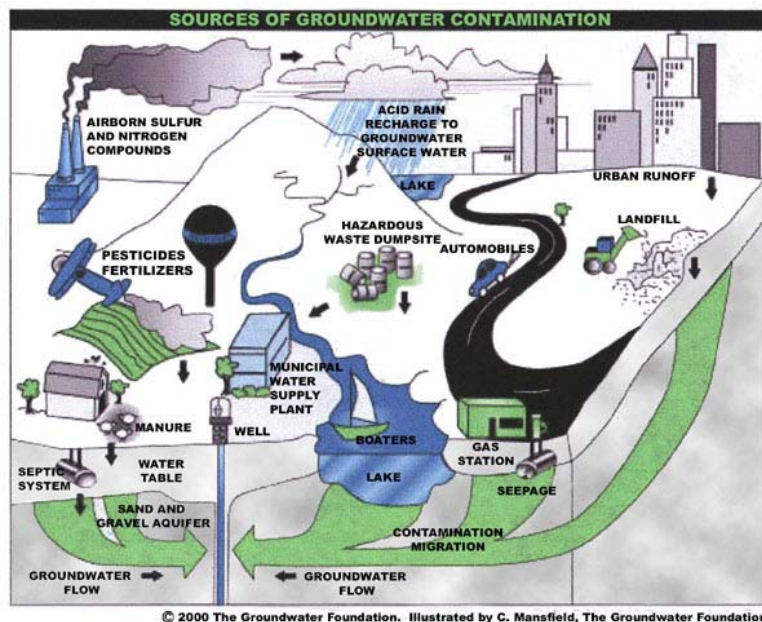

and some light commercial and industrial areas (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Residential land uses
2. Transportation corridors
3. Hazardous materials storage and use
4. Comprehensive wellhead protection planning
5. Agricultural activities

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Residential Land Uses** – Approximately 14% of the Zone II #208 consists of residential areas, and about 38% in the Zone II #112. From this perspective, residential land uses are more of a potential threat within the Zone II #112 than in #208. None of the areas have public sewers; all use septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and

AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.

- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls. Continue catch basin cleaning routines.

**2. Transportation Corridors** - Route 9 and local roads are common throughout the both of the Zone IIs. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catchbasins.

#### Transportation Corridor Recommendations:

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency

response teams. If maps aren’t yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

**3. Hazardous Materials Storage and Use** – A very small percentage (<1%) of the land area within the Zone II #208 is commercial or industrial land uses, about 2% in the Zone II #112. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver

### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal

### Source Protection Decreases Risk

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Zone II Effected	Potential Contaminant Sources*
<b>Agricultural</b>				
Dairy Farms	1	Moderate	208	Manure (microbial contaminants): improper handling
Fertilizer Storage or Use	Numerous	Moderate	208	Fertilizers: leaks, spills, improper handling, or over-application
Livestock Operations	4	Moderate	208	Manure (microbial contaminants): improper handling [2 horse farms, 1 emu farm, 1 rabbit farm]
Nurseries	1	Moderate	208	Fertilizers, pesticides, and other chemicals: leaks, spills, improper handling, or over-application [1 Greenhouse]
Pesticide Storage or Use	Numerous	High	208	Pesticides: leaks, spills, improper handling, or over-application
<b>Commercial</b>				
Gas Stations	1	High	208	Automotive fluids and fuels: spills, leaks, or improper handling or storage
Service Stations/ Auto Repair Shops	2	High	208 & 112	Automotive fluids and solvents: spills, leaks, or improper handling
Railroad Tracks	1	High	208	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills
Sand And Gravel Mining/Washing	1	Moderate	208	Heavy equipment, fuel storage, clandestine dumping: spills or leaks (another operation very near but outside of Zone II #112)
<b>Industrial</b>				
Fuel Oil Distributors	1	High	208	Fuel oil: spills, leaks, or improper handling or storage
Hazardous Materials Storage and Waste Storage	Numerous	High	208	Hazardous materials: spills, leaks, or improper handling or storage
<b>Miscellaneous</b>				
Aboveground Storage Tanks	Numerous	Moderate	208 112	Materials stored in tanks: spills, leaks, or improper handling
Composting Facilities	1	Low	208	Organic material, animal waste, and runoff: storage and improper handling
Small quantity hazardous waste generators	2	Moderate	208 112	Hazardous materials and waste: spills, leaks, or improper handling or storage
Stormwater Drains/ Retention Basins	Numerous	Low	208	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transportation Corridors	Numerous	Moderate	208	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Underground Storage Tanks	2	High	208 112	Stored materials: spills, leaks, or improper handling
Very Small Quantity Hazardous Waste Generator	5	Low	208 112	Hazardous materials and waste: spills, leaks, or improper handling or storage

Land Uses	Quantity	Threat	Locale	Potential Contaminant Sources*
<b>Residential</b>				
Fuel Oil Storage (at residences)	Numerous	Moderate	208	Fuel oil: spills, leaks, or improper handling (Most USTs have been removed)
Lawn Care / Gardening	Numerous	Moderate	208	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	Moderate	208	Hazardous chemicals: microbial contaminants, and improper disposal

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

**Potential Source of Contamination vs. Actual Contamination**

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure “Industrial Floor Drains” for more information.

**4. Protection Planning** – Currently, the Town does not have water supply protection controls that meet DEP’s Wellhead Protection regulations 310 CMR 22.21(2). Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells. Amherst has approximately 90% of the Wellhead Protection Planning Components in place; the plan needs to be formalized and submitted to the Department, and public education and outreach needs to be strengthened and continued.

### Protection Planning Recommendations:

- ✓ Develop a Wellhead Protection Plan. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Coordinate efforts with local officials to review local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21 (2). There are no local controls for the Lawrence Swamp aquifer. Adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ If local controls do not regulate floordrains, be sure to include floordrain controls that meet 310 CMR 22.21(2).

**5. Agricultural Activities** – There are several farms on the western edge of the Zone II. Crop and pasture lands make up about 16% of the land use in Zone II #208, 4% in the Zone II #112. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

### Agricultural Activities Recommendation:

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.

Other land uses and activities within the Zone IIs that have potential for contamination include auto repair shops, gas stations, large equipment storage, and a greenhouse. Refer to Table 2 and Appendix 2 for more information about these land uses.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those listed above and below should be used to better protect your water supply.

### Top 5 Reasons to Develop a Local Wellhead Protection Plan

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

## Section 3: Source Water Protection Conclusions and Recommendations

### Current Land Uses and Source Protection:

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Implementation of protective bylaws for the Jabish Brook watershed. We encourage Belchertown to expand the protection district to the Lawrence Swamp aquifer and adopt floor drain regulations throughout the Town.

### Source Protection Recommendations:

To better protect the sources for the future:

- ✓ Work with the planning board to propose protective bylaws for the Lawrence Swamp aquifer area.
- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.

- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Conduct a survey of all USTs in the Zone IIs and encourage or fund as feasible the removal of those threats.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Develop and implement Wellhead Protection Plans.

#### **Resources for Drinking Water Source Protection:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II.
2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

Land uses within the Zone III are not assessed for SWAP reports unless the source is under the direct influence of groundwater.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

#### **Conclusions:**

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

#### **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Investigate purchasing the Zone I land.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue monitoring non-water supply activities in Zone Is.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21 (2)?	<b>NO</b>	The Town "Aquifer Protection District" has bylaws for well-head protection in Jabish Brook. There is no protection for the Daigle Well. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws and health regulations and current regulations.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>YES</b>	Amherst has wellhead controls, however, Belchertown does not for the Daigle Well.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Develop a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>NO</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Establish committee; include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>NO</b>	Aim education at schools and commercial, industrial and municipal uses within the Zone II.

# Source Water Assessment Program (SWAP) Report for Sports Haven Mobile Home Park

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
February 11, 2002

Well 2	1024001-02G	341	1296	High

## INTRODUCTION

We are all concerned about the quality of the water we drink. Many potential contaminant sources, including septic systems, road salt and improperly disposed of hazardous materials may threaten the quality of water from drinking water wells. Citizens and local officials can work together to better protect drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. DESCRIPTION OF THE WATER SYSTEM

The Sports Haven Mobile Home Park is a year round, residential mobile home park with a population of approximately 150 people. The 52.9-acre facility has 54 closely located mobile homes, all utilizing on-site septic systems. Some units have individual septic systems while some share a system between two units. The facility has one active supply well, new dug well 02G. Very little information is available regarding the structure and functioning of the old dug well, 01G. A 6 x 6 foot vault is partially filled with water approximately 25 feet from the edge of the pond. There are no records for this source and there is no connection to the distribution system from that vault. However, active distribution pipes pass through the vault. The new dug well 02G was constructed in 1974, replacing the old well and is a 3-foot diameter by 16-foot deep, tile, dug well. The Zone I protective radii for Well 01G and 02G is 341 feet. The Interim Wellhead Protection Area (IWPA) radii for 01 and 02G is 1,296 feet. The protective

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

radii were based on the pump capacity rate of 28 gallons per minute, as measured during site visits. Although the pump reportedly runs continuously, 24-hours per day, the metered usage for the two highest months on record for well 02G is in excess of the pumping capacity rate. A new meter was installed in September 2000 and the facility manager is attempting to address leaks and uncontrolled water use at the facility. However, until consistent reduction in water usage is documented and verified, the conservative water usage is based on the capacity rate of the pump. The Zone I is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wells may be larger or smaller. Please refer to the attached map that shows the Zone I and IWPA radii.

The wells are shallow surficial sand and gravel wells located within a stratified drift deposit mapped as a moderate yield aquifer; there is no fine-grained confining unit, such as clay, mapped in this area. The bedrock is mapped as the Belchertown Complex, an intrusive quartz monzodiorite. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer. The shallow nature of the dug well provides minimum natural filtration.

The Sports Haven Mobile Home Park well water does not require and does not have treatment at this time. For current information on monitoring results, please review the Consumer Confidence report (CCR) that is issued annually by the water supplier or refer questions to the water supply contact listed above in Table 1.

## 2. DISCUSSION OF LAND USES IN THE PROTECTION AREAS

A number of land uses and activities within the drinking water supply protection areas are potential sources of contamination. Therefore, the overall ranking of susceptibility to contamination for the wells is high, based on the number and proximity of land uses and activities in the Zone I and IWPA, as seen in Tables 2 and 3.

### Key Land Use Issues for the Wells include:

1. **Non-conforming activities in the Zone Is**
2. **Septic Systems within Zone I**
3. **Above Ground Storage Tanks (ASTs)**

**Table 2: Table of Activities Common to the Protection Areas**

Potential Sources of Contamination	Zone I	IWPA	Threat	Comments
Trailers, lawns and residential parking	Both Wells	Both Wells	Moderate	Household hazardous materials, pesticides and herbicides
All components of septic systems	Both Wells	Both Wells	Moderate	Conventional and cesspools
Parking lots and driveways	Both Wells	Both Wells	Moderate	Limit road salt usage and provide drainage away from wells
Internal transportation corridor	Both Wells	Both Wells	Moderate	Road salt, spills and runoff
Aboveground Storage Tanks (AST, home heating kerosene)	Both Wells	Both Wells	Moderate	Kerosene

\*- For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**1. Non-conforming activities in the Zone Is** – The Zone Is for wells 01G and 02G are non-conforming with respect to MA DEP land use restrictions, which allow only water supply related activities in Zone Is. The Zone I for Well 02G contains 16 homes and related facilities including septic disposal. (One trailer was removed and one of the 16 trailers has been destroyed by fire but remains on-site). In addition, off of the facility property, there is a vault that may be an old well within the Zone I of 02G. Please note that systems not meeting DEP Zone I requirements must receive DEP approval and address Zone I issues prior to increasing water use, modifying systems or conducting any activities within Zone I. Normal residential activities generally pose minimal threat to the water quality of the public water supply provided homeowners are aware of the potential hazards of household waste, lawn care chemicals, animal waste and septic systems and they utilize best management practices. Due to the close proximity of the residents to the shallow well, the potential threat is significant if not properly managed.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

The metered water use for the system is, at times, significantly higher than the anticipated usage for a facility of this size. This excess use may be due to unchecked, excessive water use by tenants or leakage. Excessive water use expands the area of contribution to the well, increasing the potential impact from activities in the area.

**Recommendations:**

- ✓ Investigate the viability of the Old Dug well 01G. Abandon and decommission that well, as you have proposed.
- ✓ Continue your on-going efforts in leak detection and repair.
- ✓ Establish a policy for the use of low flow plumbing units and conservation measures and remind tenants to conserve water.
- ✓ Relocate well to mitigate threat to the water supply.
- ✓ Ensure that any old connection to the system are severed, such as to the old farm house.
- ✓ Monitor existing activities within Zone I. Do not conduct any additional activities within the Zone I.
- ✓ Provide information to residents about the potential hazards and liability of household chemicals, lawn care chemicals and fertilizers. Include information on Best Management Practices (BMPs) for the use of those items and proper septic system maintenance and disposal practices.
- ✓ Prepare a wellhead protection and emergency response plan.
- ✓ Contact MA DEP prior to conducting any new activities within Zone I.
- ✓ Contact the property owner to gain access to the property to investigate the open vault. If there is a potential open conduit, such as an abandoned well, request that the owner decommission the unit and fill in the vault.

**2. Septic system components** – Eight shared septic systems, four individual systems and one cesspool, are located within the Zone I of 02G. An equivalent number of systems are within the Zone I of 01G. Improper disposals of household hazardous waste through septic systems as well as, close proximity of the systems to the shallow well, pose a significant potential threat to water quality.

**Recommendations:**

- ✓ Refer to recommendations under Item 1.
- ✓ Continue the current practice of routine maintenance and replacement as appropriate, of the systems.

**3. Aboveground Storage Tanks** – All of the homes have aboveground kerosene and/or propane storage tanks. The facility does not have a tank replacement or maintenance policy.

**Recommendations:**

- ✓ Establish a policy for replacement of aging tanks (consider 10-15 years); require containment, at a minimum a concrete pad and maintenance, such as painting, for all new tanks. Require at a minimum, routine inspection and painting of existing tanks.
- ✓ Monitor for leaks and spills periodically, especially during delivery.

Work with the DEP and local officials regarding protecting the water supplies through emergency response coordination.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

## 3. PROTECTION RECOMMENDATIONS

To reduce the system's susceptibility to contamination, the Sports Haven Mobile Home Park should review and adopt the following recommendations:

### Priority Recommendations:

- ✓ Reduce water usage through leak repair, conservation measures and informing tenants of the necessity to conserve water.
- ✓ Abandon and decommission well 01G and consider replacing well 02G.

### Zone I and IWPA:

- ✓ Keep all new non-water supply activities out of the Zone I.
- ✓ Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use, modifying their system or conducting any additional non-conforming activities in Zone I.
- ✓ Prohibit public access to the well and pump house by locking facilities, gating roads, and posting signs. Check the integrity of the well caps regularly and replace as necessary.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any aboveground tanks for leaks, etc.
- ✓ Investigate alternative sites for a new well and protect that land for future use through purchase or conservation restriction that would prohibit potentially threatening activities.
- ✓ Work with the DEP and local officials regarding protecting the water supplies through emergency response coordination.
- ✓ Be sure that the town is aware that your facility is a public water supply so that you can be notified of any accidents or threats from accidents.

### Facilities Management:

- ✓ Encourage residents to utilize the Town's household hazardous waste collection days. To learn more, see the hazardous materials guidance manual at <http://www.state.ma.us/dep/consumer/consumer.htm>
- ✓ Establish policies regarding vehicle maintenance, lawn care and oil/hazardous material storage tanks, especially in Zone I.
- ✓ Repair leaks as soon as practical. Continue the current practice of on-going leak detection and repair. Establish water use restrictions as necessary to control excess water usage.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. Especially the transformers in Zone I. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Work with local officials in Belchertown to include the facility IWPA in the Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment will be provided to the public water supplier, town boards, and the local media.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## **4. ATTACHMENTS**

- Maps of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheet
- Developing a Local Wellhead Protection Plan
- Pesticide Use Fact Sheet
- Fertilizer Use Fact Sheet
- Septic system brochure
- Household Hazardous Waste information

# Source Water Assessment Program (SWAP) Report for Pine Valley Plantation

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
September 24, 2001

## Introduction

We are all concerned about the quality of the water we drink. Many potential contaminant sources, including septic systems, road salt and improperly disposed of hazardous materials may threaten the quality of water from drinking water wells. Citizens and local officials can work together to better protect drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Pine Valley Plantation is a retirement community, mobile home park. The park is a 150-acre facility, currently with 385 prefabricated homes and a total population of approximately 770 residents and staff. The facility has recently connected all of the homes to the Town sewer system. The facility has four supply wells that are all located within relatively close proximity to each other in the northeast section of the property. The Zone I protective radii for Wells 1 through 4 are as follows: Well #1 (01G), 300 feet; Well #2 (02G), 280 feet; Well #3, 303 feet; Well #4, 225 feet. The Interim Wellhead Protection Area (IWPA) radii for wells 1 through 4 are: Well #1 (01G), 880 feet; Well #2 (02G), 754 feet; Well #3, 904 feet; Well #4, 552 feet. The protective radii

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

were based on metered usage for the two highest months on record for each well. Please refer to the attached map that shows the Zone I and IWPA radii. The Zone I is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wells may be larger or smaller.

Wells #1 through #4 are all 8-inch diameter wells drilled into the bedrock aquifer. Wells #1 and #2 were drilled in 1971 while wells #3 and #4 were drilled in 1977. Well #1 is located approximately 100 feet northwest of the motor control building and drilled to a depth of 140 feet below grade. Well #2 is located 85 feet west of the building and drilled to a depth of 225 feet. Well #3 is located approximately 200 feet southeast of the building and is drilled to a depth of 440 feet with 57 feet of casing set into bedrock. Well #4 is located 75 feet southwest of the building and drilled to a depth of 120 feet with 47 feet of casing set into bedrock.

The wells are located within a stratified drift deposit mapped as a moderate to high yield surficial aquifer and there is no fine-grained confining unit, such as clay, mapped in this area. The bedrock is mapped as the Belchertown Complex, an intrusive quartz monzodiorite. There are no detailed records of the well construction or of the materials encountered during drilling. However, the length of casing in wells #3 and #4 indicates that the overburden is approximately 30 to 40 feet of sand and gravel. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

The Pine Valley Plantation Cooperative Corporation (PVPCC) well water does not require and does not have treatment at this time. For current information on monitoring results, please review the Consumer Confidence report (CCR) that is issued annually by the water supplier or refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

A number of land uses and activities within the drinking water supply protection areas are potential sources of contamination. Therefore, the overall ranking of susceptibility to contamination for the wells is moderate, based on the presence of moderate threat land use or activity in the Zone I and IWPA, as seen in Tables 2 and 3.

### Key Land Use Issues for the Wells include:

1. **Non-conforming activities in the Zone Is**
2. **Solid waste transfer station (facility only)**
3. **Aboveground storage tanks - ASTs**

**Table 2: Table of Activities Common to the Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Dumpster, recycle station, other storage	Well 1	All Well	Moderate	Accidents and illegally disposed of hazardous materials pose a potential threat
Parking lots and driveways	No	All Wells	Moderate	Limit road salt usage and provide drainage away from wells
Internal transportation corridor	No	All Wells	Moderate	Road salt, spills and runoff
Sewage pipelines/pump station	No	All Wells	Moderate	Gravity and pressure mains
ASTs (home heating kerosene)	Well 1	All Wells	Moderate	Kerosene

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Table 2: Table of Activities Common to the Protection Areas (Continued)**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Trailers, lawns and residential parking	Well 1	All Wells	Moderate	Household hazardous materials, pesticides and herbicides
Storm drains	No	All Wells	Low	Road salt, spills and runoff

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**1. Non-conforming activities in the Zone Is** – The Zone I for Well #1 is nonconforming with respect to MA DEP land use restrictions, which allow only water supply related activities in Zone Is. The Zone I for Well 1 contains a trailer and the facility solid waste transfer station, trash dumpster. Please note that systems not meeting DEP Zone I requirements must receive DEP approval and address Zone I issues prior to increasing water use, modifying systems or conducting any activities within Zone I.

**Recommendation:**

- ✓ Do not conduct any additional activities within the Zone I and continue your commendable and diligent monitoring of activities within Zone I, use of BMPs and training for emergency response. Contact MA DEP prior to conducting any activities within Zone I.

**2. Facility Transfer station and storage** - The solid waste transfer station and facility storage is within the Zone I of Well #1. Improper disposal of household hazardous waste in the trash poses a potential threat if a release from the dumpster occurs.

**Recommendations:**

- ✓ Relocate the dumpster and storage facilities outside of the Zone I. If it is not possible to relocate the dumpster, protect the area with containment such as a concrete pad and monitor the waste stream.
- ✓ Prepare an emergency response plan for responding to an accidental release.
- ✓ Conduct household hazardous waste collection.

**3. Aboveground Storage Tanks** – All of the homes have aboveground kerosene storage tanks. The facility has a policy requiring all tanks 15 years of age or older to be replaced or have secondary containment. All tanks must be painted.

**Recommendations:**

- ✓ Continue the current policy and monitor for leaks and spills during delivery.

Other activities noted within the protection areas of the wells are residential development including the PVPCC and an abutting residential neighborhood. Normal residential activities pose minimal threat to the water quality of the public water supply as well as their own private supply provided homeowners are aware of the potential hazards of household waste, lawn care chemicals, animal waste and septic systems and they utilize best management practices. Provide information to residents about the potential hazards of household chemicals, lawn care chemicals and fertilizers. Include information on Best Management Practices (BMPs) for the use of fertilizer lawn care, pesticides, household hazardous waste and septic system maintenance and disposal practices.

Stormwater discharge is located within the Zone I and IWPA of the wells. The PVPCC should use BMPs and include periodic cleaning of catch basins and street sweeping. Street sweepings and catch basin cleanings are considered solid waste and should be handled as described in the DEP's policy. Coordinate with the Town to manage these wastes. Work with the DEP, State highway and local officials regarding protecting the water supplies through emergency response coordination, especially with respect to spills and accidental releases that may be discharged through storm drains.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

## 3. Protection Recommendations

To reduce the system's susceptibility to contamination, the Pine Valley Plantation Cooperative Corporation should review and adopt the following recommendations:

### Priority Recommendation:

- ✓ Relocate the dumpster and storage facilities outside of the Zone I. If it is not possible to relocate the dumpster, protect the area with containment such as a concrete pad and monitor the waste stream.

### Zone I and IWPA:

- ✓ Keep all new non-water supply activities out of the Zone I.
- ✓ Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use, modifying their system or conducting any additional non-conforming activities in Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Prohibit public access to the well and pump house by locking facilities, gating roads, and posting signs. Check the integrity of the well caps regularly and replace as necessary.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any aboveground tanks for leaks, etc.
- ✓ Consider alternative sites for a new well and protect that land for future use through purchase or conservation restriction that would prohibit potentially threatening activities.
- ✓ Work with the DEP, State highway and local officials regarding protecting the water supplies through emergency response coordination.
- ✓ Be sure that the town is aware that your facility is a public water supply so that you can be notified of any accidents or threats from accidents.

### Training and Education:

- ✓ Continue staff training on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, certified operator, and other appropriate staff.
- ✓ Maintain the drinking water protection area signs at key visibility locations.

### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/bwp/dhm/dhmpubs.html](http://www.state.ma.us/dep/bwp/dhm/dhmpubs.html).
- ✓ Monitor all oil/hazardous material storage tanks to incorporate proper containment and safety practices.
- ✓ Implement Best Management Practices (BMPs) for the use of pesticides on facility property.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. Especially the transformers in Zone I. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Work with local officials in town to include the facility IWPA in the Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment will be provided to the public water supplier, town boards, and the local media.

- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## **4. Attachments**

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
MILL VALLEY GOLF LINKS

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 18, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Mill Valley Golf Links
<i>PWS Address</i>	380 Mill Valley Rd
<i>City/Town</i>	Belchertown, Massachusetts
<i>PWS ID Number</i>	1024006

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1024006-01G	100	406	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
# 1 (1024006-01G)**

Zone I = 100 ft.  
IWPA = 406 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I. The **high** susceptibility to potential non-microbial threats is based on the hazardous materials storage, UST and local roads within the Zone I and IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection

## Source Water Assessment Program (SWAP) Report

### for Cedarwood Apartments

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

#### SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 22, 2003

#### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

### 1. Description of the Water System

Cedarwood Apartments is a small rural, residential apartment complex that serves 12 homes in southeastern section of Belchertown with a community of approximately 30 people. Although municipal water and sewer serve parts of Belchertown, the systems do not extend to this part of town. The community utilizes on-site septic disposal systems and maintains one water source, Well #1. The well is located in the back of the parcel immediately adjacent to one of the two apartment buildings. The well, approximately 275-feet deep, has an 8-inch diameter casing set above grade and is located at the base of a steep slope.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area (Zone II) has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. Little is known about the well as there are no detailed records currently available. The well casing has been raised above grade to about 24-inches and partially protected with a sanitary seal and stone to improve drainage away from the well. Although annual yield of the well has been submitted, maximum month yield data for the well is not available. Therefore, the Zone I and Interim Wellhead Protection Area (IWPA) radii are 163 feet and 469 feet, respectively based on an estimated use from Title 5 flows.

The surficial deposits in the immediate area of the apartments are mapped as thin (0-50 feet) of till. The facility is on the edge (side slope) of a buried bedrock valley. The geology at the apartment is mapped as thin till over granite bedrock, intrusive rocks of the Belchertown complex. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The well serving the facility has no treatment at this time. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 2 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are several activities within the drinking water supply protection areas that are potential sources of contamination.

**Key issues include:**

1. **Non-conforming Zone I,**
2. **Transportation corridor including railroad, and**
3. **Residential homes**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of several moderate threat land uses or activities in the Zone I and IWPA, as seen in Table 2. Because the railroad is located topographically downgradient and on the edge of the IWPA, the railroad has been reduced from high to moderate threat activity.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	--	--	--	Zone I is not entirely owned and non-conforming land use
Transportation corridors/railroad track	Yes	Yes	Moderate	Monitor drainage to ensure storm water flows away from the well and YOP for railroad.
Residential homes w/parking	Yes	Yes	Moderate	Lawn chemicals and household hazardous materials, including petroleum products
Septic system leachfield	Yes	Yes	Moderate	Microbial threat and improper disposal of hazardous materials

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**1. Non-conforming Zone I** – Currently, the water supplier does not own or control the entire Zone I area. Systems that do not meet DEP Zone I requirements for ownership or control must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. The Zone I area includes both apartment buildings, a storage shed and the septic system for the apartments. Each building has one septic tank and a leachfield for the septic system. The apartments are heated with electricity and there is one pole-mounted transformer on the edge of the Zone I across the street.

### Recommendations:

- V Monitor access to the well casing and runoff from the hillside to prevent potential impacts from surface water.
- V Inform residents regarding the use of BMPs for household hazardous waste management and make available the opportunity for proper disposal of those materials for the tenants.
- V Monitor any proposed land use on Zone I land that is not owned or controlled by Cedarwood.
- V Consider options for acquiring additional property in Zone 1.

**2. Residential Land Uses** – The Zone I and IWPA have high-density residential land use. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Although the apartments are heated by electricity, neighboring homes may use a variety of fuels. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Stormwater** – Catchbasins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

### Residential Land Use Recommendations:

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and online at the MA DEP website, [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**3. Transportation corridor including railroad** – The well is located approximately 200 feet from the road and the railroad track is along the edge of the IWPA. Accidents and normal use and maintenance of roads and railroads pose a potential threat to water quality. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance, car washing, and accidental spills as well as waste from wildlife and pets. Railroad rights-of-way may pose a potential threat from accidents and maintenance practices.

### Recommendations:

- V Monitor the area to ensure that runoff during heavy storms does not threaten the well. If it is determined that

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

runoff backs-up toward the well, consider modifying the ground surface around the well casing to ensure that stormwater does not discharge near the well.

- ✓ Prepare an Emergency Response Plan that includes coordination between the DEP, and the Town emergency response (ER) team in the event of an accident near the wellhead. The Town ER team should be made aware of the location of your water system so that they can notify you in the event of an accident near your system.
- ✓ Request that the Selectmen or Conservation Commission, review the Yearly Operating Plan for the railroad to ensure that the railroad is aware of the location of your system's IWPA.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Please review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Consider options to control access to the well casing and runoff around the well casing.

### Zone I:

- ✓ Prohibit any new, non-water supply activities within Zone I area that are within your control.
- ✓ As is feasible, remove, relocate or control activities within the Zone I areas that are within your control that may pose a threat to the water quality.
- ✓ Consider well relocation if Zone I threats cannot be mitigated and water quality becomes impaired.
- ✓ Ensure that the well cap is water tight and secure and inspect the cap and the drainage around the well periodically.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping and evidence of vandalism; check parking areas for leaks, etc
- ✓ Continue to maintain road and parking lot drainage in the Zone I away from well.
- ✗ Do not use or store pesticides, fertilizers or road deicing material in the Zone I area that you own or control.

### Facilities Management:

- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ Concrete or earthen pads or collars around the well should slope away from the casing to prevent ponding around the well.

### Planning:

- ✓ Work with local officials in town to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Funding:

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead

protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the 2001 "Wellhead Protection Grant Program". If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described on the DEP website <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf> - "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation".

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

- Map of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheet

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for

## Quabbin Administration Building

### What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

<i>Phone Number</i>	(413) 784-1750

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate Best Management Practices (BMPs) and drinking water source protection measures.

Refer to Section 3 for recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses in the Protection Areas
3. Protection Recommendations
4. Attachments

## Section 1: Description of the Water System

*Susceptibility: High*

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

Well Names	Source IDs
Well No. 1	1024011-01G

The Quabbin Administration Building is located in Belchertown, western/central Massachusetts, immediately adjacent to the Quabbin Reservoir. There is no municipal water supply available or municipal wastewater disposal available at the site, therefore, the facility is served by one on-site groundwater source and on-site septic disposal. The well is a 6-inch diameter bedrock well, 130 feet deep and serves a population of approximately 80 people per day.

Well No. 1 is located along the south shore of the Quabbin Reservoir in Belchertown, Massachusetts inside the hangar facility in the paint shop. Geologic maps indicate thin overburden material on the uplands with some stratified drift deposits in the lowlands along the Swift River valley. The bedrock map indicates the well is located in close proximity to contacts among, metamorphic sequences of sulfidic, mafic and pelitic schist.

The Zone I is the protected area immediately surrounding the well, while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual (Zone II) recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii for this facility's well are 108 feet and 425 feet, respectively, based on historic, metered water use at the facility.

There is no evidence of a protective clay layer or a thick till layer in the vicinity of the facility. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers (i.e. clay) throughout the IWPA that can prevent contaminant migration. Please refer to the attached map to view the boundaries of the Zone I and IWPA.

Currently the well water does not receive treatment. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1. Drinking water monitoring reporting data are also available on the web at <http://www.epa.gov/safewater/ccr1.html>.

### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

## Section 2: Land Uses in the Protection Areas

The land uses for the IWPA for Quabbin Administration Building are predominantly related to the facility's operations. Land uses and activities that are potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Non-conforming Zone I
2. Paint Shop
3. Vehicle and Boat Repair/Maintenance
4. Underground Storage Tank
5. Laboratory and Very Small Quantity Hazardous Waste Generator

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Non-conforming Zone I** – The Zone I radius for Well No. 1 is 108-feet around the well. Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction and restrict the activities in the Zone I to water supply related or other non-threatening activities. Many public water supplies were developed prior to the Department's regulations and contain activities that pose a potential threat to the water supply. The following non- water supply activities occur within the Zone I:

**Non-conforming Zone I:** Although Quabbin Administration Building owns the entire Zone I area, the Zone I contains a portion of Windsor Dam Road, a paint shop, a garage containing diesel and gasoline powered equipment, and some parking spaces.

**Zone I Recommendations:**

- ✓ To the extent possible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Consider well relocation if Zone I threats cannot be mitigated and/or water quality is impacted by existing activities.
- ✓? Prohibit any new, non-water supply activities from Zone I.

**2. Paint Shop** – A paint shop is located within the Zone II. If handled improperly leaks and spills of paints and other solvents or chemicals used can potentially contaminate the water supply.

**Recommendations:**

- ✓ Continue to use Best Management Practices for storage, use, and disposal of paints, solvents, and other hazardous materials.

**3. Vehicle and Boat Repair/Maintenance** – A limited amount of vehicle maintenance occurs at the facility. If handled improperly leaks and spills of automotive fluids and cleaning solvents can potentially contaminate the water supply.

**Recommendations:**

- ✓ Continue to use Best Management Practices for storage, use, and disposal of paints, solvents, and other hazardous materials.

**4. Underground Storage Tanks (USTs)** – One 10,000 gallon UST containing No. 2 fuel oil is located within the IWPA at the facility. If managed improperly, underground storage tanks can be potential sources of contamination due to leaks or spills of the chemicals they store.

**Recommendation:**

- ✓ When considering the upgrade and replacement of the UST, consider an above ground tank (AST) located on an impervious surface with proper spill containment. Grant money may be available for the UST removal through the Massachusetts Department of Revenue. See the conclusions in Section 3 below for more information regarding grant/loan programs.

## Glossary

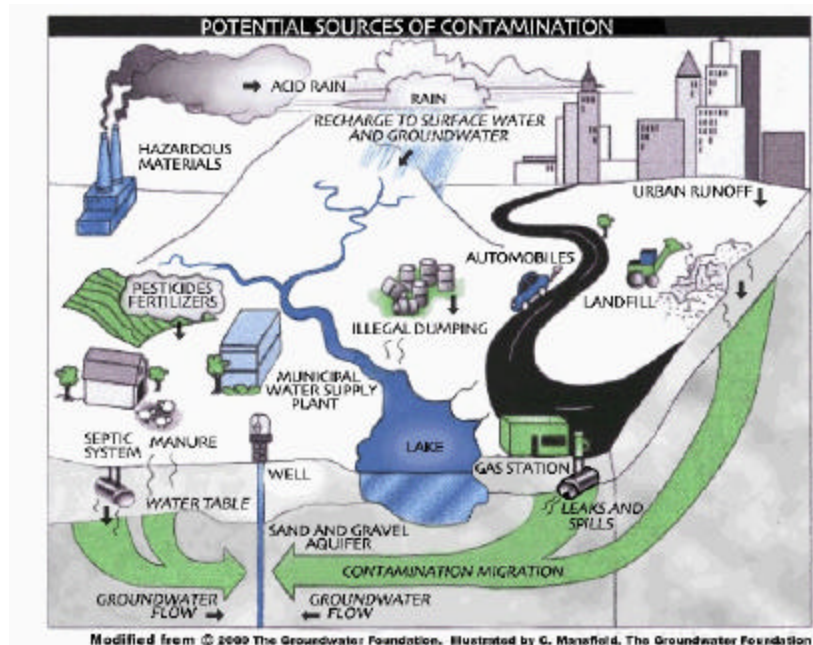

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

**5. Laboratory and Very Small Quantity Hazardous Waste Generator –** A laboratory at the facility is listed as a very small quantity generator of hazardous waste. The facility has appropriate permits, and they contract with a licensed hauler to remove the hazardous waste off site. Hazardous waste is a potential source of contamination if it is improperly handled or stored.

#### Recommendation:

- ✓ Continue to handle hazardous waste in compliance with regulations.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Quabbin Administrative Building is commended for implementing BMPs in its paint shop and laboratory and for directing stormwater drainage away from the well. Quabbin Administrative Building should review and adopt the key recommendations above and the following:

#### Priority Recommendations:

- ✓ Regularly inspect all pathways where contaminants could enter the ground from the paint shop and the maintenance garage, including electrical conduits.

#### Zone I:

- ✓ Keep additional non-water supply activities out of the Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated and water quality is impacted by existing used .
- ✓ Continue to use Best Management Practices (BMPs) and restrict activities that could pose a threat to the water supply.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and IWPA)**

For more information, refer to Appendix A: Regulated Facilities within the Water Supply Protection Area

Activities	Quantity	Threat*	Potential Source of Contamination
Paint Shop	1	High	Paints, solvents, other chemicals: spills, leaks, or improper handling or storage
Laboratory	1	Moderate	Laboratory chemicals and wastes: spills, leaks, or improper handling or storage
Vehicle/Boat Repair Shop	1	High	Automotive fluids and solvents: spills, leaks, or improper handling
Underground Storage Tanks	1	High	Stored materials: spills, leaks, or improper handling
Very Small Quantity Hazardous Waste Generator	1	Low	Hazardous materials and waste: spills, leaks, or improper handling or storage
Lawn Care	1	Moderate	Pesticides: over-application or improper storage and disposal.
Septic Systems	1	Moderate	Hazardous chemicals and microbial contaminants: improper disposal.
Stormwater Drains/Retention Basins	-	Low	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns.

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix A: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix B: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

### Top 5 Reasons to Develop a Local Wellhead Protection Plan

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

(Continued from page 4)

- ✓ Continue to keep the storage of pesticides, fertilizers and road salt outside of the Zone I.

### Training and Education:

- ✓ Continue to train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.

### Facilities Management:

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides within the IWPA.
- ✓ Septic system components should be inspected and maintained on a regular basis.
- ✓ Verify that MODF in the transformers has been replaced with no-PCB oils. Keep the area near any transformer free of tree limbs that could endanger the transformer in a storm.

### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under that program. For additional information, please refer to DEP's web site. Other funding opportunities are described in *Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation* at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

Quabbin Administrative Building management and staff should use this SWAP report to review drinking water protection measures.

- Recommended Source Protection Measures Fact Sheet

### For More Information

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

# Massachusetts Department of Environmental Protection

## Source Water Assessment Program (SWAP) Report

### For Washington Acres

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

#### SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 20, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Washington Acres
<i>PWS Address</i>	N. Washington Road
<i>City/Town</i>	Belchertown, Massachusetts
<i>PWS ID Number</i>	1024015
<i>Local Contact</i>	Mr. George Adams
<i>Phone Number</i>	508-385-4430

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1024015-01G	163	459	Moderate

#### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

### 1. Description of the Water System

Washington Acres is a small rural, residential apartment complex that serves 12 homes in southeastern section of Belchertown with a community of approximately 30 people. Although municipal water and sewer serve parts of Belchertown, the systems do not extend to this part of town. The community utilizes on-site septic disposal systems and maintains one water supply well #1. The well is located in the front of the parcel and has a 6-inch casing of unknown depth.

The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area (Zone II) has not been delineated. The actual recharge area to the well may be

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

significantly larger or smaller than the IWPA. Little is known about the well as there are no records currently available. The well casing had previously been below grade in a well tile but was recently raised above grade to protect against inundation of the casing by stormwater. There is no yield data for the well and the source has only recently had a meter installed to determine actual usage. The Zone I and Interim Wellhead Protection Area (IWPA) radii for the apartment's well are 163 feet and 469 feet, respectively based on an estimated use from Title 5 flows

The surficial deposits in the immediate area of the apartments are mapped as thin (<50 feet) stratified drift deposits with some higher areas of till or bedrock covered with a thin layer of till. The bedrock is mapped as intrusive rocks of the Belchertown complex, predominantly quartz diorite and monzodiorite. Based on the geologic maps of the area, the well is assumed to be drawing from the bedrock aquifer. The well is located in an area of thin unconfined sand and gravel deposits where there is no record of a confining, protective clay layer in the vicinity of the well. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The well serving the facility has no treatment at this time. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are several activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Zone I ownership,**
2. **Transportation corridor including railroad,**
3. **Residential homes**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of several moderate threat land uses or activities in the Zone I and IWPA, as seen in Table 2.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridors/railroad	Yes	Yes	Moderate	Monitor drainage to ensure storm water flows away from the well
Residential homes w/parking	Yes	Yes	Moderate	Lawn chemicals and household hazardous materials, including petroleum products
Septic systems	Yes	Yes	Moderate	Microbial threat and improper disposal of hazardous materials

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**1. Non-conforming Zone I** – Currently, the water supplier does not own or control the entire Zone I area. Systems that do not meet DEP Zone I requirements for ownership or control must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. The Zone I area includes two of the apartment buildings, one private residence, part of the road and the septic system for one of the buildings. Each building has two septic tanks, a drywell for the laundry and a leachfield for the septic system. The parking areas are paved with curbs and no drains. The curb next to the well protects the well from parking lot and street runoff. The apartments are heated with electricity and there is one pole-mounted transformer on the edge of the Zone I across the street.

### Recommendations:

- ✓ Continue to control access to the wellhead area and make every effort to acquire Zone I control or ownership.
- ✓ Inform residents regarding the use of BMPs for household hazardous waste management and make available the opportunity for proper disposal of those materials for the tenants.

**2. Residential Land Uses** – The Zone I and IWPA have high-density residential land use. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Although the apartments are heated by electricity, neighboring homes may use a variety of fuels. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store and accidents during delivery.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**3. Transportation corridor including railroad** – The well is located less than 25 feet from the road and the railroad track is within the IWPA. Accidents and normal use and maintenance of roads and railroads pose a potential threat to water quality. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets. Railroad right-of-ways may pose a potential threat from accidents and maintenance practices. Because the railroad is on the edge of the IWPA, the

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

threat associated with that activity was reduced from high to a moderate threat.

### Recommendations:

- ✓ Monitor the area to ensure that runoff during heavy storms does not threaten the well. If it is determined that runoff backs-up toward the well, consider modifying the ground surface around the well casing to ensure that stormwater does not discharge near the well.
- ✓ Prepare an Emergency Response Plan that includes coordination among the DEP, you (the water supplier), and the Town emergency response (ER) team in the event of an accident near the wellhead. The Town ER team should be made aware of the location of your water system so that they can notify you in the event of an accident near your system.
- ✓ Request that the Selectmen or Conservation Commission, review the Yearly Operating Plan for the railroad to ensure that the railroad is aware of location of your systems' IWPA.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. You are commended for current protection measures such as paving the parking area and installing curbs to protect the well casing and for extending the well casing above ground. Please review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Continue to maintain septic systems and monitor activities around the well casing.

### Zone I:

- ✓ Prohibit any new, non-water supply activities within Zone I.
- ✓ As is practical, relocate or control activities that are within the Zone I that are not specific to the supplying of water.
- ✓ Consider well relocation if Zone I threats cannot be mitigated and water quality becomes impaired.
- ✓ Periodically inspect the well casing to ensure the cap is water tight and secure.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping and evidence of vandalism; check parking areas for leaks, etc
- ✓ Continue to maintain road and parking lot drainage in the Zone I away from well.
- ✓ Do not use or store pesticides, fertilizers or road deicing material within the portions of the Zone I that are within your control.

### Facilities Management:

- ✓ Septic system components should be located, inspected, and maintained on a regular basis.

- ✓ Concrete or earthen pads or collars around the well casing should slope away from well to prevent ponding of water at the casing.

### Planning:

- ✓ Work with local officials in town to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the 2001 "Wellhead Protection Grant Program". If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described on the DEP website <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf> - "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation".

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## 1. Description of the Water System

Village Greene Condominium Association (Association) is a small, residential condominium community in Belchertown, with twenty-one homes in ten buildings. Although Belchertown has municipal water and sewer, the area where the Association is located, is not connected to either the municipal water or sewer systems. Therefore, the Association homes as well as the surrounding homes and facilities, are served by on-site septic disposal systems and non-municipal, public or private water supplies. The Association maintains nine water supply wells 01G through 09G with one well per building with the exception of one source (05G) that serves two buildings. Wells 01G through 07G are clustered together in the southeastern section of the property and are located distances ranging from approximately 60 to 80 feet apart. There presently, is no metered flow data to determine actual water use from each well. The one exception is well 09G, which is a flowing artesian well that free flows at an estimated rate of 6 gallons per minute (gpm) or 8,640 gallons per day (gpd). The estimated water use from each of the other wells (01G through 08G) was based on the Title 5 septic system design flow volumes of 110 gallons per bedroom. Therefore the estimated use from each well is less than 1,000 gallons per day.

The Zone I is the protected area immediately surrounding the wellhead, while the Interim Wellhead Protection Area provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and IWPA's are based on the amount of water withdrawn from each well. Wells 01G through 08G have an estimated use of less than 1,000 gallons per day. The Zone I radius for wells 01G through 08G, based on estimated use, is 100 feet. The IWPA radius for wells 01G, 02G, 03G, 04G, 06G, 07G and 08G is 410 feet. The IWPA radius for well 05G is 415 feet because it serves two buildings and is assumed to use more water. The Zone I and IWPA radii for well 09G are 240 feet and 592 feet, respectively, based on the free flow rate of 6 gpm.

There is very little data available about the wells, other than the pumps are set at

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	Wells 05G-09G	--	--	Septic systems, homes, parking, roadway
Hazardous materials storage and use	--	Well 09G	High	Encourage the Board of Health to inspect facilities to encourage the use of BMPs and assist in regulatory compliance.
Septic systems	05G-07G	All	Moderate /High	Microbial contaminants and potentially hazardous materials from improper disposal.
High density residential with on-site parking	Wells 05G-09G	All	Moderate	Use BMPs for household hazardous waste, heating fuel, septic system management, and lawn care and stormwater runoff.
Gravel operation	--	Wells 01G-07G	Moderate	Accidental release from heavy equipment, potential for illegal dumping
Transportation corridor: local roads and State Route 9	08G	08G & 09G	Moderate	Limit road salt usage and provide drainage downgradient from wells

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

approximately 70 to 80 feet below grade. Well drilling invoices obtained from the Belchertown Board of Health for the Association's wells, show the depths to which the wells were drilled and the amount of casing used to complete the well. Based on that information, it was determined that all of the wells are completed in bedrock and range in depth from 80 to 125 feet deep. There are no drillers' records available of the type of material encountered during drilling. The geologic maps published for the area indicate stratified glacial drift (sand and gravel deposits) to depths of approximately 60 feet. The maps do not indicate a continuous clay protective layer in the area. A well log for a recently installed well on an adjacent property indicated a clay layer at a depth of approximately 30 feet. However, there is no indication of a continuous confining protective clay unit in the area. The bedrock in the area is mapped as quartz monzodiorite gneiss associated with the Belchertown Complex and is highly folded and faulted rock. Wells located in this type of hydrogeologic environment are considered to have a high vulnerability to contamination due to the absence of a continuous hydrogeologic barrier that can prevent contaminant migration from activities conducted on the ground surface in the immediate vicinity of the well(s).

The wells serving the facility do not have treatment at this time. For current information on water quality monitoring results, please request a copy of the most recent Consumer Confidence Report from the Public Water System contact person listed above in Table 1. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The protection areas for the wells are entirely within the town of Belchertown and include several activities that pose a threat to the water supplies.

### Key issues include:

1. **Non-conforming activities within Zone I,**
2. **Residential land uses with on- site septic disposal and parking,**
3. **Transportation corridors,**
4. **Hazardous materials handling, and**
5. **Comprehensive Protection Planning.**

The overall ranking of susceptibility to contamination for the Village Greene Condominium Association is high, based on the presence of at least one high threat ranked land use or activity in the Zone I and IWPA of one of the sources. Please refer to Table 2 for more details.

**1. Non-conforming activities within Zone I** – Currently, the water supplier does not own or control the entire Zone I area for the sources. Systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. The Zone I for Wells 05G through 07G have portions of septic systems within the Zone I protection area. One or two of the cesspools on site either are in failure or are anticipated to be in failure in the near future. Therefore, the threat ranking for the septic systems has been increased from a moderate to a high-risk ranking. The Zone I for well 09G includes one of the residential units and its yard and a portion of Route 9. The Zone I for well 08G includes residential units, driveways, roadways and at least one septic system. Well 08G is secured within a cement covered pit in the driveway of one of the units.

### Recommendations:

- V To the extent feasible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements. Prohibit new non-water supply activities in the Zone I.
- V Inspect the ground around the casings and the integrity of the casings and caps to ensure the wells are protected from surface influences and the caps are secure.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

- ✓ Inspect the abandoned casing near the cluster of wells to ensure the casing is secure and the ground around the casing is sloped to prevent infiltration along the casing annulus. Consider developing a long-term plan to decommission the boring in the future to prevent accidental contamination of the aquifer through that boring.
- ✓ Where it is feasible, remove all hazardous materials from Zone I including household hazardous materials. Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals, maintenance chemicals and vehicles used to access the area. Include all pool chemicals in you management plans.
- ✓ Do not use or store pesticides, fertilizers or road deicing materials within the Zone I.
- ✓ Ensure that residents are aware of best management practices (BMPs) with respect to hazardous materials handling, household hazardous materials handling and disposal and proper use of lawn chemicals.

- ✓ Short term and long term plans must consider wastewater and water supply protection options. Consider consolidation of the system, relocation of source(s) and wastewater disposal options.

**2. Residential Land Uses** – The Zone Is for some of the wells and IWPA for all of the wells have high-density residential land use. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store and accidents during delivery.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**3. Transportation corridors** – The access road and Route 9 are located within the Zone I and/or IWPA of the wells. Accidents and normal use and maintenance of roads pose a potential threat to water quality. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets.

**Recommendations:**

- ✓ Inspect the roadways to determine the discharge points of road runoff, as is feasible, for well 08G and 09G. If it is determined that runoff discharges toward the wells, consider modifying the ground surface around the well casings to ensure that stormwater does not discharge near the wells.
- ✓ Prepare an Emergency Response Plan that includes coordination between the DEP, the Association, and the Town emergency response (ER) team in the event of an accident near the wellhead. The Town ER team should be made aware of the location of your water system so that they can notify you in the event of an accident near your system.

#### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

**4. Hazardous Materials Storage and Use** – Within the IWPA of Well 09G, there is at least one commercial facility that stores or utilizes hazardous materials. In addition, portions of a gravel operation are located within the IWPA of several of the wells: 01G through 04G. Many businesses use hazardous materials, produce hazardous waste products, and/or store quantities of hazardous materials. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground. Gravel operations in and of themselves do not necessarily impact water supplies. However, proximity of excavation to the water table, use, storage and refueling of heavy equipment in a gravel pit pose a risk from petroleum products. Gravel pits can be sites of illegal disposal of potentially hazardous materials unless access is controlled.

#### Hazardous Materials Storage and Use Recommendations:

- V Educate local businesses and municipal departments regarding the use of best management practices for protecting water supplies. Distribute the fact sheets “Businesses Protect Drinking Water” and “DPWs Protect Drinking Water” available in Appendix A; they are also available online at the DEP website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common business issues.
- V Work with the local Board of Health, the municipality and businesses to register facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- V Educate local businesses and town officials and assist the Board of Health in understanding the Massachusetts and local floordrain requirements. See the brochure “Industrial Floor Drains” for more information.

**5. Comprehensive Protection Planning** – Protection planning protects drinking water by managing the land area that supplies water to a well or reservoir. Belchertown does have aquifer protection bylaws and health regulations. Although the protection measures are not fully in compliance with DEP requirements, according to the health agent, the Board will be considering suggested revisions to bring the regulations into compliance with the DEP requirements. Wellhead protection planning identifies protection strategies and establishes a timeframe for implementation. The Association has a number of issues to address for short and long term planning for protection of the water supplies and a Wellhead Protection Plan could be a useful tool for organizing a strategy for future protection.

#### Protection Planning Recommendations:

- V Consider preparing a Wellhead Protection Plan. Contact Northeast Rural Water Association for some assistance in developing a comprehensive plan.
- V For short and long term planning, the Association should consider consulting with a professional to review all water and wastewater issues at the facility.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. The Association should carefully review and adopt the key recommendations above and the following:

#### Priority Recommendations:

- V Conduct a comprehensive review of water and wastewater issues at the facility.
- V Monitor activities near the wells. Use BMPs and avoid the use and misuse of household hazardous materials near the wells, especially those proximal to homes.

#### Zone I:

- V Keep non-water supply activities out of the Zone I.
- V Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- V If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that

would prohibit potentially threatening activities, a Memorandum of Understanding or a Right of First Refusal to purchase the property. Consider consolidating sources and utilize the most protected source with consistent, good water quality.

- V Redirect road drainage in the Zone I away from well area.
- V Do not use or store pesticides, fertilizers or road deicing materials within the Zone I.

### **Training and Education:**

- V Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- V Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- V Inform neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal and septic system maintenance.

### **Planning:**

- V Have a plan to address short-term water shortages and long-term water demands and wastewater issues.
- V Keep the phone number of a bottled water company readily available in the event of an emergency.
- V Work with the Board of Health in their continuing efforts to adopt floor drain regulations and aquifer protection regulations.

### **Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. If funding is available, the Department posts a new Request for Response for the Grant program (RFR). Funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREAS

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
MAV000015090	Dory Jeep	Ware Road	Belchertown	Hazardous Waste Generator	VSQG	Sale & Service
MV4133235435	Devon Lane Power Equipment	Ware Road	Belchertown	Hazardous Waste Generator	VSQG	Sales & Service
MAV000016693	H F Greene & Son	Ware Road	Belchertown	Hazardous Waste Generator	VSQG	Construction

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

W:\SWAPPUB\Belchertown 1024016 SWAP 2003-10-08-03.doc

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
EVERGREENE GOLF CENTER

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	Evergreene Golf Center
<b>PWS Address</b>	Ware Rd
<b>City/Town</b>	Belchertown, Massachusetts
<b>PWS ID Number</b>	1024018

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well #1	1024018-01G	100	422	Low	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1024018-01G)**

Zone I = 100 ft.  
IWPA = 422 ft.

### How Was My Well's Susceptibility Determined?

Your well's **low** susceptibility to potential microbial threats is based on no septic system components within the Zone I or IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the gravel mining operation and golf driving range within the IWPA.

This source water assessment report is based on information provided by you on your New Source Approval Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Bernardston Fire & Water District**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i><b>PWS Name</b></i>	Bernardston Fire & Water District
<i><b>PWS Address</b></i>	259 Bald Mountain Road
<i><b>City/Town</b></i>	Bernardston
<i><b>PWS ID Number</b></i>	1029000
<i><b>Local Contact</b></i>	Mr. Russell Dean
<i><b>Phone Number</b></i>	413-648-9088 or 413-648-9656

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Section 1: Description of the Water System

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

<b>Zone II #: 443</b>	<b>Susceptibility: High</b>
<b>Well Names: Barton Road Wells</b>	
Well #2—New drilled well	1029000-02G
<b>Zone II #: 444</b>	<b>Susceptibility: High</b>
Sugarhouse Well	1029000-03G

Bernardston is a small, rural community in western Massachusetts along the Vermont border. The town is predominately hilly, with a portion of the south central and south eastern portions of town within a valley area and a narrow valley along the Fall River. As with most hilltowns, the town center and developed areas are located primarily along the valley floors. There are two wells serving the Bernardston Fire and Water District; one additional well, (1029000-01G) is severed from the system and designated as an emergency source. Although the emergency well (01G) is not discussed further in this report, 01G is physically adjacent to and within the same aquifer as Well #2 (02G). Well #2 (1029000-02G) is located within the Deerfield River Basin in the southern edge of town, west of Greenfield Road off Barton Road near the baseball diamond. Well #2 is an eight-inch diameter, 87-foot deep well, has an approved pumping rate of 50 gallons per minute (GPM) and a Zone I protective radius of 379-feet. Well #3, the Sugarhouse Well (1029000-03G) is located within the Connecticut River Basin, south of Burke Flat Road between Route 5 and Interstate 91. Well #3 is an 18 x 24-inch gravel packed well, 88 feet deep,

has an approved pumping rate of 430 GPM (0.62 MGD), and a 400-foot Zone I radius. The Zone II, primary recharge areas, were delineated for well #2 and #3 based upon their approved pumping rates. The Zone IIs were delineated through the SWAP program utilizing data develop during long duration pumping tests, geologic mapping and analytical modeling.

Well #2 utilizes water from a buried valley, sand and gravel aquifer adjacent to the Mill Brook. Although there is some evidence of fine sand and silt, the aquifer is unconfined. The bedrock underlying the well site is mapped as the Sugarloaf Formation, a Triassic age red or gray arkose that laterally and vertically grades into a coarse arkose conglomerate.

As noted previously Well #2 and Well #3 are located in different watersheds and therefore distinct aquifers. Well #3 is located in the buried valley, sand and gravel, unconfined aquifer adjacent to the Fall River. There is no evidence of a potentially confining (protective) clay layer. The bedrock mapped in the vicinity of well #3 is the Bernardston Formation, a fine-grained phyllite with interbeds of thin quartzite. Both wells are located in unconfined aquifers. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

Water from both sources is treated with potassium hydroxide as pH adjustment for corrosion control. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

Although the wells are within two distinct Zone IIs, there are similar some land use activities that area common within both Zone IIs. The Zone II for Bernardston is a mixture of residential, agricultural, forested, and minimal industrial/commercial land uses (refer to attached map for details). Land uses and activities that are potential sources

of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Key Land Uses and Protection Issues include:

1. Nonconforming activities in Zone I
2. Residential land uses
3. Transportation corridors
4. Hazardous materials storage and use
5. Comprehensive wellhead protection planning
6. Agricultural activities

The overall ranking of susceptibility to contamination for well #2 is moderate, while well #3 (Sugar House Well) has a high ranking, based on the threatening land uses within the water supply protection areas, as seen in Table 2.

**1. Nonconforming Activities in Zone Is** – Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Only water supply activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and the Zone I may contain non-water supply activities such as homes and public roads. The

District does not own or control all of the Zone I for either well. Passive recreation at the baseball field, associated parking and a commercial, light manufacturing facility are located within the Zone I of Well #2. Cornfield and derelict farming facilities associated with the annual maple sugaring activities are located within the Zone I of Well #3.

### Zone I Recommendations:

- ✓ To the extent possible, remove all non-water supply activities and debris from the Zone Is to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Monitor all activities and proximal to the Zone I.
- ✓ Investigate the potential of acquiring the remaining land in Zone I or entering into conservation restrictions or an agreement of Right of First refusal for the land.

**2. Residential Land Uses** – Approximately 16% of the Zone II areas consist of residential areas. None of the areas have public sewers, and so all use septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.

### What is a Zone III?

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**3. Transportation Corridors** – Within the Zone II areas, 13% of the land is used for transportation corridors. Interstate 91 runs through the entire Zone II #444, and local roads are common throughout both Zone IIs. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catchbasins.

#### Transportation Corridor Recommendations:

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.
- ✓ Provide a map of the Zone II area to MA Highway Department to ensure they are aware of the location of Bernardston's wells. Consider requesting the areas be designated low salt application areas.

**4. Hazardous Materials Storage and Use** – One percent of the land area within the Zone II is commercial or industrial land uses. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or

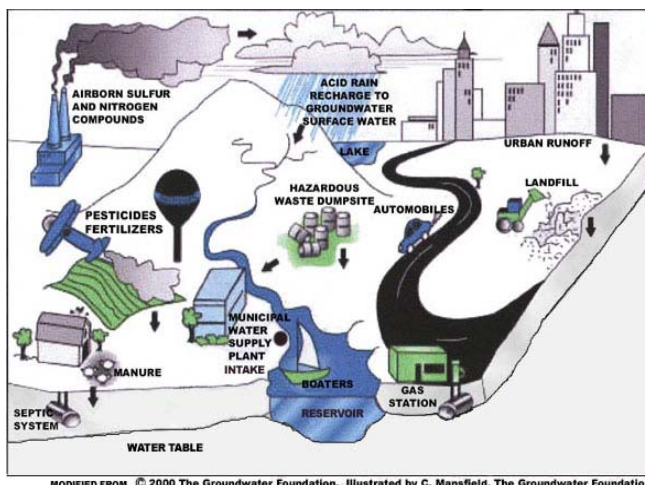

Figure 1: Sample watershed with examples of potential sources of contamination

disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

#### Hazardous Materials Storage and Use Recommendations:

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Zone II	Potential Contaminant Sources*
<b>Agricultural</b>				
Dairy Farms	1	M	444	Manure (microbial contaminants): improper handling
Livestock Operations	1	M	444	Manure (microbial contaminants): improper handling
Manure Storage or Spread-	1	H	444	Manure (microbial contaminants): improper handling
<b>Commercial</b>				
Service Stations/ Auto Repair	1	H	444	Automotive fluids and solvents: spills, leaks, or improper handling
<b>Residential</b>	<b>85.3 acres total</b>			
Fuel Oil Storage (at resi-	Numerous	M	Both	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Both	Pesticides: over-application or improper storage and disposal
Septic Systems / Cess-	Numerous	M	Both	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>				
Stormwater Drains/ Retention Basins	Numerous	L	Both	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transportation Corridors	66.7 acres	M	Both	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

practices.

- ✓ Work with the Board of Health to inspect and educate local businesses with respect to Massachusetts floordrain requirements and hazardous materials handling (including household type hazardous materials). See brochure “Industrial Floor Drains” for more information.

**5. Agricultural Activities** – Within both Zone II areas, a total of 44% of the land is used as crop or pasture land. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Provide a map of the protection areas to ensure the farmers have accurate information about the protection areas.

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

❶ Reduces Risk to Human Health

❷ Cost Effective! Reduces or Eliminates Costs Associated With:

- Increased groundwater monitoring and treatment
- Water supply clean up and remediation
- Replacing a water supply
- Purchasing water

❸ Supports municipal bylaws, making them less likely to be challenged

❹ Ensures clean drinking water supplies for future generations

❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

**Potential Source of Contamination vs. Actual Contamination**

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

- ✓ Provide the attached information on BMPs for manure and pesticide management to land owners

**6. Protection Planning** – Currently, the Town does not have water supply protection controls that meet DEP’s Wellhead Protection regulations 310 CMR 22.21(2). Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells.

**Protection Planning Recommendations:**

- ✓ Develop a Wellhead Protection Plan. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP’s guidance, “Developing a Local Wellhead Protection Plan”.
- ✓ Coordinate efforts with local officials to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21 (2). Refer to recommendations in the SWAP Zone II report.
- ✓ Work with the Board of Health to adopt floordrain controls that meet 310 CMR 22.21(2).
- ✓ Recommend that the Planning Board and board of Health contact the Department if they require assistance with implementation of protection controls.

Other land uses and activities within the Zone II areas that are potential sources of contamination are included in Table 2. Refer to Appendix B for more information about these land uses. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### Additional Information:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

## Section 3: Source Water Protection Conclusions and Recommendations

### Current Land Uses and Source Protection:

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Utilizing tight tanks at the baseball diamond facility.

### Source Protection Recommendations:

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
  - ✓ Educate residents on ways they can help you to protect drinking water sources.
  - ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents. Where possible, utilize deep sump pits for stormwater drainage management.
  - ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Encourage the use of Best Management Practices by farmers, residents, businesses, and industries.
  - ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
  - ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
  - ✓ Develop and implement a Wellhead Protection Plan.
  - ✓ Work with the Board of Health to develop and implement a floor drain regulation to further protect your water supply.

### Conclusions:

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	To the extent possible, remove non-water supply activities from each Zone I to comply with DEP's Zone I requirements. Investigate options for gaining ownership or control of the Zone I. Require nutrient management in cornfield and removal of junk near Sugar house well.
Are the Zone I areas posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Are the Zone 1 areas regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone 1?	<b>NO</b>	Monitor non-water supply activities in Zone I and investigate options for removing these activities.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)	<b>YES</b>	Continue working with the Planning Board and the Board of Selectmen to maintain land use controls that meet 310 CMR 22.21(2). Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws and health regulations, and current regulations.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>NO</b>	Work with neighboring municipalities to include Zone IIs in their wellhead protection controls.
<b>Planning</b>		
Does the PWS have a local wellhead protection plan?	<b>NO</b>	Develop a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a watershed and wellhead protection committee?	<b>NO</b>	Create committee; include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>YES</b>	Work with the Board of Health to develop and implement a floor drain regulation to further protect your water supply. For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide watershed protection education?	<b>NO</b>	Increase residential outreach through bill stuffers, school programs, Drinking Water Week activities, and coordination with local groups. Aim additional efforts at commercial, industrial and municipal uses within the Zone II.

Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

- D. Additional Documents on Source Protection

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Blandford Water Department**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i><b>PWS Name</b></i>	Blandford Water Department
<i><b>PWS Address</b></i>	Main Street, P.O. Box 7
<i><b>City/Town</b></i>	Blandford
<i><b>PWS ID Number</b></i>	1033000
<i><b>Local Contact</b></i>	Mr. Frank Burkott
<i><b>Phone Number</b></i>	413-848-2098

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

## Glossary Protection Zones

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

## Section 1: Description of the Water System

*Susceptibility:* Moderate

<i>Source Name:</i>	<i>Source ID:</i>
Long Pond Reservoir	1033000-01S

Blandford is a small, rural hilltown community in southwestern Massachusetts. The Blandford Water Department utilizes Long Pond Reservoir as the sole source of water for a portion of the Town of Blandford. Long Pond (1033000-01S) is an 81 acre impoundment holding approximately 65 million gallons of water. The watershed is part of the Cobble Mountain Reservoir watershed, the water source for the Springfield Water and Sewer Commission. The land uses within the Long Pond watershed is primarily forested upland (78%) with the remaining watershed consisting of residential and non-commercial agricultural activities, primarily hay. The Water Department owns approximately 60% of the watershed. Due to loss of their waiver from filtration in 2000, Blandford has signed an Administrative Consent Order to either develop an alternate water supply or filter the source. Please refer to the attached map to view the boundaries of the protective zones.

Prior to distribution, the pH of the water from the reservoirs is raised with soda ash for corrosion control and the water is disinfected with chlorine prior to distribution. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

There are few activities that pose significant anthropogenic threats to the reservoir. However, due to the nature of surface water supplies and the current unfiltered status of the reservoir, the source is considered highly vulnerable to potential contamination. In fact naturally occurring bacteria present in the intestines of animals and in the soils can pose a significant threat to water quality of surface water supplies through runoff. Land uses and activities that are considered potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Residential land use in Zone A and watershed
2. Forest/Watershed management
3. Transportation corridors

The overall ranking of susceptibility to contamination for the system from controllable land use activities is moderate, based on the presence of several moderate threat land use within the water supply protection areas, as seen in Table 2. It is important to reiterate that surface water supplies are considered highly vulnerable to anthropogenic and naturally occurring threats.

**1. Residential Land Uses** – There are three residences located within the Long Pond watershed. None of the areas have public sewers, therefore on-site septic systems are used. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the

groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Consider negotiating a Right of First refusal agreement or conservation restrictions for land not currently owned by the Town.

**2. Transportation Corridors** - Gibbs Road transects the watershed of Long Pond on the northwest side, and there are other local roads within the watershed. Gibbs Road and the trail that runs toward the reservoir intake are of particular concern due to their proximity to the pond. Inspect the area regularly for erosion and runoff issues and correct them as appropriate. Typical roadway maintenance and use can pose a potentially significant source of contamination from accidents and washouts along dirt roads. De-icing materials, automotive chemicals and other debris on roads are picked up by stormwater washed into catch basins and discharge into the reservoirs.

#### Transportation Corridor Recommendations:

- ✓ Inspect drainage along roads in the watershed. Make every effort to ensure stormwater discharges outside of the protection areas as feasible or allowed to settle before entering feeder streams. Consider various strategies to detain/slow the flow and retain sediments to keep the runoff out of Long Pond.
- ✓ Work with local emergency response teams to ensure effective management of potential spills.

**3. Protection Planning** – Currently, Blandford and Otis do not have Watershed Protection Districts and protective bylaws.

#### Protection Planning Recommendations:

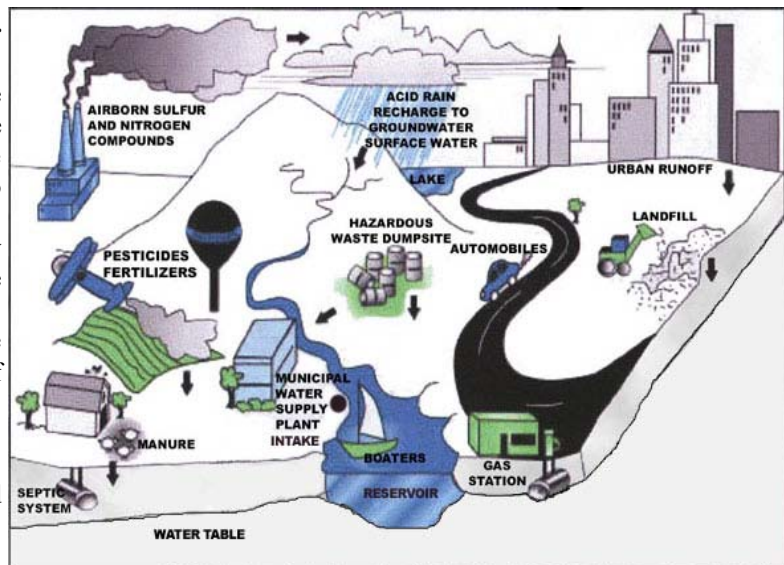

- ✓ Coordinate efforts with local officials to compare local watershed protection

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

MODIFIED FROM © 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

Figure 1: Sample watershed with examples of potential sources of contamination

controls with current MA Watershed Protection Regulations 310 CMR 22.21(2). Include Otis in the protection plans. For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.

### Section 3: Source Water Protection Conclusions and Recommendations

#### Current Land Uses and Source Protection:

As with many water supply protection areas, the system's Zone C contains potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Ownership of most of the watershed
- Performing clean-up of old farm dump near Long Pond.

#### Source Protection Recommendations:

To better protect the sources for the future:

- ✓ Inspect the protection areas regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your watershed and to cooperate on responding to spills or accidents.
- ✓ Work with landowners in your protection areas to make them aware of your water supply and to encourage the use of a best management practices for residential and recreational uses.
- ✓ Inspect stormwater drainage along roads in the watershed. Make every effort to ensure stormwater discharges outside of the protection areas. Alternatively consider various strategies to detain/slow the flow and retain sediments to keep the runoff out of Long Pond.

- ✓ Inspect, maintain, and clean catch basins on a regular schedule.

#### Conclusions:

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Source Protection Grant Program provides funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring, about May 1, the Department posts a new Request for Response (RFR- the grant application form) for the grant program.

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### Source Protection Decreases Risk

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Agricultural</b>			
Haying -- No fertilizers or pesticides	2	M	Accidental fuel spill.
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Transportation Corridors/Roads and trails (Legal/illegal access)	Numerous	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling. Illegal access to watershed.
<b>Notes:</b> <ol style="list-style-type: none"> <li>When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.</li> <li>For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.</li> <li>For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.</li> </ol> <p>* <b>THREAT RANKING</b> - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.</p>			

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone C. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## Section 4: Appendices

- A. Protection Recommendations
- B. Additional Documents on Source Protection

### For More Information

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, town boards, and the local media.

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

### Top 5 Reasons to Develop a Local Surface Water Protection Plan

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone A?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone A posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone A regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone A?	<b>YES</b>	Continue monitoring non-water supply activities in Zone As.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Surface Water Protection Controls that meet 310 CMR 22.20C?	<b>NO</b>	The Town Watershed Protection bylaw is in compliance DEP's regulations. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws, health regulations, and current regulations.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>NO</b>	Work with neighboring municipalities to include the watershed in their protection controls.
<b>Planning</b>		
Does the PWS have a local surface water supply protection plan?	<b>YES</b>	Update the surface water supply protection plan as necessary. Follow "Developing a Local Surface Water Supply Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a watershed protection committee?	<b>NO</b>	Establish committee; include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>Not Applicable</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide watershed protection education?	<b>NO</b>	Aim additional efforts at the public and neighboring community.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Meadowbrook Acres Mobile Home Park

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 22, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Meadowbrook Acres Mobile Home Park (the Park) is located on Route 20 in Brimfield near the western border with Monson. The Park is comprised of approximately 95 trailers, an administration building, a clubhouse, and other associated facilities. The total population ranges from approximately 130 people year-round to 150 people seasonally. The facility is served by two potable supply wells, the Upper well (01G) and the Lower well (02G). There is no municipal wastewater disposal facility in

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Brimfield; therefore, wastewater from the facility is disposed of through on-site, individual septic systems. The facility is in the process of changing the wastewater disposal from individual septic systems throughout the park to a combined system away from the wells. The facility has received a groundwater discharge permit and has a system design but presently does not have available funds to complete the construction.

The Upper well is a 280-foot deep, 6-inch diameter, bedrock well located below grade in a vault. The Lower well is a 260-foot deep, 6-inch diameter bedrock well also located in a vault below grade. Geologic mapping in the area indicates thin overburden deposits of sand and gravel less than 50 feet deep. The Lower well is likely in relatively thin stratified drift, deposited by receding glaciers some 14,000 to 18,000 years before present. Recent streams and rivers may have reworked the sand and gravel and deposited recent alluvium. The Upper well is likely on the edge of the valley with only thin till layer over bedrock. The bedrock in the area is mapped as intrusive rocks and their metamorphic equivalents of the Bronson Hill Formation, predominantly schist.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water are allowed to occur or other non-threatening activities. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The Zone I and IWPA protective radii for both wells 248 feet and 616 feet, respectively. These protective radii were calculated based on the metered water use from the two highest months of use from the Upper well. Please refer to the attached map that shows the Zone Is and IWPAs. The Zone I areas are not conforming to current DEP requirements. The Zone I areas include residences, parking areas, roadways, fuel oil/kerosene storage, and septic tanks. The IWPAs include the remainder of the facility, Route 20 and a utility right-of-way.

There is no evidence of a continuous, protective confining clay layer in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from activities on the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer.

The well serving the facility has no treatment at this time. The DEP requires public water suppliers to regularly monitor the quality of the water. For current information on

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
High density residential land use	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells. Provide information about BMPs
Fuel Storage Above Ground	Yes	Yes	Moderate /High	Require proper maintenance and upgrades to fuel oil/kerosene tanks to prevent releases from occurring. Encourage propane use.
Septic System	Yes	Yes	Moderate	See septic systems brochure in the appendix, relocate septic systems outside of Zone I
Lawn care/gardening	Yes	Yes	Moderate	Encourage residents in proper storage, disposal, and application of pesticides.
Transportation corridors/right-of-way	Yes	Yes	Moderate	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Residential Land Uses; and,**
3. **Transportation corridors including railroad.**

The overall ranking of susceptibility to contamination for the well is high, based on the presence of at least one high threat land use or activity in the IWPA, as seen in Table 2.

**1. Non-conforming Zone I** – Currently, the wells do not meet DEP's restrictions, which only allow water supply related activities in Zone I or other non-threatening activities. The facility's Zone Is contain septic systems, driveways, roads, and residences. Systems not meeting DEP Zone I requirements must receive DEP approval prior to any activity and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Work with residents within Zone I to encourage the replacement of fuel oil or kerosene heat with propane heat and to properly remove the fuel oil/kerosene tanks from the residence if they do convert to an alternative heating source.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Direct driveway drainage in the Zone I away from the well.
- ✓ Relocate septic systems outside of the Zone I.
- ✓ Consider establishing age and condition standards for fuel tanks and incentives for converting to propane.

**2. Residential Land Uses** - The residences have on-site septic systems. If managed

improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** - Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catchbasins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at: [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

Copies of this assessment have been made available to the public water supplier and town boards.

contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Transportation corridor including railroad** – The well is located less than 25 feet from the road and the railroad track is within the IWPA. Accidents and normal use and maintenance of roads and railroads pose a potential threat to water quality. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance, car washing, and accidental spills as well as waste from wildlife and pets. Railroad right-of-ways may pose a potential threat from accidents and maintenance practices.

### Recommendations:

- ✓ Monitor the area to ensure that runoff during heavy storms does not threaten the well. If it is determined that runoff backs-up toward the well, consider modifying the ground surface around the well casing to ensure that stormwater does not discharge near the well.
- ✓ Prepare an Emergency Response Plan that includes coordination between the DEP, the Town emergency response (ER) team in the event of an accident near the wellhead. The Town ER team should be made aware of the location of your water system so that they can notify you in the event of an accident near your system.
- ✓ Request that the Selectmen or Conservation Commission, review the Yearly Operating Plan for the railroad to ensure that the railroad is aware of location of your systems' IWPA.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The Park is commended for having securely locked covers over the wellheads and monitoring activities near the wells. Continue to move toward funding the upgrade of the septic systems. The Park should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Encourage the replacement of fuel oil or kerosene heat with propane heat so that oil/kerosene tanks can be removed from the Zone Is.
- ✓ Relocate septic systems outside of the Zone Is.

### Zone I:

- ✓ Aboveground storage tanks that cannot be removed from your Zone Is should be located on an impermeable surface, and should a spill occur, containment should be large enough to hold the complete liquid volume of the tank.
- ✓ Prohibit new, non-water supply activities from the Zone Is.
- ✓ Restrict use of salt within Zone Is and drain stormwater away from well.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Conduct regular inspections of Zone Is, check any aboveground tanks for leaks.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone Is.

- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

**Planning:**

- ✓ Work with local officials in town to develop and include the IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. If funds are available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? inventory land uses within the recharge areas of all public water supply sources;
- ? assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? publicize the results to provide support for improved protection.

#### Maintaining Your Good Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## INTRODUCTION

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Massachusetts Department of Environmental Protection (MA DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attached Map of the Protection Areas
5. Attachments

## 1. DESCRIPTION OF THE WATER SYSTEM

#### Well # 1

The Brimfield Housing Authority (Housing Authority) is an elderly housing complex located off of Route 20 in the center of town, behind the Town Hall and is classified as a Community water supply. The facility contains three separate apartment buildings, an office building, a maintenance garage with a cement floor and a community center. The single water supply well (Well #1) for the Housing Authority is within an underground vault located in the lawn east of the main building, approximately twenty-five feet south of the paved parking area. The water withdrawal is not metered at the Housing Authority and a pumping test has not been conducted to determine the safe yield of the aquifer and well. Therefore, the water usage was estimated to be approximately 8,550 gallons per

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

day, utilizing Title 5 septic system design flow criteria of 150 gallons per day, per unit. Based on that estimated water usage, the Zone I radius for Well #1 is 240 feet and the radius for the Interim Wellhead Protection Area (IWPA) is 590 feet.

Well #1 has a 6-inch diameter steel well casing set into the bedrock and an open rock boring to the bottom of the well, approximately 467 feet deep. No further details about the well construction are known. The well, the storage tank, the motor controls and the distribution pumps are all located within a locked, underground vault with a cement floor. Although it is unknown if a grout sanitary seal was emplaced around the well during construction, the cement floor of the vault is intact and provides some protection from potential contaminants traveling along the casing.

Geological mapping of the area indicates the metamorphic bedrock aquifer that the well taps is quartzofeldspathic gneiss and sillimanite schist from the Hamilton Reservoir Formation of the Brimfield Group. Stratified drift deposits (sand and gravel) of undetermined thickness overlay the bedrock in this area. During the site visit, some shallow, sand and gravel residential and public supply wells were observed in the vicinity of the Housing Authority. Although the actual depth to bedrock is not known, anecdotal information indicates the sand and gravel over the bedrock is greater than 20 feet in thickness.

Although there is some sand and gravel (approximately 20 feet) material overlying the bedrock aquifer utilized by the Housing Authority, the sand and gravel is highly porous. Sand and gravel does not provide a significant hydrogeologic barrier to prevent contaminant migration from the ground surface into the bedrock aquifer. Bedrock wells drilled in these conditions are assigned a high vulnerability to contamination due to the absence of a hydrogeologic barrier.

### The Water Quality

The water quality from the Brimfield Housing Authority water supply Well #1, currently does not require treatment and meets all US Environmental Protection Agency (EPA) and MA DEP drinking water quality standards. On three occasions, in 1997 and 1998, very low concentrations of Volatile Organic Compounds (VOCs) were reported in a sample from the Housing Authority's water supply. Two neighboring properties, the elementary school and the fire station have also reported very low concentrations of VOCs in their water supplies. In all cases, the reported concentrations were well below the Maximum Contaminant Levels as established by the EPA and the MA DEP. The source(s) of these compounds has not been identified.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Housing Authority	Below Grade Transformers	Yes	Yes	Moderate	Oil/Potentially PCBs – Contact utility to determine
	Storage, use, and handling of hazardous materials	Yes	Yes	High	Maintenance equipment, petroleum products, generator and fertilizer
	Parking lot, driveways & roads	Yes	Yes	Moderate	Continue use of salt alternatives
	Storm drains	Yes	Yes	Low	Roof drain in Zone I; stormwater drains in IWPA
	Septic system: lines, tank and field	Yes	Yes	Moderate	The tank is in Zone I; the leachfield is in the IWPA. See septic systems brochure
USTs	Petroleum products (USTs), Two Tier IC confirmed gasoline release sites	No	No	High	Known gasoline/heating oil storage. Two release sites. No confirmed impact on the Housing Authority well water quality

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

However, there are two confirmed hazardous materials release sites (two gasoline stations on Route 20) in the vicinity of the Housing Authority that are being cleanup and/or monitored. Table 2 also identifies other activities near the Housing Authority's well. Due to these factors, the Housing Authority is required to continue monitoring for VOCs annually. No VOCs were reported in the samples collected in 1999 and 2000. For current monitoring results, please refer to the Housing Authority's most recent Consumer Confidence Report (CCR) or call Virginia Butler, the Public Water System contact person listed above.

## 2. DISCUSSION OF LAND USES IN THE PROTECTION AREAS

There are a number of land uses and activities within the drinking water supply protection areas and within close proximity to the Housing Authority that are potential sources of contamination. Please refer to Table 2.

Key issues include:

1. Non-water related activities within Zone I;
2. Below Grade Transformers;
3. Storage, use, and handling of hazardous materials;
4. Parking lot, driveways & roads;
5. Septic System;
6. Storm drains;
7. Underground Storage Tanks (USTs) for petroleum products at two gasoline stations (confirmed, hazardous materials release sites), school and fire station/DPW garage.

One high and three moderate threat activities are located within the Zone I and IWPA. In addition, two confirmed release sites and two other UST facilities are located within proximity of the Housing Authority. Based on these activities and the historical water quality issues, the overall ranking of susceptibility to contamination for the Housing Authority well is high.

1. Activities within Zone I - Currently, the well does not meet DEP's land use restriction that allows only water supply related activities and buildings in the Zone I. The Zone I for Well #1 contains almost all activities related to the facility including apartment

buildings, parking areas and maintenance storage garage. Please note, systems that do not meet DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use, modifying systems or conducting any other new activities within the Zone I.

2. Below Grade Transformers – All electrical transformers contain oil and depending on the age of the transformer, the oil may contain PCBs. The three transformers at the Housing Authority are recessed below grade in open bottom pits. If one of the transformers were to rupture, the oil would be released to the soils and could potentially impact water quality in the well. Upon request, the electrical utilities change the oil in transformers that contain PCBs and may convert the below grade transformers to above grade systems.

3. Storage, use, and handling of hazardous materials – The maintenance garage is located within the Zone I of the well. The garage was tidy with no evidence of significant amounts of materials storage or spills. Although the garage has a cement floor and there are no floor drains, the materials kept within the

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws), including:

- ◆ Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
- ◆ MA DEP SWAP Strategy
- ◆ Land Use Pollution Potential Matrix
- ◆ Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the water department, town boards, the town library and the local media.

garage (gasoline power generator, lawn mower, small amounts of petroleum products and fertilizer) pose a potential treat to the well due to proximity and the potential for accidental release. It is recommended that an alternative storage facility, away from the Zone I be considered. Until an alternative storage site is available, secondary containment and proper management of these materials is important.

4. Parking area, driveway and roads - The parking area is within 25 feet of the well vault and the drive and roadways are within 31 feet of the vault. All of the areas are paved with storm drains that discharge to a single outfall located approximately 180 feet south of the well

5. Septic System – Some components of the Housing Authority's septic system, such as sewer lines and tank are within the Zone I. The leachfield is in the IWPA approximately 250 feet from the well. The Housing Authority maintains the septic system through regular pumping and the tenants are informed regarding proper disposal practices. There is no sewer in Brimfield.

6. Storm drain - .One drywell for roof runoff is located approximately 110 feet south of the well. As previously noted in item 4, parking lot storm drains discharge within the Zone I to a single outfall located approximately 180 feet south, topographically down gradient, of the well

7. USTs - Although none of the USTs are within the IWPA, there are currently four known UST locations within close proximity to the Housing Authority. Two gasoline stations along Route 20, on the corner of Route 19 are confirmed (Tier 1C) gasoline release sites. Both site owners are cleaning up the sites and monitoring private wells and the groundwater quality in the vicinity of their facilities. The Brimfield Elementary School has a relatively new 10,000-gallon UST east of the building just south of the Housing Authority. The Brimfield Fire Station has a new gasoline UST just south of the station and the school. Both the school and fire station USTs have monitoring systems to detect leaks.

## 3. PROTECTION RECOMMENDATIONS

The Brimfield Housing Authority along with its certified operator should review and adopt the following recommendations, some of which may require contact with and cooperation of the Brimfield Town government: Implementing these recommendations will reduce the system's susceptibility to contamination.

### Zone I and IWPA:

3 Remove all potentially hazardous materials (gasoline, petroleum products and fertilizers) from the Zone I. The Housing Authority is eligible and should consider applying for a Wellhead Protection Grant to construct a storage shed outside of the Zone I. Until that time, use containment and caution when using and storing these products.

- 3 Keep all new non-water supply activities out of the Zone I.
- 3 Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying their system.
- 3 Conduct regular inspections of the Zone I and IWPA. Look for illegal dumping, evidence of vandalism and other activities on and off of your property that may pose a potential threat to your water supply.
- 3 Consider upgrading the current gasoline powered backup generator to a propane or natural gas back-up power source in the future. This is also an eligible grant project.

### Training and Education:

- 3 Continue educating tenants with respect to using cleaning compounds that are safe for the septic system and regarding proper disposal practices, i.e. only sanitary waste in the septic system.

- 3 Post drinking water protection area signs at key visibility locations.

**Facilities Management:**

- 3 Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/brp/dws/dwspubs.html](http://www.state.ma.us/dep/brp/dws/dwspubs.html).
- 3 Upgrade all existing oil/hazardous material storage areas to incorporate secondary containment and safety practices.
- 3 Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on Housing Authority property. Minimize or eliminate fertilizers within Zone I. See Pesticide Fact Sheet.
- 3 Continue the good practice of inspecting and maintaining septic system components on a regular basis. Refer to the appendices for more information regarding septic systems.
- 3 Contact the utility again regarding the below grade transformers. One request has already been made to the utility. Request that the utility make a determination if PCBs are present in the transformers and inquire about upgrading the transformers to above grade units with cement pads. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

**Planning:**

- 3 Work with local officials in Brimfield to include the Housing Authority IWPA in an Aquifer Protection District with protective bylaws to assist you and other PWSs in improving protection. The DEP can assist the community in developing bylaws.
- 3 Prepare a Wellhead Protection Plan and Emergency Response/Contingency Plan to address short-term water shortages/emergencies and long-term water demands. As an example, keep the phone number of a bottled water company readily available.
- 3 Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
WOODBINE COUNTRY STORE

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 13, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Woodbine Country Store
<i>PWS Address</i>	Main St
<i>City/Town</i>	Brimfield, Massachusetts
<i>PWS ID Number</i>	1043008

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1043008-01G	131	436	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #  
1 (1043008-01G)**

Zone I = 131 ft.  
IWPA = 436 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and the IWPA. The **high** susceptibility to potential non-microbial threats is based on the storage of hazardous materials such as fuel oil and underground storage of gasoline within the IWPA. Other moderate threats include local roads and parking areas within the Zone I and the IWPA. In addition, there is a facility identified as a Confirmed Hazardous Materials Release Site within the IWPA. Contact the Bureau of Waste Site Cleanup for additional information about the site at 413-784-1100.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection

## Source Water Assessment Program (SWAP) Report

### for Brimfield Elementary School

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

#### SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared  
October 31, 2003

**Table 1: Public Water System (PWS) Information**

<i>Phone Number</i>	<b>413-245-7337</b>

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone 1 (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #2	1043014-02G	250	736	High

#### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

#### Description of the Water System

The Brimfield Elementary School (the school) is located in the central portion of Brimfield just south of the Town center on Route 19. The school student and staff population is approximately 415 people per day and the school is served by one potable supply well (Well #2-02G). Well #1 is severed from the distribution system but the school maintains Well #1 as an emergency source. The emergency source will not be further addressed in this report. Well #2 was installed to replace Well #1 in 1992 as part of a school expansion and upgrade project. The well is located southwest of the school on the edge of the ball field. There is no municipal wastewater sewer system in

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

Brimfield; therefore, the school and surrounding facilities are served by on-site septic disposal.

Well #1 is an 8-inch diameter, bedrock well that is 466 feet deep. Geologic mapping in the area and the well log indicates overburden deposits of 124 feet of sand with some till over the bedrock. The school is located in an area that is mapped as a potential, medium yield, sand and gravel aquifer. The area is a bedrock valley that was filled with stratified drift (sand and gravel) during the recession of the glaciers about 14,000 to 18,000 years ago.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water or non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The Zone I and IWPA protective area radii are 250 and 736 feet, respectively. These protective radii were calculated based on the approved withdrawal rate of the well which was based on a 48-hour pumping test conducted during the New Source Approval Process. Please refer to the attached map that shows the Zone I and IWPA.

The Zone I area for the well is conforming to current DEP requirements. The Zone I area for Well #2 includes the playing fields for the school. DEP approved the activity provide no pesticides and fertilizers are used on the fields. The leachfield is located just outside Zone I. All of the school building and facilities, two USTs, three leachfields, the fire station, the DPW Highway garage and part of the Brimfield Housing Authority facilities are also located within the IWPA.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments/threats
USTs (1 gasoline, 1 fuel oil)	No	Yes	High	UST w/leak detection at school and fire station
Floor Drains in Boiler Rooms	No	Yes	Moderate	Consult with UIC program regarding compliance
Athletic fields	Yes	Yes	Moderate	Continue current practice of prohibiting the use of pesticides/fertilizers on fields
School facilities and parking	No	Yes	Moderate	Limit road deicing usage, use BMPs for household hazardous materials and monitor parking areas and control stormwater
High density residential housing	No	Yes	Moderate	Septic systems, household hazardous materials and parking
Transportation Corridor	No	Yes	Moderate	Wales Road (Rt. 19)
Fire Station	No	Yes	Moderate	Vehicle washing and vehicle storage
Septic systems components	No	Yes	Moderate	School housing authority and DPW leachfields in the IWPA
Highway Department - VSQG	No	Yes	Moderate	Hazardous materials storage and use and recycling center

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Geological mapping of the area indicates the metamorphic bedrock aquifer that the well taps is quartzofeldspathic gneiss and sillimanite schist from the Hamilton Reservoir Formation of the Brimfield Group. Stratified drift deposits (sand and gravel) of undetermined thickness overlay the bedrock in this area. During the site visit, some shallow, sand and gravel residential and public supply wells were observed in the vicinity of the school. Although the actual depth to bedrock is not known, anecdotal information indicates the sand and gravel over the bedrock is greater than 20 feet in thickness.

Although there is some sand and gravel (approximately 124 feet) material overlying the bedrock aquifer utilized by the school, the sand and gravel is highly porous. Sand and gravel does not provide a significant hydrogeologic barrier to prevent contaminant migration from the ground surface into the bedrock aquifer. There is no evidence of a continuous, protective confining clay layer in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from activities on the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer. The water does not require and is, at the time this report was prepared, not treated. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information. Please note that the land use descriptions are limited and the school area is described as Urban Open space for lack of a better descriptor.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Zone I**
2. **Floor drains in boiler rooms,**
3. **School facilities and athletic fields,**
4. **Residential housing,**
5. **Transportation corridors and right of ways,**
6. **Underground Storage Tanks**
7. **Hazardous materials/waste**

There are several activities within the Zone I and IWPA that pose a significant threat to the water supply. The overall ranking of susceptibility to contamination for the well is moderate based on several high threat activities within the protection areas. Please refer to Table 2.

1. **Zone I** – The water supplier does own the entire Zone I area. The Zone I includes a ball field.

### Zone I Recommendations:

- ✓ Prohibit any additional activities within Zone I and where feasible, remove non-conforming activities within the Zone I areas.
- ✓ Use Best Management Practices for maintenance and access to the area.
- ✓ Do not use or store pesticides or fertilizers within the

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

### Zone I.

**2. Floor Drains in Boiler Room** – There are floor drains in the boiler room, that are assumed to discharge to the septic system. However, the discharge point is not known. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry wells in areas where hazardous materials or petroleum may enter the floor drain. The floor drain must be protected to prevent boiler blow down, oil or other prohibited discharges through the floor drain.

#### Recommendations:

- ✓ Be sure that the floor drains are in compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207 or Tony Zaharias 413-755-2122).
- ✓ Containment to prevent accidental releases to the floor drain may be an option. Contact the regional DEP contact for the UIC program listed above. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. We recommend that you require your boiler maintenance contractor to use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.
- ✓ Seal the floor drain if it cannot be adequately protected to prevent a prohibited discharge.

**3. School facilities and athletic fields** – Elementary schools generally use only household type hazardous materials for cleaning. There are state and federal regulations controlling some of the activities and products used at schools to promote “healthy schools”. All of the school’s facilities are located within the Zone I or IWPA of the wells. Potential exists for contamination of the well by onsite use of fertilizers and/or pesticides; continue to prohibit their use in Zone I. Storm drains in the parking areas at the school drain directly into the ground.

#### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields across the street. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA.
- ✓ Investigate Integrated Pest Management and Best Management Practices within the IWPA as necessary.
- ✓ Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or deicing materials within Zone I.
- ✓ Review your emergency response plan regarding accidental releases within the area. Ensuring that emergency responders in town are aware of the locations of your resource areas.
- ✓ Refer to the Massachusetts Public Health Associations Healthy Schools website online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html) for additional information.

**4. Residential Land Use** – There is high-density residential housing at the Brimfield Housing Authority within the IWPA protection area. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Residential Land Use Recommendations:**

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**5. Transportation corridors and parking** - Roads and parking areas are potential sources of contamination due to deicing of roadways and leaks or spills of fuels and other hazardous materials during accidents.

**Recommendation:**

- V Contact the local fire department to ensure that the Zone I and IWPA areas are included in Emergency Response Planning.

**6. Underground Storage Tank (UST)** – The school has a 10,000-gallon double-walled, UST with fuel oil and the Fire Department has an UST with gasoline; both are located within the IWPA of the water supply. If managed improperly, Underground Storage Tanks can be a potential source of contamination due to leaks or spills of the chemicals they store. Both tanks are relatively new and have leak detection.

**Recommendation:**

- V Any modifications to the UST must be accomplished in a manner consistent with Massachusetts’s plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs. Monitor all activities associated with the products especially during delivery.

**7. Hazardous Materials Storage and Use** – The Brimfield Highway Department, Fire Department and recycling facilities are located within the IWPA. The Highway Department is a registered hazardous waste (oil) generator. There were no floor drains observed during the assessment and the hazardous materials appeared to be handled appropriately. Spill kits and signs designating areas of storage should be available. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground. It should be noted that vehicle washing is a restricted activity under the UIC regulations. In addition, there are vehicles stored on site. There is also a well that serves the facility northwest of the garage and it’s cap was loose at the time of the assessment. The cap on the well should be inspected and changed to a watertight cap with a sanitary seal.

**Hazardous Materials Storage and Use Recommendations:**

- V Continue current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.
- V Review the attached fact sheet for additional information about vehicle washing activities.
- V Continue to manage any vehicles that are stored on site to ensure there is no leakage of petroleum products.
- V Promote the use of BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.

### **3. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will further reduce the well’s susceptibility to contamination. The DEP commends the effort shown in current protection practices of not using pesticides and fertilizers in the Zone I.

Please review and adopt the key recommendations listed above and as follows:

**Priority Recommendations:**

- ✓ Request that the Town departments monitor their well and continue to use BMPs for management of hazardous materials in the protection areas.

**Zone I and IWPA:**

- ✓ Prohibit any new non-water supply activities from Zone I.
- ✓ Continue to conduct regular inspections of the Zone I and IWPA.
- ✓ Monitor activities and if there is evidence of increased activity or access to the well, consider limiting access with a fence. Inspect the cap to ensure the integrity of the seal.
- ✓ Post drinking water supply signs in key locations such as along the access road and in the parking areas but away from the wells themselves.
- ✓ Provide information to staff and pertinent school organizations about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, pesticides and household hazardous waste.

**Training and Education:**

- ✓ Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies).
- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator.

**Facilities Management:**

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and the certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator. The school is currently not registered as a generator of hazardous waste or waste oil. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" and register to participate, if necessary.

**Planning:**

- ✓ Work with local officials to develop an Aquifer Protection District Bylaw that includes the school well's IWPA and to assist you in continued protection of the water supply.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- ✓ Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Medsource Technologies

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department  
of Environmental  
Protection, Bureau of  
Resource Protection,  
Drinking Water Program

Date Prepared:  
November 7, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS NAME</i>	<b>Medsource Technologies</b>
<i>PWS Address</i>	<b>69 Mill Lane</b>
<i>City/Town</i>	<b>Brimfield, Massachusetts</b>

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Medsource Technologies is located in Brimfield, a small, rural community in south central, Massachusetts. The facility manufactures orthopedic devices and surgical instruments. Brimfield does not have public water or municipal wastewater sewers available. Therefore, the facility is served by an on-site water supply and septic disposal. The facility is a registered small quantity hazardous waste generator (SQG).

The total staff is approximately 85 people per day and is served by a single potable

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

supply well (01G) located at the facility. The well is located within an older building at the facility and is a 6-inch diameter, bedrock well that is approximately 380 feet deep.

The Zone I is the protected area immediately surrounding the well, while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual (Zone II) recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii for this facility's well are 175 feet and 471 feet, respectively, based on one year of metered water use. Review of currently available data indicates that normal water use may, at times may be greater than that used for the initial Zone I determination.

The overburden in the area is mapped as a relatively thin layer (0 to 50 feet thick) of sand and gravel (stratified drift) covering glacial till and bedrock. The overburden was likely deposited during the recession (melting) of the glaciers some 14,000 to 18,000 years ago. The bedrock in the area is mapped as a sulfidic schist of the Partridge Formation. There is no evidence of protective barrier of either thick till or of a confining, protective clay layer in the vicinity of the well. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface. Please refer to the attached map of the Zone I and IWPA.

The water from the well is not treated prior to distribution at this time. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1. Refer to Table 2 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The protection areas for Well #1 includes the entire facility including the septic system, chemical storage and use, fuel storage (AST), the road, the parking area and residences.

#### Key issues include:

1. **Non-conforming activities within Zone I,**
2. **Residential/commercial land uses with on-site septic disposal**
3. **Transportation corridors,**
4. **Hazardous materials storage and use.**

**Table 2: Table of Activities within the Water Supply Protection Areas for Both Sources**

Potential Contaminant Sources	Zone I	IWPA/ Zone II	Threat	Comments
Non-conforming Zone I	--	--	--	Non-conforming uses in Zone I
Hazardous materials storage and use	Yes	Yes	High	Continue the use of BMPs and coordinate with emergency responders.
SQG	Yes	Yes	Low	Hazardous materials/SQG
Septic system	No	Yes	Moderate	Microbial threat and potential improper disposal of hazardous materials

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridor and parking	No	Yes	Moderate	Limit road deicing materials and monitor parking areas.
Transformer (ground mounted)	Yes	Yes	Low	Although most transformers today do not contain PCBs the oils may pose a threat due to the proximity to the well.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

The overall ranking of susceptibility to contamination for Medsource water system is high, based on the presence of at least one high threat ranked land use or activity in the Zone I and IWPA. However, Medsource is commended for their diligent management of hazardous materials on-site. Please refer to Table 2 for more details.

**1. Non-conforming activities within Zone I** – Currently, the water supplier does own the entire Zone I area, however, the activities conducted within the Zone I are non-conforming and pose a threat to the water supply. Please note that systems not meeting DEP Zone I requirements must receive DEP approval and address Zone I activities prior to increasing water use or modifying systems. The well is located within one of the facility's buildings. Medsource is a registered Small Quantity Hazardous Waste Generator, and heats with fuel oil utilizing one aboveground storage tank (AST) that is located outside of the building. There were no floor drains observed. The parking area is paved and utilizes drywells.

#### Recommendations:

- V Consider relocation of the well if potential threats cannot be mitigated and water quality is impacted by activities.
- V To the extent feasible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements. Prohibit new non-water supply activities in the Zone I.
- V Where it is feasible, remove all hazardous materials from the Zone I. Continue current good housekeeping practices and the use of BMPs for the storage, use, and disposal of hazardous materials.
- V Continue to carefully monitor the delivery, handling and storage of chemicals and products.
- V Inspect the well casing and cap regularly to ensure it is sanitary and watertight.

**2. Residential Land Uses** – The IWPA for Well #1 has low-density residential land use. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks,

Figure 1: Example of how a well could become contaminated by different land uses and activities.

maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm> for additional information.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Consider distributing the fact sheet “Residents Protect Drinking Water” available in Appendix A and online at the website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**3. Transportation corridor** – Local roads and part of State Route 19 is located within the IWPA and the access and parking areas for the facility are within Zone I as well. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and

contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets. The facility is served by direct recharge of stormwater to the overburden aquifer through drywells.

#### **Recommendations:**

- ✓ Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they are aware of the location of your well.
- ✓ Monitor the parking area for spills especially during deliveries.

**4. Hazardous Materials Storage and Use** – Medsource utilizes hazardous materials and generates hazardous waste. There were no floor drains observed during the assessment and the hazardous materials appeared to be handled appropriately. Spill kits and signs designating areas of storage were noted during the visit. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground.

#### **Hazardous Materials Storage and Use Recommendations:**

- ✓ Continue current management of hazardous materials on-site and consider relocation of the well to minimize any potential threat from an accidental release at the site.
- ✓ Contact the Bureau of Waste Prevention (John Downes – 413-755-2231) if you have any question regarding disposal of hazardous materials.
- ✓ Aboveground storage tanks should be located on an impermeable surface, and also contained in an area large enough to hold 110% of the complete liquid volume, should a spill occur.
- ✓ Monitor deliveries of oil and consider sleeving the lines to prevent accidental release.

### **3. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. Review and consider adopting the key recommendations above and the following:

#### **Priority Recommendations:**

- ✓ Consider relocation of the well if potential threats cannot be mitigated.
- ✓ Continue current use of BMPs and management practices.

#### **Zone I:**

- ✓ Prohibit any new non-water supply activities from the Zone I.

### **For More Information:**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ Continue to monitor use and handling of hazardous materials.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### **Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Inform neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal and septic system maintenance.

### **Planning:**

- ✓ Work with local officials in Brimfield to develop an Aquifer Protection District and Bylaws for compliance with 310 CMR 22.000 to include Medsource and other IWPA's in that district.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## **4. Attachments**

- Map of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheets
- List of Regulated facilities in the protection areas

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREAS

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
	Medsource Technologies (formerly Brimfield Precision)	Mill Lane Road	Brimfield	Hazardous Waste Generator	SQG	Manufacturing facility

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
CUMBERLAND FARMS

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 3, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Cumberland Farms
<i>PWS Address</i>	3 Main St
<i>City/Town</i>	Brimfield, Massachusetts
<i>PWS ID Number</i>	1043026

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1043026-01G	100	411	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1043026-01G)**

Zone I = 100 ft.  
IWPA = 411 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and the IWPA. The **high** susceptibility to potential non-microbial threats is based on the storage of hazardous materials such as gasoline and floordrains other than those connected to a sewer line within the Zone I and the IWPA. Other moderate threats include local roads and parking areas within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, Bureau of Waste Site Clean-up files, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site <http://www.dep.state.nh.us/dw/>

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Mohawk Trail Regional High School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared  
January 8, 2004

Well #1	1047000-01G	251	626	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Mohawk Trail Regional High School (the school) is located in the northeast corner of Buckland, Massachusetts. Buckland is a small, rural agricultural town in northwestern Massachusetts on the eastern slope of the Berkshire foothills. The facility consists of various building wings located adjacent to each other serving the region's seventh through twelfth grade students and the regional school system administration building. The total school system student and staff population is approximately 900 people per day. There is no municipal water system in the vicinity of the school, therefore water is supplied to the school through a single, on-site well. However, since 1998, the wastewater from the school is discharge through a sewer to the municipal wastewater treatment facility.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

Well #1 (01G) is located approximately 75 feet west of the school within a brick and cement block structure that extends approximately three feet below and three feet above grade and is secured with a bulkhead door. The well casing terminates below grade, but about two feet above the floor of the pit. Well #1 is a nominal 8-inch diameter, 400-foot deep bedrock well with approximately 135 feet of casing set into sound rock and an approved withdrawal rate of approximately 7 gallons per minute.

The Zone I protection area for a well is the area immediately around the well where only activities associated with supplying water or other non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. In the mid-1990s, the school was reconstructed and expanded. Due to site constraints, the facility was allowed to expand and utilize the existing well following testing under the New Source Approval Process and providing upgrades to the facility to enhance protection of the source. The school well has a Zone I protective radius of 251 feet and an IWPA protective radius of 626 feet based on an approved withdrawal rate of 7 gallons per minute (10,159 gallons per day). Although the well is approved for approximately 10,159 gpd, actual usage is less than 6,000 gallons per day. Please refer to the attached map that shows the Zone I and IWPA. Although much of the school facility is within the Zone I, the school converted to propane for fuel, removed a gasoline storage tank, connected to the municipal sewer and located the main parking areas outside of the Zone I.

The school is located in the Deerfield River valley north of Route 112 and south of the river. Geologic mapping indicates sand and gravel deposits between 50 and 100 feet deep, however, information from the school indicates 135 feet of casing in the well. The sand and gravel deposits in the river valley are stratified drift deposited during the

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-	-	Contact DEP prior to conducting any work in the Zone I or expanding the system/facility.
Transportation corridor/parking	Yes	Yes	Moderate	Limit road-deicing usage, monitor parking areas and control stormwater.
Athletic fields	Yes	Yes	Moderate	Prohibit the use of pesticides/fertilizers on school fields in Zone Is. Utilize an IPM for athletic fields.
School (Middle and High Schools)	Yes	Yes	Moderate	Use BMPs for hazardous materials.
Hazardous materials (VSQG)	Yes	Yes	Moderate	Use BMPs for maintenance hazardous materials and laboratory materials.
Transformers	Yes	Yes	Low	Monitor transformers for potential leaks

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

recession of the glaciers some 18,000 years ago. Recent rivers have reworked the stratified drift and deposited additional alluvium in the valley. The bedrock geology in this area is a complex. The bedrock in the immediate area of the school is mapped as granite biotite gneiss, Collinsville Formation, part of the Shelburne Falls Dome.

There is no evidence of a continuous, protective confining layer such as thick clay or till in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from activities on the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer. The water from the wells is not treated prior to distribution. Water suppliers are required to regularly monitor the quality of the water. You may request additional information regarding the current water quality from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas and in close proximity to the protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **School facilities and athletic fields;**
3. **Transportation corridors/parking; and**
4. **Hazardous materials.**

There are several activities within the Zone Is and IWPAs that pose a potential threat to the water supply. The overall ranking of susceptibility to contamination for the well is moderate based on at least one moderate threat activity within the protection areas. Please refer to Table 2.

**1. Non-conforming Zone I** – Although the water supplier does own or have control of the entire Zone I area through a Conservation Restriction, there are numerous activities within the Zone I that are non-conforming. The entire school facility is within the Zone I of the well. Systems not meeting DEP Zone I requirements for ownership or control or

non-conforming activities within Zone I must receive DEP approval and address Zone I issues prior to increasing water use or modifying systems/facilities.

### Zone I Recommendations:

- ✓ Prohibit any new non-water supply activities within Zone I and, where feasible, remove non-conforming activities within the Zone I areas.
- ✓ Do not use or store pesticides or fertilizers in Zone I.
- ✓ Inspect the well regularly to ensure the cap is secure, there is no standing water near the well and to ensure that the bulkhead is secure.
- ✓ Relocate the well if it cannot be secured or if water quality is impaired by activities near the wells.
- ✓ Monitor all activities associated with petroleum products within the Zone Is.

**2. School facilities and athletic fields** – All of the school's facilities are located within the Zone I and/or IWPA of the wells. Middle schools generally use only

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier and town boards.

household type hazardous materials. Although high school laboratory and photo labs can use potentially harmful materials, the potential threat from disposal of these materials is somewhat minimized because the school is connected to the municipal sewer. All of the floor drains and laboratory facilities discharge their wastewater through the sewer. The school is presently registered as an inactive hazardous waste generator and has established procedures in place for the use and management of potentially hazardous materials in the laboratories and studios. There are state and federal regulations controlling some of the activities and products used at schools to promote "healthy schools". According to the facilities manager pesticides and fertilizers are not used on the athletic fields.

#### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA.
- ✓ Investigate Integrated Pest Management and Best Management Practices within the Zone I and IWPA.
- ✓ Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides or fertilizers within Zone I.
- ✓ Review your emergency response plan regarding to accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- ✓ For additional information, refer to the Massachusetts Public Health Association's Healthy Schools website online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html).

**3. Transportation corridor/parking** – The school's internal transportation corridors and parking are located partially within the Zone I and within the IWPA. Accidents and normal use and maintenance of corridors and parking areas may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up deicing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as, waste from wildlife and pets.

#### Recommendations:

- ✓ Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they are aware of the location of your well.
- ✓ Limit access to the Zone I areas and direct runoff away from the wells.

**4. Hazardous Materials Storage and Use** – The school utilizes hazardous materials for maintenance and in the laboratories and although the school is a registered generator of hazardous waste and waste oil, the status is "inactive". Hazardous materials such as paint, thinners, petroleum products, etc. should be kept in containment and used with caution. Cleaning and disposal of non-hazardous materials may be through the sewer. Spill kits and signs designating areas of storage should be available. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, or floor drain leading directly to the ground. Review the attached fact sheet for additional information regarding the thresholds for triggering a very small quantity hazardous waste generator.

#### Hazardous Materials Storage and Use Recommendations:

- ✓ Continue current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.
- ✓ Continue to use BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.
- ✓ Ensure that management plans are up to date and staff review BMPs for the handling of hazardous materials.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the well's susceptibility to contamination. The DEP commends the school District for upgrading the facilities to protect the water supply well during the renovation and expansion of the school. The Department encourages continued diligence in management of activities near the wells.

Please review and adopt the key recommendations listed above and as follows:

#### **Priority Recommendations:**

- V Inspect the well regularly and ensure the bulkhead is secured to prevent access to the well.

#### **Zone I and IWPA:**

- V Prohibit any new non-water supply activities from Zone I.
- V Conduct regular inspections of the Zone I and IWPA and the well.
- V Post drinking water supply signs in key location such as along the access road and in the parking areas but away from the well.
- V Provide information to staff and pertinent school organizations about the potential hazards of household chemicals, lab chemicals, lawn care chemicals and fertilizers.
- V Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, lab chemicals, pesticides and household hazardous waste.
- V Replace the split cap on the well with a pitless adaptor and sanitary cap.

#### **Training and Facilities Management:**

- V Incorporate groundwater education into school curriculum (7-12 curricula available; contact DEP for copies).
- V Staff should be instructed on the proper disposal of spent household chemicals and or lab chemicals. Include custodial staff, groundskeepers, and the certified operator.
- V Manage hazardous materials and waste in accordance with regulation and in a manner protective of the water supplies and public health and safety.

#### **Planning:**

- V Work with local officials to develop an Aquifer Protection District and Bylaw that includes the school well's IWPA and to assist you in continued protection of the water supply.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- V Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

#### **Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

- Recommended Source Protection Measures Fact Sheet

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Hawlemont Regional Elementary School

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 31, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses in the Protection Areas
3. Protection Recommendations
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Hawlemont Regional Elementary School is located in the small, rural town of Charlemont, in northwest Massachusetts on the Mohawk Trail (State Route 2). The school has a student and staff population of approximately 210 people. There is no municipal water system in Charlemont but there is a wastewater treatment plant that serves the center of town, including the school. Therefore, the school discharges wastewater to the treatment plant but water is supplied to the school through two on-site wells. Well #1 (01G) is the main water source for the school; Well #2 is physically

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

disconnected from the system but the water quality is regularly monitored and remains a potentially active source. The use of Well #2 was discontinued in 1999 when low concentrations of the volatile organic compounds tetrachloroethylene (PCE) and trichloroethylene (TCE) were detected in water samples collected from Well #2; the compounds were not detected in Well #1. Although the concentrations did not exceed the maximum concentration limits set by DEP and Environmental Protection Agency (EPA), the school does not use the well but continues to monitor the water quality. Although the compounds have not been detected in the water from Well #2 since the Spring of 2000, the school does not use the well. Water quality in both wells is regularly monitored and the school and DEP have an agreement that if the water quality becomes impaired in Well #1, the school will develop an alternative water source.

The school is located south of Route 2 and the Deerfield River bounds the school property on the south. The school is located in the center of town with residences and businesses surrounding the area. Generally, the DEP requires development of a new source that is in compliance with current regulations if a system with a non-conforming source expands. However, due to site constraints and good water quality in the existing Well #1, renovations and an expansion of the school were recently completed, with the school maintaining the use of the existing wells provided the water quality is not impaired. Well #1, the main source is an 8-inch diameter, gravel developed well, screened from 90 to 95 feet below grade that is located in the basement of the building in the boiler room. The school will be installing a berm around the well to prevent inundation of the well if a release occurs in the basement. Well #2 is located within an 8x5x5-feet deep concrete bulkhead, west of the school.

The school is within the Deerfield River valley at the base of the Berkshire foothills between Rice Brook and Mill Brook. The surficial geology at the school site is glacial drift, sand and gravel, deposited within a glacially deepened bedrock valley. Receding glaciers deposited the sand and gravel some 18,000 years ago. In fact there is a delta at the outlet of the Mill Brook as it enters the Deerfield River valley. The deposits within the valley have been reworked by recent streams and rivers with additional recent alluvium deposited by the river. Information from the school indicates sand and gravel to at least 95 feet below grade. However, there is no record of a clay-confining unit in the area. The topography rises dramatically north of the river valley and Route 2. The hillsides north of the school generally have thin till over bedrock. The bedrock at the school is mapped as bands of the Hawley Formation; interbedded amphibolite, greenstone and schist and just east of the school is a mapped contact with a black, fine-

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-	-	Contact DEP prior to expanding the facility or conducting any work in the Zone I.
Fuel oil storage (UST/AST)	Yes	Yes	High/Moderate	Spills, leaks, or improper handling of fuel oil
Transportation corridors and parking	Yes	Yes	Moderate	Be sure emergency responders are aware of the location of your wells.
Residential land uses	Yes	Yes	Moderate	Nitrates, microbial contaminants, and improper disposal of hazardous chemicals
School	Yes	Yes	Moderate	Continue policy of not using pesticides and fertilizers
Commercial/Institution uses	Yes	Yes	Moderate	Household/commercial hazardous materials: recommend BMPs

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

grained schist and quartzite interbedded with amphibolite. There is no empirical evidence of a protective clay layer or thick till to prevent activities on the ground surface from threatening the water supplies. In fact, the very low levels of VOCs were detected in water from the bedrock well on site. Therefore, both the bedrock and the sand and gravel aquifers are identified as having high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration.

The Zone I is the area immediately around the well that is considered most vulnerable to contamination. The Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual recharge area (Zone II) has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The DEP allows only activities related to supplying water or other non-threatening activities within the Zone I. Many systems that were developed prior to the DEP requirements are grandfathered, but any expansion or changes to the facility require DEP approval and compliance with Zone I restrictions. As noted, the DEP allowed the school to expand and to continue using the non-conforming Well #1 until such time that the water quality is impacted from activities near the well. The Zone I and IWPA for both wells are the same. The Zone I and IWPA were based on estimated water use from the wells. The Zone I and IWPA radii for both wells are 134 feet and 437 feet, respectively. The school has installed a meter on Well #1 in 2001 and a preliminary review of the data indicates the school actually uses less water than was initially based on Title 5 flow estimates. Upon review of two full years of water metered data following the school renovation project, the DEP may reduce the size of the protection areas based on actual metered use. Please refer to the attached map of the Zone I and IWPA.

The protection areas for the school's wells include many activities that pose a potential risk of contamination. There are also activities that are just outside of the protection areas that may pose a significant threat to the wells if not managed. All of the school facilities, including an underground fuel oil storage tank, are located within the Zone I or IWPA of one of the wells. As noted previously, the school discharges all of its wastewater to the municipal sewer. If funding becomes available, the school may wish to consider delineating the Zone II recharge area for Well #2 so that the protection strategy for the well can be more focused and perhaps identify a potential location for a new source if one is required in the future.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

The well serving the school has no treatment at this time. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1. Drinking water monitoring reporting data is also available on the web EPA's at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html), for Envirofacts.

## 2. Discussion of Land Uses in the Protection Areas

There are numerous land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

### Key issues include:

1. **Non-conforming Zone Is;**
2. **Elementary School;**
3. **Fuel storage tanks (UST/AST);**
4. **Commercial businesses;**
5. **Transportation and parking; and**
6. **Residential.**

The overall ranking of susceptibility to contamination for the wells is high, based on the presence of at least one high threat land use or activity in the protection areas, as seen in Table 2.

**1. Non-conforming Zone I** – Currently, the wells do not meet DEP's restrictions, which require the system to own or control the entire Zone I area and allow only water supply related or other non-threatening activities in Zone I. The school's Zone Is include all school facilities including a fuel oil underground storage tank (01G). The tank was relocated as part of the renovation and is a new tank with leak detection. Systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying the system's facilities.

### Recommendations:

- ✓ Do not allow any new non-water supply activities in the Zone I.
- ✓ Monitor and control all activities near both wells.
- ✓ Monitor all fuel deliveries.

**2. School facilities and athletic fields** – Elementary schools generally use only household hazardous materials for cleaning. There are state and federal regulations controlling some of the activities and products used at schools to promote "healthy schools". All of the school's facilities are located within the Zone I or IWPA of the wells. However, municipal sewer serves the facility.

### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required. Do not use fertilizers and pesticides in the Zone Is.
- ✓ Investigate Integrated Pest Management and Best Management Practices within the IWPA as necessary.
- ✓ Use secondary containment for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or deicing materials within Zone I.
- ✓ Review your emergency response plan regarding accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- ✓ Refer to the Massachusetts Public Health Associations Healthy Schools website for additional information, online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html).

**3. Fuel Oil Storage – Underground/Aboveground Storage Tank (UST/AST)** – Although the UST fuel oil tank is new the UST can pose a potential threat to the water supply because of potential leaks and/or releases especially during delivery. If managed improperly, underground storage tanks and the associated fuel oil lines can be a potential source of contamination due to leaks or spills of the chemicals they store. The school also has a propane AST which does not pose as significant a threat as the fuel oil UST. In addition, there are commercial and residential facilities that are within close proximity to the school that use various types of fuel for heating including oil, propane, kerosene or wood.

### Recommendations:

- ✓ Any modifications to the UST/AST must be accomplished in a manner consistent with Massachusetts' plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.

- ✓ Monitor deliveries of oil as many spills are related to delivery.
- ✓ Be sure that the floor drains are running freely and are connected to the municipal wastewater treatment facility.
- ✓ Containment of the fuel system to prevent accidental releases to the floor is important. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. DEP recommends that you require that your boiler maintenance contractor use containment, protect the well and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.
- ✓ Seal all cracks in the floor to adequately protect the well.

**3. Residential Land Uses** – There is an apartment complex immediately adjacent to the school and there is at least one other apartment building and approximately twelve other residences within the protection areas of the wells. It is assumed that all are connected to the municipal sewer. However, it is unknown what fuel sources the surrounding residences utilize. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” attached to this report and on-line at the following DEP website which provides BMPs for common residential issues: [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm).
- ✓ Promote BMPs for stormwater management and pollution controls.

**4. Transportation corridor/parking** – Mohawk Trail (State Route 2), residential, commercial and facility parking are located within the Zone I and IWPA. Accidents and normal use and maintenance of corridors and parking areas may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as, waste from wildlife and pets.

**Recommendations:**

- ✓ Prepare an Emergency Response Plan that includes coordination among town emergency responders to be sure they are aware of the location of your well.
- ✓ Continue to manage on-site and off-site stormwater to ensure it flows away from the wells.

**5. Commercial facilities** - There are commercial/institutional facilities located within the IWPA of the school wells. The facilities include restaurants, a church, a general store and a hardware store. The town’s Fire Department is also on the edge of the IWPA for Well #1. Some businesses use or store hazardous materials or generate hazardous waste. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground.

**Recommendations:**

- ✓ Inform the businesses that your PWS is nearby and offer information regarding the use of BMPs at their facilities.

Implementing the following recommendations will reduce the system’s susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells’ susceptibility to

contamination. The school is commended for not using pesticides and fertilizers on its athletic fields and for continuing to monitor the quality of the water in Well #1. The water supplier should review and adopt the key recommendations above and the following:

**Priority Recommendations:**

- ✓ Monitor fuel oil delivery and activities within close proximity to the wells. Do not use or store hazardous materials in the vicinity of the wells.

**Zone I:**

- ✓ Keep all new non-water supply activities out of the Zone I.
- ✓ Post the area with “Public Drinking Water Supply Recharge Area” signs at appropriate locations away from the actual wells.
- ✓ Consider well relocation if Zone I threats cannot be mitigated or if water quality is impacted by activities. Consider delineating the Zone II for the existing well and utilizing that information to potentially site a new well if it is needed for the future.

**Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Incorporate groundwater education into the school curriculum and community.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the area and is treated according to DEP guidance.

**Facilities Management:**

- ✓ If it is feasible in the future, consider upgrading the heating system to propane for the purpose of removing fuel oil storage from the school.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on school property.
- ✓ Keep the area near transformers free of tree limbs that could endanger the transformer in a storm.

**Planning:**

- ✓ Work with local officials in town to develop an Aquifer Protection District with bylaws and include the facility’s IWPA in the District, along with other public water supply wells in town and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.
- ✓ The school may wish to consider delineating the Zone II for the sand and gravel Well #1. This would allow for a more focused protection plan and may result in identifying an alternative site that may be protected for a new well should it become necessary in the future.

**Funding:**

The Department’s Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the “Wellhead Protection Grant Program”. If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in “Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation” at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Woodland Park is a mobile home park located in the town of Charlemont in the Berkshire foothills of northwestern Massachusetts. The park community has 25 homes and is served by a single water supply well located north of Zoar Road. The well is a 200-foot deep well presumed to be in bedrock with a 6-inch diameter casing. Charlemont does have a municipal wastewater treatment plant, but it does not serve this area of town. Therefore, the community is served by on-site septic disposal systems.

The Zone I is the area immediately around the well where only activities associated with

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

supplying water or other non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The well has a Zone I radius of 235 feet and an Interim Wellhead Protection Area radius of 578 feet.

Geologic mapping has the area immediately in the vicinity of the well designated as a potentially productive sand and gravel aquifer. The facility is located along the Deerfield River valley that is a deepened bedrock valley that is filled with sand and gravel that was likely deposited during the recession (melting) of glaciers some 14,000 to 18,000 years ago. Over time, the river reworked the deposits and recent alluvium is also present. Mapping indicates sand and gravel deposits of 50 to 100 feet in the immediate vicinity of the well and 0 to 50 feet in thickness immediately northwest of the facility where scarring from a previous sand and gravel-mining operation is apparent. Bedrock rises steeply to the north of the well to Coon Hill and Blueberry Peak usually indicative of thin overburden. Bedrock outcrops are mapped just northwest of the facility on Zoar Road. The bedrock is mapped as the Moretown Formation, a schist and amphibolite of the Rowe–Hawley Zone.

The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA.

The well serving the facility has no treatment at this time. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Driveways/road and parking areas	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Fuel Storage Above Ground	Yes	Yes	Moderate	Proper maintenance and upgrades to fuel oil tanks to prevent releases from occurring
Septic System	Yes	Yes	Moderate	See septic systems brochure in the appendix, relocate septic systems outside of Zone I
Lawn care/gardening	Yes	Yes	Moderate	Encourage residents in proper storage, disposal, and application of pesticides.
Railroad Tracks	No	Yes	High	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Key issues include:

1. **Non-conforming Zone I;**
2. **Residential Land Uses; and,**
3. **Railroad Tracks.**

The overall ranking of susceptibility to contamination for the well is high, based on the presence of at least one high threat land use or activity in the IWPA, as seen in Table 2.

1. **Non-conforming Zone I** – Currently, the well does not meet DEP's restrictions, which only allow water supply related activities or other non-threatening activities in Zone Is. The facility's Zone I contains driveways, roads, and residences. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Work with residents within Zone I to encourage the replacement of fuel oil or kerosene heat with propane heat and to properly remove the fuel oil/kerosene tanks from the residence if they do convert to an alternative heating source.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Direct driveway drainage in the Zone I away from the well.
- ✓ If possible relocate septic systems outside of the Zone I.

2. **Residential Land Uses** - The residences have on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** - Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.

- **Stormwater** – Catchbasins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and at the DEP drinking water program website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.

3. **Railroad tracks** - Railroad tracks cross the southern portion of the IWPA. Over-application or improper handling of herbicides on the railroad property or right-of-way is a potential source of contamination. Leaks or spills of transported chemicals or train maintenance

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

chemicals are also potential sources of contamination to the water supply.

### Recommendations:

- ✓ Work with local officials during their review of the railroad right-of-way Yearly Operating Plans to ensure that the portion of right-of-way within the Woodland Park IWPA is not sprayed with herbicides.
- ✓ Work with your local fire department to ensure that the IWPA is included in Emergency Response Planning.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Woodland Park is commended for having a securely locked cover over the well and diligent observance of activities on-site. Woodland Park should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Encourage the replacement of fuel oil or kerosene heat with propane heat so that oil/kerosene tanks can be removed from the Zone I.
- ✓ If possible, relocate septic systems outside of the Zone I.

### Zone I:

- ✓ Aboveground storage tanks that cannot be removed from your Zone I should be located on an impermeable surface, and also contained in an area large enough to hold the complete liquid volume, should a spill occur.
- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Restrict use of salt within Zone I and drain stormwater away from well.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Conduct regular inspections of the Zone I, check any aboveground tanks for leaks.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Buried fuel lines should be sleeved to help prevent leaks.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, and certified operator. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

### Facilities Management:

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on Woodland Park property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

**Planning:**

- ✓ Work with local officials in town to develop an Aquifer Protection District and protective bylaws and include the IWPA in the District and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

- Recommended Source Protection Measures Fact sheet
- Your Septic System Brochure
- Pesticide Use Fact sheet
- Source Protection Sign Order Form

Massachusetts Department of Environmental Protection  
**Source Water Assessment and Protection (SWAP) Report**  
for  
**Cheshire Water Department**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

**Table 1: Public Water System Information**

<i><b>PWS Name</b></i>	Cheshire Water Department
<i><b>PWS Address</b></i>	80 Church Street
<i><b>City/Town</b></i>	Cheshire
<i><b>PWS ID Number</b></i>	1058000
<i><b>Local Contact</b></i>	Wilbur Chase, Operator
<i><b>Phone Number</b></i>	(413) 743-3816

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water directly to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

*Zone II #:* 352

*Susceptibility:* High

<i>Well Names</i>	<i>Source IDs</i>
Well #1	1058000-02G
Well #2	1058000-03G

Cheshire is a small, rural community in northwestern Massachusetts. The Hoosic River flows through the center of the community of approximately 1,400 residents. Cheshire Water Department maintains two active groundwater supplies (Well #1 and #2). Cheshire Water Department also maintains two emergency, surface water reservoirs (Kitchen and Thunder Brook reservoirs) that are not addressed in this report. The wells are located east of Route 8, north of the center of town. Well #2 was constructed as a mechanical back up well 25 feet from Well #1 and the two wells are pumped alternately to meet the system water needs. Both wells are 12 by 18-inch diameter, gravel packed wells, 51 feet in depth with 10-foot screens and submersible pumps. Water from the wells is pumped to a motor control and chemical feed building where Calciquest (blended orthophosphate/polyphosphate compound) is added to the water to sequester the hardness (calcium and magnesium) in the water.

The wells are located on the edge of a buried valley aquifer and utilize water from an unconfined, sand and gravel aquifer within the Hoosic River valley. The bedrock valley was deepened by advancing glaciers some 18,000 years before present and later filled with sand and gravel (glacial drift) as the glaciers melted. Although there is some evidence of fine grained material in the aquifer, there is no confining (protective) clay layer at the site to prevent potential contaminants from entering the aquifer from the ground surface. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent potential contaminant migration from the surface. The Town of Adams' wells are also located within Cheshire, approximately 6,400 feet north (downgradient) of the wells

Bedrock at the well site is mapped as the Kitchen Brook dolomite, a fine-grained massive dolomite with a quartz and calcite-rich region in the upper section. The dolomite contributes to the hardness of the water in the aquifer. The complex bedrock geology of the lowlands and surrounding uplands is mapped as folded and faulted schists, quartzites as well as some marbles and dolomites.

The Zone II for these wells was delineated utilizing conceptual, geological and analytical modeling in accordance with the requirements of the New Source Approval Process following an extended duration pumping test. Please refer to the attached map.

## Section 2: Land Uses in the Protection Areas

The Zone I radius for both wells is 400-feet, and is predominantly owned by the Cheshire Water Department although there is a small area coincident with the bike path (Ashuwillatuck Trail) that is owned by the Massachusetts Department of Environmental Management. The trail is used for passive (non-motorized) recreation and transects the Zone I and runs along the eastern edge of the Zone II. Although historically the old rail bed was used by snowmobiles, the DEM

rules do not allow motorized vehicles on the trail.

The Zone II for Cheshire's wells is a mixture of residential, forested and agricultural crop land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

**Key Land Uses and Protection Issues include:**

1. Residential Land Uses
2. Transportation corridors
3. Agricultural activities
4. Hazardous materials storage and use

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Residential Land Uses** – Approximately 50% of the Zone II consists of residential areas. None of the areas have public sewers; all use septic systems. There is no clear count of how many residential homes utilize oil versus gas or whether the oil tanks are above or below grade. There is at least one private property which has a 2000 gallon underground storage tank (UST). If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) are potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

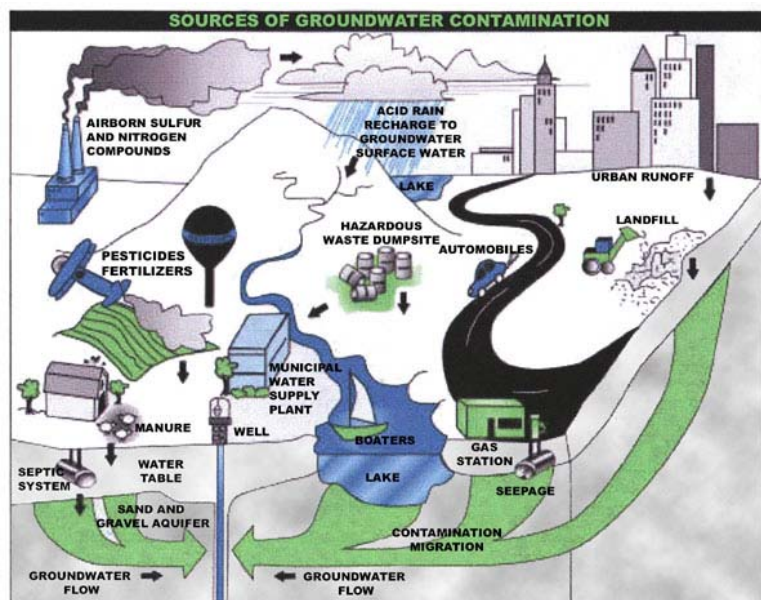

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

© 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

“Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

- ✓ Inventory residential fuel sources and encourage residents to remove any underground tanks and contain all other tanks.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**2. Transportation Corridors** - Route 8 runs along the western border of the Zone II, just west of the wells. Local roads are common throughout the Zone II. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catch basins.

**Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff. Request a copy of the State Highway Department’s schedule for catch basin cleaning.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren’t yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

**3. Agricultural Activities** – There are several farms with crop lands within the Zone II. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water sources.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Supply the land owners with maps of the Zone II area.

**4. Hazardous materials storage and use** — Many small businesses, municipalities and industries use hazardous materials, produce hazardous waste products, and/or store quantities of hazardous materials in UST/AST. These

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

**What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**Source Protection Decreases Risk**

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Agricultural</b>			
Crop lands (hay, corn)	57.7 acres	Moderate	Fertilizer and pesticide usage
<b>Commercial</b>			
Gas Stations	1	High	Automotive fluids and fuels: spills, leaks, or improper storage or handling
Service Stations/ Auto Repair Shops	7	High	Automotive fluids and solvents: spills, leaks, or improper storage or handling
Sand and Gravel Operation	2	Moderate	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
Chemical Storage	1	High	Chemical wastes: spills, leaks, or improper handling or storage
<b>Residential</b>			
Septic Systems/ Cesspools	Numerous	Moderate	Household hazardous waste: improper disposal and microbial contaminants
<b>Miscellaneous</b>			
Fire Training Facilities/ Fire Station	1	Moderate	Fuels and other chemicals: improper use or storage
Elementary School	1	Moderate	Fuel oil, cleaning and other chemicals; over-application or improper management of fertilizers and pesticides on athletic fields; parking areas; spills, leaks, or improper handling
Underground Storage Tanks	Numerous	High	Stored materials: spills, leaks, or improper handling

Activities	Quantity	Threat*	Potential Source of Contamination
Aboveground Storage Tanks	Numerous	Moderate	Petroleum products and hazardous materials: spills, leaks, or improper handling
Waste Transfer/ Recycling Station	1	Moderate	Water contacting waste materials: improper management, seepage, and runoff
Road and Maintenance Depots (covered salt storage)	1	Moderate	Asphalt materials and other chemicals, gasoline and diesel storage: spills, leaks, or improper handling of deicing materials
Floor Drains in Commercial/Industrial Facilities	Numerous	High	An inspection of the Zone II found several non-complaint floor drains in facilities where hazardous materials were stored.

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity

include a 10,000 gallon UST at the Cheshire School, and a 1000 gallon UST at the First Baptist Church. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

#### **Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure “Industrial Floor Drains” for more information. Encourage the Board of Health to enforce the local floor drain regulation.

Other land uses and activities within the Zone II that pose potential threats include the bike path. Although passive recreation poses minimal threat, the use of motorized vehicles poses a more significant threat. Request that DEM enforce their rules for no motorized vehicle access. Monitor activities and report any violations to the DEM. Refer to Table 2 and Appendix 2 for more information about these land uses.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. The final report of the findings of an Underground Injection Control Inspection is included as Attachment E of this report to help identify some potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

#### **Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system’s Zone II contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Passing wellhead protection bylaws to protect the land areas near the Cheshire Water Department wells.
- Implementing a Public Education program on wellhead protection.
- Working with the board of Health to pass floor drain regulations.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Support the passage of wellhead protection bylaws and floor drain regulations to protect the Zone II for Adams’ wells located in Cheshire.
- ✓ Inspect the Zone I and Zone II regularly.

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>YES</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Maintain current signs. Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988 if needed.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue monitoring along bike path and non-water supply activities in Zone Is. Request DEM enforce their rules for access.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>YES</b>	The Town "Aquifer Protection District" bylaw meets DEP's wellhead protection requirements. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for current regulations.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>YES</b>	Continue to work with neighboring municipalities to include Zone IIs in their wellhead protection controls.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>YES</b>	Continue current measures toward maintaining Wellhead Protection; modify plan as necessary.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Establish committee; include representatives from citizens' groups, neighboring communities, and the business community. Propose bylaws for Adam's Zone II.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>Partial</b>	For guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> . Encourage Board of Health to adopt guidelines as a requirement.
Does the PWS provide wellhead protection education?	<b>YES</b>	Continue public education program.

- ✓ Continue to educate residents on ways they can help you to protect drinking water sources.
- ✓ Notify Massachusetts Highway Department regarding the location of the Zone II and coordinate with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Develop and implement a Wellhead Protection Plan.

#### **Resources for Drinking Water Source Protection:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

#### **Conclusions:**

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

#### **For More Information**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II.

2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

#### **Section 4: Appendices**

- E. UIC Report for the town of Cheshire

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Hutchinson Water Company

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Hutchinson Water Company serves a small residential community in the Town of Cheshire, Massachusetts, a small town in northern Berkshire County. The Water Company serves 120 homes with a total population of approximately 400 people and is located in the south end of Town, east of Cheshire Reservoir, the headwaters of the Hoosic River. There is a municipal water system in Cheshire, but there is no municipal wastewater disposal available. All facilities in Cheshire utilize on-site septic disposal. The municipal water system is located in the center of town and does not serve this area. The Water Company maintains and operates three water supply wells (Wells #2, #4 and

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

#5). Well #1 was abandoned and decommissioned in 1972. Wells #3 and #4 were used simultaneously until Well #3 collapsed. Well #3 was abandoned and decommissioned after Well #5 was installed to replace Well #3. Well #2 is maintained as an emergency supply source but is severed from the system due to high nitrate levels in the water. The source of nitrates in the gravel aquifer utilized by Well #2 is believed to be the adjacent agricultural activity. Presently, Wells #4 and #5 operate as the active well for the system and they operate simultaneously. Only Wells #4 and #5 will be addressed in this report.

Wells #4 and #5 are located east of the community, approximately 250 feet from the nearest residence and are located within 50 feet of each other. Well #4 was installed in 1979 and is a 155-foot deep, 6-inch diameter bedrock well with an approved withdrawal rate of 24,000 gallons per day (17 gpm) based on previous metered water use. Well #5 installed in 1997, is a 300 feet deep, 8-inch diameter well with 80 feet of casing set into the bedrock. The pumping test for Well #5 indicated the well and aquifer had a capacity of approximately 45 gallons per minute but well #5 was approved for a withdrawal rate of only 21 gpm as a replacement for Well #3.

Geologic mapping of the area indicates deep stratified drift deposits of sand and gravel west of the wells, in the Cheshire Reservoir/Hoosic River valley. Information from the owner indicates the depth of Well #2 is approximately 250 feet drilled into sand and gravel. These deposits were laid down during the recession of the glaciers some 18,000 years ago. Recent alluvial has likely been laid down in the center part of the valley where Cheshire Reservoir and the Hoosic River are located. The upland areas are generally covered with relatively thin till over bedrock although the side slopes may have varying thickness of overburden on top of the bedrock. Mapping indicates till over bedrock in the vicinity of Wells #4 and #5 although thin deposits of sand and gravel are evident from the mining operations nearby. Well #5 was constructed with 80 feet of casing set into bedrock. The bedrock is mapped as a metamorphic rock, the Cheshire Quartzite.

The Zone I is the area immediately surrounding the well and the Interim Wellhead Protection Area, (IWPA) provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. There is a hydrogeologic barrier (clay layer) at least in the immediate vicinity of the well. However, unless this hydrogeologic barrier is known to exist throughout the IWPA, the aquifer is considered to have a high vulnerability to contamination. Nonetheless, the hydrogeologic barrier that does exist provides some protection relative to impeding the downward migration of

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-		Contact DEP prior to increasing the system or conducting any additional activities in Zone I.
Residential Fuel Storage Above Ground	Both Wells	Both Wells	Moderate	Proper maintenance and upgrades to fuel oil tanks to prevent releases from occurring
Lawn Care/Gardening	Both Wells	Both Wells	Moderate	Encourage residents in proper storage, disposal, and application of pesticides.
Transportation Corridor	Both Wells	Both Wells	Moderate	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

contaminants from areas overlying the barrier. The wells operate simultaneously but either well could supply the entire demand of the system. The Zone I and IWPA for Well #4 are 307 feet and 933 feet, respectively based on metered water use. The Zone I and IWPA for Well #5 are 310 feet and 1,070 feet, respectively based on pumping test data and the previous withdrawal rate of Well #3, the well that Well #5 replaced. Since the protection radii are similar and the wells are so close together, the protection areas for Wells #4 and #5 essentially overlap. Please refer to the attached map of the Zone Is and IWPAs.

Water from the wells serving the facility is not treatment at this time. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Residential Land Uses; and**
3. **Transportation Corridor.**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of at least one moderate threat land use or activity in the IWPA, as seen in Table 2.

**1. Non-conforming Zone I** – Currently, the wells do not meet DEP's restrictions, which only allow water supply related activities or other non-threatening activities within the Zone Is. The Zone Is contain approximately seven residences including driveways, roads, parking spaces, residences and associated septic systems. Systems not meeting DEP Zone I requirements must notify the DEP, receive approval and address Zone I issues prior to increasing water use or modifying systems. In the recent past, there has been some truck traffic in Zone Is to access the adjacent gravel pit. The owner has prohibited the traffic.

### Recommendations:

- ✓ Based upon the current location of homes it may not be possible to prohibit vehicle parking within Zone Is; however, the company should consider educating residents' efforts to controlling activities in the Zone Is relative to fuel usage and use of household hazardous materials.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone Is.
- ✓ Consider efforts to have residents convert to propane or maintain tanks through tank age limitations and new tank standards.
- ✓ Consider replacing the wells if the gravel removal operation encroaches on the wells.

**2. Residential Land Uses** – The community served by the water company utilizes on-site septic disposal. There are approximate 60 residents within the protection areas. If managed improperly, activities associated with residential

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store. Require fuel lines to be sleeved to protect from leaks.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on the following DEP website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Consider a bylaw requiring that replacement heating/hotwater systems not be fueled by fuel oil or kerosene. Encourage maintenance of those tanks that exist and encourage conversion to propane.
- ✓ Continue efforts to manage wastewater disposal and maintenance of the systems.

**3. Transportation Corridor** – Minor roads and residential parking can be potential sources of contamination due to salting of roadways and leaks or spills of fuel and other hazardous materials during accidents. In addition, there has, in the past, been traffic within the Zone I to access the adjacent gravel pit.

### Recommendation:

- ✓ Contact the local fire department to ensure that the IWPA is included in Emergency Response Planning.
- ✓ Continue to prohibit access through Zone Is.
- ✓ Consider replacing the wells if the gravel removal operation encroaches on the wells.

The Water Company is commended for recent measures taken to secure and protect the well casings and for prohibiting access through the Zone Is. Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. The facility should continue efforts in water supply protection through reviewing and adopting the key

recommendations above and the following:

**Zone I:**

- ✓ Keep non-water supply activities out of the Zone Is.
- ✓ Restrict use of salt within Zone Is and drain stormwater away from the wells.
- ✓ Continue to prohibit access to the Zone Is.
- ✓ Conduct regular inspections of the Zone Is.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone Is.
- ✓ Consider well relocation if gravel operations encroach significantly on the wells.

**Facilities Management:**

- ✓ Provide residents with Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on properties.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

**Planning:**

- ✓ Work with local officials in town to include the facility's IWPAs in Aquifer Protection District Bylaws and be sure local emergency responders are aware of the protection areas in the event of an accident in the area.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Encourage residents to maintain and upgrade wastewater disposal systems.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at the following DEP website: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

**4. Attachments**

- Map of the Public Water Supply (PWS) Protection Areas

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Pine Valley Mobile Home Park

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 5, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Pine Valley Mobile Home Park is located in Cheshire, Massachusetts, a small town in northern Berkshire County. The park accommodates 96 trailers with a total population of approximately 190 people and is located east of and across the Hoosic River from the center of town. There is a municipal water system in Cheshire but there is no municipal wastewater disposal available. The park and all facilities in Cheshire utilize on-site septic disposal. The municipal water system is less than ¼-mile from the park but currently does not serve the park. Therefore, water is supplied through two on-site water supply wells.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Wells #1 and #2 are located south of the trailer park approximately 165 feet from the nearest trailer and approximately 250 feet from a residence. There are no well construction logs available but the owner reports the wells are gravel packed wells with estimated yields of Wells #1 and #2 at 150 gallons per minute and 70 gallons per minute, respectively. The wells are constructed within a confined gravel aquifer with a clay layer between the ground surface and the well screened in the sand and gravel.

The Zone I is the area immediately surrounding the well and the Interim Wellhead Protection Area, (IWPA) provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. There is a hydrogeologic barrier (clay layer) at least in the immediate vicinity of the well. However, unless this hydrogeologic barrier is known to exist throughout the IWPA, the aquifer is considered to have a high vulnerability to contamination. Nonetheless, the hydrogeologic barrier that does exist provides some protection relative to impeding the downward migration of contaminants from areas overlying the barrier. The wells operate simultaneously but either well could supply the entire demand of the system. The protective radii are the same for both wells based on the maximum usage as reported from metered data: the Zone Is and IWPAs are 262 feet and 622 feet. Please refer to the attached map of the Zone Is and IWPAs.

The well serving the facility has no treatment at this time. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Non-conforming Zone I;**
2. **Residential Land Uses; and**
3. **Transportation Corridor.**

The overall ranking of susceptibility to contamination for the well is moderate, based on

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-		Contact DEP prior to increasing the system or conducting any additional activities in Zone I.
Fuel Storage Above Ground	Yes	Yes	Moderate	Proper maintenance and upgrades to fuel oil tanks to prevent releases from occurring
Lawn Care/Gardening	Yes	Yes	Moderate	Encourage residents in proper storage, disposal, and application of pesticides.
Transportation Corridor	Yes	Yes	Moderate	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

the presence of at least one moderate threat land use or activity in the IWPA, as seen in Table 2.

1. **Non-conforming Zone I** – Currently, the well does not meet DEP's restrictions, which only allow water supply related activities or other non-threatening activities within the Zone I. The Zone I contains driveways, roads, parking spaces, residences and associated septic systems. Systems not meeting DEP Zone I requirements must notify the DEP, receive approval and address Zone I issues prior to increasing water use or modifying systems. The system has been working toward having residents convert to propane and remove fuel oil from Zone I.

### Recommendations:

- ✓ Based upon the current location of homes it may not be possible to prohibit vehicle parking within the Zone I; however, the Park should continue efforts to controlling activities in the Zone I relative to fuel usage and use of household hazardous materials.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Direct driveway and parking lot drainage in the Zone I away from the well.
- ✓ Continue efforts to have residents convert to propane or maintain tanks through tank age limitations and new tank standards.

2. **Residential Land Uses** – Pine Valley and the surrounding residences all utilize on site septic disposal. Pine Valley is presently working with the DEP to stay in compliance with wastewater requirements. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of

contamination due to leaks or spills of the fuel oil/kerosene they store. Require that fuel lines are sleeved to protect from leaks.

- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on the following DEP website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Consider a bylaw requiring that replacement heating/hotwater systems not be fueled by fuel oil or kerosene. Encourage maintenance of those tanks that exist and encourage conversion to propane.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

- ✓ Continue efforts to manage wastewater disposal and maintenance of the systems.

3. **Transportation Corridor** - Major roads are potential sources of contamination due to salting of roadways and leaks or spills of fuels and other hazardous materials during accidents.

#### Recommendation:

- ✓ Contact the local fire department to ensure that the IWPA is included in Emergency Response Planning.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Pine Valley Mobile Home Park is commended for their past efforts to utilize deep wells that are fairly remote from the facility, posting signs in the Zone Is, and educating tenants on wellhead protection issues. The facility should continue efforts in water supply protection through reviewing and adopting the key recommendations above and the following:

#### Zone I:

- ✓ Keep non-water supply activities out of the Zone Is.
- ✓ Restrict use of salt within Zone Is and drain stormwater away from well.
- ✓ Consider connecting to town water if threats cannot be mitigated or water quality is impacted.
- ✓ Conduct regular inspections of the Zone Is.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone Is.

#### Facilities Management:

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility properties.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

#### Planning:

- ✓ Work with local officials in town to include the facility's IWPA in Aquifer Protection District Bylaws.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Continue efforts to maintain and upgrade wastewater disposal systems.

#### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at the following DEP website: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses in the Protection Areas
3. Protection Recommendations
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Chester Elementary School is a small, rural school with a total student and staff population of approximately 110 people per day, located on Middlefield Road in the town of Chester, Massachusetts. The school, which was completed in 2003, serves the Towns of Chester and Middlefield, which are rural residential and recreational communities situated in the Berkshire foothills in western Massachusetts. The Town of Chester does have a municipal water system but it does not serve this area of Town. The Town does not have a municipal wastewater system. Therefore, the school operates

## What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The Zone II** The primary recharge area defined by a hydrogeologic study.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

a single public water supply well and disposes of wastewater through an on-site septic system. The school well is a 6inch diameter, 350-foot deep bedrock well that is located immediately adjacent to the school soccer field. Bedrock was encountered at 39 feet below grade but the casing was extended to 60 feet below grade into sound bedrock. The well casing extends above grade and has a secure well cap.

The Zone I is the protective area immediately surrounding the source and is assumed to contribute recharge to the source. The Zone I for individual wells is a circle centered on the well with a radius ranging from 100 to 400 feet based on the approved withdrawal rate from the well. An Interim Wellhead Protection Area (IWPA) is a primary recharge area designated for a groundwater source when the Zone II has not yet been delineated. The actual recharge area for a well may be significantly larger or smaller than the IWPA. The Zone I and IWPA protective radii for Well #1 are 133 feet and 437 feet respectively based on the approved withdrawal rate of 1,656 gallons per day for the well. The well was tested and approved through the New Source Approval process and although the soccer field is in the western half of the Zone I, the DEP has approved that use provided pesticides and fertilizers are not used on the field. Therefore the well is considered to be conforming with Zone I requirements.

The IWPA of the well includes a 500-gallon propane underground storage tank (UST), a 6,000 gallon No. 2 fuel oil UST, a diesel powered backup generator, the boiler room, the tank room, some components of the septic system, part of the school, the CSX railroad track and Middlefield Road. In addition, the remainder of the school, the closed and capped Chester wood waste landfill, and the septic system leachfield are located north of (approximately 300 feet and 500 feet, respectively) but outside of the IWPA. The DEP Division of Solid Waste regulates the landfill. Prior to construction of the school and well, an extensive environmental assessment of the landfill was conducted, a risk assessment completed and the landfill was consolidated, closed and capped. There were preliminary monitoring requirements during the school development and there are long-term monitoring requirements of soil gas and groundwater quality for sampling points located between the landfill and the school. For further information regarding the Town's regulatory compliance with respect to the landfill, contact the DEP Bureau of Waste Prevention, Solid Waste Division in Springfield. For further information regarding the permitting of the school well, contact the Drinking Water program.

Geologic mapping indicates the school is located in the Berkshire foothills on the east limb of the Berkshire anticlinorium. The uplands are covered with thin till overburden

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Conforming Zone I	-	-	-	Contact DEP prior to conducting any work in Zone I or expanding the system.
Septic system components	No	Yes	Moderate	Maintain septic system. The school leachfield is outside of protection areas.
Transportation corridors, railroad track, school parking and stormwater structures	No	Yes	Moderate	Control the use of deicers and coordinate with emergency response personnel and the railroad company. Monitor for leaks and spills near the well.
School	No	Yes	Moderate	Use BMPs for school facilities.
Underground storage tank (fuel oil/propane); diesel generator	No	Yes	High/Low	Use BMPs and monitor for leaks and spills especially during deliveries.
Athletic fields	Yes	Yes	Low	Continue to prohibit the use of fertilizers and pesticides in Zone I.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

covering the bedrock. The school is located on the west side of the narrow river valley between the railroad track and the West Branch of the Westfield River. The valley fill is sand and gravel deposited by the receding glaciers 14,000 to 18,000 years ago and was likely reworked by recent streams and rivers with additional recent alluvium deposited. The bedrock at the school site is mapped as light grey to green quartz-plagioclase-granulite or schist of the Moretown Formation. There is no evidence of a continuous confining, clay layer or a thick till layer in the immediate vicinity of the well. Wells located in these conditions are considered to be located in aquifers with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from activities on the ground surface. Please refer to the attached map of the Zone I and IWPA.

The water from the well is treated through an ion exchange water softener prior to distribution. The DEP requires public water suppliers to regularly monitor the quality of the water. For current information on monitoring results and treatment, please refer questions to the Public Water System contact person listed above in Table 1 for the most recent information. Drinking water monitoring reporting data is also available at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html), the EPA's website for Envirofacts.

## Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

## 2. Discussion of Land Uses in the Protection Areas

There are some land uses and activities within the drinking water supply protection areas that are potential sources of contamination. Although most of the agricultural activities are outside of the Zone I and IWPA, because the IWPA is not a scientifically determine recharge area, the DEP often identifies activities that are near the source.

### Key issues include:

1. **Zone I;**
2. **School and Athletic fields ;**
3. **Underground storage tank; and**
4. **Transportation corridor/parking.**

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use or activity in the protection areas of the well, as seen in Table 2. The fuel oil UST located within the IWPA is ranked as a high threat; the tank is a new tank that is constructed in compliance with current UST regulations.

**1. Zone I –** Well #1 has a conforming Zone I with respect to ownership and activities within the Zone I. There is a soccer field within the Zone I of Well #1, however, the DEP may allow passive recreational activities and non-threatening activities within the Zone I. The school does not use pesticides or fertilizers within the Zone I.

### Recommendations:

- ✓ Continue using BMPs to protect the water supplies.
- ✓ Do not allow any non-conforming activities within Zone I. Inspect the well cap regularly to ensure security and that there is no standing water around the casing.
- ✓ Do not use pesticides and fertilizers in the Zone I.

**2. School and athletic fields –** The athletic field is within the Zone I and some of the school facilities are within the IWPA of the well. However, although the grease trap and some components of the wastewater system are within the IWPA, the leachfield for the septic system is approximately 500 feet away from the IWPA for the well. Elementary schools generally use only household hazardous materials and the recommendations for small schools are similar to those for residents. In addition, there are state and federal controls on some activities and products used at schools to promote “healthy schools”.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

Copies of this assessment have been made available to the public water supplier and town boards.

Potential exists for contamination of the well by on-site use of cleaning materials, petroleum from lawn equipment, fertilizers, and pesticides. If managed improperly, activities associated with residences and the school can contribute to drinking water contamination. The school presently does not use pesticides or fertilizers on the field. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, petroleum products for home equipment and lawn maintenance equipment and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail are not properly maintained, they could be a potential source of microbial contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source Pollution web site for additional information at the following MADEP website <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

#### School and Residential Use Recommendations:

- V The tank room is used for storage of supplies and some equipment. There is a floor drain in the tank room, which according to the school, is connected to the parking lot stormwater discharge system that discharges to a detention basin south of the soccer field. During the assessment, it was noted that cleaning equipment and cleaning materials were stored in the tank room. The cleaning materials are no longer stored in the tank room and will be stored in the janitor's closet where there is a low level, janitor's sink but there is not a floor drain in the room.
- V Continue the use and maintenance of BMPs for activities within close proximity to the well.
- V If annual floor cleaning requires the use of hazardous materials, dispose of the residual as appropriate.
- V Continue to prohibit the use of pesticides or fertilizers within the Zone I of the well. Consider the use of Integrated Pest Management to minimize the use of pesticides and nutrients in fertilizers. Continue the use of Best Management Practices for all activities at the school and at the athletic fields. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- V Continue to use secondary containment for any petroleum products kept for maintenance and lawn care equipment. Presently, the maintenance equipment is kept in a storage trailer on the south side of the school.
- V Review your emergency response plan regarding accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- V Refer to the Massachusetts Public Health Association's Healthy Schools website for additional information at: [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html)

**3. Underground fuel oil storage** – There is one fuel oil UST, one propane UST and a diesel fueled generator located within the IWPA. The propane UST poses minimal threat to the water supply, the UST fuel oil tank is a double walled tank with monitoring and the diesel generator AST is also double walled to protect against leaks. If managed improperly, fuel oil tanks can be a potential source of contamination due to leaks or spills of the materials they store.

**Recommendation:**

- ✓ Any modifications to the tanks must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs and USTs.
- ✓ Monitor all activities associated with the fuel oil especially delivery.
- ✓ Have spill containment/absorbent materials available on-site.

**4. Transportation corridor and parking** – The CSX railroad, Middlefield Road and parking areas for the school are within the IWPA of the well. The storm drains for the parking areas are directed to detention basins south (downgradient) of the well location but within the IWPA. Accidents and normal use and maintenance of roads, parking lots and railroads may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets.

**Recommendations:**

- ✓ Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they are aware of the location of your well.
- ✓ Notify the Town Highway Department of your well. Review the stormwater management near the well with the Highway Department and work to ensure runoff is directed away from the well.
- ✓ Contact the Town Board of Health or Selectmen regarding the review of the railroad company's Yearly Operating Plan (YOP) for right-of-way maintenance. Be sure they are aware of the protection areas for your new well.

### **3. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will reduce the source's susceptibility to contamination. The Chester Elementary School is commended for design criteria that direct stormwater downgradient of the well and for removing floor drains from the boiler room design. The Department recommends that you request your boiler maintenance contractor have absorbent materials on hand in the event of an accidental spill and that any boiler blow down generated during maintenance must be disposed of off-site by the contractor.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at the following DEP website: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Davenport Building

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 14, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Davenport Building is located on the north side of Route 143 in the center of Chesterfield and was formerly the elementary school for the Town. A regional school was built in the late 1990 and the Davenport Building now is utilized for Town Offices, a daycare center and as a general community center. The estimated population for the facility is approximately 75 people. The Building is supplied by a single potable supply well (Well #1 -01G) located approximately 5 feet from the west side of the building.

The Zone I is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wellhead may be larger or smaller. The current

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

well has a Zone I protective radius of 100 feet and an Interim Wellhead Protection Area (IWPA) radius of 408 feet based on estimated water use utilizing Title 5 flow volumes. Water use of less than 300 gallons per day was confirmed when the facility installed a meter during 2002. Please refer to the attached map that shows the Zone I and IWPA.

There are no records regarding the construction or depth of the well. The geologic map of the area shows complex bedrock structure in the area and describes the bedrock as the Goshen Formation, a quartzite and quartzite schist. The overburden is generally thin till with no evidence of a hydrologic barrier to potentially threatening activities at the ground surface. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer. At the time this report was prepared, water from the Building's well is not treated. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I,**
2. **Septic system components,**
3. **Floor drain in boiler room,**
4. **Parking and roadway, and**
5. **Residential uses.**

There are activities within Zone I that are not related to water supply and the well is located in an aquifer with a high vulnerability to contamination due to the absence of a significant hydrogeologic barrier to prevent contaminant migration from the surface. The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of several moderate threat land uses or activities in the Zone I and IWPA, as seen in Table 2.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Septic System components	No	Yes	Moderate	Refer to the attached septic system fact sheet.
Floor Drain in the boiler room to septic system	Yes	Yes	Moderate	Floor drain must be protected from accidental spills or connected to tight tank.
Parking area and roadway	Yes	Yes	Moderate	Storm water drains away from the wellhead.
Aboveground oil tank	Yes	Yes	Moderate	Tanks are in containment.
Residential land use	Yes	Yes	Moderate	Provide residents and staff with BMPs.

- **-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).**

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**1. Non-conforming Zone I** – Currently, the well does not meet DEP's restrictions which only allow water supply related activities or non-threatening activities in Zone I. The facility's Zone I contains the building, oil tanks, roads and parking areas. The public water supplier does not own and/or control all land encompassed by the Zone I. Systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Maintain contact with the DEP regarding alternatives to the existing source.
- ✓ Monitor activities within the Zone I and minimize, as much as is feasible, activities in Zone I.
- ✓ Do not store hazardous materials in the Zone I. Where household hazardous materials are required, keep the materials in containment and use the materials with extreme caution. Dispose of waste through household hazardous waste pick-ups or store securely and in containment.

**2. Septic system components** - The septic tank, grease trap, pipeline, distribution box and leachfield are all within the Zone I or IWPA of the well. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Improper disposal of household hazardous chemicals or petroleum products to septic systems or discharge from the boiler room are also potential sources of contamination to the leachfield. The Highway Department is scheduled to have a tight tank installed for the garage.

### Recommendations:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, certified operator, daycare staff and citizens that use the facility.
- ✓ Septic system components should be inspected and maintained on a regular basis.

**3. Floor drain in the boiler room** – Floor drains may be required in boiler rooms to provide drainage in the event of a plumbing failure. If there is a potential for oil or hazardous materials to flow accidentally into the floor drain, however, the floor drain must be sealed or connected to a tight tank if no sewer is available. Boiler compressor condensate is considered industrial wastewater, and therefore cannot be discharged to the septic system. The boiler room at the Building has a floor drain that is assumed to discharge to the septic system.

### Recommendations:

- ✓ Prepare a written policy and plan for maintenance operations, especially when oil filters are changed. Require your boiler maintenance contractor to use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. Boiler blow down generated during routine maintenance cannot be discharged through the floor drain and must be disposed of off-site.
- ✓ If protection of the floor drain cannot be assured, seal the floor drain or a tight tank must be installed for the floor drain.
- ✓ Contact the DEP Underground Injection Control (UIC) program coordinator to discuss this issue (Rick Larson 413-755-2207 or Jim Gibbs 413-755-2299)

**4. Parking and roadway** - The parking areas and Route 143 are within the Zone I and IWPA of the well.

### Recommendations:

- ✓ Use minimal road salt and deicers.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

### Facilities Management:

- ✓ Septic system components should be maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ Train staff on use of non-toxic materials cleaning and maintenance materials and in the handling of hazardous materials, including household hazardous materials.

- ✓ Monitor the parking lot for spills and leaks.
- ✓ Monitor runoff from the parking area to ensure it continues to flow away from the well.

**2. Residential Land Uses** – The Zone I and IWPA for Well #1 has medium-density residential land use. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and online at the website - [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination.

Please review and adopt the key recommendations listed above and as follows:

### Zone I and IWPA:

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I and monitor the area for spills and leaks.
- ✓ Monitor oil delivery and storage.
- ✓ Post drinking water supply signs at key location such along the access road and in the parking area away from the well.
- ✓ Provide information to staff about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Do not use fertilizer or pesticides.
- ✓ Use Best Management Practices (BMPs) for hazardous products.

**Planning:**

- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. If funds are available, each program year the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road de-icing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

New Hingham Elementary School is a regional elementary school located in Chesterfield. The school serves pre-school through sixth grade and has a population of approximately 200 staff and students. There are no municipal water or wastewater systems in Chesterfield and therefore, the facility is served by an on-site water supply and wastewater disposal through a septic system. The well was installed in 1996 to a depth of 440 feet and hydrofractured to enhance water flow to the well.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The Zone I for a well is the protected area immediately surrounding the wellhead while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual recharge area (Zone II) has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The approved withdrawal rate for Well #1 is 10.3 gallons per minute based on the results from an extended duration pumping test conducted as part of the New Source Approval Process. Based on that maximum daily withdrawal rate, the Zone I and IWPA radii for Well #1 are 257 and 646 feet, respectively. All of the school facilities are located outside of the IWPA. Only walking and field mowing are conducted in the Zone I and IWPA.

New Hingham Elementary School is located in an area of thin overburden (till/hardpan) on top of bedrock. There is no evidence of a confining, protective layer of clay or thick till in the vicinity of the well. Wells located in these geological conditions are considered to have a high vulnerability to potential contamination from activities conducted on the land in the recharge area to the wells due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

Water withdrawn from the school's well does not require treatment, and is not treated at this time. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The Zone I is owned and controlled by the School District and therefore is in compliance with DEP requirements. There are few potential sources of contamination within the mapped drinking water supply protection areas.

#### Key issues include:

1. **Passive recreation**
2. **Lawn/field mowing**

The overall ranking of susceptibility to contamination for the New Hingham Elementary School well is low, based on the presence of a few low ranked potentially threatening land uses or activities in the IWPA. Please refer any questions about water quality at the facility to the contact person listed in Table 1.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Passive recreation	No	Yes	Low	Inspect the area regularly and monitor activities.
Lawn/field mowing	Yes	Yes	Low	Use caution when utilizing equipment with petroleum products near the well

\* -For more information, see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website- [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**1. Passive recreation** – The well is located in a rural area and recreation is not encouraged. All of the school facilities are located outside of the IWPA but the area is accessed infrequently for passive recreation.

#### Transportation corridor Recommendations:

✓ Monitor the area regularly.

**2. Lawn/field mowing** – The Zone I and IWPA areas are maintained for access.

✓ Use equipment near the well with caution.

The school district is commended for development of a source in such a well-protected area.

### Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. The school should review and adopt the key recommendations above and the following:

#### Priority Recommendations:

✓ Continue efforts to control access to Zone I and monitor activities in the IWPA area.

#### Zone I:

✓ Keep non-water supply activities out of the Zone I.  
✓ Continue regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.

#### Training and Education:

✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.  
✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.

#### Planning:

✓ Have a plan to address short-term water shortages and long-term water demands.  
✓ Keep the phone number of a bottled water company readily available in the event of an emergency.  
✓ Supplement the SWAP assessment with additional local information, and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your on-going local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

**For More Information:**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

Copies of this report have been forwarded to the water supplier and Town officials.

**4. Attachments**

- Map of the Public Water Supply (PWS) Protection Area.
- Recommended Source Protection Measures Fact sheet

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
CHESTERFIELD GENERAL STORE

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 10, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Chesterfield General Store
<i>PWS Address</i>	432 Main Rd
<i>City/Town</i>	Chesterfield, Massachusetts
<i>PWS ID Number</i>	1060005

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #2	1060005-02	100	422	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1060005-02G)**

Zone I = 100 ft.  
IWPA = 410 ft.

### How Was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Reports, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection

## Source Water Assessment and Protection (SWAP) Report

### for

## Briggsville Water District

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

#### SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 29, 2003

<i>Spring Name</i>	<i>Zone I, ft (sqauret)</i>	<i>Susceptibility</i>
Red Mill Spring	1063003-01G	Moderate

#### Introduction

We are all concerned about the quality of the water we drink. Groundwater sources may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

#### 1. Description of the Water System

Briggsville Water District is a small community system that serves a residential population of approximately 180 in the Briggsville section of Clarksburg. Clarksburg is a small, primarily rural, residential community in the northwest corner of Massachusetts with limited commercial and industrial activity. The District maintains one spring source

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

of water, the Red Mill Spring that provides water to the system by gravity flow. The general public utilizes the overflow from the system's cistern as a spring water source.

The system consists of collection cisterns with a concrete storage facility constructed on a steep embankment, immediately south of the North Branch of the Hoosac River and east of the confluence of an unnamed brook with the river. The USGS has identified the spring as a bedrock spring, discharging water from fractured bedrock. The bedrock is mapped as the Hoosac Schist, a quartz, biotite schist. The hill upgradient of the spring and delineated as the Zone II contribution area of the spring, is mapped as a structural anticline. The immediate vicinity of the spring has some minor unconsolidated sand and gravel materials of undetermined thickness. The collection boxes were constructed in the sand and gravel and the area graded to protect the springs from surface influences. There is no evidence of a significant and continuous protective, confining unit within the contribution area to protect the source from activities conducted on the land surface. Sources located in aquifers such as this are considered to be highly vulnerable to contamination from activities conducted within the recharge areas.

The Zone I is the most protected area around a groundwater source. The Zone I for a spring is a square area centered on the source in the direction of flow with the source 50 feet from the downgradient edge of the Zone I. The lengths of the sides of the square are based on the estimated flow from the spring or estimated volume of water used from the source. The maximum estimated flow from the springs was over 175 gallons per minute and therefore the length of the sides of the square Zone I area is 800 feet. The USGS was contracted by the DEP to determine the contribution areas (Zone II) to spring sources as part of the SWAP program. Please refer to the enclosed map for the outline of the protection areas for the District's source. The entire Zone I and Zone II areas are forest and residential development. You may request additional, current information regarding the quality of the water, from the local contact listed in Table 1. Low levels of tetrachloroethylene are routinely detected in the water sampled downstream of the spring. The source of the compound is believed to be from a length of vinyl lined, asbestos-concrete distribution pipe and it is not in the source water. The District controls the levels through a flushing program and continuously bleeding water through the lines. Please refer to the attached maps of the Zone I and Zone II protection areas and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	Zone II	Threat	Comments
Non-Conforming Zone I	Yes	-	-	Contact DEP prior to expanding or conducting any activities in Zone I
Transportation corridor	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Residential	Yes	Yes	Moderate	Supply BMPs to residents
Septic system components	Yes	Yes	Moderate	Supply BMPs to residents

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

There are a few land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I**
2. **Residential land use**
3. **Transportation corridors and right-of-way**

The source is located in an aquifer with a high vulnerability to contamination due to the absence of a significant hydrogeologic barrier to prevent contaminant migration. The overall ranking of susceptibility to contamination for the system is moderate, based on the presence of at least one moderate ranked activity in the protection areas, as seen in Table 2.

**1. Non-conforming Zone I** – The District does not own or control the entire Zone I for its source. DEP requires ownership or control of Zone I and restrictions for Zone I allowing only water supply related activities in Zone I or activities that do not pose a potential threat. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems. There are two abandoned homes and at least three occupied residential properties as well as the road, in Zone I.

### Recommendations:

- ✓ Maintain control of access to the spring and control surface runoff in the area.
- ✓ Monitor activities in the recharge areas and consider acquiring additional land to protect the sources in the future.
- ✓ Pursue options for acquiring ownership or control of Zone I.

**2. Residential Land Use** – There are several residences within the IWPA protection area. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.

- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at: [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

fact sheet "Residents Protect Drinking Water" which is attached in Appendix A and is also available at the website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), where BMPs are provided for common residential issues.

- ✓ Consider inventorying heating sources in the Zone II area including USTs.
- ✓ Inventory home occupations that may pose a potential threat to the water source, as appropriate.

**3. Transportation corridor and right-of-way** – The Zone II includes primarily rural residential roads that are relatively lightly traveled. The greatest threats from roads are deicing materials, an accidental spill, and illegal access. There is also a utility right-of-way through the Zone II. Rights-of-way are often maintained for vegetation control.

#### Transportation corridor and right-of-way Recommendations:

- ✓ Work with the Town to ensure that road runoff is directed where feasible, to water quality swales.
- ✓ Prepare an Emergency Response Plan that includes coordination between the DEP, the Water District, the Town and State Police in the event of an accident within the protection areas.
- ✓ Review the Yearly Operating Plan (YOP) for the utility to ensure that they are utilizing current maps that show the Zone II contribution area for the spring. Contact the North Adams Conservation Commission regarding the YOP.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. With the delineation of the Zone II contribution areas for the spring, the District should review the existing protection plan, update information as appropriate and work with the community in development of additional protection strategies as appropriate. Please review and adopt the key recommendations listed above, as is feasible.

#### Zone I:

- ✓ Prohibit non-water supply activities in Zone I.
- ✓ Continue regular inspections of the Zone I. Monitor for evidence of unauthorized access.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider fencing and gating the immediate area around the spring.

#### Facilities Management:

- ✓ Consider long term plans for water main replacement and additional land acquisition

#### Planning:

- ✓ Conduct a detailed review of land and land use within the delineated recharge area. Monitor proposed development and activities within the recharge area. Work with the Board of Health and Planning Board to protect the areas.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available and continue assessment of future needs of the system.
- ✓ Consider acquiring additional land and monitor proposed activities in the recharge areas. Recent experience has shown that activities such as logging upgradient from spring sources can impact water quality.

Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities. These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Source Water Assessment Program (SWAP) Report for Clarksburg Elementary School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
September 24, 2001

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Clarksburg Elementary School is an elementary school with a total staff and student population of approximately 250 people. It is located in a rural, residential setting immediately on the southeast side of Cross Road approximately one-half mile north of Houghtonville, a village within Clarksburg. Well 1 is the sole source of water for the school and is immediately north of (within five feet) the school wall. The Zone I protective radius for Well 1 is 131 feet and the Interim Wellhead Protection Area (IWPA) radius is 436 feet. The protective radii were based on metered usage for the two highest months on record. Please refer to the attached map that shows the Zone I and IWPA. The Zone I is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wellhead may be larger or smaller.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Well 1, a 6-inch diameter well, is reportedly drilled to a depth of approximately 400 feet. The well is located in a 5-foot deep pit, with a locking bulkhead cover that has been bermed to prevent parking lot runoff from entering the pit. There is no record of final construction of the well or of the materials encountered during drilling. The Geologic Map of the North Adams Quadrangle shows three bedrock contacts on the school property parcel. An inferred contact between the Kitchen Brook Dolomite and the Cheshire Quartzite is in the immediate vicinity of the well while an inferred contact with the Dalton Formation (a quartzite, schist conglomerate) is mapped north of the school near the road. The bedrock geology is complex series of folded and faulted bedrock with beds dipping to the east at the school. There is no information regarding the depth to bedrock at the school well. Bedrock wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

The Clarksburg Elementary School well water does not require and does not have treatment at this time. For current information on monitoring results, please refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

Numerous land uses and activities within the drinking water supply protection areas are potential sources of contamination.

### Key issues include:

1. **Non-conforming Activities in Zone I**
2. **Storage room in IWPA**
3. **Aboveground Fuel Oil Storage in IWPA**
4. **Floor drain in boiler room**
5. **Septic components in Zone I and IWPA**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of several moderately ranked land uses or activities in the Zone I and IWPA, as seen in Table 2.

1. **Non-conforming activities in Zone I** – Currently, the well does not meet DEP's restrictions that allow only water supply related activities in Zone I. The facility's Zone I contains school buildings, a library, the septic tank, and parking areas. The public water

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contamination*	Zone I	IWPA	Threat	Comments
School Structures	Yes	Yes	--	Continue policy of no fertilizer or pesticide usage
Aboveground Fuel Storage (AST)	No	Yes	Moderate	Aboveground heating oil in containment
Storage room	No	Yes	Moderate	Storage room with old science waste
Parking lot & roads	Yes	Yes	Moderate	Limit road salt usage, monitor for leaks and spills
Septic system components	Yes	Yes	Moderate	Recommend connecting to sanitary sewer
Low density residential w/sewer	No	Yes	Moderate	Pesticide brochures in the attachments
Floor drain	Yes	No	Moderate	Boiler room

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/). \*\* See Appendix A

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

supplier owns all but a very small portion of land encompassed by the Zone 1. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use, conducting any additional activities in Zone I or modifying systems.

### Recommendations:

- ✓ Do not conduct any new activities within Zone I.
- ✓ Do not use or store pesticides, fertilizers or deicing materials within the Zone I.
- ✓ If the existing threats cannot be mitigated, and pose increased threat, consider investigating an alternative site for a new well.
- ✓ Raise the wellhead above grade to prevent flooding and provide protection to the wellhead.
- ✓ Post signs and inspect the parking area for leaks and accidental spills. Prepare an emergency response plan to address accidents.

**2. Storage room in IWPA** – The storage shed located in the rear of the school, at the time of the visit contained various science classroom supplies. The bulk of the materials were reagents and indicators, which pose minimal hazard. However, there were some items such as acids, turpentine and denatured alcohol. The Superintendent noted that the bulk of the materials have been removed and properly disposed of. The remainder is scheduled for disposal in the near future. The District is commended for taking action to protect the supply and the DEP recommends that following to support that effort.

### Recommendations:

- ✓ Although generally there is little use of hazardous materials in an elementary school, periodically during cleaning or maintenance, household hazardous waste is generated. Review the attached documents “A Summary of Requirements for Small Quantity Generators of Hazardous Waste” and a fact sheet for Very Small Quantity Generators to determine your status and regulatory requirements.
- ✓ Contact Hilary Eustace of the Massachusetts Office of Technical Assistance at 617-626-1061 or [Hilary.Eustace@state.ma.us](mailto:Hilary.Eustace@state.ma.us) regarding proper hazardous material use, storage, disposal, emergency response, and best management practices. Develop a procedure for storage and disposal of any household type hazardous materials either through the Town's hazardous waste collection days or through other appropriate means. Develop a simple plan to ensure participation of all appropriate staff. Include all of the school staff such as teachers, custodial, groundskeepers, certified operator, and food preparation staff in the training.

**3. Aboveground Fuel Oil Storage Tank (UST)** – The fuel oil is stored in 4 above

ground, 330-gallon storage tanks. The tanks are located within adequate cement containment, in a secured shed approximately 195 feet from the well. ASTs are more protective than underground storage but still pose some concern in close proximity to the well. An AST in the IWPA containing petroleum products is a concern due to the potential threat posed by a release of large quantities of fuel near the well. The containment structure provides a significant margin of protection from accidental release.

### Recommendations:

- ✓ Closely monitor activities associated with the fuel tank refilling and usage.
- ✓ Any further modifications to the AST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs.

**4. Floor Drain** - The floor drain in the boiler room is required to protect the school from accidental plumbing failure. However, the floor drain discharges to the septic

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

system; Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system. The floor drain must be protected to prevent boiler blow down or other prohibited discharges through the floor drain. There are no hazardous materials stored in the boiler room and an outside contractor maintains the boiler.

### Recommendations:

- ✓ Oil lines from the tank to the boiler can be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. A policy and plan should be in place during maintenance operations, especially when oil filters are changed. We recommend that you require your boiler maintenance contractor to use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.
- ✓ If protection measures are not taken, an alternative is to install a tight tank and connect the boiler room floor drains to the tank.
- ✓ Another alternative is to request to connect to the sanitary sewer that runs along the street. An oil water separator may be required.

**5. Septic system components in the Zone I and IWPA** – The septic system piping and tank are in the Zone I and the school's two leach fields are in the IWPA. An IWPA is considered a nitrogen sensitive area in the Title 5 regulations, which may in some instances result in additional treatment requirements. It is our current understanding that the school is moving forward with plans to connect to the municipal sewer.

- ✓ The Department strongly recommends constructing an external to the building, DEP standard design kitchen grease trap and connecting all wastewater discharges to the North Adams sanitary sewer system. Both the Department and the EPA, in letters to the Clarksburg Town Administrator dated May 23, 2001 and June 18, 2001, have endorsed this action to protect the water supply at the school and public health and safety.
- ✓ Septic system components should be inspected and maintained on a regular basis until such time that the system is connected to the sewer. Refer to the Appendices for more information regarding septic system

Other activities noted during the assessments were parking, roadways and storm water runoff. Storm water runoff ultimately either discharges into the ground or to nearby surface water bodies. As flowing storm water travels, it picks up debris and contaminants from streets, parking areas and lawns. Common potential contaminants include lawn chemicals, pet waste, leakage from dumpsters, household hazardous waste, and contaminants from vehicle leaks, maintenance, washing or accidents. Minimize parking in the Zone I, post drinking water signs and monitor the area for leaks and accidental spills. Residential homes surround the school. Residential homes pose minimal threat to public and private water supplies provided home owners use Best Management Practices with respect to septic system maintenance and disposal practices, household hazardous waste, auto care and lawn and pest control. Work with your community to continue providing information regarding the use of Best Management Practices. The DEP can provide your community with information on how to develop public outreach and support local protection measures.

Finally, the Clarksburg Highway Department Garage is located approximately 600 feet

northeast of the well. Although the facility is not within the IWPA of the well, the close proximity warrants that the Town ensures BMPs are employed for activities involving hazardous materials storage, use and disposal. The facility is currently not registered as a Hazardous Waste Generator. A copy of the requirements for registration will be sent to the Clarksburg Board of Selectmen. In addition, although the floor drains in the facility were sealed, there is no indication that an investigation of the discharge point of the floor drains was conducted as part of the closure, as is required. State plumbing code requires adequate drainage capacity in facilities. It is our understanding from the Highway Superintendent that a tight tank is proposed to comply with that code and an investigation of the discharge area will be conducted. The Department strongly recommends the investigation be conducted as soon as is feasible.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The staff of the Clarksburg Elementary School is commended for current protection measures. The Clarksburg Elementary School in conjunction with the district and local officials should review and adopt the key recommendations above and the following:

#### **Priority Recommendation:**

- ✓ Connect to the municipal sewer system.

#### **Zone I and IWPA:**

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Monitor all non-compliant activities in the Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Prohibit public access to the well by locking facilities and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check area for accidental spills and leaks, etc.
- ✓ Maintain road and parking lot drainage and catch basins.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Register as a VSQG and properly dispose of all potentially hazardous materials stockpiled in the storage facility
- ✓ Investigate and consider requesting a connection to the municipal sewer system.

#### **Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous materials.
- ✓ Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies or other references).
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

#### **Facilities Management:**

- ✓ Prohibit non-sanitary wastewater discharges to on-site septic systems. Post signs near sinks as appropriate.
- ✓ Remove hazardous materials from rooms with floor drains that drain to the ground or septic systems.
- ✓ Generally there is little use of hazardous materials in an elementary school. However, periodically during cleaning or maintenance, household hazardous waste is generated. Contact Hilary Eustace of the Massachusetts Office of Technical Assistance at 617-626-1061 or [Hilary.Eustace@state.ma.us](mailto:Hilary.Eustace@state.ma.us) regarding proper hazardous material use, storage, disposal, emergency response, and best management practices. Develop a procedure for storage and disposal of any hazardous materials either through the Town's hazardous waste collection days or through other appropriate means. Make the process simple to ensure participation of all appropriate custodial staff. The school will have to register as a Very Small Generator of Hazardous Waste to dispose of small quantities of hazardous materials. Include custodial staff, groundskeepers, certified operator, and food preparation staff in the training.
- ✓ Implement Best Management Practices (BMPs) for the use of pesticides on facility property.
- ✓ Septic system components should be inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ Concrete wellhead protective pads should slope away from well and well casing should extend above ground.
- ✓ For utility transformers, including pole mounted transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Contact the utility if the area near the transformer has tree limbs that could endanger the transformer in a storm.

#### **Planning:**

- ✓ Work with local officials in Clarksburg to encourage the development of and implementation of Aquifer Protection Bylaws that would include public water supply protection areas, including the school well's IWPA. The Department can assist your community in developing wellhead protection bylaws.
- ✓ Review and update as appropriate, your plan to address short-term water shortages and long-term water demands. Keep

- the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers address Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Wellhead Protection Grant or the Source Water Protection Technical Assistance/Land Management Grant Program. For additional information, please refer to the attached program fact sheet. Please note that each program year, the Department posts a new Request for Response (RFR – grant application form) for the Grant programs on the internet on or about May 1 and the response is due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Colrain Fire District #1

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection,  
Drinking Water Program

Date Prepared:  
October 15, 2003

Well #2	1066000-02G	324	1,093	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road de-icing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Colrain is a small, rural, hilltown community in northwestern Massachusetts along the Vermont border. The Colrain Fire District #1 serves 42 residential connections, a population of approximately 150 people. There is a municipal wastewater treatment facility in Colrain, and municipal sewer is available to serve parts of Colrain but not the area served by the District. Therefore, the area where the well is located is served by on-site septic disposal systems. The District maintains and operates a single 12x18-inch diameter, 60-foot deep, gravel packed well located within the floodplain of the North River. Based on the results of a 48-hour pumping test conducted in 1994 when the well was installed, the source has an approved withdrawal rate of 31 gallons per minute (44,640 gpd). Well #2 (02G) replaced Well #1 (01G), which was a series of three well points that lost capacity and were abandoned.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The Zone I is the protection area immediately surrounding the wellhead, while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii, based on the daily pumped volume from the well, are 347 feet and 1,392 feet, respectively. Please refer to the attached map of the Zone I and IWPA.

Well #2 is located on the down gradient edge of an unconfined sand and gravel deposit along the North River valley. The deposits were laid down in a bedrock valley during the recession (melting) of the glaciers some 14,000 – 18,000 years ago. More recent alluvial deposits have been laid over the glacial deposits in the floodplain of the North River. There is no record or evidence of a confining, protective clay layer in the vicinity of the well. The bedrock underlying the area is mapped as the lower portion of the Conway Formation, predominantly micaceous schist. Wells located in this type of geologic setting are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface. Well #2 is also located within close proximity to the North River and downstream of the leading edge of a large river meander. There has been some concern regarding the long-term stability of the bank of the river as it naturally cuts closer to the well. The riverbank is somewhat stabilized by riprap along the shore nearest to the well.

For information on current water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 2 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The protection areas for Well #2 (02G) include a hay field, the river and forest and floodplain on the east side of the river. Approximately 40% of the IWPA protection area is crop or pasture land. There are few potential sources of contamination within the mapped drinking water supply protection areas. However, the actual recharge area for the source has not yet been delineated.

#### Key issues include:

1. **Non-conforming Zone I,**

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridor	No	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Residential	No	Yes	Moderate	Supply BMPs to residents
Agricultural activities	Yes	Yes	Moderate /High	Refer commercial farmers to NRCS for assistance, as needed. Supply hobby farmers with information about BMPs.
Septic components	No	Yes	Moderate	Supply BMPs to residents.

\* -For more information, see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website- [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

2. **Transportation corridor,**
3. **Residential land use, and**
4. **Agricultural uses.**

The overall ranking of susceptibility to contamination for the Colrain Fire District #1 supply well (02G) is moderate based on the presence of several moderate ranked potentially threatening land uses or activities in the Zone I and IWPA. Please refer any questions about water quality at the facility to the contact person listed in Table 1.

**1. Non-conforming Zone I** – The water supplier does not own or control the entire Zone I area. Systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. The District owns the Zone I west of the river but does not own the Zone I east of the North River. The Zone I land across the river is presently forest. Only hay is grown in the field within the Zone I west of the river.

#### **Zone I Recommendations:**

- V Monitor proposed activities east of the river and consider acquiring Zone I through ownership or land use controls. Consider purchasing a Conservation Restriction or entering into an agreement for Right-of-First Refusal if there appears to be a potential for development of the land. Continue to control access to the wellhead area.
- V Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
- V Continue to prohibit the use and storage of pesticides, fertilizers or manure within the Zone I.

**2. Residential Land Use** – There are several residences within the IWPA protection area. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

#### **Residential Land Use Recommendations:**

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**3. Transportation corridor** – The well is located on State Route 112. The greatest threat from the road is deicing materials, an accidental spill and or illegal access.

#### **Transportation corridor Recommendations:**

- V Work with the Town/State to ensure that road runoff is directed where feasible, to an area downgradient (south) of the well.
- V Prepare an Emergency Response Plan that includes coordination between the DEP, the Fire District, the Town, MA highway and State Police in the event of an accident near the wellhead.
- V Consider fencing the area if access becomes an issue in the future.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

Copies of this assessment have been made available to the public water supplier and town boards.

**4. Agricultural Activities** – The protection areas include a large percentage, approximately 40%, of land for agricultural activities. Pesticides, fertilizers and manure have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store. Frequently, farms and golf courses have maintenance garages for equipment and storage tanks.

### Agricultural Activities Recommendations:

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Call the local office of the NRCS in Greenfield for assistance or refer to the fact sheets available online at the website <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Encourage farmers to incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Promote the use of BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.
- ✓ Continue your current work with farmers, and include hobby farmers, to ensure that pesticides and fertilizers are being stored within a structure designed to prevent runoff.
- ✓ The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available that is available online at the NRCS website: <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>. Call the local office of the NRCS for assistance. The Colrain highway superintendent may find this information useful.
- ✓ Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer hobby farmers and interested parties to the following websites for additional information: <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual>.

## 5. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. The water supplier should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- V Continue efforts to control access to Zone I and monitor activities in the IWPA area.
- V Consider having the Zone II for the well delineated so that protection can be focused in areas that are within the actual contribution area of the well.

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

### **Zone I:**

- ✓ Prohibit any new non-water supply activities from the Zone I.
- ✓ Continue regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ Inspect drainage within the Zone I and monitor the stability of the riverbank regularly.
- ✓ Continue your current practice of prohibiting the use of pesticides, fertilizers or spreading of manure within the Zone I.

### **Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous materials.
- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Educate neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal and septic system maintenance.
- ✓ Keep areas near transformers free of tree limbs that could endanger the transformer in a storm.

### **Planning:**

- ✓ Consider investing in the delineation of a Zone II contribution area to improve protection planning for the well. This same recommendation was made to the

Griswoldville water supplier. In the meantime, work with local planning and Board of Health officials in Colrain to develop Aquifer Protection District Bylaws and to include the Colrain supply IWPA in that district. Work with the Shelburne and Griswoldville water suppliers to request protection planning in Colrain.

- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Supplement the SWAP assessment with additional local information, and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government agencies, non-governmental organizations and agricultural facilities through programs listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available on line and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

The DEP's Wellhead Protection Grant Program provides funds to assist public water suppliers and their partners in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under this grant program. If funds are available, in the spring, DEP posts a new Request for Response for the grant program (RFR).

These recommendations are only part of your on-going local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## **4. Attachments**

- Map of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheet

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Colrain Elementary School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared  
January 6, 2004

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Colrain Elementary School (the school) is located approximately in the center of Colrain, on Route 112. Colrain is a small rural town in northwestern Massachusetts on the Vermont border. The total school student and staff population is approximately 235 people per day. Although there are two public water supply systems in Colrain, and a wastewater treatment facility, neither of water systems serves the school nor does the wastewater facility serve this area of town. Therefore, the school is served by one potable supply well (Well #1) and disposes of its wastewater through an on-site septic system.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

The Zone I is the area immediately around the well where only activities associated with supplying water or non-threatening activities are allowed. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The school's well has a Zone I protective radius of 146 feet and an IWPA protective radius of 445 feet. These protective radii were based on the withdrawal rate approved following a pumping test conducted on the well in 1995. The Zone I area for the well is not conforming to current DEP requirements. The Zone I area for Well #1 includes most of the school building and approximately 25 parking spaces. The IWPA includes the remaining sections of the school, the fuel oil underground storage tank (UST) and all of the septic system components including tanks and leachfield. Refer to the attached map that shows the Zone I and IWPA.

In 1995, the school was renovated and expanded. Site constraints prohibited development of a new source at the school and because the water quality for the existing well was not impaired by activities near the well, the DEP allowed the school to continue utilizing the existing well following a pumping test and analysis. During reconstruction, the septic system and the underground fuel oil storage tank were upgraded and located outside of the Zone I. The well is an 8-inch diameter, approximately 300 feet deep bedrock well, located within the basement of the oldest section of the school near the west wall.

The school is located in the narrow river valley of the East Branch of North River. Geologic mapping of the area indicates overburden deposits of less than 50 feet of sand with some amount of till over bedrock. The surficial deposits in the area are sand and

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Fuel Oil Storage	No	Yes	High	UST w/leak detection at school
Athletic fields	No	Yes	Moderate	Continue prohibiting the use of pesticides/fertilizers on school fields.
School facilities	Yes	Yes	Moderate	Limit road deicing usage, use BMPs for household hazardous materials and monitor parking areas and control stormwater
Low density residential and hobby farming/animals	No	Yes	Moderate	Septic systems, household hazardous materials, home heating fuel and manure management
Transportation Corridor/parking	No	Yes	Moderate	Jacksonville Road (Rt. 112) and school parking
Septic systems components	No	Yes	Moderate	School septic system in the IWPA
Transformers	No	Both	Low	Monitor transformers for potential leaks

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

gravel that was likely deposited during the recession of the glaciers some 14,000 to 18,000 years ago. Streams and rivers have reworked the stratified drift and deposited additional alluvium. The bedrock in the area is mapped as quartz mica schist with interbeds of quartzite and marble of the Conway Formation.

There is no evidence of a continuous, protective confining layer in the vicinity of the well. Wells drilled in these conditions are considered highly vulnerable to potential contamination from activities on the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer. The water from the well does not require treatment prior to distribution. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Underground storage tank;**
3. **School facilities and athletic fields; and**
4. **Transportation corridors and parking.**

There are several activities within the Zone I and IWPA that pose a significant threat to the water supply. The overall ranking of susceptibility to contamination for the well is high based on at least one high threat activity within the protection areas. Please refer to Table 2.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

**1. Non-conforming Zone I** – The water supplier does not own or control the entire Zone I area. Systems not meeting DEP Zone I requirements for ownership or control, or non-conforming activities within Zone I must get DEP approval and address Zone I issues prior to increasing water use or modifying systems. During the 1995 school expansion, the DEP approved the use of the existing well due to site constraints and good water quality from the existing well.

### Zone I Recommendations:

- ✓ Prohibit any additional activities within Zone I and, where feasible, remove non-conforming activities within the Zone I areas.
- ✓ Use Best Management Practices for handling household hazardous chemicals and site maintenance.
- ✓ Monitor all fuel oil deliveries and parking areas.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Prohibit the use or storage of any hazardous materials near the well. Inspect the well regularly to ensure the cap is secure.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

**2. Underground fuel oil storage** – There is one fuel oil UST located within the IWPA. If managed improperly, fuel oil tanks and their associated fuel lines can be a potential source of contamination due to leaks or spills of the materials they store. The fuel lines are sleeved and graded to drain back to the tank.

#### Recommendation:

- ✓ Any modifications to the tank must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs and USTs.
- ✓ Monitor all activities associated with the fuel oil especially delivery.
- ✓ Have spill containment/absorbent materials available on-site.

**3. School facilities and athletic fields** – Elementary schools generally use only household type hazardous materials. There are state and federal controls on some activities and products used at schools to promote "healthy schools". All of the school's facilities are located within the Zone I or IWPA of the well. Potential exists for contamination of the well by onsite use of cleaning materials, petroleum from lawn equipment, fertilizers, and pesticides. Storm drains in the parking areas at the school drain directly into the ground.

#### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields across the street. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- ✓ Investigate Integrated Pest Management and Best Management Practices within the IWPA as necessary.
- ✓ Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or deicing materials within Zone I.
- ✓ Review the handling of laboratory wastes to determine if a tight tank is appropriate.
- ✓ Review your emergency response plan regarding accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- ✓ Refer to the Massachusetts Public Health Association's Healthy Schools website online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html) for additional information.

**4. Residential Land Use** – There are a few rural residences within the IWPA protection area. One home adjacent to the school has horses (hobby farming). There are also residences across the river from the school that are within the IWPA. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks,

maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Residential Land Use Recommendations:**

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- V Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

**5. Transportation corridor** – Route 112 along with the access and parking areas for the facility are located within the Zone I and IWPA. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets. Parking lot storm runoff is discharged through infiltration catch basins.

**Recommendations:**

- V Prepare an Emergency Response Plan that includes coordination among the emergency responders to be sure they are aware of the location of your well.

### **3. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will further reduce the well’s susceptibility to contamination. The DEP commends the effort shown in current protection practices of not using pesticides and fertilizers in the Zone I and the relocation of the UST and septic system during reconstruction.

Please review and adopt the key recommendations listed above and as follows:

**Priority Recommendations:**

- V Monitor all activities associated with the fuel oil, especially delivery.

**Zone I and IWPA:**

- V Prohibit any new non-water supply activities from Zone I.
- V Conduct regular inspections of the Zone I and IWPA.
- V Consider relocating the well if water quality is impacted by activities near the well.
- V Post drinking water supply signs in key locations, such as, along the access road and in the parking areas but away from the well.
- V Provide information to staff and pertinent school organizations about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- V Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, pesticides and household hazardous waste.

**Training and Education/Facilities Management:**

- V Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies).
- V Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and the certified operator.
- V In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator. The school is currently not registered as a generator of hazardous waste or waste oil. Review the enclosed document “A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE” and consider registering to participate if it is appropriate.

**Planning:**

- V Work with local officials to develop an Aquifer Protection District and Bylaws that includes the school well’s IWPA along with other water supply protection areas in town and to assist you in continued protection of the water supply.

- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- V Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
BAKER'S COUNTRY STORE

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 10, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Baker's Country Store
<i>PWS Address</i>	101 River St.
<i>City/Town</i>	Conway, Massachusetts
<i>PWS ID Number</i>	1068003

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1068003-01G	100	402	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
# 1 (1068003-01G)**

Zone I = 100 ft.  
IWPA = 402 ft.

### How Was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on septic system comp, a tight tank and several leachfields within the Zone I and/or the IWPA of the well. The **high** susceptibility to potential non-microbial threats is based on storage of hazardous materials such as gasoline and the underground storage tanks for gasoline and diesel within the Zone I and IWPA as well as local roads and parking.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information you submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
HOLLY'S BARN

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 10, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Holly's Barn
<i>PWS Address</i>	176 South Deerfield Road
<i>City/Town</i>	Conway, Massachusetts
<i>PWS ID Number</i>	1068004

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1068004-01G	148	447	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1068004-01G)**

Zone I = 148 ft.  
IWPA = 447 ft.

## How Was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and parking areas within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report

## For

### Conway Grammar School

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
January 11, 2000

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? inventory land uses within the recharge areas of all public water supply sources;
- ? assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? publicize the results to provide support for improved protection.

#### Maintaining Your Good Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## INTRODUCTION

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting or storage, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to you or your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attached Map of the Protection Areas
5. Appendices

## 1. DESCRIPTION OF THE WATER SYSTEM

#### Well #1

The Conway Grammar School has a total staff and student population of approximately 240 people and is located in a rural setting surrounded primarily by woodland, rural and agricultural land uses. The well for the Conway Grammar School is located on a wooded parcel of land, approximately 150 feet south of a former ice pond, 300 feet north of a farmhouse and approximately 800 feet north of South Deerfield Road (State Route 116). The Zone I radius for Well #1 is 194 feet and the Interim Wellhead Protection Area (IWPA) radius is 496 feet. The well was developed and tested under the DEP's New Source Approval Process in 1990 at a pumping rate of 4 gallons per minute (gpm). The Zone I and IWPA protective radii are based on the well's approved safe yield of 3 gpm (4,320 gallons per day). Please refer to the attached map that shows the Zone I and IWPA.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Well #1 is a 6-inch diameter drilled well with steel casing grouted to 33 feet below ground. Geologic mapping of the area indicates the bedrock is garnetiferous, quartz-mica schist of the Conway Formation. Bedrock was encountered 9 feet below grade and the boring was advanced to 545 feet below ground with the pump set at approximately 500 feet. The driller recorded water-bearing fractures from 380 to 440 feet below grade and under static (non-pumping condition) water freely flowed out of the top of the casing. Therefore, during well completion, the ground level around the well was raised with fill and the casing was extended approximately 3 feet above the ground. A casing drain was installed approximately 4 feet below ground to keep water in the well from freezing during the winter. When the well pump is off, water flows freely to a nearby brook.

During the site visit, bedrock outcrops were observed immediately adjacent to the well and throughout the parcel. This confirms that the bedrock is shallow, with little or no hydrogeologic barrier between the ground surface and the bedrock aquifer. Bedrock wells drilled in these conditions are considered to be highly vulnerable to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the ground surface.

### Water Quality

The water quality from well #1 currently meets all US Environmental Protection Agency and Massachusetts Department of Environmental Protection drinking water standards. The Conway School well water does not require and does not have treatment at this time. For current information on monitoring results, please contact the Principal, Ms. Judith Siciliano listed above.

## 2. DISCUSSION OF LAND USES IN THE PROTECTION AREAS

There are a few land uses and activities within the drinking water supply protection areas that are potential sources of contamination. Please refer to Table 2.

Key issues include:

1. The Town's Salt Shed and dirt-floored barn used for storage,
2. Stockpiled clean soil and crushed asphalt within the IWPA,
3. Residential and recreational uses within IWPA.

Although there are no activities within the Zone I, the overall susceptibility ranking of the well to contamination is moderate, based on the presence of at least one moderate threat land use or activity in the IWPA.

**Table 2: Activities within the Water Supply Protection Areas**

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Highway Department	Salt Shed and former cow barn	No	Yes	Moderate	Dirt-floored former cow barn is being used for equipment storage. Potential threat from hydraulic/petroleum fluids and other materials that may be stored there.
	Stockpiled cut asphalt/soil	No	Yes	Moderate	Approximately 200 – 300 c.y. of crushed asphalt and dirt were stockpiled.
Residential	Two Residences with barn and non-commercial farm animals	No	Yes	Moderate	See septic system, pesticide and manure brochures in the appendix.
School	Athletic Field	No	Yes	Moderate	Continue policy of no fertilizer or pesticide usage. Include in landscaper's contract.
	Transformer	No	Yes	Low	Due to the age of the transformer, it likely does not contain PCBs. However, contact your utility company to confirm.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

1. Town's Salt Shed – The aerial photograph (map) attached to this report was taken in 1997. It is our understanding that the shed was constructed in 1999 and therefore does not appear on the photograph. However the former cow barn and farmhouse do appear on the photo. The cow barn is shown on the map under the 3 of the number "13" shown within the blue circle outlining the IWPA. The new salt shed is located immediately north of the former cow barn.

Please note that the 1998 Sanitary Survey states explicitly that the Department must be informed prior to conducting activities within the Zone I or IWPA. The Town did receive verbal approval from the Department to construct the salt shed. Although the salt shed is covered and the tarmac is paved, there is no drainage control from the facility, which could result in ponding of water at the site. In addition, the Town is utilizing the former cow barn for storage. The floor of the old barn is dirt and currently the Town is storing the truck sander bodies and tires in the barn along with miscellaneous items. The potential threats from these items are release of hydraulic fluid from the sanders, the potential release of petroleum products from motor vehicles utilizing the facility, as well as motor oils stored there and used to maintain those vehicles. The relatively thin soil does not provide a significant barrier to prevent potential contaminants from entering the bedrock aquifer utilized by the school's well, therefore, careful consideration must be made of the activities conducted within the IWPA. The Town must prohibit activities within the IWPA that pose a significant threat to the public water supply and use Best Management Practices and controls for those activities that will be allowed in this area. No activities may take place in the Zone I that are not directly related to the Public Water Supply.

2. Stockpiled soil and crushed asphalt – Approximately 200 to 300 cubic yards of clean fill, top soil, and crushed asphalt were stockpiled within the IWPA of the school well. The material is located just outside of the Zone I beginning approximately 248 feet from the well. Asphalt and other recyclable materials are considered to pose a moderate threat. The piles of dirt and asphalt also do not appear on the map but were observed immediately north and slightly east of the new salt shed.

The Department can offer technical assistance to the Town to determine what types of activities should be prohibited within the IWPA and the Best Management Practices that should be employed for those activities that will be conducted on Town property within the IWPA.

3. Residential and recreational land uses within the IWPA include recreation horses, normal household activities and a snow mobile trail. In general, normal residential activities pose some threat to public and private water supplies. Use of best management practices minimizes the threat to both private and public wells. Judicious use of pesticides, petroleum products, maintenance of septic systems and animal manure management will protect both the public and private residential; water supplies.

Implementing the following recommendations will help minimize the system's susceptibility to contamination.

## 3. PROTECTION RECOMMENDATIONS

The Conway Grammar School and Town of Conway should review and adopt the following recommendations at the school:

### Zone I and IWPA:

- ✓ Remove or manage all potentially hazardous materials within the IWPA including the asphalt, petroleum products or

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### **For More Information:**

Contact Catherine V. Skiba at DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

Copies of this assessment have been provided to the water department, town boards, the town library and the local media.

equipment containing petroleum products.

- ✓ Contain or control all materials that could pose a potential hazard to public water supplies.
- ✓ If the Town intends to continue utilizing the cow barn, seal the floor and restrict (control) activities that could pose a threat to the water supply.
- ✓ Control the runoff from the salt shed road and parking lot to prevent ponding.
- ✓ Work with the Selectmen, Board of Health and Planning Board to manage activities within the IWPA. Due to the vulnerability of the bedrock aquifer, it is imperative that the Town and school carefully consider activities proposed for the IWPA. Refer to the Wellhead Protection Plan guidance and the model bylaws for types of activities that should be prohibited and controlled in the vicinity of a public or private water supplies.
- ✓ Post drinking water protection area signs at key visibility locations of the Zone I.
- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I and IWPA. Look for illegal dumping and evidence of vandalism.
- ✓ Do not use or store hazardous materials within Zone I.

### **Training and Education:**

- ✓ Train staff on proper hazardous material use, storage, use, disposal, emergency response, and best management practices. Include custodial staff, groundskeepers, certified operator, and food preparation staff in the training.

- ✓ Arrange to have hazardous materials disposal available for the school staff, primarily the custodial staff, either through the Town's hazardous waste collection days or through other means. The school may have to register as a Very Small Generator of Hazardous Waste to dispose of small quantities of hazardous materials.
- ✓ Incorporate groundwater education into the school's curriculum (K- Grade 6 curricula available from DEP; DEP can suggest other agencies' curricula as well).

### **Facilities Management:**

- ✓ Implement standard operating procedures regarding proper storage, handling, use and disposal of hazardous materials. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/brp/dws/dwspubs.html](http://www.state.ma.us/dep/brp/dws/dwspubs.html) and [www.dep.state.ma.us/dep/bwp/dhm/dhmpubs.htm](http://www.dep.state.ma.us/dep/bwp/dhm/dhmpubs.htm). Also contact Hillary Eustace of the Massachusetts Office of Technical Assistance at 617-626-1061 or [Hilary.Eustace@state.ma.us](mailto:Hilary.Eustace@state.ma.us).
- ✓ Septic system components should be inspected and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### **Planning:**

- ✓ Work with local officials in Conway to inform them of the significance of the school's IWPA so they may assist you in improving and maintaining protection of the school's water supply.
- ✓ Contact the Department for guidance regarding any further development of activities within the IWPA.
- ✓ It is recommended that the Town consider zoning bylaws to protect the public water supply areas within the community. Refer to the Department's model bylaws for examples of activities that should be prohibited within the Wellhead Protection Areas and those that should be restricted or controlled. Utilize BMPs where appropriate.
- ✓ Prepare a Wellhead Protection Plan and Emergency Response Plan to address short-term water shortages, long-term water demands and management. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional, new information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Financial:**

- ✓ The Conway Grammar School is eligible to apply for Wellhead Protection and Source Water Protection Technical Assistance Grants under the State Revolving Funds (SRF) program. An announcement for the Grant programs is attached to this report

and Department personnel are available to assist you through the grant application process. Preparation of a wellhead protection plan and preparation of Town protective bylaws are types of eligible projects

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
CONWAY SCHOOL OF LANDSCAPE DESIGN

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 24, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Conway School of Landscape Design
<i>PWS Address</i>	322 South Deerfield Street
<i>City/Town</i>	Conway, Massachusetts
<i>PWS ID Number</i>	1068009

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1068009-01G	100	406	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1068009-01G)**

Zone I = 100 ft.  
IWPA = 406 ft.

### How was my Well's Susceptibility Determined?

Your well's **moderate** susceptibility to potential microbial threats is based on the septic system components within the IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and parking areas within the Zone I and the IWPA.

This source water assessment report is based on information provided by you during the development of the new facility, water quality data and from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment and Protection (SWAP) Report for Cummington Water Department

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department  
of Environmental  
Protection, Bureau of  
Resource Protection,  
Drinking Water Program

Date Prepared:  
August 20, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Cummington is a small rural residential community located in the foothills of the Berkshires in western Massachusetts. The Cummington Water Department has 76 service connections in the center of the small community that serves residential homes, municipal buildings including the school, and several businesses. The water system

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

serves a total population of approximately 480 people. Well 03G, the main water supply source is a 50-foot deep, 10 x 18-inch diameter gravel packed well, located within the floodplain of the Westfield River, installed in August 1988. The source was approved through the New Source Approval Process for a withdrawal rate of 50 gallons per minute. The Zone I and Interim Wellhead Protection Area (IWPA) radii are 379 feet and 2,000 feet, respectively. The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the recharge area has not been delineated. A Zone II, the actual recharge area has not been delineated for Well #3. The actual recharge area to the well may be significantly larger or smaller than the IWPA.

The Water Department also has a spring source, Fanny Rodgers Spring (04G). The Spring (04G) consists of two cisterns that flow by gravity to a third cistern that are all located within close proximity of each other. Water may then flow by gravity into the distribution system or is bypassed to waste. The spring water has received a low vulnerability rating through two rounds of Microscopic Particulate Analysis indicating the source is not significantly influenced by surface water. Although the spring water is regularly monitored for quality, the source remains active primarily as a back-up source because of the natural corrosivity of the water. If the Water Department intends to increase use of the spring system, it will be required to adjust the pH of the water for corrosion control to minimize the potential leaching of copper and lead from plumbing fixtures.

As part of the SWAP program, the United States Geological Survey (U.S.G.S.) was retained by the MA DEP to estimate the contributing area to public water supply springs through the use of geologic mapping. The U.S.G.S. determined the discharge from the springs by a combination of flow measurement and estimation of recharge, thereby estimating the maximum anticipated flow rate from the springs. The springs are located in a wooded area at the base of a slope. The Zone I and Zone II were based on an estimated maximum flow rate of 8 gallons per minute (gpm) from the spring system. The Zone I for a spring is a square oriented so that the sides of the box are parallel to groundwater flow. The spring is centered relative to the sides of the box and 50 feet upgradient of the downgradient edge of the box. For a flow rate of 8 gpm, the Zone I for the springs is a box with sides 518 feet in length.

Bedrock Well #1 (01G), located at the north end of the Main Street, is designated as an Emergency source of water. The well does not have a pump installed and all piping has

**Table 2: Table of Activities within the Water Supply Protection Areas for Both Sources**

Potential Contaminant Sources	Zone I	IWPA/ Zone II	Threat	Comments
Non-conforming Zone I	Both	--	--	PWS does no own Zone I, non-conforming uses
Hazardous materials storage and use	Well #3	Well #3	High	Conduct inspections of facilities, encourage the use of BMPs and regulatory compliance. Coordination with emergency responders.
Auto repair garages	No	Well #3	Moderate	Hazardous materials/VSQG
High density residential w/septic	Well #3	Both	Moderate	Use BMPs for household hazardous waste, heating fuel, septic system management, and lawn care and stormwater runoff.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
School	--	Well #3	Moderate /High	Use BMPs for household hazardous waste, septic system management, lawn care and stormwater runoff. Investigate fuel source at the school and inspect the boiler room for floor drains and their discharge point.
Highway Department garage, USTs and Closed Landfill	--	Well #3	High	Hazardous materials storage/VSQG and leaks and overfills of USTs, landfill leachate
Electric utility storage facility	--	Well #3	Moderate	Transformers, vehicles, etc.
Transportation corridor: local roads and State Route 9	Well #3	Both Sources	Moderate	Limit road salt usage and provide drainage downgradient from wells
Agricultural uses – pesticide, fertilizers, manure spreading	Well #3	Both Sources	High	Activities include haying, corn crop, and a dairy farm. Potential threats from pesticides, nutrients, petroleum products and microbial contaminants.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

been severed from the distribution system. Bedrock well #2 (02G) was located in the town garage and was abandoned and decommissioned several years ago. Wells #1 and #2 will not be address further in this report.

Bedrock in the area is mapped as the Goshen Formation consisting of two distinct units: one is interbedded quartzite and schist; the other is interbedded schist and phyllite. The springs are located at the base of a hill in a swampy area with an unknown thickness of peat. The recharge area is generally an upland area that is dominated by exposed bedrock or bedrock covered with a varying thickness of till (hardpan). Recharge to the springs is through the till and schist. The contributing area to the springs includes hay fields, cornfields, a few residences and a rural road. Due to the exposed bedrock and thin till, the springs are considered to have a high vulnerability to potential contamination from activities conducted on the land surface in the recharge area because of the lack of a protective barrier such as clay. Please refer to the attached map of the Zone I and Zone II for the spring.

As previously noted, Well #3 is located within the Westfield River valley, which is a narrow, buried bedrock valley, filled with glacially derived stratified drift (sand and gravel) and recent alluvial deposits. The aquifer is an unconfined sand and gravel deposit adjacent to the Westfield River; there is no record of a confining, protective clay layer in the vicinity of the well. Wells located in this type of geologic condition are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface. The Town of Cummington has established an Aquifer Protection District and adopted protective Zoning Bylaws for that area. The Zone I and IWPA include much of the Main Street of Cummington, including a baseball field, municipal buildings, agricultural, commercial and residential uses as well as Route 9. Cummington does not have a municipal wastewater treatment plant and therefore all facilities dispose of wastewater through on-site septic disposal systems. Please refer to the attached map of the Zone I and IWPA.

For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 1 for additional information regarding the location of the well and activities within the protection areas.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

## 2. Discussion of Land Uses in the Protection Areas

The protection areas for Well #3 (03G) include the entire town center for Cummington, which includes several activities that pose a threat water supply. The recharge area for the Fanny Rodgers Spring (04G) source includes agriculture and residential uses.

### Key issues include:

1. **Non-conforming activities within Zone I,**
2. **Residential/commercial land uses with on-site septic disposal**
3. **Transportation corridors,**
4. **Hazardous materials handling,**
5. **Agricultural uses,**
6. **Protection Planning.**

The overall ranking of susceptibility to contamination for the Cummington Water Department system is high, based on the presence of several high threat ranked land uses or activities in the Zone I, IWPA and Zone II. Please refer to Table 2 for more details.

The Town of Cummington is commended for adopting protective bylaws and for the Water Department's diligence in monitoring activities within the Zone I and IWPA. Continued monitoring and public outreach is recommended to prevent accidents and minimize threats within the protection areas of the wellhead and continue to pursue Zone I acquisition options.

**1. Non-conforming activities within Zone I** – Currently, the water supplier does not own or control the entire Zone I area for either source. Please note that systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. The Zone I for Well #3 includes a baseball field, fire station, hardware store, a cornfield, the river, part of a dairy farm across the river and part of Main Street; the Zone I for the Fanny Rogers Spring includes a portion of a cornfield.

### Recommendations:

- ✓ To the extent feasible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements. Prohibit new non-water supply activities in the Zone I.
- ✓ Agreement Options - Until land is available for acquisition or preservation, attempt to obtain a Memorandum of Understanding and Right of First Refusal.
  - A Memorandum of Understanding (MOU) is an agreement between the landowner and public water supplier in which the landowner agrees not to engage in specific threatening activities. The MOU should be specific to the land use or activity. For instance, if the land is residential with a septic system, the owner could agree not to place chemicals, petroleum products, or other hazardous or toxic substances, including septic system cleaners, into the septic system, and agree that the system will be pumped at a specific frequency. Understanding how an activity threatens drinking water quality is an important component of developing an effective MOU.
  - A Right of First Refusal is a legal document that gives the water supplier the first chance to purchase land when it becomes available. A reference for a Right of First Refusal is included in the Appendices.
  - A Conservation Restriction is also a legal document that limits the type of activities that can be conducted on the property to those associated that do not pose a significant threat to the water supply.
- ✓ Where it is feasible, remove all hazardous materials from the Zone I of Well #3. Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals, maintenance chemicals and vehicles used to access the area.
- ✓ Do not use or store pesticides, fertilizers or road deicing materials within the Zone I.
- ✓ Ensure that residents and commercial facilities are aware of best management practices (BMPs) with respect to hazardous materials handling, household hazardous materials handling and disposal and proper use of lawn chemicals.
- ✓ Carefully monitor the delivery, handling and storage of chemicals and products at facilities within the Zone I.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

**2. Residential Land Uses** – The Zone I and IWPA for Well #3 has high-density residential land use. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store and accidents during delivery.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

### Residential Land Use Recommendations:

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**3. Transportation corridors** – Numerous roads are located within the Zone I, IWPA and Zone II. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets.

### Recommendations:

- V Work with the State Highway Department and the Town Highway Department to determine the location and discharge points of road runoff as is feasible. If reasonable, discharge stormwater to discharge downgradient of the well.
- V Review potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). For more information, call the local office in Hadley at 413-585-1000 or visit the U.S.D.A. web site at [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov). Fact sheets are also available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- V Prepare an Emergency Response Plan that includes coordination between the DEP, the Water Department the Town and State Police in the event of an accident near the wellhead.

**4. Hazardous Materials Storage and Use** – There are a few commercial, municipal and utility facilities within the protection areas of Well #3 that store or utilize hazardous materials. Many businesses use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials. If hazardous materials are

improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground. It should be noted that vehicle washing is a restricted activity under the UIC regulations. Review the attached fact sheet for additional information about vehicle washing activities.

### Hazardous Materials Storage and Use Recommendations:

- V Educate local businesses and municipal departments regarding the use of best management practices for protecting water supplies. Distribute the fact sheets “Businesses Protect Drinking Water” and “DPWs Protect Drinking Water” available in Appendix A; it is also available online at the website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common business issues.
- V Work with the local Board of Health, the municipality and businesses to register facilities that are unregistered generators

of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.

- V Educate local businesses and town officials and assist the Board of Health in understanding the Massachusetts and local floordrain requirements. See the brochure “Industrial Floor Drains” for more information.
- V The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities in small communities through programs such as those listed on the USDA web site at <http://search.sc.egov.usda.gov/>. Additional information is available on the web site [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call the local office in Hadley at 413-585-1000.

**5. Agricultural Activities** – A small percentage, of the IWPA and most of the Zone II areas are in agricultural land use. Pesticides, fertilizers and manure have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. Frequently, farms and other large commercial facilities have maintenance garages for equipment and storage tanks. If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the products they store.

**Agricultural Activities Recommendations:**

- V Inform commercial farmers in your protection areas of your water supply protection area and encourage them to work with (or continue working with) the USDA Natural Resources Conservation Service (NRCS) and to have a farm plan to protect water supplies. Recommend that water suppliers and farmers review the fact sheets available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS in Hadley at 413-585-1000, for assistance as is appropriate.
- V Encourage farmers and any large commercial property owners to incorporate an Integrated Pest Management (IPM) approach into their pest (plant and insect) management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment. The Department of Agricultural Resources regulates the use of pesticides.
- V Very often farms and large commercial properties store maintenance equipment and associated petroleum products on site. Promote the use of BMPs for fuel storage, hazardous material handling, storage, disposal, and emergency response planning.
- V Consider providing hobby farmers with information about protecting their own wells and the public water supply by encouraging the use of BMPs. For additional resources, refer to [http://www.state.ma.us/dep/brp/dws/dws\\_pubs.htm](http://www.state.ma.us/dep/brp/dws/dws_pubs.htm) and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual>. The Planning Board, Board of Health and Conservation Commission may be able to provide information on BMPs to hobby farmers as well.

**6. Protection Planning** – Protection planning protects drinking water by managing the land area that supplies water to a well or reservoir. Cummington does have a protective bylaw that includes part of the Town center area. Cummington also was awarded a Wellhead Protection Grant to prepare a protection plan for the community. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation.

**Protection Planning Recommendations:**

- V Prepare a Wellhead Protection Plan and establish a protection team. Refer to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP’s guidance, “Developing a Local Wellhead Protection Plan” and continue current efforts in wellhead protection planning.
- V For long term planning, the Water Department may wish to consider having the Zone II delineated for Well #3 to assist in focusing protection efforts. Perhaps, the Department can collaborate with the West Cummington Department to have Conceptual Zone II delineations completed for both systems’ wells.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. The West Cummington Water Department should review and adopt the key recommendations above and the following:

**Priority Recommendations:**

- V Continue efforts to acquire ownership or control of Zone I and limit access to the well.
- V Consider having the Zone II delineated for Well #3 to focus protection measures on areas that contribute directly to the well.
- V Continue to conduct detailed inspections of the IWPA to monitor activities near the well.

**Zone I:**

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Use BMPs within the Zone I for treatment chemicals and
- ✓ Prohibit public access to the well and pump house with locking facilities, gating roads, and posting signs as appropriate.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities, a Memorandum of Understanding or a Right of First Refusal to purchase the property.
- ✓ Redirect road drainage in the Zone I away from well area.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

**Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Inform neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal and septic system maintenance.
- ✓ Keep the area near transformer free of tree limbs that could endanger the transformer in a storm.

**Planning:**

- ✓ Work with local officials in Cummington to review Aquifer Protection District Bylaws for compliance with 310 CMR 22.000 and to include the West Cummington supply IWPA in that district.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.
- ✓ Work with the Board of Health to adopt floor drain regulations and hazardous materials handling regulations. Include an inspection program for facilities that handle hazardous materials.
- ✓ Have the highway department review their status as a hazardous waste generator and register as appropriate.

**Funding:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office (Hadley 413-585-1000) of the NRCS for assistance.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Source Water Assessment Program (SWAP) Report For West Cummington Water Department

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 5, 2001

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The West Cummington Water Department serves 26 homes in a small section of the rural community of West Cummington. The community is served by on-site septic disposal systems. Well 02G is a replacement well installed in November 2000 and is a 38-foot deep, 8 x 12-inch diameter gravel packed well. Although the source has a safe yield in excess of 30-gallons per minute, the approved withdrawal rate for the well is 3.33 gallons per minute based on existing historical demand of the system. The Zone I and Interim Wellhead Protection Area (IWPA) radii are 202 feet and 507 feet, respectively. The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The well is located within an unconfined sand and gravel deposit adjacent to the Westfield River. There is no record of a confining, protective clay layer in the vicinity of the well. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

Potassium hydroxide is added to the water supply to adjust the pH for corrosion control. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are few potential sources of contamination within the drinking water supply protection areas.

### Key issues include:

1. **Zone I ownership; and**
2. **Transportation corridor.**

The overall ranking of susceptibility to contamination for the well is low, based on the presence of few threatening land uses or activities in the Zone I and IWPA, as seen in Table 2. However, since the aquifer is vulnerable, diligence should be maintained to prevent accidents and monitor activities in the vicinity of the wellhead.

**1. Zone I ownership** – Currently, the water supplier does not own or control the entire Zone I area. Please note that systems not meeting DEP Zone I requirements for ownership or control must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. Although the map indicates the field adjacent to well is “cropland”, this area is an abandoned field that contains only the motor control building and the treatment facilities for the water supply. A small portion of the Zone I extends across the river and includes the access to the abutters property. That property is utilized as a primitive camping area with a fixed campsite but no utilities. The field is an abandoned hayfield and is currently not utilized as cropland or pasture.

### Recommendations:

- V Continue efforts to acquire Zone I through ownership or land use controls. Control access to the wellhead area. Consider purchasing a Conservation Restriction or entering into an agreement for Right-of-First Refusal.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridor	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Structures and access	Yes	Yes	-	Water supply structures. Use BMPs. Control or prohibit access

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

- ✓ Use Best Management Practices (BMPs) for handling treatment chemicals and vehicles used to access the area.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

**2. Transportation corridor** – The well access is along a rural residential road that is relatively lightly traveled. The greatest threat from the road is deicing materials and an accidental spill.

### Recommendations:

- ✓ Work with the Town to ensure that road runoff is directed as is feasible, to an area downgradient (southeast) of the well.
- ✓ Prepare an Emergency Response Plan that includes coordination between the DEP, the Water Department the Town and State Police in the event of an accident near the wellhead.
- ✓ Limit access through the property and work to eliminate any right-of-way.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. The West Cummington Water Department should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Continue in efforts to acquire ownership or control of Zone I and limit access.

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Use BMPs within the Zone I for treatment chemicals and
- ✓ Prohibit public access to the well and pump house with locking facilities, gating roads, and posting signs as appropriate.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.
- ✓ Redirect road drainage in the Zone I away from well area.

- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Inform neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal and septic system maintenance.
- ✓ Concrete pads should slope away from well and well casing should extend above ground.

### Planning:

- ✓ Work with local officials in Cummington to include the West Cummington supply IWPA in the Aquifer Protection District.
- ✓ Have a plan to address short-term water shortages and long-term water demands.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

- V Keep the phone number of a bottled water company readily available in the event of an emergency.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response (grant application) for the Grant program (RFR) on or about May 1. The responses are generally due on or about July 31. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Academy at Swift River is a private, 14 month boarding school for students ranging in age from 13 to 18, located in the rural communities of Cummington and Plainfield. The facility is served by on-site septic disposal and a single water supply well #1 (01G). Well #1 is a 280-foot deep, 6-inch diameter, bedrock well. The Department approved well #1 in 1989, with a withdrawal rate of 26.25 gallons per minute; a maximum daily withdrawal of 37,800 gallons. However, actual water use at the school is significantly less than the approved withdrawal rate of the well. Therefore, the Department reduced the Zone I to 250 feet based on actual water use (10,000 gpd); the IWPA remains at the 1,240 based on the approved withdrawal rate of the well (37,800 gpd). The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA.

The lodge, now a science classroom building, is located just outside of the Zone I at a distance of approximately 270 feet from the well. The school utilizes micro-pipette techniques and frozen biological specimens but does not have a tight tank for the laboratory wastewater discharge. Please note that the Title 5 regulations prohibit discharge of non-sanitary wastewater to a septic system. The facility uses propane for a heating fuel source. Although the main supply tank is north of the main building, other smaller tanks are located at remote buildings.

USGS maps the bedrock within the area as meta-sedimentary and meta-volcanic rocks with complex folding, resulting in steeply dipping, nearly vertical beds. Immediately at the well site the rock is mapped as quartzite schist of the Goshen Formation. The overburden is a relatively thin layer of till. There is no record of a confining, protective clay layer in the vicinity of the well. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The well serving the facility has no treatment at this time. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination.

**Key issues include:**

1. **Non-conforming activities in Zone I;**
2. **School facilities.**

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
School facilities	No	Yes	Moderate	School facilities within IWPA; household hazardous materials and waste
Septic System	No	Yes	Moderate	See Septic System Brochure
Laboratory waste to septic	No	No	Moderate	Contact Program Coordinator – Wastewater Program
Residential Use	No	Yes	Moderate	See Best Management Practices
Parking lots and transportation corridor	No	Yes	Moderate	Limit road salt usage and maintain drainage away from wells

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

The overall ranking of susceptibility to contamination for wells 2 and 3 is moderate, based on the presence of one or more moderate ranking land uses or activities in the Zone I and IWPA, as seen in Table 2.

**1. Non-conforming activities in Zone I;** – The lodge, classroom building is located just outside of the Zone I of the well. The only activities within the Zone I are related to passive recreation and foot traffic through campus. The main foot pathway from the north buildings to the lodge/classroom building which has been in place for approximately 12 years was paved in 2001 to control erosion; there is no motor vehicle traffic on the pathway. It was also noted during the site visit that the well cap did not have a sanitary, watertight cap. DEP prohibits all activities not related directly to water supply within Zone I. Please note that systems not meeting DEP Zone I requirements must receive DEP approval and address Zone I issues prior to increasing water use, modifying systems or conducting any activities within Zone I.

**Recommendations:**

- ✓ Prohibit any new non-water supply activities within the Zone I.
- ✓ Supply a watertight sanitary cap for the well.
- ✓ Do not use pesticides or fertilizers within the Zone I. Minimize sodium-based deicers within the Zone I.

**2. School facilities** – All of the school facilities are located within the IWPA of the well except the septic system leach field. The leach field is located outside of the IWPA and appears to be topographically cross gradient from the well site. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste. The school should evaluate how laboratory wastes are treated and disposed; a tight tank may be required.

**Recommendations:**

- ✓ Use Best Management Practices for all activities at the school with respect to household hazardous materials and education of staff regarding septic system management.
- ✓ Contact Paul Nietupski, at 413-755-2218 the wastewater management program coordinator, regarding the laboratory wastewater management.
- ✓ Storage of hazardous materials (even household type hazardous materials) should be an impermeable surface and contained in an area large enough to hold 110% of the liquid volume, should a spill occur.
- ✓ Review the facility's status with respect to registration as a Very Small Quantity Generator of Hazardous Waste. Whether you are required to register or not, please

implement standard operating procedures regarding proper storage, use and disposal of hazardous hazardous materials. To learn more, refer to for the Requirements for Small Quantity Generators.

Another potential threat to the well within the IWPA noted during the site visit was the old shallow dug well near the main building. The dug well was partially covered at the time of the visit and the Department recommended decommissioning the well to prevent potential contamination of the shallow aquifer and to eliminate the physical hazard. The school is commended for having filled and properly decommissioning the well following the SWAP site visit.

Catch basins transport storm water from the roadway and adjacent properties to the ground. As flowing storm water travels, it picks up debris and contaminants from streets, parking areas and lawns. Common potential contaminants include lawn chemicals, pet waste, leakage from dumpsters,

**Glossary**

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

household hazardous waste, and contaminants from vehicle leaks, maintenance, washing or accidents. The drains are directed topographically downgradient of the well to an area on the edge of the IWPA. Monitor parking areas and inspect, maintain, and clean catch basins on a regular schedule. Please note that material cleaned out of catch basins is considered solid waste and must be disposed of in compliance with DEP policy. Residential uses also pose minimal threat to public and private water supplies provided septic systems and household hazardous materials are properly managed.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The Swift River Academy water supply well is fairly well protected and the school is commended for conducting on-going protection measures. Please review and adopt the key recommendations above and the following to further protect the source:

### Priority Recommendations:

- ✓ Install a sanitary cap on the wellhead.
- ✓ Comply with non-sanitary wastewater disposal requirements.

### Zone I:

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Continue to prohibit public access to the well and pumphouse by locking facilities, sealing all openings in the walls and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any above ground tanks for leaks, etc.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Maintain drinking water protection area signs at key visibility locations away from the well at the perimeter of protection areas.
- ✓ Incorporate groundwater education into school curriculum (contact DEP for copies of appropriate curricula as required).

### Facilities Management:

- ✓ The Academy at Swift River is not a registered Very Small Quantity Generator of Hazardous Waste. Review your status and determine compliance if required. Whether registration is required or not, implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, refer to attachments and <http://www.state.ma.us/dep/consumer/consumer.htm> regarding management of household hazardous materials.
- ✓ Eliminate non-sanitary wastewater discharges to on-site septic systems. Instead, in areas using hazardous materials such as science labs, discharge drains to a tight tank.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ Protective pads around the wellhead should slope away from well casing.

### Planning:

- ✓ Work with local officials in Cummington and Plainfield to include the school's IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.

- V Supply residential neighbors with assistance and information regarding proper management of household hazardous materials management.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response for the Grant program (RFR). On or about May 1 the new RFR is available and the application is due back on or about June 31. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report For SHIRE VILLAGE CAMP

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 25, 2004

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Shire Village Camp
<i>PWS Address</i>	Mellor Rd
<i>City/Town</i>	Cummington, Massachusetts
<i>PWS ID Number</i>	1069009

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1 (01G)	1069009-01G	107	427	High	Moderate
Well #2 (02G)	1069009-02G	158	454	High	Moderate
Well #3 (03G)	1069009-03G	107	427	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for MAIN  
BUILDING WELL (01G)  
(1069009-01G)**

Zone I = 107 ft.  
IWPA = 427 ft.

## How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system and animals within the Zone I or the IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the parking and other camping activities within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, a Sanitary Survey, water quality data and from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
COWGIRLS' REALTY TRUST, LLC

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 10, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	Cowgirls' Realty Trust, LLC
<b>PWS Address</b>	445 Berkshire Trl
<b>City/Town</b>	Cummingtown, Massachusetts
<b>PWS ID Number</b>	1069010

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well #1	1069010-02G	100	422	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1069010-02G)**

Zone I = 100 ft.  
IWPA = 422 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the IWPA. The **high** susceptibility to potential non-microbial threats is based on the local roads, parking and underground storage of gasoline within the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

IWPA = 422 ft.

## How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and parking within the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Dalton Fire District**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i><b>PWS Name</b></i>	Dalton Fire District
<i><b>PWS Address</b></i>	20 Flansburg Avenue
<i><b>City/Town</b></i>	Dalton
<i><b>PWS ID Number</b></i>	107000
<i><b>Local Contact</b></i>	Mr. Gilbert Rudd, Jr.
<i><b>Phone Number</b></i>	413-684-6124

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

A well or surface water supply's water supply protection area is the land area contributing water to the source where protection activities should be focused.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer defined by hydrogeologic studies that must be approved by DEP. For wells that have not had a scientifically delineated Zone II, an Interim Wellhead Protection Area (IWPA) is designated.

**The IWPA** is the larger area that is likely to contribute water to the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed.

## Section 1: Description of the Water System

### Groundwater Source

Well Name	Source ID	Susceptibility
Mobile Home Park Well	1070000-01G	Moderate

### Surface Water Sources

Source Name	Source ID	Susceptibility
Egypt Brook Reservoir	1070000-02S	Moderate
Windsor Reservoir	1070000-03S	High

Dalton is a small, rural community in western Massachusetts. The Dalton Fire District maintains three surface water sources (Windsor, Egypt, and Anthony Reservoirs) and one groundwater source (Trailer Park Well) for drinking water purposes. Additionally, Dalton receives 46 million gallons of water per month from the Pittsfield Water Department which diverts water from the Windsor Brook watershed.

The Windsor Reservoir, the main source of water for Dalton, is located just over the Dalton municipal boundary in Hinsdale and Windsor. Its watershed is within these towns and partially in the town of Peru. The Anthony and Egypt Reservoirs and their respective watersheds are located entirely within Dalton. The Anthony Brook headwall is maintained as an emergency source only and is not addressed further in this report. Water from the Windsor and Egypt brook Reservoirs is treated through a conventional filtration plant at the district's Reservoir Road Water Treatment Plant. The plant, capable of treating water from either or both reservoirs, utilizes a sedimentation basin followed by two slow sand filter beds. Following filtration the water is chlorinate for disinfection and the pH adjusted for corrosion control.

The well (1070000-01G) is located south of Route 9, where it was constructed in 1993 to serve a mobile home park nearby. The mobile home park is located so that treated reservoir water could not easily be supplied to the park, therefore a well was installed to supply the area. The trailer park well is a bedrock well, drilled to a depth of 440 feet, and has an approved safe yield of 15 gpm. The Zone I for the well is 300 feet, and the Interim Wellhead Protection Area (IWPA) is 880 feet, based on the approved safe yield rate. The well is drilled into the carbonate rocks of the Stockbridge Formation and water from the well is chlorinated prior to distribution.

For current information on water quality monitoring results and treatment processes, please refer questions to the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The land uses within the watershed of the Winsor Reservoir and the IWPA of the well are a mixture of agricultural, residential, and forests; there are numerous roads throughout. The watershed for Egypt Reservoir has only forested land with a utility right-of way. The most significant threat to the surface water supplies is from sediment and microbial threats from erosion, stormwater and

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II or IWPA protection area.

aquatic wildlife. Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Tables of Regulated Facilities and Underground Storage Tanks attached in Appendix B.

#### Key Land Uses and Protection Issues include:

1. Nonconforming Zone A
2. Residential land uses
3. Transportation corridors
4. Hazardous materials storage and use
5. Protection Planning
6. Agricultural activities
7. Utility Right-of-way
8. Presence of Beavers in Surface Water Sources

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the main source, Windsor Reservoir water supply protection areas, as seen in Table 2. However, the sources (Egypt Reservoir and the Trailer park Well) have individual susceptibility rankings of moderate.

**1. Nonconforming Zone A** – The Zone I for the well is a 300-foot radius around the wellhead. The water supplier owns or controls all of Zone I. There is haying

conducted in the Zone I however, pesticides, fertilizers or manure may not be used on the field. The Zone A for reservoirs is 400 feet from the shoreline and 200 feet on either side of all feeder streams. Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I/Zone A, or control the Zone I/Zone A through a mechanism such as a conservation restriction. Local roads run throughout the Zone A of Windsor Reservoir and the District does not own any of the land around Egypt Brook Reservoir. Only water supply activities are allowed in the Zone I/Zone A. However, many public water supplies were developed prior to the Department's regulations and contain non-water supply activities such as homes and public roads.

#### Zone A Recommendations:

- ✓ Prepare a watershed/wellhead protection plan for all of the systems sources. Prioritize lands to protect within the Zone A, watershed and IWPA.
- ✓ Obtain a Right of First Refusal for acquiring land critical to protecting water supply within the Zone A.
- ✓ Consider purchasing the land or acquiring a conservation restriction on the land not owned by the District to minimize potential threats.
- ✓ Encourage the use of BMPs for the storage, use, and disposal of household hazardous materials and road runoff.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone A.
- ✓ Contact the property owners and the appropriate municipalities to be sure they are aware they are within the Zone A. Provide information and refer them to DEP if they require assistance implementing BMPs.
- ✓ Prepare a public access control plan including management, patrolling and monitoring.

**2. Residential Land Uses** – Approximately 13% of the IWPA consists of a high density residential areas. About 3% of the watershed of Windsor Reservoir has residential land use, including areas within the Zone A. None of the areas have public sewers; all use septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems provide a direct discharge to the ground. In addition, if septic systems fail or are not properly maintained they can be a potential source of microbial contamination.

### What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

- **Lawn Care and Landscaping** - Lawn care products can pose a significant threat to water supplies by leaching nutrients and pesticides into groundwater and surface water.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.

### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

### Residential Recommendations - Septic systems:

- ✓ **System Care** - Educate residents on private septic systems about using cleaning compounds that are safe for the septic system, on proper disposal

practices, i.e. only sanitary waste in the septic system. Information on septic systems can be found at Massachusetts Department of Environmental Protection's website <http://www.state.ma.us/dep/brp/files/yoursyst.htm>.

- ✓ **Proper Disposal** - Residents should dispose of used oil, antifreeze, paints, and other household chemicals properly - not in septic systems.

### Residential Recommendations - Lawn Care and Landscaping:

- ✓ **Environmentally Sound Lawn Care** - Provide educational materials to residents about the proper application of pesticides or fertilizers. Landscape with native grasses, native flowering plants and trees and shrubs. Once established native plants require less water and may not require fertilizer, herbicides or pesticides use. Encourage the use of native plants and landscaping by establishing a demonstration area at a town facility. Information on environmentally sound lawn care practices can be obtained from the Massachusetts Department of Food and Agriculture Pesticide Bureau's website at <http://www.massdfa.org>.

### Residential Recommendations - Household Hazardous Waste:

- ✓ **Proper Disposal** - Educate residents on the problem of disposing of hazardous materials in landfills, septic systems, wastewater treatment plants, storm drains, and on the ground. Encourage residents to use the Town of Dalton's Household Hazardous Waste Collection opportunities. Consider working with the host communities and Berkshire Planning Commission to coordinate Household Hazardous Waste Collection days.
- ✓ **Alternative Products** - Provide residents with information on options that are available to substitute less hazardous substances for many products used in the home.

### Residential Recommendations - Heating Oil Tanks:

- ✓ **Inventory Tanks** - Work with host communities to inventory USTs. If there are significant numbers of tanks consider options for financial incentives to replace the tanks with ASTs.
- ✓ **Underground Storage Tanks** - Target homeowners with underground storage tanks for education and outreach.

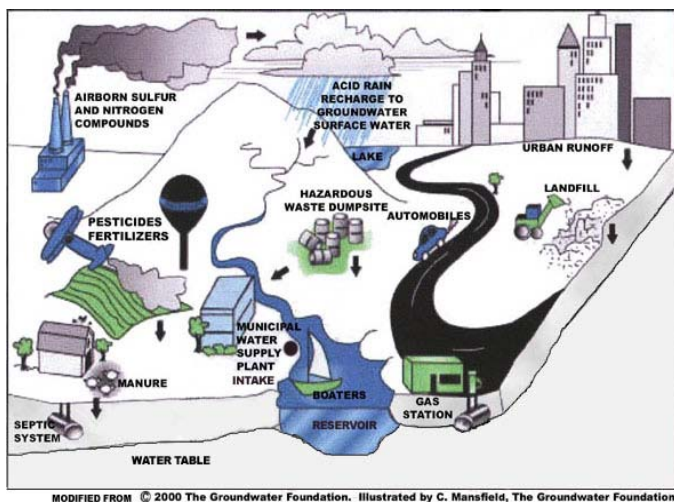

Figure 1: Sample watershed with examples of potential sources of contamination

- ✓ **Aboveground Storage Tanks** - Provide educational materials to residents regarding the proper storage of liquid petroleum products in aboveground storage tanks. The Department recommends zoning and non-zoning controls to prohibit the siting of liquid petroleum products storage in protection areas unless such storage is aboveground, on an impervious surface and either in a container or in an aboveground tank within a building, or in an area that has a containment system designed and operated to hold either 10 percent of the total possible storage capacity of all containers, or 110% of the largest container storage capacity whichever is greater. Consult with the local fire department for any additional local code requirements regarding aboveground storage tanks. A fact sheet on basement or outside oil tank can be obtained from the <http://www.state.ma.us/dep/bwsc/files/HSFS.pdf>

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	IWPA	Watershed	Potential Contaminant Sources*
<b>Agricultural</b>					
Forestry Operation	Numerous	L	—	Windsor Egypt	Herbicides or pesticides, equipment maintenance materials: leaks, spills, or improper handling; road building
Livestock Operations	1	M	—	Windsor	Manure (microbial contaminants): improper handling
Pesticide Storage or Use	1	H	—	Windsor (Egypt)	Pesticides: leaks, spills, improper handling, or over-application , (Right of Way areas only)
<b>Commercial</b>					
Gas Stations	2	H	—	Windsor	Automotive fluids and fuels: spills, leaks, or improper handling or storage
<b>Residential</b>					
Fuel Oil Storage (at residences)	Numerous	M	Yes	Windsor	Fuel oil: spills, leaks, or improper handling. May be AST or UST
Lawn Care / Gardening	Numerous	M	Yes	Windsor	Pesticides: over-application or improper storage and disposal
Septic Systems / Cess-pools	Numerous	M	Yes	Windsor	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>					
Aquatic Wildlife	Periodic	L	—	Windsor	Microbial contaminants
Clandestine Dumping	Periodic	H	—	Windsor	Debris containing hazardous materials or wastes
Composting Facilities	1	L	—	—	Organic material, animal waste, and runoff: storage and improper handling
Transmission Line Rights-of-Way - Type: Electric	1	L	—	Egypt	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors	Numerous	M	Yes	Windsor	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling

Land Uses	Quantity	Threat	IWPA	Watershed	Potential Contaminant Sources*
Underground Storage Tanks	1	H		Windsor	Stored materials: spills, leaks, or improper handling
Utility Substation Transformers	1	L		Windsor	Chemicals and other materials including PCBs: spills, leaks, or improper handling
Very Small Quantity Hazardous Waste Generator		L		Windsor	Hazardous materials and waste: spills, leaks, or improper handling or storage

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and trans-

**3. Transportation Corridors** - Route 9 runs through the IWPA and the watershed of Windsor Reservoir, and local roads are common throughout the protection areas. Route 9 is a heavily traveled State road, and therefore poses a greater threat to those supplies that are in close proximity to it; however, it is equally important to use best management practices in any area with transportation corridors within the protection areas. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catch basins.

**Transportation Corridor Recommendations:**

- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.
- ✓ Work with local emergency response teams to ensure that any spills within the watershed can be effectively contained and that those teams are aware of the boundaries of your watersheds and IWPA.

**Stormwater Catch Basins Recommendations:**

- ✓ **Inspect, Maintain, and Clean** - Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Additionally, street and parking lot sweeping reduces the amount of potential contaminants in runoff. Note: Catch basin cleanings are classified as solid waste by DEP and must be handled and disposed in accordance with all regulations, policies, and guidance. In the absence of written approval from DEP, catch basin cleanings must be taken to a facility permitted by DEP to accept solid waste. For information on DEP's Nonpoint Competitive Grants Program Upcoming Funding Opportunity refer to: <http://www.state.ma.us/dep/brp/mf/mfpubs.htm#wpa>.
- ✓ **Best Management Practices** - Work with the Towns to develop Best Management Practices that are the most effective, practical means of preventing or reducing pollution from nonpoint sources. Information is available at <http://www.epa.gov/OWOW/NPS/roads.html>.
- ✓ **Local Controls** - Encourage and assist officials to develop a local stormwater ordinance. For more information see <http://www.epa.gov/owow/nps/ordinance/stormwater.htm>.
- ✓ **Storm Drain Stenciling Program** - Work with local watershed groups to institute a Storm Drain Stenciling

Program. For more information on how to develop a storm drain stenciling program go to <http://www.earthwater-stencils.com>

- ✓ **Stormwater Planning** - Encourage local officials to become familiar with and begin to implement a stormwater management program to meet DEP's Phase II Storm Water Regulations. For additional information, refer to the Stormwater Management Information at <http://www.state.ma.us/dep/brp/www/wwpubs.htm#storm>.

**4. Hazardous Materials Storage and Use** – A very small percentage (<1%) of the land area within Windsor Reservoir's watershed is commercial land use. Many small businesses use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet "Businesses Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure "Industrial Floor Drains" for more information.

**5. Protection Planning** – Forested land covers 59% of the IWPA, 87% of the Windsor Reservoir watershed, and more than 95% of the Egypt Brook Reservoir

watershed. Protected open space within the IWPA and watershed is noted on the Land Uses section of the map, the greatest of which is within the Egypt Reservoir's watershed. Currently, Dalton has not passed any bylaws to comply with water supply protection control regulations 310 CMR 22.21(2), which should include floor drain prohibitions.

Dalton has sold Conservation Restrictions (CR) to the MA DEM to allow public access to the watershed. Although the CR limits allowable activities, it does not specify control measures other than a 500 foot setback from the reservoir.

Wellhead Protection Plan and a Watershed Protection Plan coordinate community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public education and outreach, and can help to pass a bylaw for control regulations. The development of successful Plans are outlined in five steps in DEP's "Developing a Local Wellhead Protection Plan" and in "Developing a Local Watershed Protection Plan" (see Appendix A for the full report) as:

- Establish a protection committee or team
- Define the Water Source Protection Areas
- Identify potential sources of contamination
- Protect and manage the source protection areas
- Conduct ongoing public education and outreach
- An access control and monitoring plan should be an integral part of a watershed protection plan. The assessment of potential impacts of public access to the watershed are critical in protecting the water supply and for long and short term planning for the Water District.
- Since both Pittsfield and Dalton utilize the Windsor and Cady Brook watersheds, consider consulting with Pittsfield to develop a watershed protection strategy.

Please use the guidance booklets included in the appendix to help create your plan. Compile the information supplied in the Zone II reports, this and other reports; include copies of maps outlining the protection areas (Zone I, IWPA, Zone

**Top 5 Reasons to  
Develop a Local Wellhead  
and Surface Water  
Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

A, Zone B, and Zone C) and detail the protection measures in place. Outline a plan with a time line for completion of the various plan components. Submit your written report to the DEP Regional office and/or Boston office for approval.

#### **Protection Planning Recommendations:**

- ✓ Create and formalize a Wellhead Protection Plan and a Watershed Protection Plan. Refer to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan" (see Appendix A).
- ✓ Work with the other host communities (Peru, Windsor, Hinsdale) to adopt protective bylaws and regulations for the Windsor Reservoir watershed. The Department will be instrumental in assisting Dalton in this effort.

**6. Agricultural Activities** – Crop and pasture lands make up about 22% of the land use in the IWPA, 4% in the watershed of Windsor Reservoir. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits compost facilities and field application are potential sources of contamination to ground and surface water. The Egypt Brook reservoir watershed is not owned by the District although the property is protected from development by Agriculture Restrictions. The entire watershed is forested and actively logged. The owner demonstrates apparent good stewardship of the land, however the access points to the forestry activities are within the Zone A of the reservoir and feeder brook posing a serious potential threat to the source from accidental petroleum release.

#### **Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Current land owners are predominantly excellent land stewards employing BMPs.
- ✓ Work with the landowner to identify alternative access for forestry operations. If that is not feasible, encourage the requirement that contractors working on the property inspect their vehicles and have sufficient absorbent materials to contain an accidental release.
- ✓ Consider purchase of Conservation Restrictions on large tracts especially within the Zone A.

**7. Electric Utility Right-of-Way** – Western Massachusetts Electric Company maintains power line Right-of-Way areas which transect the watershed of both surface water supplies, and run directly over brooks or rivers that are upstream

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II.
2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

Land uses within the Zone III were not assessed for this report.

#### **For More Information**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, town boards, and the local media.

#### **Source Protection Decreases Risk**

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

from the intakes. Normal maintenance of an electricity line right-of-way can introduce contaminants to a water supply through herbicide application for vegetation control. The over-application or improper handling of herbicides on a right-of-way is a potential source of contamination. Leaks or spills of transported maintenance chemicals are also potential sources of contamination to the water supply.

#### **Electric Right of Way Recommendations:**

- ✓ Review the electric right-of-way Yearly Operating Plan to ensure Best Management Practices are implemented with regard to vegetation control in the watershed but especially within the Zone A, and that the utility has accurate information regarding the locations of the wells and the Zone I and Zone A. Meet with the utility and review the maps the utility uses and, if necessary, supply them with updated copies.
- ✓ Work with your local fire department to review

emergency response plans. Updates to this plan should include the electric rights-of-way including coordination with the owner/operator of the company or companies using the right-of-way. Request emergency response teams to coordinate Emergency Response Drills and practice containment of potential contaminants from accidents within the watershed, which should attempt to include representatives from the owner/operator of the utility company utilizing the right-of-way.

**8. Presence of Aquatic mammals in Surface Water Watershed** – There is past history of aquatic mammals (beavers and muskrats) living in and near the surface water supplies, specifically Windsor Reservoir. Aquatic mammals pose a potential threat of microbial contamination of the source from *Giardia Lamblia* and *Cryptosporidium*, pathogens that are identified in the Surface Water Treatment Rule and Enhanced Surface Water Treatment Rule as posing an unacceptable risk to drinking water.

**Presence of Beavers in Surface Water Sources Recommendations:**

- ✓ Monitor the watershed and reservoirs for the presence of aquatic mammals and their proximity to the intake.
- ✓ Monitor raw water quality and assess potential impacts.

Other land uses and activities within the watersheds and IWPA that have

potential for contamination are listed in Table 2. Refer to Table 2 and Appendix 2 for more information about these land uses.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those listed above and below should be used to better protect your water supply.

### Section 3: Source Water Protection Conclusions and Recommendations

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system source water areas contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Keeping good relations with land owners in the IWAP and the watersheds especially the Zone As for better protection of the water supply.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Develop a Watershed Protection Plan with emphasis on public access control and management. Include assessment of funding mechanisms to manage watershed inspections and management as required. Evaluate and assess current activities and their potential or existing impacts to water quality and source vulnerability.
- ✓ Inspect the Zone I/Zone A regularly, and when feasible, remove any non-water supply activities.
- ✓ Continue to educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams in watershed host communities to ensure that they are aware of the stormwater drainage in your IWPA and watersheds when responding to spills or accidents. Include MA Highway Department and the communities of Windsor, Hinsdale, and Peru.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Continue working with farmers and land owners in your protection areas to make them aware of your water supply and to support the use of a NRCS farm plan to protect water supplies and BMPs for all activities.

**Resources for Drinking Water Source Protection:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

**Conclusions:**

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the water supply protection areas. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

**Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Map of the Protection Areas

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I/Zone A?	<b>YES Zone I</b> <b>NO Zone A</b>	Follow Best Management Practices (BMPs) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Investigate purchasing, or obtaining Right of First Refusal of the Zone A land.
Is the Zone I/Zone A posted with “Public Drinking Water Supply” Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone I/Zone A regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply related activities the only activities within the Zone I/Zone A?	<b>NO</b>	Continue monitoring non-water supply activities in Zone I and Zone As.
<b>Municipal Controls (Zoning Bylaws, Health Regulations, and General Bylaws)</b>		
Does the municipality have Surface Water Protection Controls that meet 310 CMR 22.20 C or Wellhead Protection Controls that meet 310 CMR 22.21 (2)?	<b>NO</b>	The Town does not meet DEP’s best efforts for surface water or wellhead protection. However, the District does monitor activities in the hay field to ensure that no fertilizers, manure or pesticides are used near the wellhead.
Do neighboring communities protect the areas of the watershed extending into their communities?	<b>NO</b>	Work with neighboring municipalities to include surface water protection areas in their water supply protection controls. Continue to work with DEM on management of State Forest Lands within the watershed.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan or Local Surface Water Protection Plan?	<b>NO</b>	Develop a water supply protection plan or plans to incorporate the surface water supplies and the well. Follow “Developing a Local Wellhead Protection Plan” and other guidance available at: <a href="http://www.state.ma.us/dep/brp/dws">www.state.ma.us/dep/brp/dws</a> . Develop an access plan to control public access to the watershed. The cost of management must be incorporated into long term planning.
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	<b>NO</b>	Create plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a water supply protection committee?	<b>NO</b>	Establish committee; include representatives from citizens’ groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For more guidance, see “Hazardous Materials Management: A Community’s Guide” at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> .
Does the PWS provide water supply protection education?	<b>NO</b>	Aim education at schools and commercial, industrial, and municipal uses within the watershed. Extend these education practices into the host communities of the surface water supplies.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Deerfield Fire District**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Deerfield Fire District
<i>PWS Address</i>	167 Mill Village Road
<i>City/Town</i>	Deerfield
<i>PWS ID Number</i>	1074000
<i>Local Contact</i>	Mr. Brian Dejnack
<i>Phone Number</i>	413-773-3359

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells, springs and reservoirs may be threatened by many potential contaminant sources, including stormwater runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

**System Susceptibility:** High

### Spring Names

### Source IDs

**MA GIS Zone II #:** 588

**Susceptibility:** Moderate

Stillwater Well	1074000-05G

**IWPA Wapping Well = 2,640 ft. radius** **Susceptibility:** High

Wapping Well	1074000-01G
--------------	-------------

Deerfield is a small, rural, developing residential and agricultural community located in northwestern Massachusetts in the Connecticut River valley. Deerfield is home to at least three private schools, Historic Deerfield and craft fairs. Light industry has recently expanded into the community. Deerfield's topography is primarily fertile valley in the center of town with north-south trending hills on the east and west sides of town. The Pocumtuck Range trends north-south along the eastern side of town and the Berkshire foothills begin along the west side of town. The Deerfield River flows through the northern portions of town. The Deerfield River flows northwest to southeast through the foothills until it enters the river valley, where it flows north then east to its confluence with the Connecticut River. The Connecticut River flows south and forms the eastern boundary of Deerfield.

Deerfield is served by two water districts: Deerfield Fire District and South Deerfield Water Supply District. The Deerfield Fire District serves the northern parts of town and also serves as a supplement to Eaglebrook School's public

water supply. The Deerfield Fire District maintains and operates seven public water supply sources. There are five spring systems: the Keats Spring (1074000-02G), Wells Spring (1074000-03G), Stillwater Spring (1074000-05G), Harris Spring (1074000-04G) and Upper Reservoir (1074000-07G). Deerfield Fire District also maintains two wells - Stillwater Well (1074000-05G) and Wapping Well (1074000-01G); the Wapping Well is an emergency source that has not been used as a steady source of water since approximately 1980 due to water quality.

Water from the Keats Spring (02G) cistern flows by gravity into the Wells Spring (03G) cistern where the water is disinfected with chlorine. Water then flows to a 50,000 gallon storage/collection cistern, the Upper Reservoir Spring. Water from all three sources continues to flow by gravity to the large 200,000 storage tank and to the distribution system. Excess water from the Wells, Keats, and Upper Reservoir spring systems may overflow the main storage tank. The Keats, Wells and Upper Reservoir spring collection systems are located upon a bedrock high of the Sugarloaf Formation sandstone on the Pocumtuck Range.

The Stillwater and Harris Spring collection systems and the Stillwater Well are installed in glacially deposited sand and gravel at the base of a bedrock (schist) escarpment. The Stillwater and Harris springs are actually comprised of a large number of individual spring boxes that are connected by manifold and eventually flow by gravity together into a pump station (Harris/Stillwater Spring Pump Station). The spring systems were constructed by the Civilian Construction Corps in the 1920s and 1930s. The District does not have accurate construction details, exact number or location of all the spring boxes. In general, each spring box is roughly two feet in diameter and two feet deep with dry stone masonry walls and a gravel bottom. In recent years the District has made an effort to locate the individual spring boxes and work is done to clear away surrounding brush, pour a concrete cap around a locking metal cover and grade the ground around the box to improve the sanitary seal on the box and prevent surface runoff from entering the box.

At least thirteen individual spring boxes comprise the Stillwater Spring (06G). As many as eight boxes collect flow from the western base of the hill and five boxes collect from the eastern base of the hill. In general, water from the spring boxes located higher on the hill, flows downhill into the lower boxes through buried clay pipe. At the base of the western side of the hill is a large concrete collection tank. Similarly, there is a tank at the base of the eastern set of boxes. Water from both the eastern and the western collection tanks flow to a third tank that collects all of the water from the Stillwater Spring. The collection tanks do not allow natural groundwater infiltration. Water then flows into the Harris/Stillwater Spring Pump Station.

The Harris Spring system (04G) is located along the base of the same hill as the Stillwater Spring, but is several hundred feet

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

south of the Stillwater spring system. The Harris spring system is comprised of five spring boxes and a single concrete collection tank. Water then flows from the collection tank to the Harris/Stillwater Pump Station.

The Harris/Stillwater Pump Station (built in 1990) has a 25,000 gallon wet well that collects all the flow from both the Harris and Stillwater spring systems. Provided there is water in the wet well, a single, vertical turbine pump, continuously pumps water (40 gpm) into the distribution system. Occasionally, flow from the spring exceeds the capacity of the pump and the excess water overflows to the Stillwater Brook. Water from the Stillwater Spring passes through a marble chip basket which buffers the pH of the water for minor corrosion control. All water from the Stillwater and Harris Springs is disinfected at the Harris/Stillwater Pump Station prior to distribution.

The Stillwater Well (05G) is located along the southern bank of the Deerfield River near the Stillwater and Harris Spring systems. The well is a 16 x 24-inch diameter gravel packed well, approximately 55 feet deep. The surficial materials within the valley are sand, silt and in some areas are glacio-lacustrine clay deposits laid down during the recession (melting) of the glaciers some 12,000 years ago. In the river valleys, recent alluvial deposits overlay the glacial deposits. The bedrock beneath the valley area and the eastern highlands is mapped as sandstone of the Sugarloaf formation, with the western hills mapped as the Conway Formation, predominantly schist with beds of quartzite.

Through the SWAP program, the Department retained the USGS to delineate the recharge contribution area or Zone II recharge area, for each of the spring sources. The discharge from the springs was estimated based on flow measurements and the area of contribution was delineated based on geologic mapping of bedrock/overburden materials and topography. The Zone II for the Stillwater Well was previously delineated by a consultant utilizing data from an extended duration pumping test, geologic mapping and analytical modeling of the aquifer. Water from the well is treated with soda ash for corrosion control and disinfected with chlorine prior to distribution into the system.

The Stillwater and Harris Spring systems and the Stillwater Well Zone II are located within the same unconfined, sand and gravel aquifer and share some of the same recharge area. Although the springs are located within the glacially deposited sand, they are located at the base of a bedrock escarpment and there is significant contribution from the bedrock as well as the overburden. The Zone II for the well and springs include areas south of the Deerfield River on the west side of town. The land use within the recharge area is residential, agriculture and sand and gravel mining.

The Zone II for the Keats Spring (02G) is primarily forest and has numerous school recreational trails throughout the area. The Zone II for the Wells Spring (03G) is primarily forest with recreational trails, but also includes two school dormitories, associated parking and activities, stormwater runoff, and two fuel oil USTs. According to the school, they have

### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

### Source Protection Decreases Risk

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Areas

Land Uses	Quantity	Threat	Source ID Zone II/ IWPA	Potential Contaminant Sources*
<b>Agricultural</b>				
Fertilizer/ pesticide storage or use	Numerous	M/H	01G, 04G, 05G, 06G	Fertilizers: leaks, spills, improper handling, or over-application
<b>Commercial</b>				
Maintenance shop	1	H	07G	Petroleum products, solvents, paints: spills, leaks, or improper handling
Residential school	1	M	03G, 07G	Fuel oil, laboratory, art, photographic, machine shop, and other chemicals: spills, leaks, or improper handling or storage, storm-water management
Very Small Quantity Haz- ardous Waste/ Oil Generator	2	M	01G, 07G	Hazardous materials and waste: spills, leaks, or improper handling or storage
Transportation corridors/ Util- ity Right-of-way	Numerous	M/H	All	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Underground storage tanks	Numerous	H	03G, 07G	Stored materials: spills, leaks, improper delivery or handling
Sand & gravel mining	1	M	04G, 05G, 06G	Spills or leaks from fuel storage, petroleum leaks from equip- ment, clandestine dumping, erosion
Aboveground storage tanks	Numerous	L/M	04G, 05G, 06G	Stored materials: spills, leaks, improper delivery or handling
<b>Residential/ Miscellaneous</b>				
Fuel oil storage (at residences)	Numerous	M	01G, 04G, 05G, 06G	Fuel oil household hazardous materials: spills, leaks, or im- proper handling
Lawn care / Gardening	Numerous	M	01G, 04G, 05G, 06G	Pesticides: over-application or improper storage and disposal
Septic systems / cesspools	Numerous	M	01G, 04G, 05G, 06G	Hazardous chemicals: microbial contaminants, and improper disposal
Aquatic animals	Periodic	H	02G, 03G, 04G, 06G	
Farm dump	1	M/H	05G	Petroleum wastes, hazardous materials, microbial contami- nants, inorganic wastes

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

directed most of the stormwater runoff to surface water bodies and to the pond. It has been previously noted that the stormwater BMP controls runoff from Pine Nook Road and the dormitories access roads.

The Zone II for the Upper Reservoir Spring (07G) has not yet been delineated but the land area upgradient of the source includes the Wells Spring Zone II. However, until the Zone II for that spring source has been delineated, an Interim Wellhead Protection Area was calculated based on the estimated yield of the spring source of 35 gpm. The

IWPA is a radial area of 1,520 feet and includes all of the Eaglebrook School and much of the Wells Spring Zone II area. Please refer to the attached map to view the boundaries of the Zone II for the well, the Draft Zone II and the IWPA for the springs.

The Upper Reservoir Cistern is located approximately 43 feet upgradient (east) from the edge of a drainage brook. The Eaglebrook School maintenance garage is immediately across the brook with the parking lot for the maintenance garage located 10 feet from the edge of the brook. There is no curb or stormwater control measures in the parking lot. All school maintenance equipment is stored at the garage and the facility is a registered Very Small Quantity Generator of waste oil and hazardous waste and has a gasoline UST for school vehicles. Other materials, dumpsters and the trash pickup truck are also stored in the parking area. These activities may pose a potential threat if runoff from the parking area is allowed to discharge to the brook. Eaglebrook School installed a stormwater collection and drainage system along Pine Nook Road to collect runoff from Pine Nook Road and the access roads to the dormitories south of the road. This BMP helps to protect the springs in the event accidental release along Pine Nook Road or at the dormitories.

In general, the source water area for springs is assumed to be the land area that is topographically uphill (upgradient) of the spring. However, the Department also includes a rectangular area terminating 50 feet downgradient of the spring source within the regulated protection area as a buffer to protect the source. The topography rises north, east and south of the Upper Reservoir Cistern and the Wells Spring is located approximately 300 feet northeast (upgradient) of the Cistern. It is likely that the actual recharge area of the Upper Reservoir Cistern mimics the Zone II of the Wells Spring, although it would obviously start at the spring. It is likely that the maintenance garage and parking areas are not within the recharge area for the Cistern, however, until the recharge area has been determined for that source, caution should be used for all activities in the vicinity of the spring and BMPs should be used for all activities at the garage. Due to the proximity of the drainage swale/brook between the spring and the maintenance garage, precautions should be used to prevent discharges or accidental releases of potentially hazardous material to the drainage area.

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ① Reduces Risk to Human Health
- ② Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ③ Supports municipal bylaws, making them less likely to be challenged
- ④ Ensures clean drinking water supplies for future generations
- ⑤ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

The springs and well are located in areas highly vulnerable to contamination from surface sources because there is minimal overburden in the Zone II of the Keats, Wells and Upper Reservoir and there is no protective clay layer. Only sand is logged in the Zone II area for the Stillwater and Harris Springs and the Stillwater Well with no evidence of a protective clay or confining layer. Sources located in this type of environment are considered highly vulnerable to contamination from activities on the land surface. In fact, low levels of 1,2-Dichloropropane, a compound that had been used in agricultural activities was reported during the initial water quality testing of the Stillwater Well, however, it has not been detected since 1981. Spring sources are generally considered to be highly vulnerable to surface contamination and activities or disturbance on the land surface.

The Wapping Well (01G) is a 33 feet deep, 12 x 24-inch diameter, gravel packed well, installed in 1949 and located along Route 5. The well has not been continuously used since about 1980 due to water quality issues associated with elevated levels of iron, manganese and sodium. The well is located approximately 65 feet from Route 5, between Route 5 and an abandoned railroad track; the District owns approximately 1 acre of land around the well. The well utilizes the shallow sand and gravel water table aquifer with an original estimated yield of 163 gpm. The well logs indicate the shallow water table aquifer overlies a clay unit of undetermined thickness. At some point in the past, the production of the well reportedly decreased due to fouling of the screen and the well was redeveloped. The District personnel periodically exercise the pump and collect water quality samples for analysis in the event they should ever need to utilize the well in a water emergency.

The source protection area is an Interim Wellhead Protection Area (IWPA) rather than a Zone II, because the actual recharge area for the well has not been determined. The Zone I and IWPA radii for the Wapping Well are a 400 foot radius and 2,640 foot radius, respectively. There is a surface water divide south of the Wapping Well and based on surface water flow, it is assumed that the shallow groundwater near the Wapping Well likely flows west and north discharging to the Deerfield River. The IWPA includes agricultural, residential and commercial land uses as well as transportation corridors including Route 5 (65 feet from the well) and the Boston & Maine Railroad to the east. A large greenhouse is located just southwest of the well.

The pH of the water from the sources is adjusted for corrosion control and the water is disinfected with chlorine prior to distribution. The District is presently working with the DEP to improve the efficiency of the corrosion control treatment process. For current information on monitoring results, please request a copy of the most recent Consumer Confidence Report from the Public Water System contact person listed above in Table 1.

## Section 2: Land Uses in the Protection Areas

The land use within the Zone IIs and IWPA for Deerfield Fire District's sources include mixed use of forest, residential, institutional and agricultural activities, (please refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Non-conforming Zone I
2. Agricultural activities

### What is a Zone III?

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

### Additional Information

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

3. Residential land uses
4. Transportation corridors/utility right-of-way
5. Hazardous materials storage and use
6. Comprehensive wellhead protection planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2. As previously noted, the aquifer that the Stillwater Well utilizes is considered highly vulnerable to contamination from activities on the ground surface due to the lack of a protective confining clay layer. Some springs are inherently highly vulnerable to contamination from surface water and activities in the ground surface.

**1. Non-conforming Zone I** – The Zone I for the Stillwater Well 05G is a 400-foot radius around the wellhead; the Zone I for the springs are square boxes oriented upgradient from the source. The Zone I area is oriented so that the spring's outlet is centered from side to side and downgradient edge of the Zone I square is 50 feet from the outlet. Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Only activities directly related to water supply or non-threatening activities are allowed in the Zone I. Many public water supplies were developed prior to the Department's regulation and contain non-water supply activities such as homes and public roads and may not be fully owned by the District. The Department encourages water suppliers to acquire ownership or control of the Zone I area. The District does not own or control the entire Zone I for the Wapping Well as route 5 is within 75 feet of the well. The DEP guidelines for the New Source Approval (NSA) specify that any well not used for more than five years is subject to the NSA. That process evaluates the potential threats to a water supply before it is approved for use.

The Zone I of the springs has been modified based on estimates of flow from the springs. Based on the newly delineated Zone Is, all are non-conforming as the District does not own or control the entire Zone I. The District is presently negotiating the acquisition of additional land in the recharge area of the Harris Spring. The following activities are within the Zone I of the sources:

- Forest with recreational trails throughout
- Pine Nook Road (a very low use, dirt road)
- Stillwater Road
- Hay fields
- Corn fields
- Electrical utility right-of-way
- Private homes
- Maintenance garage parking area

#### **Zone I Recommendations:**

- ✓ Communicate with Eaglebrook regarding their continued efforts to control runoff and stormwater at the school and to evaluate stormwater management at the maintenance garage. Encourage the continuation of cleaning up all debris that may have fallen over the bank and into the drainage swale/brook between the spring and the garage. Request that the school consider placing a berm on the edge of the parking area and direct runoff to storm drains south and west of the maintenance garage rather than into the swale/brook.
- ✓ To the extent possible, remove all non-water supply activities from the Zone Is to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone Is.
- ✓ Prohibit new activities from the Zone Is.
- ✓ Communicate with property owners in Zone Is and in Zone IIs proximal to the sources. If they are not aware that they are within the protection areas discuss land uses with them and provide them with BMPs or information regarding protection of the water source as necessary.
- ✓ Agreement Options - Until land is available for acquisition or restriction, attempt to obtain a Memorandum of Understanding and Right of First Refusal.

A Memorandum of Understanding (MOU) is an agreement between the landowner and public water supplier in which the landowner agrees not to engage in specific threatening activities. The MOU should be specific to the land use or activity. For example, if the land is residential with a septic system, the owner could agree to not place chemicals, petroleum products, or other hazardous or toxic substances, including septic system cleaners, into the

septic system, and agree that the system will be pumped at a specific frequency. Understanding how an activity threatens drinking water quality is an important component of developing an effective MOU.

A Right of First Refusal is a legal document that gives the water supplier the first chance to purchase land when it becomes available. Please refer to the example of the Right of First Refusal documents attached in the Appendices.

The Department strongly recommends that the Deerfield Fire District continue its present efforts to acquire property within the Zone I and Zone II of the spring sources if you intend to continue use of those sources. If there is no other reasonable method to secure rights and protect these sources, the District should seriously consider taking necessary water supply land by eminent domain to protect the sources.

**2. Residential Land Uses** – A small percentage of the Zone II for the Stillwater sources, Harris spring and the IWPA of the Wapping Well include residential development. Municipal wastewater sewers are not available in the protection areas, therefore, all protection areas utilize septic systems for wastewater disposal. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination from residential land use include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems discharge to the ground. If septic systems fail or are not properly maintained, they are a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Transportation corridors and right-of-way** - Several local roads are located within the Zone II of the Stillwater and Harris Springs and the Stillwater well. There is also an electric line right-of-way. There are local access roads to the Eaglebrook School and dormitories of the Wells Spring Zone II and the Upper Reservoir IWPA. Roadway construction, right-of-way vegetation maintenance, and typical use can all be potential sources of contamination for springs and wells. De-icing materials, automotive chemicals and other debris on roads are picked up by stormwater and wash into catch basins. As an example, accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Remote roadways are also frequent sites for illegal dumping of hazardous or other potentially harmful wastes.

In addition, the Wapping Well IWPA has a section of railroad line within the IWAP in the direction that is likely upgradient of the well. Rail corridors serving passenger or freight trains are potential sources of contamination due to chemicals released during normal use, track maintenance, and accidents. Accidents can release spills of train engine fluids and commercially transported chemicals.

**Transportation/Right-of-way Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.

- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.
- ✓ Examine the road grade and drainage along roads in the protection areas and evaluate the potential impact on the sources. Consider use of BMPs if the use of these roads increases over time.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Notify Town officials of potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.rurdev.usda.gov](http://www.rurdev.usda.gov) or call the Rural Development Manager at the local office in Hadley at 413-585-1000 ex. 4. Review the fact sheet available online and available information about funding at the website <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf>.
- ✓ Review the utility right-of-way Yearly Operating Plan (YOP) to ensure best management practices are implemented with regard to vegetation control in the Zone II, and that the utility has accurate information regarding the locations of the wells and the protection zones. Review the maps the utilities use. The Board of Selectmen or the Conservation Commission may receive the YOP.
- ✓ Work with local officials during their review of the railroad right of way Yearly Operating Plans to ensure that water supplies are protected during vegetation control. Request that the railroad emergency response teams coordinate Emergency Response Drills and practice containment of potential contaminants from accidents within the Zone II. And include the District in their notification list.
- ✓ Work with your local fire department to review emergency response plans. Updates to this plan should include the right-of-way and roadways. Request emergency response teams to coordinate Emergency Response Drills and practice containment of potential contaminants from accidents within the Zone II.

**4. Institutional use with hazardous materials storage** – The land area within the Zone II for the Wells Spring and the IWPA for the Upper Reservoir cistern includes Eaglebrook School. The school is served by the municipal sewer system and is predominantly topographically downgradient from the spring sources. Two dormitories with underground storage tanks (UST) and internal access roads are located within the delineated Zone II for Wells spring. The entire campus is within the IWPA for the Upper Reservoir cistern spring. The maintenance garage is located approximately 150 feet from the cistern and has a 1,000 gallon gasoline UST and hazardous materials storage; the facility is topographically downgradient and on the opposite side of a drainage divide from the spring. The two dormitories, one older and one new, that are within the Zone II have an 8,000 gallon and 2,500 gallon fuel oil storage USTs, respectively. There are a total of eleven USTs at Eaglebrook School. Most of the tanks were installed between 1984 and 1987; one tank was recently installed at the new dormitory in 2000.

If hazardous materials are improperly stored, used, or disposed, they become significant potential sources of contamination. Hazardous materials should be managed with extreme care in areas served by on-site water supply wells. USTs should be managed with care as well. Delivery should be monitored carefully because many spills occur during delivery.

The school has recently installed stormwater drains and collection system to remove stormwater runoff from the roadway upgradient of the Wells Spring and the Upper Reservoir cistern. According to the District and school facility manager, stormwater is directed toward the pond downgradient of the Wells spring and Upper Reservoir sources.

**Institutional use with hazardous materials storage :**

- ✓ Encourage the facility manager to incorporate an Integrated Pest Management (IPM) approach into the school's pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment. Encourage the facility manager to ensure that any pesticides and fertilizers that are being stored are within a structure designed to prevent runoff and if possible downgradient of Deerfield's and Eaglebrook's water supply sources.
- ✓ Continue discussions with Eaglebrook's Director of the Physical Plant to ensure they continue to handle and dispose hazardous materials properly and that USTs are monitored. Encourage the continued use of BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.
- ✓ Discuss with the school's facility management whether they have overfill containment on the school oil tanks. Suggest installation of overfill protection on tanks that are not equipped with protection.

**6. Agricultural activities** – There are croplands and pasture lands within the Zone II of the Stillwater and Harris sources of water and the IWPA of the Wapping Well. These lands include hay, corn and other crop fields. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water. Very often, farms also maintain old disposal areas (farm dumps), heavy equipment and store petroleum products and generate hazardous waste. As with other types of businesses that use, store or generate hazardous materials, proper use, storage and disposal is critical for protecting the environment and minimizing liability. Additionally, historically, farmers often have gravel borrow pits on-site. Disturbance of the overburden upgradient of springs is a significant potential threat to water quality in the springs. Any gravel mining activities

**Agricultural activities Recommendation:**

- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Review the fact sheet available online and call the local office in Hadley at 413-585-1000 ex. 4. of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Encourage farmers to incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Promote the use of BMPs for fuel oil storage, hazardous materials handling, storage, disposal, and emergency response planning.
- ✓ Encourage farmers, including nurseries and commercial property managers to ensure that pesticides and fertilizers are being stored within a structure designed to prevent runoff.
- ✓ The USDA also has various funding sources for government agencies, non-governmental organizations and agricultural facilities through programs such as those listed on the USDA web site: <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available on line and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Work with any non-commercial farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.
- ✓ Note any forest management activities, especially within the Zone II of the springs. Disturbance of the thin overburden material may impact water quality in the springs.

**7. Protection Planning** - Although Deerfield has water supply protection controls, they do not fully comply with the DEP Wellhead Protection regulation 310 CMR 22.21(2) and do not cover all of the protection areas in Deerfield. A technical assistance (consulting) firm is currently in the process of completing a Wellhead Protection Plan for the Deerfield Fire District. Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation.

**Protection Planning Recommendations:**

- ✓ Coordinate efforts with local officials to adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ Request that the Boards of Health adopt floor drain controls that meet 310 CMR 22.21 (2) and conduct inspections.

Another land use that was identified in the Zone II is a gravel mining operation near the Stillwater and Harris spring sources. Mining poses numerous threats from accidental release of petroleum products and erosion to illegal dumping in abandoned mines. Spring sources are particularly susceptible to activities that disturb the surface such as mining and forestry. The District should continue to monitor the activities in the Harris Spring Zone II and the Department encourages the efforts to acquire control of that property if you intend to continue use of that source. Additionally, there are commercial land uses within the IWPA of the Wapping Well that may utilize hazardous materials.

Activities within the protection areas that are potential sources of contamination are included in Table 2. Refer to Appendix B for more information about land uses that are permitted facilities and USTs. Identifying potential sources

of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system's Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The Deerfield Fire District is commended for:

- current efforts in upgrading the system's infrastructure, and
- for having protective bylaws.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Acquire ownership or control of the Zone I and Zone II areas critical to protecting the District's sources.
- ✓ Inspect the Zone Is regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents and abutters on ways they can help you to protect drinking water sources through the use of BMPs.
- ✓ Work with emergency response teams to ensure that they are aware of your Zone IIs and will cooperate in responding to spills or accidents.
- ✓ Continue communications with Eaglebrook School to ensure proper storage, handling, delivery and disposal of hazardous materials.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Implement the Wellhead Protection Plan upon completion and MA DEP approval.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

#### **➤ Partner with Local Businesses:**

Since many facilities and businesses use hazardous materials and produce hazardous waste products, it is essential to educate these businesses about drinking water protection. Encouraging partnerships among businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

#### **➤ Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to groundwater contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained, it is a potential source of microbial and nitrogen contamination. Animal waste is also a source of contamination.

#### **➤ Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located, what types of land uses and activities pose threats, and how their efforts can enhance protection.

#### **➤ Plan for the Future:**

One of the most effective means of protecting water supplies is local planning, including adoption of local controls to protect land use and regulations related to watersheds and groundwater protection. These controls may include health regulations, discharge prohibitions, general ordinances, and zoning bylaws/ordinances that prohibit or control potential sources of contamination within the protection areas.

#### **➤ Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State

Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site at <http://search.sc.egov.usda.gov/nrcs.asp?qu=equip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office (Hadley 413-585-1000) of the NRCS for assistance.

The Massachusetts Department of Food and Agriculture's Agricultural Environmental Enhancement Program (AEEP) provides funding to farmers to install a variety of water quality protection practices. For more information on the program contact the coordinator, Susan Phinney, at (617) 626-1772, [Susan.Phinney@state.ma.us](mailto:Susan.Phinney@state.ma.us).

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. District officials, citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Continue efforts to purchase or control activities in the Zone I as feasible.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue monitoring non-water supply activities in Zone Is and attempts to acquire Zone I.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21 (2)?	<b>Partial</b>	Deerfield does have an aquifer protection bylaws. However, they should be reviewed for compliance with 310 CMR 22.21(2) and the overlay district must be modified to include, at a minimum, the Zone II and IWPA protection areas. Please refer local boards to these recommendations and to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws and health regulations, and current regulations.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>N/A</b>	
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>In Progress by NeRWA</b>	Once the plan has been approved by the MA DEP, implement the plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>Partial</b>	Augment the plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Establish a committee; include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>NO</b>	Aim efforts at institutional, commercial, agricultural and residential land uses within the Zone IIs and IWPA.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**South Deerfield Water Supply District**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	South Deerfield Water Supply District
<i>PWS Address</i>	P.O. Box 51
<i>City/Town</i>	Deerfield
<i>PWS ID Number</i>	1074001
<i>Local Contact</i>	Mr. Roger Sadoski
<i>Phone Number</i>	413-665-3540

### Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential contaminant sources, including stormwater runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

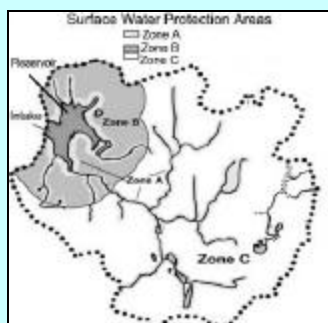

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

## Glossary Protection Zones

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

## Section 1: Description of the Water System

### *System Susceptibility:*

*Moderate*

### *Source Name*

### *Source ID*

### *Susceptibility*

Whately Glen Reservoir	1074001-01S	Moderate
Conway Reservoir	1074001-02S	Moderate

Deerfield is a small rural, agricultural and developing residential community located in northwestern Massachusetts along the Connecticut River valley. Deerfield is home to at least three private schools, Historic Deerfield and craft fairs. Light industry has recently expanded into the community. Deerfield's topography is primarily fertile valley in the center of town with north-south trending hills on the east and west sides of town. The Pocumtuck Range trends north-south along the eastern side of town and the Berkshire foothills begin along the west side of town. The Deerfield River flows through the northern portions of town. The Deerfield River flows northwest to southeast through the foothills until it enters the river valley, where it flows north then east to its confluence with the Connecticut River. The Connecticut River flows south and forms the eastern boundary of Deerfield.

Deerfield is served by two water districts: Deerfield Fire District and South Deerfield Water Supply District. The South Deerfield Water Supply District serves the southern section of town. The District maintains two reservoirs, Whately Glen Reservoir 01S and Conway Reservoir 02S, and the Sugarloaf Wellfield, a tubular wellfield 01G that is designated as an emergency source. The groundwater utilized in the Sugarloaf Wellfield was contaminated with EDB used on adjacent tobacco fields and the source has been off-line since 1984. The emergency source will not be discussed further in this report.

The Conway Reservoir, the main storage reservoir, is located in Conway. Water flows from the Conway Reservoir into the distribution reservoir, the Whately Glen Reservoir, a small distribution reservoir located in Whately, immediately downgradient of the Conway Reservoir. The watershed for the consecutive reservoirs is located in the foothills of the Berkshires on the eastern side of the Berkshire Massif. The topography of the watershed consists primarily of steeply sloping brook valleys and rolling hills. The overburden material within the watershed is predominantly a thin cover of glacial till, often referred to as hard pan, with significant areas of exposed bedrock. Some of the brook valleys have limited deposits of glacial, stratified drift (sand and gravel) or recent alluvium which are locally mined. The bedrock in the watershed is mapped as several formations consisting of metamorphic rocks and igneous intrusive rocks of the Conway Formation, predominantly schist and marble and the Williamsburg Granodiorite. The structural geology of the region is highly complex with several stages of folding resulting in a corrugated effect in the Conway Formation with faults along the valley wall.

The South Deerfield Water Supply District (District) owns approximately 910 acres (26%) of the watershed; an additional 21% of the remaining watershed is held in Chapter 61 tax status as agriculture/forest land or is state forest. Land use within the Conway/Whately Glen Reservoir watershed is primarily forested

upland (90%) with the remaining watershed consisting of residential and agricultural activities (both commercial and non-commercial) such as hayfields, pasture and forestry; a small percentage of land is utilized as commercial and transportation related land use. Please refer to the attached map to view the boundaries of the protective areas.

Water from the reservoirs is treated through a rapid sand filtration system, then chlorinated for disinfection and pH adjusted with soda ash for corrosion control. For current information on water quality monitoring results and treatment processes, please refer questions for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

There are few activities that pose significant anthropogenic threats to the reservoirs. However, due to the nature of surface water supplies the sources are considered highly vulnerable to potential contamination threats through land use. Land uses and activities that are considered potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Activities in Zone A
2. Residential land use
3. Transportation corridors
4. Agriculture/Forestry
5. Protection planning

The overall ranking of susceptibility to contamination for the system is moderate, based on the presence of at several moderate threat land uses within the water supply protection areas, as seen in Table 2. The active agriculture identified in the source protection map is primarily hay and pasture lands and portions of a dairy farm. Although manure spreading on fields had been conducted periodically in the past, reportedly it is not a current practice. Changing use on agricultural land should be monitored frequently by the water to ensure current knowledge.

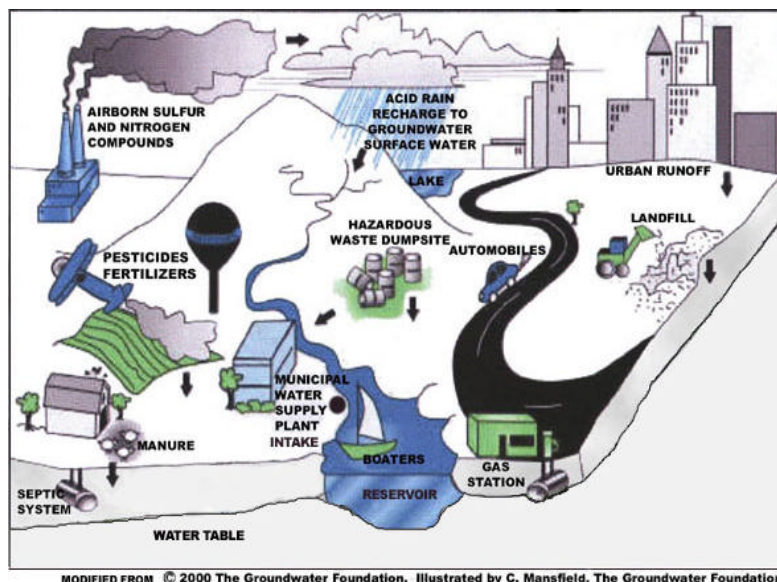

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

**1. Activities in Zone A** - The Zone A for a reservoir includes all areas within 400 feet of the reservoir shoreline and within 200 feet of either side of all streams and feeder ponds that flow into the reservoir. The Zone A is the area closest to the reservoir and its tributaries. Therefore land uses within the Zone A are of particular concern. Activities that could potentially threaten water quality if improperly managed are restricted by 310 CMR 22.20B. Activities that store, use, or dispose of hazardous materials can be potential sources of contamination if improperly managed. Wild animals, farm animals and domestic pets can be carriers of waterborne diseases such as *Giardia*, *Cryptosporidium*, *Salmonella*, etc.

Overall, the watershed is sparsely populated;

Figure 1: Sample watershed with examples of potential sources of contamination

approximately 90% of the watersheds are forested. As noted, the District owns 26% of the watersheds and an additional 21% of the total watershed land has limited protection from development through tax status under Ch. 61 (agriculture/forestry) or is state park land. The following activities occur in the Zone A of the system's reservoirs:

**Whately Glen Reservoir (01S)** - Activities include a local road and agriculture (hay fields), and a few residential homes (utilizing private septic systems).

**Conway Reservoir (02S)** - Activities include local roads, hay fields with limited, manure spreading, on portions of a dairy farm and a residence (with private septic systems). According to the water supplier, actual farming activity is very limited within the watershed. For that reason, the dairy farm/manure spreading has been ranked as a moderate as opposed to a high threat. However, if agricultural activity increases within the watershed, the potential impacts to the water supply would increase unless activities are managed appropriately.

#### **Zone A Recommendations:**

- ✓ Monitor activities on agriculture land frequently to assess actual potential threats.
  - ✓ To the extent possible, remove all prohibited activities within your control from the Zone A to comply with DEP's Zone A requirements.
  - ✓ Storage of pesticides, fertilizers or road deicing materials within the Zone A should be covered and contained.
  - ✓ To the extent possible, inform landowners within the Zone A regarding the use of BMPs for residential uses and hobby farming.
  - ✓ Prohibit all new non-water supply activities from the Zone A on land within your control and provide comment to community boards regarding newly proposed development, as is appropriate.
  - ✓ Increase patrols and enforce the no trespassing requirement, as appropriate.
  - ✓ Prioritize land to be acquired, especially in the Zone A. Acquiring land and/or acquiring conservation easements is critical to source protection.
  - ✓ Investigate erosion and runoff within the watersheds and recommend BMPs as proposed in the project funded through the Source Protection Grant.
- ✓ Agreement Options - Until land is available for acquisition or restriction, attempt to obtain a Memorandum of Understanding and Right of First Refusal.
- A Memorandum of Understanding (MOU) is an agreement between the landowner and public water supplier in which the landowner agrees not to engage in specific threatening activities. The MOU should be specific to the land use or activity. For example, if the land is residential with a septic system, the owner could agree to not place chemicals, petroleum products, or other hazardous or toxic substances, including septic system cleaners, into the septic system, and agree that the system will be pumped at a specific frequency. As another example, the portions of pasture or hay fields within the Zone A would not have manure spread on them. Understanding how an activity threatens drinking water quality is an important component of developing an effective MOU.

#### **What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watersheds**

Activities	Quantity	Threat*	Source ID	Potential Source of Contamination
<b>Agricultural</b>				
Dairy Farm (mostly outside of the watershed—marginal operation)	1	M/H	02S	Manure (microbial contaminants, nutrients): improper handling, erosion. Manure spreading is primarily outside of watersheds.
Forestry Operations	Few	M	01S, 02S	Leaks and spills, improper handling of petroleum products in equipment. Erosion.
Hayfields	5	M	01S, 02S	Leaks and spills, improper handling of petroleum products in equipment.
Agriculture—Pesticide/Fertilizer Storage or Use	Few	M	01S, 02S	Pesticides/fertilizers: leaks, spills, improper handling, or over-application. Petroleum products management for equipment.
<b>Residential</b>				
Fuel oil storage (at residences)	Numerous	M	01S, 02S	Fuel oil household hazardous materials: spills, leaks, or improper handling
Lawn care / Gardening	Numerous	M	01S, 02S	Pesticides: over-application or improper storage and disposal
Septic systems / cesspools	Numerous	M	01S, 02S	Hazardous chemicals, microbial contaminants, and improper disposal
Transportation corridors	Numerous	M	01S, 02S	Petroleum products and transported hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling. Erosion.

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

- A Right of First Refusal is a legal document that gives the water supplier the first chance to purchase land when it becomes available. Please refer to the example of the Right of First Refusal documents attached in the Appendices.
- ✓ The Department strongly recommends that the South Deerfield Water Supply District establish a program for planning to acquire ownership or control of property within the areas critical to protecting water quality of the reservoir. If there is no other reasonable method to secure rights and protect critical land areas, the District may wish to consider taking necessary water supply land by eminent domain to protect the sources. This recommendation is not only for the existing sources but also should be considered for future development of sources if they are needed.

**2. Residential Land Uses** – There are numerous residences located within the Whately Glen and Conway Reservoir watersheds. None of the areas have public sewers to remove wastewater, therefore on-site septic systems are used. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Establish efforts of negotiating fee simple purchase, Right of First refusal agreement, conservation restrictions and Memorandum of Understanding for land not currently owned or controlled by the District.
- ✓ Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

**3. Transportation Corridors** - There are numerous local roads throughout Conway/Whately Glen Reservoir watersheds, including many dirt roads/trails with legal (authorized) and illegal (unauthorized) use. Although most roadways in the watersheds are relatively low-use, even typical roadway maintenance and low use pose a potentially significant source of contamination from accidents and washouts and pesticide application for vegetation control along both the paved and dirt roads, especially in the Zone A. Unmanaged access may result in erosion, vandalism and/or illegal dumping which might cause water quality impairment. Erosion poses a potentially significant threat to water quality in areas that are proximal to feeder streams and the reservoirs, by contributing sediment, various contaminants and pathogens which may result in additional water treatment costs if they continue unchecked. Clandestine dumping is identified as a potentially significant threat to water supplies because roadways can be sites for illegal dumping of hazardous or other harmful wastes. De-icing materials, petroleum chemicals and other debris on roads are picked up by stormwater, washed and discharge into the feeder streams and reservoirs.

The District does not allow public access to District owned watershed land, however, there is evidence of illegal access on trails by ATVs. The District has an approved Surface Water Protection Plan that identified unauthorized access as an issue. The District was awarded a Source Water Protection Grant to identify stormwater related issues and to develop BMPs and a public education program. The District was also funded to have a forest management plan prepared for District owned land. Incorporation of BMPs in forestry operation is requisite to protect water quality.

**Transportation Corridor Recommendations:**

- ✓ Conduct regular inspection of watersheds for signs of access, illegal dumping and spills and enforce no trespassing.

- ✓ As part of your currently funded study, evaluate existing conditions throughout the watershed with respect to current legal and illegal use of watershed land. Identify illegal access and destinations and consider ways to address impacts from access. Some water suppliers have had success with posting land, public education, and rerouting trails off of District property and away from sensitive areas. For areas that are severely impacted, more aggressive measures of protection may include increased patrols by District personnel or locals police and impoundment of ATVs for trespassers. Develop a management strategy to eliminate and/or control access. Coordinate management strategies with the host communities.
- ✓ Work with local emergency response teams to ensure that any spills within the protection areas can be effectively contained.
- ✓ Notify officials in the communities in which your watersheds are located of potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.rurdev.usda.gov](http://www.rurdev.usda.gov) or call the Rural Development Manager at the local office in Hadley at 413-585-1000. Alternatively, review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Consider investigating disposition of any roads, ways and “trails” that may be old county roads or rights-of-way and pursue as appropriate, closing or controlling access.
- ✓ Continue with efforts to identify areas of concern with respect to runoff and erosion, develop and implement BMPs by working with the communities of Conway and Whately.

**4. Agricultural Activities/Forestry** – The watersheds include a small percentage, approximately 6%, of land for agricultural activities and an unknown percentage for forestry. Pesticides, fertilizers and manure have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store. Frequently, farms have maintenance garages for equipment and storage tanks and forestry requires the use of heavy equipment. Presently,

according to the Water District, the commercial operations are small with few or no animals.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

#### **Agricultural Activities and Forestry Recommendations:**

- ✓ Monitor agricultural lands frequently to ensure current knowledge of activities and practices on farms and open fields. Communicate with land owners as is feasible.
- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of assistance provided by the Massachusetts Department of Food and Agriculture and the USDA Natural Resources Conservation Service (NRCS). The NRCS can provide assistance to develop a farm plan to protect water supplies, if they do not already have one. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local Hadley office of NRCS at 413-585-1000 for assistance.
- ✓ As part of a farm plan, farmers may incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Promote the use of BMPs for fuel oil storage, hazardous material handling,

#### **Top 5 Reasons to Develop a Local Surface Water Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

- ✓ storage, disposal, and emergency response planning.
- ✓ The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS for assistance at 413-585-1000 for assistance. This may be also appropriate for the host communities of Conway and Whately.
- ✓ Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.
- ✓ As part of the currently funded project, evaluate past forest management practice and prepare a water supply forest management plan and implement and update the plan as appropriate.

**5. Protection Planning** – The District has an approved Water Supply Protection Plan, however, plans periodically require updating to correct errors in the original plan, to reflect completed tasks and new conditions. The Department notes that the current plan has an error regarding the acres of land within the watershed protection areas, the percentage of land owned by the District and reports that road salt is not used on any roads within the watershed. An effective overall protection plan will not only include detailed land use, but also includes: coordinated community efforts which identify protection strategies, establishing a timeframe for implementation, and will provide a forum for public education and outreach. The watershed is primarily woodland with the District owning approximately 26%. Good forest management of both District land and private land can beneficially impact water quality and health of the watershed forests.

**Protection Planning Recommendations:**

- ✓ Establish active watershed protection planning and forest management for water supply protection in a comprehensive watershed plan.
- ✓ Encourage and support efforts by private land owners in active forest management for water supply protection.
- ✓ Consider working with communities and their local officials and boards in the watershed in active watershed protection planning and education efforts.
- ✓ Following the completion of the stormwater study and forest management plan, update the water supply protection plan. The 2000 WSPP did not include the inventory conducted by the District in 1999 of the fuel sources utilized in the watershed. Update that inventory in the next revision of the WSPP.
- ✓ Work with communities within which the watersheds are located to monitor and comment on any proposed development and growth, especially in the Zone A.

Land uses and activities within the watershed that are potential sources of contamination are included in Table 2. Identifying potential sources of contamination is an important initial step toward protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### Section 3: Source Water Protection Conclusions and Recommendations

#### For More Information

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, town boards, and the local media.

#### Current Land Uses and Source Protection:

As with many water supply protection areas, the system's watershed contains potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Pursuing funding for preparation and implementation of a Water Supply Protection Plan (WSPP), erosion control study and forest management plan,
- Active involvement in inspecting and inventorying land uses in the watershed,
- Detailed knowledge of the watershed.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Continue inspection of the Zone A protection areas regularly, and when feasible, remove or manage any non-water supply activities, specifically the maintenance activities and fuel oil storage in Zone A.
- ✓ Continue cooperation and communication with emergency response teams to ensure that they are aware of the boundaries of the watershed for notification of spills or accidents.
- ✓ Through the implementation of the WSPP, provide information to landowners in your protection areas to make them aware of your water supply and to encourage the use of best management practices for residential and recreational uses and other ways they can help you to protect drinking water sources.
- ✓ Update the Watershed Protection Plan following completion of the stormwater inventory and forest management plan.
- ✓ As part of the stormwater evaluation and mitigation plans, identify problem area specifically in the Zone A along roads throughout the watershed. Make every effort to ensure stormwater discharges and run-off is detained prior to release to protection areas. Consider various strategies to detain/slow the flow and retain sediments to keep the runoff out of tributaries and the reservoirs.
- ✓ If local controls do not regulate floor drains, encourage communities to adopt floor drain controls and hazardous waste management strategies.
- ✓ Request that local highway departments inspect, and maintain drainage areas.
- ✓ Once the forest management plan has been approved, implement the plan to establish/maintain a healthy and ideal watershed forest, which will buffer anthropomorphic and natural environmental impacts on water quality and quantity.

**Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues, above and in Appendix A.

**➤ Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships among businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

**➤ Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to water supply contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Animal waste is also a source of microbial contamination.

**➤ Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the source protection areas are located, what types of land uses and activities pose threats, and how their efforts can enhance protection.

**➤ Plan for the Future:**

One of the most effective means of protecting water supplies is local planning, including adoption of local controls to protect land use and regulations related to watershed protection. These controls may include health regulations, discharge prohibitions, general ordinances, and zoning by-laws/ordinances that prohibit or control potential sources of contamination within the protection areas.

**➤ Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>.

One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office (Hadley 413-585-1000) of the NRCS for assistance.

The Department's Source Protection Grant Program provides funds to assist public water suppliers and their partners in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under this grant program. If funds are available, each spring DEP posts a new Request for Response for the grant program (RFR). Visit the DEP <http://www.state.ma.us/dep/brp/mf/othergrt.htm> and <http://www.state.ma.us/dep/brp/dws/grants.htm> for information about available funds.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help establish local drinking water protection priorities. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the protection areas. Use this information to establish priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendix**

### **A. Protection Recommendations**

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone A?	<b>Partial</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Continue to pursue ownership or control of land critical to protection such as the Zone A.
Is the Zone A posted with "Public Drinking Water Supply" or "No Trespassing" signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone A regularly inspected?	<b>YES</b>	Continue regular inspections of drinking water protection areas. Increase patrols as appropriate and develop a plan to control access in critical areas.
Are water supply-related activities the only activities within the Zone A?	<b>YES</b>	Continue monitoring non-water supply activities in Zone As.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, Ordinances and General Bylaws)		
Do the watershed municipalities have Surface Water Protection Controls that meet 310 CMR 22.20C?	<b>YES</b>	Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws, health regulations, and current regulations to be sure by-laws are current with regulations.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>NO</b>	Request that the municipalities of Whately and Conway review their bylaws for compliance with 310 CMR 22.20C and request that they adopt them as appropriate. Work with the community to review development within the watershed.
<b>Planning</b>		
Does the PWS have a local surface water supply protection plan?	<b>YES</b>	Update the Plan as appropriate to address newly identified threats, inventories that may not been included and to adjust protection priorities as tasks are completed such as the stormwater management plan and the forest management plan and correct errors in the current plan
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Update plan as appropriate by developing a joint emergency response plan with the Fire Department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams. Complete vulnerability assessment as appropriate for the system.
Does the municipality have a watershed protection committee?	<b>NO</b>	Consider establishing a committee that includes representatives from citizens' groups, host communities, and the business community.
Do the Boards of Health conduct inspections of commercial and industrial activities?	<b>N/A</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> . There are no registered generators of hazardous waste in the watershed.
Does the PWS provide watershed protection education?	<b>YES</b>	Continue efforts to provide information about BMPs to residents.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
THE WOK

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	The Wok
<b>PWS Address</b>	723 Greenfield Rd
<b>City/Town</b>	Deerfield, Massachusetts
<b>PWS ID Number</b>	1074008

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well	1074008-01G	167	463	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well  
(1074008-01G)**

Zone I = 167 ft.  
IWPA = 463 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I. The **high** susceptibility to potential non-microbial threats is based on the parking, State Route 5 and a lumber facility within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by your operator on a Public Water Supply Annual Statistical Report form, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Easthampton Water Department**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Easthampton Water Department
<i>PWS Address</i>	109 Hendricks Street
<i>City/Town</i>	Easthampton
<i>PWS ID Number</i>	1087000
<i>Local Contact</i>	Mr. Thomas Newton
<i>Phone Number</i>	413-529-1422

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

*System Susceptibility*

*High*

*Recharge Area = MA GIS Zone II ID # 564 and # 201*

*Susceptibility: High*

<i>Source Name:</i>	<i>Source ID</i>
Maloney Well	1087000-07G

*MA GIS Zone II ID# 235*

*Susceptibility: High*

<i>Source Name:</i>	<i>Source ID</i>
Hendrick Street Wellfield	1087000-04G
Pines Well	1087000-05G
Nonotuck Park Well	1087000-08G
Brook Street Well	1087000-09G

Easthampton is a small, residential and industrial city in the Connecticut River valley of western Massachusetts. The Easthampton Water Department utilizes water entirely from ground water sources within the Barnes Aquifer. The Barnes Aquifer has been designated as a Sole Source Aquifer by the Environmental Protection Agency. The Hendricks Street Wellfield, the oldest component of the system, was developed in 1908, consists of 106 driven wells of various depths and has an approved withdrawal rate of 1.2 million gallons per day (MGD). The Pines Well, built in 1962, is a 10-inch gravel developed well, with an approved withdrawal rate of 1 MGD. The Pines Well (05G) is located approximately 150 feet from the western portion of the Hendrick Street Wellfield (04G). The Nonotuck Park Well (08G) is a replacement well for the original Nonotuck well, which is now listed as an emergency source only. The replacement well went on line in 1995 and is an 18 by 24-inch diameter gravel packed well with an approved withdrawal rate of 1.14 MGD. The Brook Street Well (09G) was completed in 1998 in the central part of town and is a 24 by 36-inch diameter, gravel packed well with an approved yield of 1.2 MGD withdrawal. The Zone I for the Hendrick Street wellfield is a radial distance of 250 feet from the outer perimeter of the wellpoints resulting in an oval shaped Zone I. The remaining wells each have a Zone I radius of 400 feet. The Pines Well, Brook Street, Hendrick Street and Nonotuck Park sources are located within approximately 1 mile of each other and the Zone II (#235) includes all of those sources. Please refer to the Zone II map.

The Maloney Well is located approximately 2 miles north, (downgradient) of the other Easthampton sources. The Maloney Well is an 18-inch diameter, gravel developed artesian well installed in 1976 with an approved withdrawal rate of 1.7 MGD. Due to high manganese levels, the Maloney Well is used primarily to supplement the system under high demand. The Zone II for the Maloney Well was delineated as part of the SWAP program. The Zone II (#564) for the Maloney well incorporates a large area as it is at the mouth of three buried valley aquifers that merge and discharge to the Connecticut River valley just east of the Maloney Well site. The Maloney well also has a Zone I radius of 400 feet.

The aquifer utilized by Easthampton is part of the Barnes Aquifer, an extensive sand and gravel aquifer that has been designated by the EPA as a “Sole Source Aquifer”. The aquifer extends through Holyoke, Westfield, Southamptton and Easthampton. The regional Barnes Aquifer Protection Committee consists of representatives of each of the communities, academia and the regional planning agency to promote education about and protection of the aquifer on a regional basis. As noted, the contribution area for the Maloney well is quite extensive due to the well’s location downgradient of the convergence of three large, buried valley aquifers that discharge to the Connecticut River valley near the Oxbow. The recharge area includes an aquifer that flows from the northwest and merges with the Barnes aquifer before discharging to the Connecticut River basin. The aquifers are glacially deepened bedrock valleys that were filled with sand and gravel during the glacial recession (melting) some 10,000 years ago. Glacial Lake Hitchcock was formed throughout much of the Connecticut River valley leaving some areas with an extensive clay confining unit. The Maloney well is located in an area that has a thick, confined clay layer above the sand and gravel aquifer utilized by that well. However, the confining clay unit thins out near the boundaries of the valley and does not exist to the south and west of the Maloney well. The confining unit does underlie much of the center of Easthampton, the most densely developed section of the Zone II.

Although some portions of the aquifer are protected from activities and land use on the ground surface by the clay layer, the aquifer is considered to be highly vulnerable to contamination because the hydrogeologic barrier (i.e. clay) is not continuous throughout the developed recharge area. Please refer to the attached map to view the boundaries of the Zone II.

Water from the Pines Well and Hendrick Street Wellfield is treated by aeration to remove Trichloroethylene (TCE) an industrial solvent, then chlorinated for disinfection prior to distribution. An extensive, on-going investigation of the contamination has been conducted by the Department and the City. For further information about that investigation, contact the Department’s Bureau of Waste Site Cleanup at the Springfield Office at (413) 784-1100. For current information on monitoring results and treatment

processes, please refer questions to the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

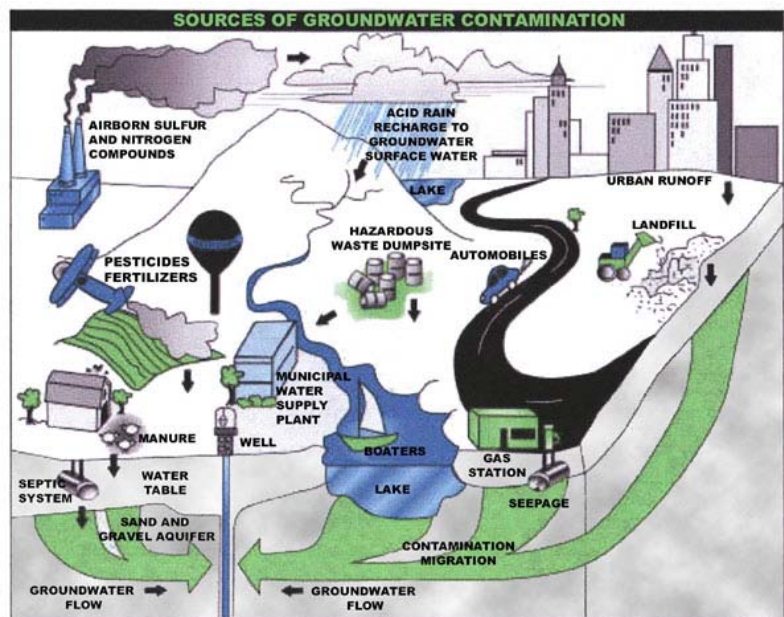

The Zone II areas for Easthampton’s water supplies are a mixture of residential, agricultural, commercial, and industrial land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

© 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

**Key Land Uses and Protection Issues include:**

1. Non-conforming Zone I
2. Residential land uses
3. Transportation corridors
4. Hazardous materials storage and use
5. Confirmed oil or hazardous material contamination sites
6. Comprehensive wellhead protection planning
7. Agricultural activities
8. Wastewater Treatment Facility
9. Right-of-Way

The overall ranking of susceptibility to contamination for the system is high, based on the presence of several high threat land uses within the water supply protection areas, as seen in Table 2.

**What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**1. Non-conforming Zone Is** – The Zone I for each of the wells is a 400 foot radius around the wellhead. The Zone I for the wellfield is a 250 foot radial distance from the perimeter of the well points. Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) require public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Only water supply activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and contain non-water supply activities such as homes and public roads as well as other land not owned by the water supplier. Wells 06G and 08G have only recreational activities within the Zone I. The Zone Is for sources 04G and 05G are not entirely owned or controlled by the water supplier and contain residential areas and roadways as well as a sewer line and storm drain. The residential area is served by public sewers; the sewer lines and storm drains that run through the Zone I area are sleeved to protect the aquifer from leaks. Although the City does not own the entire Zone I of source 09G, there is a Conservation Restriction on that land. The Zone I for the Maloney well includes a small area that was previously owned by and utilized by an industry. The City currently owns the parcel, including the Zone I area and has recently received a Brownsfield grant to investigate the site. Although only a very small area of the site lies within the Zone I, the remainder of the parcel lies within the Zone II of the Maloney well. In addition to the activities associated with the industry, there is a wellfield, outside of the Maloney Well Zone I that was utilized by the facility. The field is only partially intact but little is know about the wellfield. According to the City Planner, further investigations and

recommendations regarding the site are forthcoming. For further information regarding the area, contact the City Planning Department.

**Zone I Recommendations:**

- ✓ To the extent possible, remove all non-water supply activities from the Zone Is to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt or any other chemicals within the Zone I.
- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Contact the property owners to be sure they are aware that they are within the Zone I and Zone II of the well(s). Provide information about BMPs.
- ✓ Consider options for future acquisitions of land.

*(Continued on page 8)*

**Source Protection Decreases Risk**

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Zone II	Potential Contaminant Sources*
<b>Agricultural</b>				
Fertilizer/Pesticide Storage or Use Orchards/crops	Numerous	M	Both	Fertilizers/Pesticides: leaks, spills, improper handling, or over-application
Dairy Farm	2	M	564	Manure (microbial contaminants): improper handling
Livestock Operations other than dairy	Numerous	M	Both	Manure (microbial contaminants): improper handling
Manure Storage or Spreading	Numerous	H	Both	Manure (microbial contaminants): improper handling
Forestry Operation—Sawmill	1	M	564	Equipment maintenance
<b>Commercial</b>				
Body Shops	3	H	Both	Vehicle paints, solvents, and primer products: improper management
Gas Stations	6	H	Both	Automotive fluids and fuels: spills, leaks, or improper handling or storage
Service Stations/ Auto Repair Shops/ Excavating/Construction Companies	16	H	Both	Automotive fluids and solvents: spills, leaks, or improper handling
Bus and Truck Terminals	1	H	Both	Fuels and maintenance chemicals: spills, leaks, or improper handling
Cemeteries	6	M	Both	Over-application of pesticides: leaks, spills, improper handling; historic embalming fluids
Dry Cleaners	1	H	Both	Solvents and wastes: spills, leaks, or improper handling
Funeral Homes	5	L	Both	Hazardous chemicals: spills, leaks, or improper handling
Golf Courses	1	M	564	Fertilizers or pesticides: over-application or improper handling
Laundromats	2	L	Both	Wash water: improper management

Table 2 Continued

Activities	Quantity	Threat*	Zone II	Potential Source of Contamination
Printer And Blueprint Shops	2	M	Both	Printing inks and chemicals: spills, leaks, or improper handling or storage
Repair Shops (small engine and appliances)	2	H	Both	Engine fluids, lubricants, and solvents: spills, leaks, or improper handling or storage
Medical Facilities	8	M	Both	Biological, chemical, and radioactive wastes: spills, leaks, or improper handling or storage
Sand And Gravel Mining/Washing	3	M	Both	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
<b>Industrial</b>				
Asphalt and Concrete Plants	2 Asphalt, 1 Concrete	M	Both	Hazardous chemicals and wastes: spills, leaks, or improper handling or storage
Fuel Oil Distributors	3	H	Both	Fuel oil: spills, leaks, or improper handling or storage
Furniture stripping/ refinishing	1	H	564	Hazardous chemicals: spills, leaks, improper handling or storage
Hazardous Materials Storage	Numerous	H	Both	Hazardous materials: spills, leaks, or improper handling or storage
Lagoons and Pits	1 (Closed)	-	564	Liquid wastes: improper seepage or overflows
Industry/Industrial Parks	1	H	564	Industrial chemicals and metals: spills, leaks, or improper handling or storage
Machine/Metalworking Shops	10	H	Both	Solvents and metal tailings: spills, leaks, or improper handling
Plastic Processors	2	H	Both	Solvents, resins and process wastes: spills, leaks, or improper handling or storage
RCRA TSDF Facilities	Numerous	H	Both	Hazardous wastes: spills, leaks, or improper handling or storage
<b>Residential</b>				
Fuel Oil Storage (at residences)	Numerous USTs	H	Both	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Both	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Both	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>				
Aboveground Storage Tanks	Numerous	M	Both	Materials stored in tanks: spills, leaks, or improper handling
Aquatic Wildlife	Present	L	Both	Microbial contaminants
Landfills	3 (1 Active)	H	564	Potential for seepage of leachate

Table 2 Continued

Activities	Quantity	Threat*	Zone II	Potential Source of Contamination
<b>Miscellaneous</b>				
Large Quantity Hazardous Waste Generators	Numerous	H	564	Hazardous materials and waste: spills, leaks, or improper handling or storage
NPDES Locations	1	L	564	Hazardous material and wastes: improper disposal
Confirmed Oil or Hazardous Material Release Sites	18	--	Both	Tier Classified Oil or Hazardous Materials Sites are not ranked due to their site-specific character. Individual sites are identified in Appendix B.
Road and Maintenance Depots	1	M	Both	Deicing materials, automotive fluids, fuel storage, and other chemicals: spills, leaks, or improper handling or storage
Schools	3	M	Both	Fuel oil, laboratory, art, photographic, machine shop, and other chemicals
Small quantity hazardous waste generators	Numerous	M	Both	Hazardous materials and waste: spills, leaks, or improper handling or storage
Stormwater Drains/Retention Basins	Numerous	L	Both	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
<u>Electric/Natural gas</u> - Line Rights-of-Way	2	L	Both	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors	Numerous	M	Both	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or im-
Underground Storage Tanks	Numerous (>)	H	Both	Stored materials: spills, leaks, or improper handling
Utility Substation Transformers	2	L	Both	Chemicals and other materials including PCBs: spills, leaks, or improper handling
Very Small Quantity Hazardous Waste Generator	Numerous	L	Both	Hazardous materials and waste: spills, leaks, or improper handling or storage
Wastewater Treatment Plant/Collection Facility/ Lagoon	1	M	564	Treatment chemicals or equipment maintenance materials: improper handling or storage; wastewater: improper management
Water Treatment Sludge Lagoon	1	M	Both	Sludge and wastewater: improper management
Junk/Salvage Yard	5	H	564	Automotive chemicals, waste, and batteries: spill, leaks or improper handling

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

*(Continued from page 4)*

**2. Residential Land Uses** – Approximately 30% of the Zone II #235 consists of residential areas; the other Zone IIs have about 23% of land utilized as residential. While much of the Zone II area located within Easthampton is served by the municipal sewer system, all of the Southampton areas and most of the Northampton areas use on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catchbasins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Continue proactive inspection of areas within the Zone II and continue supporting the removal of USTs and upgrading of septic systems or connection to the municipal sewer. Be sure communities are aware that they can utilize municipal incentive programs to fund removal of USTs, upgrade septic systems as well as remove lead paint from residential properties.

**3. Transportation Corridors** – Many state routes run through the Zone IIs of the wells. Local roads are common throughout the Zone IIs. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catchbasins.

**Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone IIs.
- ✓ Work with the Town and State to have catchbasins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams in Northampton, Holyoke and Northampton to ensure that any spills

within the Zone IIs can be effectively contained.

- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.
- ✓ Notify City and town officials of potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP).

**4. Hazardous Materials Storage and Use** – A small percentage of the land area within the Zone IIs is commercial or industrial land uses. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST (see Appendix B for a list of registered facilities). If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.
- ✓ Work with the Board of Health and local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Work with your local fire department and the Board of Health to review emergency response plans and to coordinate response actions.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure “Industrial Floor Drains” for more information.
- ✓ The USDA has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>.

**5. Presence of Oil or Hazardous Material Contamination Sites** – The Zone IIs

contain DEP Tier Classified Oil and/or Hazardous Material Release Sites indicated on the map as Release Tracking Numbers 1-0000549, 1-0000129, 1-0000291, 1-0013737, 1-0000264, 1-0011448, 1-0000674, 1-0012049, 1-0000064, 1-0000066, 1-0013515, 1-0000608, 1-0000512, 1-0013956, 1-0012881, 1-0000514, 1-0011448, 1-0000264, 1-0000639, and 1-0000723. Refer to the attached map and Appendix 3 for more information.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites. Contact the Bureau of Waste Site Cleanup for further information regarding those sites.

**6. Agricultural Activities** – There are several farms within the Zone IIs. Approximately 20% of the land use within each of the Zone IIs is cropland and pastureland. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources

**Top 5 Reasons to  
Develop a Local Wellhead  
Protection Plan**

❶ Reduces Risk to Human Health

❷ Cost Effective! Reduces or Eliminates Costs Associated With:

- Increased groundwater monitoring and treatment
- Water supply clean up and remediation
- Replacing a water supply
- Purchasing water

❸ Supports municipal bylaws, making them less likely to be challenged

❹ Ensures clean drinking water supplies for future generations

❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water is a place people want to live and businesses want to locate.

- ✓ Conservation Service (NRCS) farm plan to protect water supplies.
- ✓ Commercial facilities may be eligible for funding BMPs through the Department of Food and Agriculture or the Work and NRCS. Contact the NRCS about the Environmental Quality Incentives Program (EQIP).

**7. Protection Planning** – Currently, although the City has water supply protection controls, the entire Zone II and recharge areas are not protected by controls that meet DEP’s Wellhead Protection regulations 310 CMR 22.21(2). Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells.

**Protection Planning Recommendations:**

- ✓ Develop a Wellhead Protection Plan. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP’s guidance, “Developing a Local Wellhead Protection Plan”.
- ✓ Coordinate efforts with local officials in Northampton and Southampton to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21(2). Work through the Barnes Aquifer Protection Committee and with the DEP to encourage all host communities to adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ Work with the Barnes Aquifer Protection Committee, DEP and the local boards to review if all communities regulate floordrains; be sure to include floordrain controls that meet 310 CMR 22.21(2).

**8. Wastewater Treatment Plant** – The Zone II contains the Easthampton Wastewater Treatment Plant that discharges to the Connecticut River near Interstate I-91 in Easthampton. The facility also has a wet weather discharge within the Zone II of the Maloney well. However there is a confining clay layer in that vicinity. Activities associated with wastewater treatment involve storage and use of hazardous materials such as chlorine and fuel oil. Municipal wastewater contains contaminants including bacteria, viruses, metals and volatile chemicals. Spills, leaks or mismanagement of wastewater, hazardous materials and storm water at the plant is a potential source of contamination.

**Wastewater Treatment Plant Recommendations:**

- ✓ Ensure wastewater treatment facility is operated and maintained according to DEP requirements.
- ✓ Work to have stormwater drains and the drainage system around the wastewater treatment plant mapped.
- ✓ Work with plant to be sure that best management practices are used for proper handling of materials and in containing spills and leaks.
- ✓ Work with plant to be sure emergency planning includes notification for Easthampton Water Department.
- ✓ Ensure that the all of the plant’s storage tanks have containment and are maintained and monitored properly.

**9. Right-of-Way** – There are three different utility rights of way within the Zone IIs: natural gas, electric and sewer pipeline. The risk for the sewer pipeline is from a possible rupture of the line, potentially allowing the contents to enter into the water supply. Normal maintenance of any right-of-way, including electrical line rights-of-way, can introduce contaminants to a water supply through herbicide application for vegetation control. The over-application or improper handling of herbicides is a potential source of contamination.

**Right-of-Way Recommendations:**

**What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

**Additional Information**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Contact Catherine V. Skiba in DEP’s Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, City and abutting community boards.

- ✓ Review the natural gas pipeline and electricity right-of-way Yearly Operating Plan to ensure Best Management Practices are implemented with regard to vegetation control in the Zone II, and that the utility has accurate information regarding the locations of the wells and the Zone I. Review the maps the utilities use, and provide them with up-to-date maps if necessary.
- ✓ Work with your local fire department to review emergency response plans. Updates to this plan should include the utility rights-of-way and coordination with the owner/operator of the utilities using the right-of-way.
- ✓ Continue working with the DPW regarding maintenance of the sewer line and storm drains.

Other land uses and activities within the Zone II that are potential sources of contamination are included in Table 2. Refer to Appendix B for more information about some of these land uses. One issue that the city has been aware of and has been tracking is the number of non-commercial USTs within the aquifer. As noted in Appendix B, there are approximately 275 USTs in the aquifer in Easthampton. This does not include those in other communities within the aquifer. Easthampton has been tracking the progress of the removal of these tanks. Continue tracking USTs and consider funding options for assisting in the removal of the tanks.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Sleeved sewer lines
- Sleeved storm drains
- Active participation in the Barnes Aquifer Protection Committee
- Inventorying and actively supporting removal of USTs in the Barnes Aquifer.
- Proactive and knowledgeable about activities within the Zone II areas and pursue mitigation of threats

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Continue working with the Aquifer Protection Committee and through other effort, to educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Continue your partnership with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Coordinate and implement a plan for Easthampton and surrounding communities to remove underground storage tanks to protect the unconfined aquifer from contamination.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Develop and implement a Wellhead Protection Plan.
- ✓ Work with the City Planning Department to target and prioritize assessment of properties within the Zone II.
- ✓ Continue working with the Board of Health to conduct inspections and implement hazardous materials strategies.
- ✓ Continue efforts to encourage other municipalities to protect the aquifer.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

➤ **Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships between businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

➤ **Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to groundwater contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained, it could be a potential source of microbial contamination. Animal waste is also a source of microbial contamination.

➤ **Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located; what types of land uses and activities pose threats; and how their efforts can enhance protection.

➤ **Plan for the Future:**

One of the most effective means of protecting water supplies is local planning, include adoption of local controls to protect land use, regulations related to watersheds and ground water protection. These controls may include health ordinances/regulations, discharge prohibitions, general ordinances, and zoning by laws that prohibit or control potential sources of contamination within the protection areas.

➤ **Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available on line and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf>.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>YES</b> (except 04G)	Follow Best Management Practices (BMPs) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Pursue acquiring control of Zone I lands not owned by the supplier by purchase or conservation restriction.
Is the Zone I posted with “Public Drinking Water Supply” Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone I regularly inspected?	<b>YES</b>	Continue monthly inspections of drinking water protection areas. Increase frequency when possible.
Are water supply related activities the only activities within the Zone I?	<b>YES</b> (05G, 07G, 09G) <b>NO</b> (04G, 06G, 08G)	Continue monitoring activities in Zone I. Consider Right of first refusal, purchase of conservation restriction, etc.
<b>Municipal Controls</b> (Zoning Regulations, Health Regulations, and General Ordinances/By laws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21 (2)?	<b>YES</b>	The City’s Zoning Ordinance meets DEP’s wellhead protection requirements. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model by laws, health regulations, and current regulations.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>PARTIAL</b>	Holyoke, Westfield and Easthampton have wellhead protection ordinances. Work with Northampton to include your wellhead protection areas in their water supply protection controls. Request that Southampton to implement protection and include Easthampton’s Zone II. Contact the Town Boards and the BPAC. DEP may be of assistance to you.
<b>Planning</b>		
Does the PWS have a local Wellhead Protection Plan?	<b>NO</b>	Work with the Barnes Aquifer Protection Committee to create comprehensive watershed plans. For more guidance, follow “Developing a Local Wellhead Protection Plan” and other guidance available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>YES</b>	Include representatives from citizens’ groups, neighboring communities, and the business community as committee members.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>YES</b>	Easthampton does have a floor drain regulation. Other communities may not. For more guidance, see “Hazardous Materials Management: A Community’s Guide” at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>PARTIAL</b>	Aim education efforts at schools and commercial, industrial, and municipal uses within the Zone II. Work through BPAC to access host communities.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREAS

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
130782	Tubed Products, Inc.	44 O'Neil Street	Easthampton	Hazardous Waste Generator	Large Quantity	Industry
				Oil Waste Generator	Small Quantity	
				Air Handler	Major (BM1000)	
130780	National Nonwovens	180 Pleasant Street	Easthampton	Hazardous Waste Generator	Small Quantity	Industry
				Air Handler	Minor Synthetics (SM150)	
				Oil Waste Generator	Very Small Quantity	
26963	National Nonwovens	Mechanics Street	Easthampton	Hazardous Waste Generator	Small Quantity	Industry
				Air Handler	Minor Synthetics (SM150)	
				Toxic User	Large Quantity	
				Oil Waste Generator	Small Quantity	
25961	The October Company, Inc.	O'Neil Street	Easthampton	Hazardous Waste Generator	Small Quantity	Industry
				Oil Waste Generator	Very Small Quantity	
				Air Handler	Major Synthetics (SM1000)	

				Toxic User	Large Quantity	
133906	Gazette Printing Company, Inc.	58 O'Neil Street	Easthampton	Hazardous Waste Generator	Very Small Quantity	Printers
27990	Peter Rapid Cleaners	38 Union Street	Easthampton	Hazardous Waste Generator	Very Small Quantity	Dry Cleaners
31055	A & B Auto Sales	156 Northampton Street	Easthampton	Hazardous Waste Generator	Very Small Quantity	Auto Sales & Repair
				Oil Waste Generator	Very Small Quantity	
133907	Rock Valley Tool, Inc.	54 O'Neil Street	Easthampton	Hazardous Waste Generator	Very Small Quantity	
				Oil Waste Generator	Small Quantity	
35459	Fedor Oldsmobile Pontiac, Inc	228 Northampton Street	Easthampton	Hazardous Waste Generator	Very Small Quantity	Auto Sales & Repair
				Oil Waste Generator	Small Quantity	
130785	The October Company, Inc.	51 Ferry Street	Easthampton	Hazardous Waste Generator	Very Small Quantity	Industry
				Oil Waste Generator	Very Small Quantity	
				Toxic User	Large Quantity	
				Plant	RES Application Approved	
36572	The Town of Easthampton	30 Northampton Street	Easthampton	Hazardous Waste Generator	Small Quantity	
10018	Easthampton DPW	30 Northampton Street	Easthampton	Hazardous Waste Generator	Very Small Quantity	Town DPW

				Oil Waste Generator	Small Quantity	
132014	Cernak Buick, Inc.	102-104 Northampton Street	Easthampton	Hazardous Waste Generator	Very Small Quantity	Auto Sales & Repair
37256	M & L Plastics	50 Terrace View	Easthampton	Hazardous & Oil Waste Generators	Very Small Quantities	Plastic Manufacturing
130781	Phillip Manufacturing Company	19 Ward Avenue	Easthampton	Air Handler	Minor (BM450)	Manufacturing
130786	Easthampton Dye Work	1 Cottage Street	Easthampton	Air Handler	Minor (BM150)	Industry
132648	Industrial Properties	1 Ferry Street	Easthampton	Plant	RES Application Approved	Industrial Park
50669	Riverside Industries	1 Cottage Street	Easthampton	Air Handler	Minor (BM150)	Industry
				Oil Waste Generator	Very Small Quantity	
135711	Pride Convenience, Inc.	60 Union Street	Easthampton	Oil Waste Generator	Very Small Quantity	Service Station
				Fuel Dispenser	Fuel Dispenser	
954	Easthampton Water Treatment Plant	90 Ferry Street	Easthampton	Surface Water Discharge (NPDES)	Major	Wastewater Treatment
				Oil Waste Generator	Very Small Quantity	
126211	Easthampton Mobil	124 Northampton Street	Easthampton	Fuel Dispenser	Fuel Dispenser	Gas Station
132647	Easthampton Landfill	Oliver Street	Easthampton	Landfill	Solid Waste	Landfill
178246	7-Eleven #22397	97-101 Union Street	Easthampton	Fuel Dispenser	Fuel Dispenser	Gas Station/ Convenience Store

				Hazardous Waste Generator	Small Quantity

## Commercial Registered Underground Storage Tanks – U.S. Fire Service

This list does not include non-commercial and residential facilities. An inventory of the Barnes Aquifer Protection Area was conducted during the early 1990's and updated as the tanks are removed. According to that inventory, there still are nearly 275 USTs remaining in Easthampton not included in this table. This does not include those that may be located in Southamptton, Northampton and Holyoke.

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site:  
<http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitellst.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

For more location information, please see the attached map. The map lists the release sites by RTN. Refer to DEP BWSC for additional information.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for

## Egremont Water Department

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

Table 1: Public Water System Information

<i>PWS Name</i>	Egremont Water Department
<i>PWS Address</i>	133 Mt. Washington Road
<i>City/Town</i>	Egremont
<i>PWS ID Number</i>	1090000
<i>Local Contact</i>	Mr. Jack Muskrat
<i>Phone Number</i>	413-644-9614

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

## Glossary Protection Zones

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

## Section 1: Description of the Water System

### Surface Water Sources

**Susceptibility:** Moderate

#### Source Name:

#### Source ID

Karner Brook Reservoir

1090000-01S

Egremont is a small rural residential community in the Berkshire hills of southwestern Massachusetts with the Egremont Water Department supplying drinking water to a small portion of the town. The Water Department maintains an intake structure on Karner Brook. The watershed of the Karner Brook Reservoir lies within the towns of Egremont and Mount Washington and a small portion within the state of New York. Approximately 86% of the watershed is protected through ownership by the Water Department or is part of the Taconic State Park in New York and the Mount Washington State Forest in Massachusetts. Greater than 90% of the land use within the watershed is as forested land. The remaining small percentage is residential and agricultural uses. Please refer to the attached map to view the boundaries of the protective zones.

Water from the brook is filtered through a slow sand filter and disinfected with chlorine prior distribution. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

There are few activities that pose significant anthropogenic threats to the reservoirs. However, due to the nature of surface water supplies, the sources are considered highly vulnerable to potential contamination. Land uses and activities that are considered potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Residential land use in Zone A and watershed
2. Transportation corridors
3. Forestry/Watershed Management
4. Protection Planning
5. Water Treatment Facility

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Residential Land Uses** – Approximately 21 acres (2%) of the watershed consists of residential areas. None of the areas have public sewers, therefore on-site septic systems are used. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. The closest use to the intake structure is a bridge constructed of treated timbers providing access to a resident. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic

systems fail or are not properly maintained they can be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Consider negotiating a Right of First refusal agreement or conservation restrictions for land not currently owned by the Town.
- ✓ Consider alternative access for this resident. If no alternative can be found, use BMPs for the crossing to prevent erosion and to protect from accidental release along this access.
- ✓ Inspect the bridge semi-annually. Review construction materials and consider materials that are not potential source of contamination in any reconstruction of bridge.

**2. Transportation Corridors** – There are many roads located throughout the watersheds, including many that are dirt roads. Though most are low-use roadways, the close proximity of some of the roads to the brook and typical roadway maintenance and use can pose a potentially significant source of

contamination from accidents and washouts along the dirt road. De-icing materials, automotive chemicals and other debris on roads are picked up by stormwater washed into catch basins and discharge into the reservoirs. The Conservation Commission required BMPs along the road close to the intake that include detention basins.

#### Transportation Corridor Recommendations:

- ✓ Evaluate all options for management of access to local roads. Include evaluation of continuing current practice of full access, closing roads to all traffic (abandonment of road), closing road to all commercial traffic and limiting access to residents with a locked gate and key for residents only.
- ✓ Identify stormwater drains and the drainage system along the many local

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

MODIFIED FROM © 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

Figure 1: Sample watershed with examples of potential sources of contamination

roads in the watershed. Alternatively consider various strategies to detain/slow the flow and retain sediments for dirt roads within the watershed.

- ✓ Inspect, maintain, and clean catch basins and retention basins on a regular schedule.
- ✓ Work with local emergency response teams to ensure effective management of potential spills.
- ✓ Work with the resident to protect the water supply along the right-of-way.

**3. Forestry/Watershed management** – The majority of the watershed is not currently logged, but there is a potential for this practice to occur in the future. There is no watershed/forest management plan at this time. There is no evidence of significant aquatic wildlife such as beavers or muskrats in the watershed at this time.

- ✓ Include in the protection plan, an evaluation of the need for a forest inventory and forest management plan specifically designed for watershed management.
- ✓ Evaluate whether there are impacts associated with access and determine what, if any, management strategies are required for public access to the watershed.
- ✓ Continue to inspect the watershed regularly.
- ✓ Right of way maintenance should be conducted by mechanical means. Supply all utilities and road maintenance crews with detailed maps of the watershed area where they may be conducting maintenance. Meet with the staff in charge of conducting the maintenance and confirm all stream crossings and Zone A areas are accurately mapped.
- ✓ Continue contact with the DEM regarding activities within the watershed, specifically those related to access and forest operations.

**4. Protection Planning** – Currently, Egremont does not have a Watershed Protection District and Bylaw, which should be approved by DEP for compliance with water supply protection control regulations 310 CMR 22.21(2). A Watershed Protection Plan has not been prepared and submitted for approval

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

of content and procedures by the Department's Boston office. These types of protection plans coordinate community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public education and outreach. The development of a successful Watershed Protection Plan is outlined in DEP's "Developing a Local Watershed Protection Plan" (see Appendix A for the full report).

#### Protection Planning Recommendations:

- ✓ Develop a Watershed Protection Plan that will focus on public access. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Coordinate efforts with local officials to review local watershed protection controls. If there are no local controls or they do not meet the current regulations, adopt controls or strategies that will meet 310 CMR 22.21(2) and protect the source. For more information on DEP land use controls see <http://mass.gov/>

#### Source Protection Decreases Risk

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Potential Contaminant Sources*
<b>Agricultural</b>			
Forestry Operation	Historical, DEM	L	Leaks, spills, or improper handling of hazardous materials, erosion. No current logging.
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides/Fertilizers: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Clandestine Dumping	Historical	M	Debris may contain hazardous materials or wastes
Fishing	Numerous (in brook)	L	Debris, microbial contaminants
Tire Dumps	1 (small)	M	Tires: improper handling or management
Transportation Corridors	Numerous	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Transformers: Pole Mounted	Numerous	L	MODF spills from accidents, potentially PCBs in older transformers
<b>Notes:</b> <ol style="list-style-type: none"> <li>When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.</li> <li>For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.</li> <li>For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.</li> </ol> <p>* <b>THREAT RANKING</b> - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.</p>			

dep/brp/dws/protect.htm.

- ✓ If local controls do not regulate floordrains, be sure to include floordrain controls that meet 310 CMR 22.21(2).

**5. Water Treatment Facility** - The Egremont water treatment facility is located within the Zone A of the source. Activities associated with water treatment involve storage and use of hazardous materials such as chlorine, sodium hydroxide. All chemicals are stored above ground and within secondary containment. According to the watershed protection plan, storm water from the facility discharges outside of the watershed. Spills or leaks of hazardous materials during handling and delivery and storm water are a potential source of contamination.

**Water Treatment Facility Recommendations:**

- ✓ Ensure water treatment facility is operated and maintained according to DEP requirements.
- ✓ Ensure stormwater drains and the drainage system around the treatment plant do drain outside of the watershed. Maintain catchbasins as necessary.
- ✓ Continue current use of best management practices for proper handling of materials and in containing spills and leaks.
- ✓ Update emergency plans as necessary.

Land uses and activities within the watershed that are potential sources of contamination are included in Table 2. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### Section 3: Source Water Protection Conclusions and Recommendations

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system's watershed contains

#### Top 5 Reasons to Develop a Local Surface Water Protection Plan

- ➊ Reduces Risk to Human Health
- ➋ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ➌ Supports municipal bylaws, making them less likely to be challenged
- ➍ Ensures clean drinking water supplies for future generations
- ➎ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Maintaining high awareness of the watershed

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the protection areas regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your watershed and to cooperate on responding to spills or accidents.
- ✓ Work with landowners in your protection areas to make them aware of your water supply and to encourage the use of a best management practices for residential and recreational uses.
- ✓ Develop and implement Forest Management Plan and a Watershed Management Plan for water supply protection.

**Conclusions:**

These recommendations are only part of your ongoing local drinking water source

protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Source Protection Grant Program provides funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring, about May 1, the Department posts a new Request for Response (RFR- the grant application form) for the grant program.

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the watershed. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Additional Documents on Source Protection

### **For More Information**

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, town boards, and the local media.

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone A?	<b>NO</b>	Follow Best Management Practices (BMPs) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Make every effort to obtain remaining Zone A land. Watershed lands have recently been purchased and will be protected from development.
Is the Zone A posted with “Public Drinking Water Supply” Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone A regularly inspected?	<b>YES</b>	Continue monthly inspections of drinking water protection areas. Increase frequency when possible.
Are water supply related activities the only activities within the Zone A?	<b>NO</b>	Continue monitoring non-water supply activities in Zone As.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Surface Water Protection Controls that meet 310 CMR 22.20 C?	<b>NO</b>	The Town does not meet DEP’s best efforts for watershed protection. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws, health regulations, and current regulations.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>NO</b>	Work with Mount Washington to develop a protective by-law and include Karner Brook watershed in the water supply protection controls.
<b>Planning</b>		
Does the PWS have a local Surface Water Protection Plan?	<b>NO</b>	Develop a surface water protection plan. Follow “Developing a Local Surface Water Protection Plan” available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams and be sure they are aware of the watershed boundary areas.
Does the municipality have a watershed protection committee?	<b>NO</b>	Establish committee; include representatives from citizens’ groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>N/A</b>	
Does the PWS provide watershed protection education?	<b>YES</b>	Aim additional education efforts at residents within the watershed and those using the watershed for recreation.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Erving Water Department**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Erving Water Department
<i>PWS Address</i>	12 Main Street
<i>City/Town</i>	Erving
<i>PWS ID Number</i>	1091000
<i>Local Contact</i>	Andrew Tessier
<i>Phone Number</i>	(978) 544-3636 x100

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

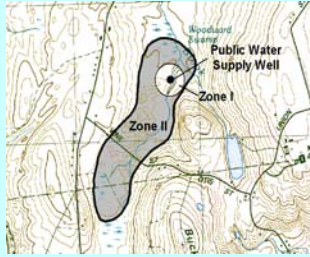

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

**Zone II #:** 448

**Susceptibility:** High

Well Names	Source IDs
Well #1	1091000-01G

The Town of Erving is a small, rural community that began as manufacturing/industrial community along the Miller's River. Much of the community is hilly with the bulk of the development along the river valley. Erving Water Department is served by one well (1091000-01G). Well #1 is a 12 by 24-inch diameter, gravel packed well, 52-foot in depth. The well has an approved pumping rate of 260 gallons per minute (0.37 millions of gallons per day) based on an extended duration pumping test and historical pumping data. The Zone II, primary recharge area was delineated as part of the SWAP program. The well is located in an unconfined, stratified drift aquifer at the base of a delta of glacial origin. There is no evidence of a confining unit such as clay in the vicinity of the well. Wells located in this type of aquifer are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers (i.e. clay) that can prevent contaminant migration. The bedrock in the area is mapped as the Poplar Mountain gneiss formation of the Middle Paleozoic age; a dark-gray, well-foliated, micaceous gneiss of fairly complex composition. Please refer to the attached map to view the boundaries of the Zone II.

The water quality data from the well periodically shows fluctuating levels of sodium. There are multiple roads and two state highways located within the Zone II, with Route 2 located approximately 500 feet from the well. Sodium hydroxide is added to the water to buffer the pH for corrosion control prior to distribution. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The Zone II for Erving is a mixture of forest, residential, light agricultural and light commercial land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Nonconforming Zone I
2. Residential land uses
3. Transportation corridors
4. Hazardous materials storage and use
5. Wastewater Treatment Plant
6. Oil or hazardous material contamination sites
7. Railroad Right-of-Way
8. Comprehensive wellhead protection planning
9. Agricultural Activities

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Nonconforming Zone I** – The Zone I for Well #1 encompasses a 400-foot radial area around the wellhead. Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Only water supply activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and contain non water supply activities such as homes and public roads. The Zone I for the well in this case includes two residences, a local road, and State Route 2 is just outside of the Zone I.

**Zone I Recommendations:**

- ✓ To the extent possible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non water supply activities out of the Zone I.

**2. Residential Land Uses** – Approximately 23% of the Zone II consists of residential areas. Public sewer services most of the area, but there are still some septic systems in use within the Zone II. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.

- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

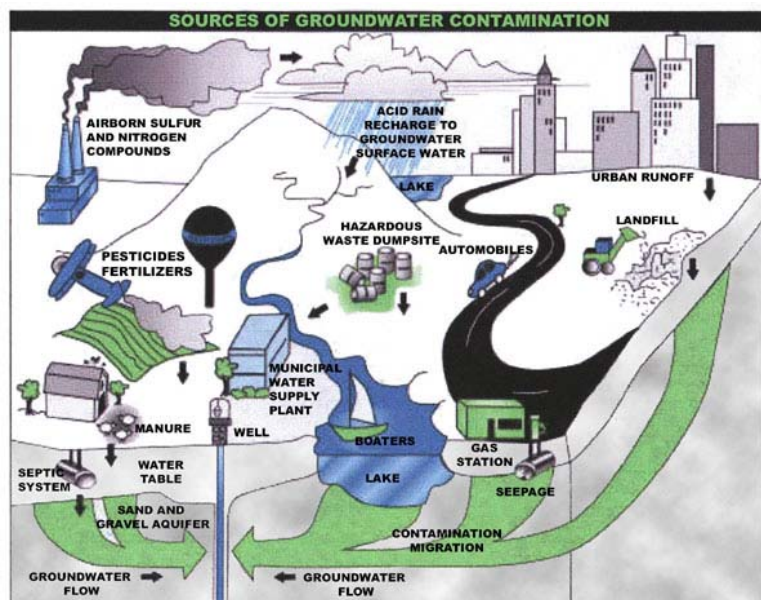

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office  
for more information on Source  
Protection and the Waiver  
Program.

© 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

- residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Transportation Corridors** - Route 2 runs just outside of the Zone I and through the Zone II just east of the wells. Route 63 runs along the eastern boundary and has catchbasins that discharge into a brook flowing past the well. Local roads are common throughout the Zone II. Erving has water quality data demonstrating seasonally increased levels of sodium in the water supply. The Massachusetts Highway Department has designated Route 2 a low salt area, however, Route 63 is not.

Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites

for illegal dumping of hazardous or other potentially harmful wastes. De-icing materials, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catchbasins.

**Transportation Corridor Recommendations:**

- ✓ Map local stormwater drains and the drainage system along transportation corridors; request a copy of Massachusetts Highway Department's maps and catch basin maintenance program. Wherever possible, ensure that drains discharge stormwater outside of the Zone II. For instance, request the State Highway Department redirect the Route 63 and Route 2 catch basins to flow outside of the Zone II or remotely from the well. The storm drains from the northern section of Route 63 discharge through a swale to the brook flowing past the well. Contact the Clean State Initiative coordinator Rick Larson 413-755-2207 for assistance.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

**4. Hazardous Materials Storage and Use** – Two percent of the land area within the Zone II is commercial or

industrial land uses. Erving's Waste Water Treatment Plant is located on the western edge of the Zone II. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet "Businesses Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships

**What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**Source Protection Decreases Risk**

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Potential Contaminant Sources*
<b>Agricultural</b>			
Forestry Operation	Proposed	L	Erosion, equipment maintenance materials: leaks, spills, or improper handling; road building
Livestock Operations	1	M	Manure (microbial contaminants): improper handling
<b>Commercial</b>			
Car/Truck/Bus Washes	1	L	Vehicle wash water, soaps, oils, greases, metals, and salts: improper management
Bus and Truck Terminals	1	H	Fuels and maintenance chemicals: spills, leaks, or improper handling
Railroad Tracks	Throughout	H	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or
<b>Industrial</b>			
Hazardous Waste Storage, Treatment and	1	H	Hazardous materials: spills, leaks, or improper handling or storage

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Aboveground Storage Tanks	Numerous	M	Materials stored in tanks: spills, leaks, or improper handling
Aquatic Wildlife	History of	L	Microbial contaminants
Fire Training Facilities	1	M	Fuels and other chemicals: improper use or storage
NPDES Locations	1	L	Hazardous material and wastes: improper disposal
Oil or Hazardous Material Sites	5	--	Tier Classified Oil or Hazardous Materials Sites are not ranked due to their site-specific character. Individual sites are identified in Appendix B.
Road And Maintenance Depots	1	M	Deicing materials, automotive fluids, fuel storage, and other chemicals: spills, leaks, or improper handling or storage
High School	1	L	Fuel oil, laboratory, art, photographic, machine shop, and other chemicals: spills, leaks, or improper handling or storage
Small quantity hazardous waste generators	1	M	Hazardous materials and waste: spills, leaks, or improper handling or storage
Stormwater Drains/ Retention Basins	Numerous	L	Debris, pet waste, and deicing and other chemicals in stormwater from roads, parking lots, and lawns
Tire Dumps	1	M	Tires: improper handling or management
Transportation Corridors	Numerous	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Underground Storage Tanks	Numerous	H	Stored materials: spills, leaks, or improper handling
Utility Substation Transformers	Numerous	L	Chemicals and other materials including PCBs: spills, leaks, or improper handling
Very Small Quantity Hazardous Waste	3	L	Hazardous materials and waste: spills, leaks, or improper handling or storage
Wastewater Treatment Plant/Collection Facility/	1	M	Treatment chemicals or equipment maintenance materials: improper handling or storage; wastewater: improper

between businesses, water suppliers, and communities enhance successful public drinking water protection practices.

- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure "Industrial Floor Drains" for more information.

**5. Wastewater Treatment Plant** – The Zone II contains the Erving Wastewater Treatment Plant that discharges immediately outside of the Zone II boundary into the Miller River. Activities associated with wastewater treatment involve storage and use of hazardous materials such as chlorine and fuel oil. Municipal wastewater contains contaminants including bacteria, viruses, metals and volatile chemicals. Spills, leaks or mismanagement of wastewater, hazardous materials and storm water at the plant is a potential source of contamination.

**Wastewater Treatment Plant Recommendations:**

- ✓ Ensure wastewater treatment facility is operated and maintained according to DEP requirements.
- ✓ Work to have stormwater drains and the drainage system around the wastewater treatment plant mapped.
- ✓ Work with plant to be sure that best management practices are used for proper handling of materials and in containing spills and leaks.
- ✓ Work with plant to be sure emergency planning includes notification for Erving Water Department.
- ✓ Ensure that the plant's underground storage tank has secondary containment and maintained properly.

**6. Presence of Oil or Hazardous Material Contamination Sites** – The Zone II contains DEP Tier Classified Oil and/or Hazardous Material Release Sites. Refer to the attached map and Appendix 3 for more information.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.

**7. Railroad Right-of-Way** – The railroad runs through the entire Zone II. Rail corridors that serve passenger and/or freight trains are a potential source of contaminant due to chemicals released during normal use, track maintenance, and

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

❶ Reduces Risk to Human Health

❷ Cost Effective! Reduces or Eliminates Costs Associated With:

- ♦ Increased groundwater monitoring and treatment
- ♦ Water supply clean up and remediation
- ♦ Replacing a water supply
- ♦ Purchasing water

❸ Supports municipal bylaws, making them less likely to be challenged

❹ Ensures clean drinking water supplies for future generations

❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water is a place people want to live and businesses want to locate.

accidents. Normal maintenance of a railroad right-of-way can introduce contaminants to a water supply through herbicide application for vegetation control. The over-application or improper handling of herbicides on railroad right-of-way is a potential source of contamination. Leaks or spills of transported chemicals or train/track maintenance chemicals are also potential sources of contamination to the water supply.

**Railroad Right of Way Recommendations:**

- ✓ Review the railroad right-of-way Yearly Operating Plan to ensure Best Management Practices are implemented with regard to vegetation control in the Zone II, and that the utility has accurate information regarding the locations of the wells and the Zone I. Review the maps the utility uses.
- ✓ Work with your local fire department to review emergency response plans. Updates to this plan should include the railroad rights-of-way including coordination with the owner/operator of the track and trains using the right-of-way. Request emergency response teams to coordinate Emergency Response Drills and practice containment of potential contaminants from train accidents within the Zone II, which should attempt to include representatives from the owner/operator of the trains utilizing the right-of-way.

**8. Protection Planning** - Currently, the Town does not have water supply protection controls that meet DEP's Wellhead Protection regulations 310 CMR

22.21(2). However, a consulting firm is currently in the process of completing a Wellhead Protection Plan for Erving Water Department. Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation.

**Protection Planning Recommendations:**

- ✓ Follow the recommendations detailed in the Zone II report and the plan when it is complete.
- ✓ Coordinate efforts with local officials to adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ Contact Catherine Skiba of the Springfield Office of the Department to assist the Planning Board and Board of Health in presenting a bylaw to the public and promulgating regulations.

**9. Agricultural Activities** – There are several non-commercial farms with crop lands within the Zone II. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water sources.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.

Other land uses and activities within the Zone II that are potential sources of contamination are included in Table 2. Refer to Appendix B for more information about these land uses. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Maintaining a high awareness of the activities within the watershed

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

#### **Additional Information**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

- or accidents.
- ✓ Request Massachusetts Highway Department to redirect the Route 63 catch basins to flow south out of the Zone II and those on Route 2 away from the well.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Develop and implement a Wellhead Protection Plan.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

#### **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue monitoring non-water supply activities in Zone Is.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>NO</b>	Continue to request that the Planning Board and Selectmen present protective bylaws for adoption at Town Meeting. The Department can assist you in this effort.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>N/A</b>	
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	A consultant is currently working on a wellhead protection plan. Be sure that at a minimum, issues raised in this assessment are included in the plan.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, MA Highway, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Establish committee; include representatives from citizens' groups, neighboring communities, and the business community. Conservation Commission has volunteered to participate.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>SOME</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>NO</b>	Aim efforts at commercial, industrial and municipal uses within the Zone II.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREA

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
32684	Commonwealth of Massachusetts DPW	Route 2	ERVING	Hazardous Waste Generator	Very Small Quantity	Highway Depot
1020	Erving Waste Water Treatment Plant	16 Public Works Blvd.	ERVING	Hazardous and Oil Wastes Generator	Very Small Quantity	Waste Water Treatment Plant
				Surface Water Discharge (NPDES)	Major	
32684	Massachusetts Highway Department	Route 2	ERVING	Non Permitted Action (Non-Notifier)	Requires change of use or permit	Maintenance Depot
				Hazardous Waste Generator	Very Small Quantity	
				Sludge	Landfill	
*MAV000003 260	Town of Erving DPW	River Road	ERVING	Oil Waste Generator	Small Quantity	Maintenance Depot

\*Massachusetts Identification Number

For information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitellst.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0012574	Route 2	Erving	Oil
1-0000071	Route 2	Erving	
1-0010122	Route 2, East of French King Bridge	Erving	Oil
1-0001000	Route 2	Erving	Gasoline, Oil

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
ERVING TOWN OFFICES

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	Erving Town Offices
<b>PWS Address</b>	Town Offices
<b>City/Town</b>	Erving, Massachusetts
<b>PWS ID Number</b>	1091004

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well # 1	1091004-01G	100	405	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #  
1 (1091004-01G)**

Zone I = 100 ft.  
IWPA = 405 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the parking, local roads, residences and other facilities within the Zone I and the IWPA.

This source water assessment report is based on information provided by you during a site visit, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted to the Department.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report

## For

### Erving Paper Mills, Inc.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
March 19, 2001

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

#### SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Table 1: Public Water System (PWS) Information

<i>PWS Name</i>	Erving Paper Mills, Inc.
<i>PWS Address</i>	97 East Main Street
<i>City/Town</i>	Erving, Massachusetts
<i>PWS ID Number</i>	1091005

<i>Phone Number</i>	978-544-2711 ext. 209

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well # 1	1091005-01G	182	478	High
Well # 2	1091005-02G	182	478	High
Well # 3	1091005-03G	150	448	High

## INTRODUCTION

We are all concerned about the quality of the water we drink. Many potential contaminant sources, including septic systems, road salt and improperly disposed of hazardous materials may threaten the quality of water from drinking water wells. Citizens and local officials can work together to better protect drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. DESCRIPTION OF THE WATER SYSTEM

#### The Wells

Erving Paper Mills, Inc. has been in the paper manufacturing business since approximately 1908. They produce food service paper products such as napkins utilizing 100% waste (recycled) paper and are one of the area's largest recycled paper users. The main Erving Paper Mill (the mill) utilizes river water for paper production. Wells 1 (01G) and 2 (02G) supply potable water to the mill and are located approximately 50 feet and 30 feet north of Route 2, respectively; the mill is immediately south of Route 2. Erving Paper Mills uses the wells alternately. There is a single master meter that does not distinguish between wells. Well 3 (03G), serves the currently inactive and vacant storage and shipping site, the former Usher Plant. The Usher Plant, which is owned by the same company and located approximately 1 mile west of the mill along Route 2 has been vacant since 1995. Well 3 is located approximately 5 feet north of the building and immediately south (approximately 50 feet) of an active railroad track.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

Well 1, an 8-inch diameter well drilled to a depth of 485 feet below ground in 1977, extends above grade with its motor controls in a small shed near the wellhead. Well 2, a 6-inch diameter well drilled in 1941 to a depth of 238 feet, is located in a 5'x5'x6' concrete vault 200 feet west of Well 1. The wellhead (Well 2) is raised 24 inches above the vault floor. Well 3 is reportedly an 8-inch diameter well, drilled to a depth of 400 feet. The casing extends above grade and is set within a concrete well tile.

All three wells are bedrock wells. Geological maps of the area describe the bedrock as the Dry Hill Gneiss, a medium to fine grained granite-gneiss. Numerous bedrock outcrops are mapped in the immediate vicinity of the mill indicating shallow depth to bedrock. A large bedrock fault is mapped approximately 2,000 feet east of the mill wells separating the Dry Hill formation from the Crag Mountain Schist Formation. The bedrock aquifer utilized by the three Erving Paper Mills, Inc. wells has a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the ground surface into the aquifer.

Each of Wells 1 and 2 has a Zone I protective radius of 183 feet and an Interim Wellhead Protection Area (IWPA) radius of 478 feet. Well 3 has a Zone I radius of 150 feet and an IWPA radius of 448 feet. The Zone I and IWPA for Wells 1 and 2 are based on metered water usage data submitted by Erving Paper Mills, Inc. Since the storage facility is not active, the water usage and Zone I and IWPA for Well 3 are based on Title 5 septic system design flow volumes assuming the number of people that historically worked at the facility. Assessment information is presented in Tables 2 and 3.

Please refer to the attached maps of the Zone Is and IWPAs and Tables 2 and 3 for more information.

### The Water Quality

For current information on monitoring results, please contact the Public Water System contact person listed above in Table 1.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

## 2. DISCUSSION OF LAND USES IN THE PROTECTION AREAS

There are a number of land uses and activities within the drinking water supply protection areas for Erving Paper Mills, Inc. which are potential sources of contamination. The overall ranking of susceptibility to contamination for the wells is high, based on the presence of at least one high threat land use or activity in the Zone I and IWPA, as seen in Tables 2 and 3.

**Table 2: Table of Activities Common to the Protection Areas**

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Paper Mill	Active Railroad track	Well 3	All Wells	High	Maintenance, and accidents pose a potential threat
	Parking lots and driveways	Well 3	All Wells	Moderate	Limit road salt usage and provide drainage away from wells
	Transportation corridor (Route2)	Wells 1&2	All Wells	Moderate	Road salt, spills and runoff
	Sewage pipelines/pump station	All Wells	All Wells	Moderate	Gravity and pressure mains
	Storm drains	All Wells	All Wells	Low	Road salt, spills and runoff

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

Key Land Use Issues for the Wells include:

1. Non-conforming Activities in the Zone Is;
2. Industrial facility (paper mill)
3. Sewage pipelines
4. Transportation corridor
5. Railroad Right-of-Way.

1. **Zone Is** – All three wells are non-conforming with respect to MA DEP land use restrictions, which allow only water supply related activities in Zone Is. The Zone Is for Wells 1 and 2 contain nearly all paper mill buildings and activities, a sewer line, storm drains and Route 2. The Well 3 Zone I contains mill buildings, sewers, storm drains, a railroad track and storage facilities. Please note that systems not meeting DEP Zone I requirements must receive DEP approval and address Zone I issues prior to increasing water use, modifying systems or conducting any activities within Zone I. Also please note, wells that have been inactive for greater than five years must come into compliance with Zone I requirements prior to being put back on line.

- ✓ **Recommendation:** Do not conduct any additional activities within the Zone I and continue your commendable and diligent monitoring of activities within Zone I, use of BMPs and training for emergency response. Contact MA DEP prior to conducting any activities within Zone I.

2. **Industrial Facility** - The Erving Paper Mill is an active industrial facility and currently holds DEP Bureau of Waste

Figure 1: Example of how a well could become contaminated by different land uses and activities.

**Table 3: Table of Activities Specific to Each Protection Area**

**Water Supply Protection Area for Wells 1 and 2**

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Paper Mill	Large Quantity Toxics User	Both	Both	High	Hazardous materials are used in the processes
	Small Quantity Hazardous Waste Generator	Both	Both	Moderate	Non-water supply structures in Zone I
	USTs and hazardous materials storage	No	No	--	USTs and hazardous waste storage are outside of the IWPA

**Water Supply Protection Area for Well 3**

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
	Lawns and parking	Yes	Yes	Moderate	Vegetation control, spills

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at: [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

Prevention permits as a large quantity toxics user, small quantity hazardous waste generator, and air quality permittee. The entire area is sewered with the Publicly Owned Treatment Works (POTW) located immediately west of the mill. All of the facility's wastewater and one storm drain near the USTs is discharged to the POTW. The mill has a functioning waste recovery system on-site, contracts out hazardous waste disposal and is permitted to burn waste oil. Best Management Practices are used in the handling, storage, and shipping of the hazardous wastes. The hazardous waste storage facility and the fuel oil USTs at the mill are outside of the IWPA. The facility has a hazardous material emergency response plan that is periodically reviewed and updated as necessary and works cooperatively with the Town and local officials in coordination of water supply protection and emergency response.

✓ **Recommendations:** Continue reviewing and updating plans for emergency response and staff training regarding handling and management of hazardous materials. Continue the use of Best Management Practices.

3. **Sewage pumping station, pipelines and storm drains** – Gravity sewer lines, pumping station and storm drains are located within the Zone Is of the mill wells and the Usher Plant well. The storm drains direct runoff away from the wells and toward the river. The wastewater treatment plant and NPDES discharge locations are both topographically downgradient of the wells and outside of the IWPA. The POTW surface water discharge location is however upstream (1 mile) of the Usher Plant location. Well 3 is approximately 400 feet from the river.

✓ **Recommendations:** Maintain records of sewers and storm drains; continue monitoring the function of the sewerage pumping station.

4. **Railroad right-of-way** - The railroad track runs through the Erving Paper Mills, Inc. property and is within the IWPA of Wells 1 and 2 and the Zone 1 of Well 3. Rail corridors serving passenger and/or freight trains are potential sources of contamination due to chemicals released during normal use, maintenance, and accidents. Normal maintenance of a railroad right-of-way can introduce contaminants to a water supply through herbicide application for vegetation control. Accidents can release a variety of petroleum products and commercially transported chemicals.

✓ **Recommendations:** Be sure that the railroad is aware that you are a public water supply and consider incorporating rail accidents into your emergency response plan.

Implementing the recommendations below will reduce the system's susceptibility to contamination.

## 3. PROTECTION RECOMMENDATIONS

Erving Paper Mill, Inc. should review and adopt the following recommendations at the facilities:

### Zone I:

- 3 Keep all new non-water supply activities out of the Zone I.
- 3 Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use, modifying their system or conducting any additional non-conforming activities in Zone I.

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the water supplier, town boards, the town library and the local media.

- 3 Wells that have been inactive for greater than five years are required to meet Zone I restrictions prior to reactivation.
- 3 Consider well relocation if Zone I threats cannot be mitigated.
- 3 Prohibit public access to the well and pump house by locking facilities, gating roads, and posting signs.
- 3 Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any above ground tanks for leaks, etc.
- 3 Consider alternative sites for a new well and protect that land for future use through purchase or conservation restriction that would prohibit potentially threatening activities.
- 3 Continue your coordination with the DEP, State highway and local officials regarding diligence in protecting the water supplies through emergency response coordination.
- 3 Be sure that the railroad is aware that your facilities are public water supplies so that you can be notified of any accidents or threats from the railroad.
- 3 Secure the Usher Plant to discourage vandalism and further deterioration of the building.

### **Training and Education:**

- 3 Continue staff training on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, certified operator, and other appropriate staff.
- 3 Maintain the drinking water protection area signs at key visibility locations.

### **Facilities Management:**

- 3 Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/bwp/dhm/dhmpubs.html](http://www.state.ma.us/dep/bwp/dhm/dhmpubs.html).

- 3 Monitor all oil/hazardous material storage tanks to incorporate proper containment and safety practices.
- 3 Implement Best Management Practices (BMPs) for the use of pesticides on facility property.
- 3 For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### **Planning:**

- 3 Work with local officials in town to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- 3 Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- 3 Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## **4. ATTACHMENTS**

- Maps of the Public Water Supply (PWS) Protection Areas.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Weatherhead's complex is located on the Mohawk Trail, (State Route 2) in Erving approximately 1,000 feet from the Route 63 intersection. The facility served by the public water system consists of two apartment buildings with a swimming pool, one residence, a bowling alley with a snack bar, a self-serve car wash and a full service restaurant. The facility heats with propane and there is no record of fuel oil on-site although the residents may use various fuels. Wastewater is discharged to the Erving

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

municipal wastewater treatment plant. The facility is also connected to the Erving Water Department municipal water system and utilizes water to supplement in an emergency and times of high demand. The facility utilizes dry wells for storm drains in the parking areas.

The Zone I is the protected area immediately surrounding the well while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual (Zone II) recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii for this facility's well are 267 feet and 687 feet, respectively, based on metered water use of approximately 13,000 gallons per day.

The overburden in the immediate area is mapped as a thick glacial stratified drift deposit over bedrock. The feature is a delta formed into Glacial Lake Hitchcock during the recession of the glaciers some 18,000 years ago. There is no evidence of a protective barrier of either thick till or of a confining, protective clay layer in the vicinity of the well. The bedrock in the immediate area of the well is mapped as Fourmile and Dry Hill gneiss, rock associated with the Bronson Hill Zone. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface. Please refer to the attached map of the Zone I and IWPA.

Water from the well is not treated. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 2 for additional information regarding the location of the well and activities within the protection areas.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

## 2. Discussion of Land Uses in the Protection Areas

The protection areas for Well #1 includes the entire facility: apartment buildings, 6 homes, part of Routes 2 and 63, side streets, the car wash and the restaurant.

#### Key issues include:

1. **Non-conforming activities within Zone I;**
2. **Residential;**
3. **Commercial facilities; and**
4. **Transportation corridors.**

**Table 2: Table of Activities within the Water Supply Protection Areas for Both Sources**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	--	--	--	Non-conforming uses in Zone I. Contact DEP prior to expanding the system or conducting any work in Zone I.
Residential	Yes	Yes	Moderate	Provide BMPs for household hazardous materials management.
Car wash	Yes	Yes	Low	The facility is connected to the municipal sewer.
Self-storage units	No	Yes	--	Monitor for storage of hazardous materials such as petroleum.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/den/hrn/dws/](http://www.state.ma.us/den/hrn/dws/).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridor/parking with dry wells	Yes	Yes	Moderate	Limit road deicing materials and monitor parking areas.
Transformers	Yes	Yes	Low	Although most transformers today do not contain PCBs, the oils may pose a threat due to the proximity to the well.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

The overall ranking of susceptibility to contamination for Weatherhead's water system is moderate, based on the presence of several moderate threat ranked land uses or activities in the Zone I and IWPA. Please refer to Table 2 for more details.

**1. Non-conforming activities within Zone I** – Currently, the water supplier does own the entire Zone I area however, the activities conducted within the Zone I are non-conforming and may pose a potential threat to the water supply. Systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I activities prior to increasing water use or expands the facility.

#### Recommendations:

- ✓ Consider relocation of the well if potential threats cannot be mitigated and water quality is impacted by activities or consider utilizing the Erving supply as an alternative.
- ✓ To the extent feasible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements. Prohibit new non-water supply activities in the Zone I.
- ✓ Where it is feasible, remove all hazardous materials from the Zone I. Continue current good housekeeping practices and the use of BMPs for the storage, use, and disposal of hazardous materials that are within your control.
- ✓ Monitor the parking lots for spills and accidental releases, as is feasible.
- ✓ Ensure that the local emergency response team is aware of your source and the protection areas in the event there is an accident.
- ✓ Inspect the well vault regularly to ensure it is sanitary and watertight.

**2. Residential Land Uses** – The Zone I and IWPA for Well #1 has high-density residential land use. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Although the facility itself uses propane, other properties in the IWPA may use alternate fuels. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and the associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and online at the MA DEP website - [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**3. Commercial facilities** – There are several commercial facilities located within the Zone I and IWPA: the car wash, restaurant, bowling alley and self-storage units. The potential threats are similar to those associated with residential land use such as household hazardous materials.

#### **Recommendations:**

- ✓ Since the parking area storm drains are dry wells, limit use of deicing materials.
- ✓ Provide the businesses with recommendations for BMPs regarding monitoring use of hazardous materials and monitor parking areas for accidental releases.

- ✓ Consider controlling the type of materials stored in the facility to limit hazardous material storage, including petroleum products.

**4. Transportation corridor/parking** – Route 2, Route 63 and parking for the apartments and commercial facilities are located within the Zone I and IWPA. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wild life and pets.

#### **Recommendations:**

- ✓ Prepare an Emergency Response Plan that includes coordination among the emergency responders to be sure they are aware of the location of your well and protection areas.

### **3. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. Review and consider adopting the key recommendations above and the following:

#### **Priority Recommendations:**

- ✓ Consider relocation of the well or utilizing Erving water if potential threats cannot be mitigated and water quality is impacted.
- ✓ Inventory activities in the IWPA and catalog any new potential threats identified.

#### **Zone I:**

- ✓ Prohibit any new non-water supply activities from the Zone I.
- ✓ Continue to prohibit public access to the well and pump house with locking facilities, gating roads, and posting signs as appropriate.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ Redirect road drainage in the Zone I away from the well area.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and local town boards.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Inform neighbors and consumers regarding BMPs with respect to household hazardous materials handling.

### Planning:

- ✓ Since the system is already within the Zone II protection area for the Erving water supply well, be sure the emergency responders are aware of your source.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the program fact sheet. Each program year, if funds are available, the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at the following DEP website: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
THE BUCK RUN

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 10, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS NAME</b>	The Buck Run
<b>PWS Address</b>	7 West Main Street
<b>City/Town</b>	Erving, Massachusetts
<b>PWS ID Number</b>	1091012

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well #1	1091012-01G	100	419	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1091012-01G)**

Zone I = 100 ft.  
IWPA = 419 ft.

### How Was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and parking areas within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
CHARLES F ZILINSKI MEMORIAL FIELD

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Charles F Zilinski Memorial Field
<i>PWS Address</i>	Prospect Street Ext
<i>City/Town</i>	Erving, Massachusetts
<i>PWS ID Number</i>	1091014

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1091014-01G	100	411	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1091014-01G)**

Zone I = 100 ft.  
IWPA = 411 ft.

## How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and the IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads residences and parking within the Zone I and the IWPA.

This source water assessment report is based on a site visit, water quality data and/or from other sources of information. DEP has not verified the accuracy of information submitted by you to the Department.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Gabriel Abbott Memorial School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Gabriel Abbott Memorial School (the school) is located on the south side of North County Road in Florida. Florida is a small, rural, town in northwestern Massachusetts on the Vermont border. Florida does not have a municipal water system or a wastewater treatment facility. Therefore the school is served by an on-site water supply and septic disposal system. The total school student and staff population is approximately 150 people per day.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

The school is served by one potable supply well (Well #1-01G), a 6-inch diameter, 150-foot deep, bedrock well that is located east of the school at the edge of the parking lot. The school, North County Road, a parking area for 12 to 15 cars, the septic system and a small play area are all within the protection areas of the well. The Town and school have undertaken steps to protect the well from potential threats during the past few years. The well was originally located in an 8-foot deep pit, but recently the well casing was extended to above grade to minimize the potential for flooding of the casing. The school also had an underground fuel oil storage tank located immediately adjacent to the well; that tank was replaced with an aboveground tank in 2000. Following the tank replacement, the Town applied for and was awarded a wellhead protection grant to move the tank topographically downgradient of the well and away from the immediate vicinity of the well. The Town is also in contact with staff from the regional Underground Injection Control Program (UIC) to address the floor drain in the basement that is believed to discharge to the septic system.

The school is located on the Hoosac Range of the Berkshire Highlands. Numerous bedrock outcrops in the area confirm the geologic mapping of thin till over bedrock. The bedrock in the immediate area of the school is mapped as the Hoosac Schist a grey-black quartz-mica schist. There is no evidence of a protective barrier of either thick till or of a confining, protective clay layer in the vicinity of the well. Wells located in this type of geologic setting are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water or other non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The well has a Zone I protective radius of 100 feet and an IWPA protective radius of 411 feet. These protective radii were based on the metered water use reported by the school of approximately 500 gpd. Please refer to the attached map that shows the Zone I and IWPA.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Fuel Oil Storage	No	Yes	Moderate	AST within containment in IWPA; floor drains in boiler room are being addressed.
School	Yes	Yes	Moderate	Limit road deicing materials use, use BMPs for household hazardous materials, monitor parking areas and control stormwater.
Residential housing	No	Yes	Moderate	Septic systems, household hazardous materials, home heating fuel.
Septic systems components	No	Yes	Moderate	Residential and the school's wastewater components are in the IWPA.
Transportation and parking	Yes	Yes	Moderate	Monitor stormwater runoff and redirect as necessary to protect the well.

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Water suppliers are required to monitor the water quality on a regular basis and the water from the school well is not treated prior to distribution. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas and in close proximity to the protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Above ground storage tanks;**
3. **School facilities;**
4. **Floor drain in the boiler room;**
5. **Transportation corridors/parking; and**
6. **Residential.**

There are several activities within the Zone I and IWPA that pose a potential threat to the water supply. The overall ranking of susceptibility to contamination for the well is moderate based on at least one moderate threat activity within the protection areas. Please refer to Table 2.

**1. Non-conforming Zone I** – The water supplier does not own or control the entire Zone I area for the well, however, the only activities in the Zone I are passive recreation and a periodic beaver population in the nearby wetland. Systems not meeting DEP Zone I requirements for ownership or control or non-conforming activities within Zone I must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Zone I Recommendations:

- ✓ Prohibit any additional non-water supply activities within Zone I and, where feasible, remove non-conforming activities within the Zone I areas.
- ✓ Do not use or store pesticides or fertilizers in Zone I.
- ✓ Do not store or use household hazardous materials near the well.
- ✓ Inspect the well regularly to ensure the cap is secure and there is no standing water near the well.

**2. Above ground fuel oil storage** – There is a fuel oil AST within containment in the IWPA. If managed improperly, fuel oil tanks and their associated piping can be a potential source of contamination due to leaks or spills of the materials they store.

### Recommendation:

- ✓ Any modifications to the tank must be accomplished in a manner consistent with Massachusetts' plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs and USTs.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier and town boards.

- V Monitor all activities associated with the fuel oil, especially delivery.
- V Have spill containment/absorbent materials available on-site

**3. School facilities** – Elementary and preschools generally use only household type hazardous materials.

#### Recommendations:

- V Continue the use of Best Management Practices for all activities at the school.
- V Review your emergency response plan regarding accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- V For additional information, refer to the Massachusetts Public Health Association's Healthy Schools website online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html).

**4. Floor Drains in Boiler Room** – There are floor drains in the boiler room, that are assumed to discharge to the septic system. However, the discharge point is not known. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry wells in areas where hazardous materials or petroleum may enter the floor drain. The floor drain must be protected to prevent boiler blow down, oil or other prohibited discharges through the floor drain. The school is presently working with the regional DEP UIC staff to resolve the issues regarding the floor drains.

#### Recommendations:

- V Be sure that the floor drains are in compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207 or Tony Zaharias 413-755-2122).
- V Containment to prevent accidental releases to the floor drain may be an option. Contact the regional DEP staff for the UIC program listed above. Oil lines from the tank to the boiler are sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. We recommend that you require your boiler maintenance contractor use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.
- V Seal all cracks in the floor and the floor drain if it cannot be adequately protected to prevent a prohibited discharge.

**5. Transportation corridor/parking** – Transportation corridors and parking are located within the Zone I and IWPA. Accidents and normal use and maintenance of corridors and parking areas may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as, waste from wildlife and pets.

#### Recommendations:

- V Prepare an Emergency Response Plan that includes coordination among the emergency responders to be sure they are aware of the location of your well.
- V Consider prohibiting parking immediately in front of the well casing.

**6. Residential Land Use** – There are two residences within the IWPA protection area. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the well’s susceptibility to contamination. The DEP commends the school and the Town on their efforts to remove the UST, pursue grant funds to move the AST, protect the well casing and address floor drains in the boiler room.

Please review and adopt the key recommendations listed above and as follows:

**Priority Recommendations:**

- ✓ Communication with the Town boards and emergency responders regarding the location of the well and the protection areas and continue efforts to protect the well.

**Zone I and IWPA:**

- ✓ Consider prohibiting parking immediately adjacent to the well.
- ✓ Prohibit any new non-water supply activities from Zone I.
- ✓ Conduct regular inspections of the Zone I and IWPA.
- ✓ Post drinking water supply signs in key locations such as along the access road and in the parking areas, but away from the well.
- ✓ Provide information to staff and pertinent school organizations about the potential hazards of household chemicals.
- ✓ Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, cleaning products and household hazardous waste.

**Training and Education:**

- ✓ Staff should be instructed on the proper disposal of spent chemicals. Include custodial staff, teachers, groundskeepers, and the certified operator.

**Planning:**

- ✓ Request that local officials develop and include the IWPA in an Aquifer Protection District and to continue assisting you in protection of the water supply.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- ✓ Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department’s Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for

funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
Whitcomb Summit Motel

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 25, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Whitcomb Summit Motel
<i>PWS Address</i>	Mohawk Trail
<i>City/Town</i>	Florida, Massachusetts
<i>PWS ID Number</i>	1098005

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I (feet)</i>	<i>Zone II</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1 Spring	1098005-01G	591	Refer to the map	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and a Contribution Area or Zone II. The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The Contribution Area is the larger area that is likely to contribute water to the spring. Refer to **Figure 1** on page 2 for an example of a Zone I and Contribution Area.

The Contribution Area of Zone II is the primary recharge area for the aquifer and the spring source. This area was defined by a hydrogeologic study conducted for the MA DEP SWAP program by the USGS. The Zone II was approved by DEP. Refer to the attached map to determine the land within your Zone II.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Contribution Area (Zone II). Please see the enclosed map for your well's Zone I and Zone II areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I IWPA  
EXAMPLE Source Protection  
Area for WELL #1 SPRING  
(1098005-01G)**

Zone I = 591 ft.  
Refer to map for the  
Contribution Area

### What is a Protection Area?

A spring's water supply protection area is the land around the spring where protection activities should be focused. Each spring has a Zone I protective area and a contribution area (Zone II).

## How Was My Well's Susceptibility Determined?

Your spring's **high** susceptibility to potential microbial threats is based on the septic system components within the contribution area and the physical construction of the spring collection box. The source is considered to be under the influence of surface water and the system is required to address this issue through specific actions as detailed by the Department. Contact the Department for further information regarding this source. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and the motel facilities within the Zone II contribution area.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Northfield Mount Hermon School**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Northfield Mount Hermon School
<i>PWS Address</i>	206 Main Street
<i>City/Town</i>	Gill
<i>PWS ID Number</i>	1106002
<i>Local Contact</i>	George Santucci
<i>Phone Number</i>	413-498-3455

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

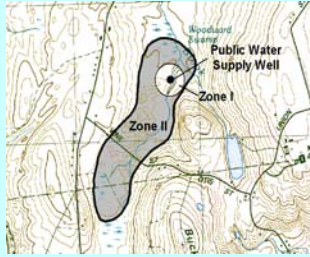

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

**Zone II #:** 499

**Susceptibility:** High

Well Names	Source IDs
Tubular Wellfield	1106002-01G

The Northfield Mount Hermon School has two campuses located in the rural communities of Northfield and Gill in Western Massachusetts along the Vermont border. The tubular wellfield for Northfield Mount Hermon School is located on the northwest side of the school campus in the neighboring community of Bernardston. The wellfield consists of twelve, 2 ½-inch diameter, 24-foot deep wells in series, manifolded together. The Zone I for the wellfield and the Zone II are shown on the attached map. The Zone I is oval shape with radial distance of 250 feet on the two end wellpoints. The Zone II, recharge area was delineated as part of the SWAP program utilizing analytical modeling and hydrogeologic mapping. Bernardston had designated an area around the wellfield as a water supply protection area, however that area must be revised to reflect the recently delineated Zone II, recharge area. Please refer to the attached map to view the boundaries of the Zones I and II.

The surficial deposits in the area are a result of glacial retreat some 10,000 to 12,000 years before present and in some areas overlain with recent alluvial deposits. Well logs from exploration programs indicate coarse sand and gravel from the surface to approximately 30 feet below grade, general coarsening downward until fine silt and clay are logged from 50 to 60 feet below grade where till was encountered. Drilling refusal at bedrock was noted in the logs at approximately 70 feet below grade. The well points are 24 feet in depth and therefore are above the potentially confining clay unit. Aquifers in this type of geologic setting are considered to be highly vulnerable to contamination because there is no confining layer such as clay to create a hydrogeologic barrier that can prevent contaminant migration to the aquifer. USGS mapped the bedrock in the area as the Bernardston Formation primarily consisting of fine-grained phyllite with interbeds of thin quartzite, several feet thick. In some areas the phyllite merges with dark gray and black slate.

Chlorine is used to disinfect the well water and sodium hydroxide is added for pH adjustment prior to distribution. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The Zone II area for Northfield Mount Hermon School is a mixture of residential, agricultural, and forested land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include: -

1. Residential land uses
2. Hazardous waste generator
3. Transportation corridors
4. Comprehensive wellhead protection planning
5. Agricultural activities
6. Railroad Right-of-Way

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2. The water supplier owns or controls the entire Zone I and is therefore in compliance with the Department's Zone I requirements. It was noted, however, that a floor drain was present in the pump house at the wellfield. Department policy allows for a drain in the water supply pump house provided it discharges at least 100 feet from the well and no hazardous materials can enter the drain. Since the water supply chemicals are properly stored in containment, it is recommended that a berm be placed around the drain itself as a precaution to prevent any accidental release through the drain from any lubricants that may be present on the pump.

**1. Residential Land Uses** – Approximately 7% of the Zone II consists of residential areas. Since Bernardston does not have a municipal sewer, wastewater is disposed of through on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**2. Hazardous Materials Storage and Use** – A small engine repair shop is located near the wellfield within the Zone II, just outside the Zone I. Its close proximity to

© 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

the source is of concern if good housekeeping and management is not practiced. The facility is registered as a Very Small Quantity Generator of Hazardous Waste. An inspection was conducted at the shop for the Underground Injection Control Program that regulates industrial floor drains. An illegal floor drain was noted during the inspection and a notice of non-compliance was issued. The Department will require the facility to come into compliance with all appropriate regulations and evaluate if a release has occurred at the facility. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store hazardous materials. If hazardous materials are improperly stored, used, or disposed of, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

#### **Hazardous Materials Storage and Use Recommendations:**

- ✓ Monitor the progress of the evaluation at the small engine repair shop. Refer to the Department's UIC contact Tony Zaharias at 413-755-21220 for further information.
  - ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet "Businesses Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.
  - ✓ Assist the local Board of Health to identify those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Assist the local Board of Health to educate local businesses on Massachusetts' floordrain requirements. See brochure "Industrial Floor Drains" for more information.

#### **Potential Source of Contamination vs. Actual Contamination**

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**3. Transportation Corridors** - Route 10 intersects the Zone II just north of the wellfield and local roads are common throughout the Zone II. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing materials, automotive chemicals and other debris on roads are picked up by stormwater and wash into catch basins.

#### **Source Protection Decreases Risk**

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

#### **Transportation Corridor - Recommendations:**

- ✓ **Low Salt Areas** - Join in efforts with the other water districts to submit a formal request to MA Highway Department and the Town of Bernardston in establishing Low Salt Areas within the Zone II and local roads. Encourage both organizations to educate employees and private contractors of the restrictions in designated Low Salt Areas.
- ✓ **Design and Best Management Practices** -

#### **What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Potential Contaminant Sources*
<b>Agricultural</b>			
Fertilizer Storage or Use	2 fields	M	Fertilizers: leaks, spills, improper handling, or over-application
Pesticide Storage or Use	2 fields	H	Pesticides: leaks, spills, improper handling, or over-application
<b>Commercial</b>			
Golf Course and maintenance shop	1	M	Fertilizers or pesticides: over-application or improper handling, hazardous materials
Railroad Tracks	1	H	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills
Repair Shops (Engine, Appliances, etc.)	1	H	Engine fluids, lubricants, and solvents: spills, leaks, or improper handling or storage
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cess-pools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Aboveground Storage Tanks	Numerous	M	Materials stored in tanks: spills, leaks, or improper handling (residential)
Small quantity hazardous waste generators	2	M	Hazardous materials and waste: spills, leaks, or improper handling or storage
Stormwater Drains/ Retention Basins	Numerous	L	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transportation Corridors	Numerous	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

Encourage Massachusetts Highway Department and its contractors to design a stormwater drainage system along within the Zone II that discharge stormwater outside of the recharge areas. Be sure the local and state highway departments are aware of the boundaries of the Zone II.

- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that you are notified of any spills within the Zone II and that the spill is effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

**4. Protection Planning** – Although the Bernardston does have an area around the wellfield that is designated as a water supply protection area, the controls don't entirely cover the Zone II nor meet DEP's Wellhead Protection regulations 310 CMR 22.21(2). Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells.

**Protection Planning Recommendations:**

- ✓ Work with Bernardston planners and the Bernardston Water Department to develop a comprehensive Water Supply Protection Plan for the various supplies in town. Update you current plan to include the newly delineated Zone II and assist Bernardston in establishing a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Coordinate efforts with local officials to review the recommendations in the Zone II reports that compare local wellhead protection controls with current

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

MA Wellhead Protection Regulations 310 CMR 22.21(2). The Department staff is available to assist you and the community of Bernardston in developing comprehensive protection. The Planning Board should contact Catherine V. Skiba 413-755-2119 of the Springfield Office. Contact For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.

- ✓ Refer to the Zone II reports for recommendations regarding floordrains, be sure to include floordrain controls that meet 310 CMR 22.21(2). Again coordinate with other water suppliers and the Board of Health. The Board of Health should contact Catherine V. Skiba 413-755-2119 of the Springfield Office.

**5. Agricultural Activities** – Croplands and pasture lands make up 38% of the land uses in the Zone II. There are corn and hayfields in the Zone II, in close proximity to the Zone I. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

**Agricultural Activities Recommendation:**

- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.

- ✓ Require any farmers working on your property that is leased, to have a farm plan and adhere to regulations and BMPs for fertilizer and pesticide use.
- ✓ Inform farmers that they are within the Zone II. The DFA—Pesticide regulations controls the types of pesticides that may be applied in a sensitive areas.

**6. Railroad Right-Of-Way** – A railroad spur runs through the Zone II north of the wellfield serving freight trains and is a potential contaminant source due to the possibility of chemicals released during normal use, track maintenance, and accidents. Over-application or improper handling of herbicides during railroad right-of-way maintenance is a potential source of contamination. Leaks or spills of transported chemicals or train maintenance chemicals are also potential sources of contamination to the water supply.

**Railroad Right-of-Way - Recommendations:**

- ✓ **Best Management Practices** - Work with local officials during their review of the railroad right-of-way Yearly Operating Plan to ensure Best Management Practices are implemented with regard to vegetation control in the Zone II, and that pesticides are not used in the Zone I.
- ✓ **Emergency Response Plan** - Work with your local fire department to review emergency response plans. Request that emergency response teams practice containment of potential contaminants from train accidents.

Other land uses and activities within the Zone II that are potential sources of contamination are included in Table 2. Refer to Appendix B for more information about these land uses. Land uses of concern that were mapped outside of the Zone II but nearby were the oil distribution facility, a junkyard and a cement plant. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources from daily activities and emergency response. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### Section 3: Source Water Protection Conclusions and Recommendations

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I and Zone II regularly.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Update Emergency Response Plan. Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Work with farmers in your protection areas and those that work school properties to make them aware of your water supply and to encourage the use of an NRCS farm plan and the Pesticide Bureau recommendations to protect water supplies.

#### What is a Zone III?

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

#### Additional Information

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

**Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

**Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>YES</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>YES</b>	Continue monitoring activities in Zone I.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>PARTIAL</b>	Bernardston's "Aquifer Protection District" bylaw does not meet 310 CMR 22.21(2) requirements. The district outline must be modified to include the Zone II and updated to include additional controls. Contact the Planning Board with these requests. Refer them to this and Bernardston's Zone II reports for recommended revisions to the bylaws. Contact the Department for assistance with these efforts.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>N/A</b>	
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>YES</b>	Update the plan as appropriate and continue to follow and maintain the Wellhead Protection Plan
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Work with the Bernardston Planning Board, Board of Health and the other water supplier in town to establish committee. Include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>NO</b>	Aim efforts at residential, commercial and municipal uses within the Zone II.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREA

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
50167	Agway Inc.	Route 10	Bernardston	Air Handler	BM 150	Agricultural Supply
*MAV000015 231	Charles Repair Shop	Turners Falls Road	Bernardston	Generator of Hazardous Waste	Very Small Quantity Generator	Small Engine Repair

\*Massachusetts Identification Number

### Underground Storage Tanks

Facility Name	Address	Town	Description	Tank Type	Tank Leak Detection	Capacity (gal)	Contents
Agway Inc.	RFD 1 Route 10	Bernardston	Agricultural Supply	1 Wall		10000	Fuel Oil

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitellst.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0001084	Route 10 (Agway)	Belchertown	

For more location information, please see the attached map. The map lists the release sites by RTN.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Gill Elementary School

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 2, 2003

**Table 1: Public Water System (PWS) Information**

<b>PWS NAME</b>	Gill Elementary School
<b>PWS Address</b>	48 Boyle Road
<b>City/Town</b>	Gill, Massachusetts
<b>PWS ID Number</b>	1106004
<b>Local Contact</b>	Mr. William Barton
<b>Phone Number</b>	800-340-6041

<b>Well Name</b>	<b>Source ID#</b>	<b>Zone I (in feet)</b>	<b>IWPA (in feet)</b>	<b>Source Susceptibility</b>
Well No. 1	1106004-01G	112	427	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses in the Protection Areas
3. Protection Recommendations
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Gill Elementary School is located in the small, rural town of Gill, in western Massachusetts near the Vermont border. The school has a student and staff population of approximately 160 people. There are no municipal water or wastewater systems in Gill, therefore, the school is served by one on-site water supply well and on-site septic disposal system. The well for the school is located east of the school on the edge of the field, just in the woods. The school reports that the well is an 8-inch diameter, gravel developed well approximately 81 feet deep. The well has 5-feet of screen and 76 feet of casing. In 1989, the school raised the well casing above grade to address chronic bacteria problems associated with water inundating the casing. The original well for the school is immediately west, in front of the school. That well is not used.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The area is on the edge of the Connecticut River valley at the base of the Berkshire foothills. The surficial geology at the school itself is thin but deepens somewhat to the east into the Ashuela Brook valley. The deposits deepen to the east of the school and are mapped as glacial outwash deposits associated with Glacial Lake Hitchcock. There is no record of the materials encountered during drilling but geologic mapping indicates fine materials interbedded or overlying coarse materials. Recent alluvium covers the area near the brook. The bedrock is mapped as the Mount Toby Formation, a sedimentary conglomerate rock. There is no empirical evidence of a protective clay layer or thick till to prevent activities on the ground surface from threatening the water supply. Therefore, the aquifer is identified as having a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA.

The Zone I is the area immediately around the well that is most vulnerable. The Zone I for a well is the protected area immediately surrounding the wellhead while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual recharge area (Zone II) has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The DEP allows only activities related to supplying water or other non-threatening activities within the Zone I. Many systems that were developed prior to the DEP requirements are grandfathered, but any expansion or changes to the system require DEP approval and compliance with Zone I restrictions. Well #1 has a Zone I radius of 112 feet and an IWPA radius of 427 feet. The Zone I was based on the maximum daily water use as determined from metered water data reported on a monthly basis.

The protection areas for the school include very few activities that pose a risk of contamination. However, there are activities that are just outside of the protection areas that may pose a significant threat to the well if not managed. There is an active cornfield within the IWPA. The farmer maintains a 150-foot buffer area along the edge of the field closest to the well where he does not apply herbicides. The septic system, the school and the underground storage tank for the fuel oil are located immediately outside of the IWPA. If funding becomes available, the school may wish to consider delineating the Zone II recharge area for the well so that the protection strategy for the well can be more focused.

The well serving the school has no treatment at this time. The DEP requires public water

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-	-	Contact DEP prior to expanding the system or conducting any work in the Zone I.
Fuel oil underground storage/floor drain in boiler room	-	-	Moderate /High	Spills, leaks, or improper handling of fuel oil from school discharged through floor drain
Floor drains in boiler room	No	Yes	Moderate	Potential release of oil to the ground in the IWPA.
Septic Systems	-	-	-	Nitrates, microbial contaminants, and improper disposal of hazardous chemicals
School – lawn care	No	Yes	Moderate	Continue policy of not using pesticides and fertilizers
Pesticide and fertilizer use	No	Yes	High	Pesticide and fertilizer: improper handling/application

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are few land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Floor drain in the boiler room**
3. **Elementary School;**
4. **Fuel oil storage; and**
5. **Agricultural use.**

The overall ranking of susceptibility to contamination for the wells is high, based on the presence of at least one high threat land use or activity in the IWPA, as seen in Table 2.

**1. Non-conforming Zone I** – Currently, the well does not meet DEP's restrictions, which require the system to own or control the entire Zone I area and allow only water supply related or other non-threatening activities in Zone I. The school's Zone I contains only passive recreation (ball field) and a wooded wetland. However, the school does not own and/or control all land encompassed by the Zone 1. Systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Do not allow any non-water supply activities in the Zone I.
- ✓ Locate the floor drain discharge location.

**2. Floor Drains in Boiler Room** – There is a sump pump and floor drain in the boiler room. The discharge point could not be exactly located during the assessment but it was believed to be to a surface discharge east of the school in the wooded area. It could not be determined if the discharge was in the Zone I or the IWPA. Title 5 prohibits disposal

of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry wells in areas where hazardous materials or petroleum may enter the floor drain. Contact the UIC coordinator to discuss compliance. If an accidental release occurred through the floor drain it may pose a threat to the well. It may be necessary to have the floor drain and sump pump to prevent groundwater from flooding the basement and it may be unreasonable to have the drain discharge to a tight tank. However, the floor drain must be protected to prevent boiler blow down, oil or other prohibited discharges through the floor drain.

### Recommendations:

- V Be sure that the floor drains are in compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
- ♦ Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207 or Tony Zaharias 413-755-2122).

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

- ✓ Containment of the fuel system to prevent accidental releases to the floor drain may be an option. Contact the regional DEP contact for the UIC program listed above. Oil lines from the tank to the boiler may be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. DEP recommends that you require that your boiler maintenance contractor use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.
- ✓ Seal all cracks in the floor and the floor drain if it cannot be adequately protected to prevent a prohibited discharge.

**3. School facilities and athletic fields** - Middle schools generally use only household hazardous materials for cleaning. There are state and federal regulations controlling some of the activities and products used at schools to promote "healthy schools". None of the school's facilities are located within the Zone I or IWPA of the wells. However, the facilities are just outside of the protection areas.

#### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic field. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- ✓ Investigate Integrated Pest Management and Best Management Practices within the IWPA as necessary.
- ✓ Use secondary containment for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or deicing materials within Zone I.
- ✓ Review your emergency response plan regarding accidental releases within the area. Ensuring that emergency responders in town are aware of the locations of your resource areas.
- ✓ Refer to the Massachusetts Public Health Associations Healthy Schools website online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html) for additional information.

**4. Fuel Oil Storage – Underground Storage Tank (UST)** – Although the UST fuel oil tank is outside of the protection areas, the UST can pose a potential threat to the water supply. If managed improperly, underground storage tanks and the associated fuel oil lines can be a potential source of contamination due to leaks or spills of the chemicals they store.

#### Recommendations:

- ✓ Any modifications to the UST must be accomplished in a manner consistent with Massachusetts plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.
- ✓ Monitor deliveries of oil as many spills are related to delivery.

**5. Agricultural Activities** – There is agricultural activity in an adjacent field within the IWPA of the well. The field is used to grow corn for a dairy farm and pesticides are applied by a licensed applicator. The licensed applicator is responsible for complying with regulations regarding application of products within the IWPA of the school well.

#### Recommendations:

- ✓ Attempt to obtain an agreement from the farm owner/operator that they will:
  - Follow all applicable UMASS recommendations on Integrated Pest Management.
  - Become certified in UMASS/Natural Resource Conservation Service Nutrient Management Certification program.
  - Obtain and follow a Farm Plan through Natural Resource Conservation Service. Alternatively, complete and follow a plan developed through the publication *On Farm Strategies to Protect Water Quality: An Assessment and Planning Tool for Best Management Practice*.

- ✓ Continue working with the commercial farmer in your protection area. Encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. If they are not currently working with NRCS and DAR, suggest that they review the fact sheet available online and call the local office of the NRCS in Hadley at 413-585-1000 for assistance or online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Encourage farmers to incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Continue your current work with farmers, to ensure that pesticides and fertilizers are being stored within a structure designed to prevent runoff.
- ✓ The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP), may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS for assistance.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The school is commended for replacing the old well with one that is fairly remote from the school and for not using pesticides and fertilizers on its athletic fields. The water supplier should review and adopt the key recommendations above and the following:

#### Priority Recommendations:

- ✓ Monitor fuel oil delivery and boiler room floor drains.

#### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Post the Zone I area with "Public Drinking Water Supply Recharge Area" signs at appropriate locations away from the actual well.
- ✓ Consider well relocation if Zone I threats cannot be mitigated or if water quality is impacted by activities.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.

#### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations away from the actual well.
- ✓ Incorporate groundwater education into the school curriculum.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the area and is treated according to DEP guidance.

#### Facilities Management:

- ✓ If it is feasible in the future, consider upgrading the heating system to propane for the purpose of removing fuel oil storage from the school.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on school property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

**Planning:**

- ✓ Work with local officials in town to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
ALAN'S BAR B QUE

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 6, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Alan's Bar B Que
<i>PWS Address</i>	235 French King Highway
<i>City/Town</i>	Gill, Massachusetts
<i>PWS ID Number</i>	1106007

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1106007-01G	163	458	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1106007-01G)**

Zone I = 163 ft.  
IWPA = 458 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and parking areas within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, water quality data, sanitary survey and from other sources of information provided to the Department by the owner. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- 3 inspect the Zone I and IWPA regularly;
- 3 work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- 3 restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- 3 make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- 3 remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- 3 do not use pesticides, fertilizers or road salt within the Zone I;
- 3 address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- 3 water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

Day Use Well	1108010-03G	100	422	High	High

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for  
TWINNING BROOK  
WELL (1108010-01G)**

Zone I = 100 ft.  
IWPA = 422 ft.

### How Was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and the IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads within the Zone I and the IWPA and the high ranking for the Day Use well (03G) is based on fuel oil storage in the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report for Bachelor Knolls

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## Introduction

We are all concerned about the quality of the water we drink. Many potential contaminant sources, including septic systems, road salt and improperly disposed of hazardous materials may threaten the quality of water from drinking water wells. Citizens and local officials can work together to better protect drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Bachelor Knolls water system is a residential subdivision located off of Bachelor Street in the north central part of Granby. The subdivision consists of 31 single-family residential homes served by on-site septic systems and a single public water supply well. Granby does not have a municipal water supply or municipal sewer. The neighborhood is served by a single well, Well #1 (01G) that pumps to the storage tank.

The Zone I and Interim Wellhead Protection Area radii for Well #1 are 279 feet and 746 feet, respectively. The protective radii were based on metered usage for the two highest months on record for the well. Please refer to the attached map that shows the Zone I and IWPA radii. The Zone I is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wells may be larger or smaller.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Well #1 is an 8-inch diameter well reportedly drilled to a depth of 130 feet. Well #1 is located in a small block building and utilizes a vertical turbine pump to fill the adjacent storage tanks. The subdivision is located in an area mapped as a potentially medium yield overburden (gravel) aquifer; there is no confining (clay) unit mapped in this area. The bedrock is mapped as sedimentary rocks of the Jurassic Period. There is no record of well construction, materials encountered during drilling, or of whether the well withdraws water from the gravel or the bedrock aquifer. There is no record of a significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the gravel or the bedrock aquifer. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface.

The Bachelor Knolls well water does not require and does not have treatment at this time. For current information on monitoring results, please review the Consumer Confidence report (CCR) that is issued annually by the water supplier or refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

A number of land uses and activities within the drinking water supply protection areas are potential sources of contamination. Therefore, the overall ranking of susceptibility to contamination for the wells is moderate, based on the presence of several moderate threat land uses or activities in the Zone I and IWPA, as seen in Tables 2 and 3.

### Key Land Use Issues include:

1. **Non-conforming activities in the Zone I**
2. **Residential homes**
3. **Septic systems**

**1. Non-conforming activities in the Zone Is** – The Zone I for Well #1 is non-conforming with respect to MA DEP land use restrictions, which allow only water supply related activities in the Zone I. The Zone I for Well #1 contains all activities associated with a residential neighborhood: roadways, transformers and residential homes. Please note that systems not meeting DEP Zone I requirements must receive DEP approval and address Zone I issues prior to increasing water use, modifying systems or conducting any activities within Zone I.

### Recommendations:

- ✓ Do not conduct any additional activities within the Zone I. Contact MA DEP prior to conducting any activities within Zone I.

**Table 2: Table of Activities Common to the Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Roadways	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Transformers	Yes	Yes	Moderate	Potential release of MODF; contact utility to inform them you are a PWS
Septic system components	Yes	Yes	Moderate	Several residential systems in Zone I; multiple in IWPA
Residential homes, lawns and swimming pools	Yes	Yes	Moderate	Household hazardous materials, pesticides and herbicides

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

- ✓ Prepare an emergency response plan for responding to an accidental release of hazardous materials such as home heating fuel or gasoline.
- ✓ Monitor the Zone I and IWPA for spills and leaks of materials such as household hazardous materials and petroleum products.

**2. Residential homes** – Residential development includes the subdivision and abutting residential neighborhoods. Normal residential activities pose minimal threat to the water quality of the public water supply as well as their own private supply, provided homeowners are aware of the potential hazards of household waste (including automotive maintenance), lawn care chemicals, pool chemicals, animal waste and septic systems and they utilize best management practices.

**Recommendations:**

- ✓ Provide residents with information about protecting the facility's resources. Include information on Best Management Practices (BMPs) for the use of pesticides, household hazardous waste and septic system maintenance and disposal practices.
- ✓ Encourage residents to participate in household hazardous waste collection days and the paint exchange program in Granby.

**3. Septic Systems** - Granby does not have municipal sewers in this area, therefore all homes are served by on-site septic disposal. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste.

**Recommendations:**

- ✓ Provide residents with information about proper maintenance and disposal practices for septic systems. Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.

Work with the DEP and local officials regarding protecting the water supplies through emergency response coordination, especially with respect to spills and accidental releases that may be discharged through storm drains.

### 3. Protection Recommendations

To reduce the system's susceptibility to contamination, the Bachelor Knolls water supplier should review and adopt the following recommendations:

**Priority Recommendation:**

- ✓ Provide residents with information about protecting the neighborhood's resources. Include information on Best Management Practices (BMPs) for the use of pesticides, household hazardous waste and septic system maintenance and disposal practices. Keep up to date on the Hazardous Waste Pickup dates in Granby and the schedules for the paint exchange shed and inform residents. Refer to the following website for guidance <http://www.state.ma.us/dep/consumer/consumer.htm>

**Zone I and IWPA:**

- ✓ Keep all new non-water supply activities out of the Zone I.
- ✓ Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use, modifying their system or conducting any additional non-conforming activities in Zone I.
- ✓ Continue the practice of prohibiting public access to the well by locking facilities, and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any aboveground tanks for leaks, etc.
- ✓ Consider alternative sites for a new well and protect that land for future use through purchase or conservation restriction that would prohibit potentially threatening activities if Zone I threats cannot be mitigated.
- ✓ Work with the DEP and local officials regarding protecting the water supplies through emergency response coordination.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:

[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws)

Copies of this assessment have been provided to the public water supplier, town boards, and the local media.

- ✓ Be sure that the town is aware that your facility is a public water supply so that you can be notified of any accidents or threats from accidents. Ask that your facility be included in Town wide water supply protection efforts.

## Training and Education:

- ✓ Train the water supply personnel on proper emergency response and best management practices so that you may assist the residents in protecting their water supply.
- ✓ Maintain the drinking water protection area signs at key visibility locations along the roadway.

## Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of any hazardous materials. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/bwp/dhm/dhmpubs.html](http://www.state.ma.us/dep/bwp/dhm/dhmpubs.html).
- ✓ Continue the practice of not utilizing fertilizers or pesticides near the supply.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. Especially the transformers in Zone I. If PCBs are present, inform the utility that you are a PWS and urge the immediate replacement of the MODF. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

## Planning:

- ✓ Work with local officials in town to include the facility IWPA in an Aquifer Protection District Bylaws and to assist you in improving protection. Prepare a wellhead protection plan.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential contaminant sources, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

St. Hyacinth College (the school) is located in the central section of Granby on School Street (State Route 202). The facility consists of several buildings located adjacent to each other. The total school student and staff population has fluctuated during the past few years as the use of the facility has changed. Presently, the facility is the temporary home of Holyoke Catholic High School and has a current population of approximately 500 people per day. The school is served by two potable supply wells: Well #1 and Well #2. The school utilizes Well #1 as the main source and Well #2 is utilized as an active backup source. Well #1 is a 350-foot deep bedrock well; Well #2 is a 40-foot

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

deep (shallow), gravel well. Well #1 is located in a vault near the main complex in front of the gymnasium and laundry. Well #2 is located in a pit in an old hay field; there is evidence of high water on the sidewalls of the pit at a level above the top of the well casing. There is no municipal wastewater sewer system in Granby; therefore, the school and surrounding facilities are served by on-site septic disposal.

Geologic mapping in the area indicates overburden deposits of approximately 50 feet in the vicinity of Well #2 and greater than 50 feet with some amount of till over bedrock in the vicinity of Well #1. The school is located in an area that is mapped as a potential, medium yield, sand and gravel aquifer. The sediments are likely sand and gravel deposited during the recession of the glaciers some 14,000 to 18,000 years ago. The bedrock in the area is mapped as intrusive rocks of the Belchertown Complex.

The Zone I is the area immediately around the well where only activities associated with supplying water or other non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. Both wells have Zone I protective radii of 246 feet and an IWPA protective radii of 609 feet. These protective radii were calculated based on the metered water use from the two highest months of use from Well #1. Please refer to the attached map that shows the Zone I and IWPA. The Zone I area for Well #1 is not conforming to current DEP requirements. The Zone I area for Well #1 includes the school, parking areas, the maintenance garage, former locations of USTs, the current fuel oil tank vault and components of septic systems; the IWPA of Well #1 includes the remainder of the school facilities, parking and the main leachfield. According to the current owners, the maintenance equipment has been removed from the garage. The Zone I for Well #2 includes only an abandoned hay field; the IWPA of Well #2 includes

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Fuel Oil Storage	No	Well #1	Moderate	Contained within a vault
Floor Drains in Boiler Rooms	No	Well #1	Moderate	Consult with UIC program regarding compliance
Agriculture/Athletic fields	No	Both	Moderate	Continue prohibiting the use of pesticides/fertilizers on school fields; use IPM.
School facilities, parking and infiltration catchbasins	Well #1	Both	Moderate	Limit road deicing usage, use BMPs for household hazardous materials and monitor parking areas and control stormwater
Low density residential housing	No	Well #2	Moderate	Septic systems, household hazardous materials, home heating fuel
Transportation Corridor	No	Well #2	Moderate	Route 202
Septic systems components	No	Both	Moderate	Residential and part of the school leachfield are in the IWPA
Hazardous materials	No	Well #1	High	Maintenance hazardous materials/laboratory waste
Transformers	No	Both	Low	Monitor transformers for potential leaks
Confirmed hazardous materials release site	Well #1	Well #1	-	Contact Bureau of Waste Site Cleanup

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

part of Route 202 and the leachfield. All of the underground petroleum storage tanks have been removed however, the school is a confirmed hazardous materials release site as a result of a leak from a gasoline UST that was removed some time ago; remediation at the site is on-going. In addition, the school is a registered very small quantity generator of hazardous waste.

Many water supplies were developed prior to the current DEP Zone I restrictions and are therefore, grandfathered sources. Water suppliers with non-conforming sources must notify the DEP prior to conducting any additional activities within the Zone I or expanding the systems. Water suppliers are required to frequently monitor the quality of water distributed. The water utilized at St. Hyacinth College is not treated prior to distribution. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

There is no evidence of a continuous, protective confining clay layer in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from activities on the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Fuel oil storage;**
3. **Confirmed Hazardous Materials Release Site;**
4. **Floor drains in boiler rooms;**
5. **School facilities and athletic fields;**
6. **Transportation corridors and parking; and**
7. **Hazardous materials.**

Figure 1: Example of how a well could become contaminated by different land uses and activities.

There are several activities within the Zone I and IWPA that pose a significant threat to the water supply. The overall ranking of susceptibility to contamination for the well is high based on at least one high threat activity within the protection areas. Please refer to Table 2.

**1. Non-conforming Zone I** – Although the water supplier owns and controls the entire Zone I area for both wells, there are non-conforming activities within the Zone I of Well #1. Many water supplies were developed prior to the promulgation of the current DEP Zone I requirements and those sources are grandfathered sources. Sources not meeting DEP Zone I requirements must receive approval from DEP and address Zone I issues prior to increasing water use or modifying systems.

### Zone I Recommendations:

- ✓ Prohibit any additional activities within Zone I and, where feasible, remove non-conforming activities within the Zone I areas.
- ✓ Use Best Management Practices for handling treatment

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier and town boards.

chemicals and vehicles used to access the area.

- ✓ Monitor all deliveries, especially petroleum products and hazardous materials and parking areas.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Consider replacement of the source if water quality becomes impacted by activities

**2. Fuel oil storage** – There is one fuel oil tank in a vault located within the IWPA. If managed improperly, tanks and associated fuellines can be a potential source of contamination due to leaks or spills of the materials they store.

#### Recommendation:

- ✓ Any modifications to the tank must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs.
- ✓ Monitor all activities associated with the fuel oil especially delivery.
- ✓ Have spill containment/absorbent materials available on-site.

**3. Confirmed Hazardous Waste Release Site** – The school is designated as a confirmed hazardous materials release site related to the removal of a gasoline tank years ago. As noted, remediation at the site is on-going.

#### Recommendations:

- ✓ Contact the Bureau of Waste Site Cleanup (413) 784-1100, regarding information about the status of this site. The site identification number is RTN # 1-0014117.

**4. Floor Drains in Boiler Room and garage** – There are floor drains in the boiler room, and there was a pit in the garage. The pit in the garage has been filled in and will be sealed; the drains in the boiler room discharge to a wet well from which water can be pumped into the septic system. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry wells in areas where hazardous materials or petroleum may enter the floor drain. The floor drain must be protected to prevent boiler blow down, oil or other prohibited discharges through the floor drain. The facility has contacted their consultant to address this issue. The consultant has already contacted the UIC program coordinator to discuss the alternatives.

#### Recommendations:

- ✓ Continue persuing compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207 or Tony Zaharias 413-755-2122).
- ✓ Consider installing a tight tank.
- ✓ Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. We recommend that you require your boiler maintenance contractor to use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.
- ✓ Seal all cracks in the floor and the floor drain if it cannot be adequately protected to prevent a prohibited discharge.

**5. School facilities and athletic fields** – Schools generally use only household type hazardous materials. However, high school laboratory and photo labs can use potentially harmful materials and the school does not have a tight tank for the laboratory waste. There are state and federal regulations controlling some of the activities and products used at schools to promote "healthy schools". All of the school's facilities are located within the Zone I or IWPA of the well. Potential exists for contamination of the well by onsite use of fertilizers and/or pesticides. Storm drains in the parking areas at the school drain directly into the ground.

#### Recommendations:

- V Continue the use of Best Management Practices for all activities at the school and at the athletic fields. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- V Investigate Integrated Pest Management and Best Management Practices within the IWPA as necessary.
- V Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- V Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or deicing materials within Zone I.
- V Review the handling of laboratory wastes to determine if a tight tank is appropriate.
- V Review your emergency response plan regarding to accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- V Refer to the Massachusetts Public Health Associations Healthy Schools website available online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html) for additional information.
- V Review laboratory wastes and determine if a tight tank or other management process is required. Laboratory, photo and other non-sanitary wastewater should not be disposed of through a septic system. Refer questions to Paul Nietupski at 413-755-2218 of the Springfield Office of the DEP regarding wastewater issues.

**6. Transportation corridor** – Route 202 is located within the IWPA along with the access and parking areas for the facility. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance, car washing, and accidental spills, as well as waste from wildlife and pets.

**Recommendations:**

- V Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they are aware of the location of your well.
- V Monitor the sodium levels in the water.

**7. Hazardous Materials Storage and Use** – The school utilizes hazardous materials for maintenance. Hazardous materials such as paint, thinners, petroleum products, etc. should be kept in containment and used with caution. Cleaning and disposal should not be through the septic system. Spill kits and signs designating areas of storage should be available. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground. The school is a registered very small quantity hazardous waste generator.

**Hazardous Materials Storage and Use Recommendations:**

- V Review current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.
- V Use BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the water supply's susceptibility to contamination. The DEP commends the effort shown in current protection practices of not using pesticides and fertilizers in the Zone I. The school should comment to the various town boards regarding developments that may impact the school's wells.

Please review and adopt the key recommendations listed above and as follows:

**Priority Recommendations:**

- V Replace the wells if the sources cannot be adequately protected or if water quality is impacted.

**Zone I and IWPA:**

- V Prohibit any new non-water supply activities from Zone I.
- V Conduct regular inspections of the Zone I and IWPA.
- V Monitor activities and if there is evidence of increased activity or access, consider relocating the wells.
- V Post drinking water supply signs in key location such as along the access road and in the parking areas but away from the wells themselves.
- V Provide information to staff and pertinent school organizations about the potential hazards of household chemicals,

lawn care chemicals and fertilizers.

- V Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, pesticides and household hazardous waste.

#### **Facilities Management and Education:**

- V Incorporate groundwater education into school curriculum (7-12 curricula available; contact DEP for copies).
- V Staff should be instructed on the proper disposal of spent chemicals. Include custodial staff, teachers, groundskeepers, and certified operator.
- V Contact the UIC coordinator to evaluate compliance for the floor drains in the boiler room and waste disposal.

#### **Planning:**

- V Work with local officials to develop an Aquifer Protection District Bylaw that includes the IWPA's and to assist you in continued protection of the water supply.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- V Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

#### **Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## **4. Attachments**

- Map of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheet
- UIC/Industrial Floor Drain

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREAS

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
	St. Hyacinth College	School Street	Granby	Hazardous Waste Generator (Waste oil)	VSQG	Maintenance
				Air Quality	AQ	Plant

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitelist.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0014117	School Street	Granby	Oil

For more location information, please see the attached map. The map lists the release sites by RTN.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Granby Housing Authority

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared  
October 21, 2003

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1111002-01G	246	609	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential contaminant sources, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Granby Housing Authority is comprised of 4 buildings each with 14, 1-bedroom apartment units and an administration building. The facility is located in the central section of Granby on Phins Hill Road. The total population is approximately 60 people. The facility is served by a single potable supply well, Well #1 and wastewater from the facility is discharged to a municipal sewer connected to South Hadley.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

Well #1 is a 280-foot deep bedrock well. The well is located in a vault behind the facility. Geologic mapping in the area indicates thin overburden deposits with the bedrock in the area mapped as Jurassic aged sedimentary rocks of the Portland Formation.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water or non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The Zone I and IWPA protective radii are 209 feet and 519 feet. These protective radii were calculated based on the metered water use from the two highest months of use from Well #1. Please refer to the attached map that shows the Zone I and IWPA. The Zone I area for Well #1 is not conforming to current DEP requirements. The Zone I area for Well #1 includes one of the buildings, parking areas, and the maintenance garage. The IWPA includes the remainder of the facility, parking, West State Street and a farm supply store southeast of Route 202. The maintenance garage has a floor drain that is believed to have an oil-water separator and to be connected to the sewer. Lawn and maintenance equipment is stored in the facility including paints, thinners and petroleum products.

There is no evidence of a continuous, protective confining clay layer in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from activities on the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer. The water is not treated prior to distribution. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Lawn	Yes	Yes	Low	Continue prohibiting the use of pesticides/fertilizers on lawns at the facility.
High density residential housing	Yes	Yes	Moderate	Septic systems, household hazardous materials, home heating fuel
Transportation Corridor/parking	Yes	Yes	Moderate	Route 202 and internal road and parking
Hazardous materials – Fertilizers & pesticides at the store	No	Yes	Moderate/High	Maintenance of hazardous materials – store materials in containment. Farm store partially within IWPA.
Transformers	No	Yes	Low	Monitor transformers for potential leaks

**-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).**

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Residential facilities;**
3. **Transportation corridors and parking; and**
4. **Hazardous materials.**

There are several activities within the Zone I and IWPA that pose a significant threat to the water supply. The overall ranking of susceptibility to contamination for the well is moderate based on at least one moderate threat activity within the protection areas. Please refer to Table 2. Although the farm store does have pesticides and fertilizers, they are stored for sale and not application on site.

**1. Non-conforming Zone I** – Although the water supplier owns and controls the entire Zone I area, there are non-conforming activities within the Zone I. Systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Zone I Recommendations:

- ✓ Prohibit any additional activities within Zone I and where feasible remove non-conforming activities within the Zone I areas.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
- ✓ Monitor all deliveries, especially petroleum products and hazardous materials and parking areas.
- ✓ Continue to prohibit the use of pesticides, fertilizers or road salt within Zone I.

**2. Residential Land Uses** – The residences have on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - Although Granby Housing Authority heats by electricity, the other private residences within the northern portion of the IWPA may heat with fuel oil or diesel fuel. If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Transportation corridor and parking** – Route 202 is located within the IWPA along with the access and parking areas for the facility. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets.

### Recommendations:

- ✓ Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they are aware of the location of your well.
- ✓ Monitor the sodium levels in the water.

**4. Hazardous Materials Storage and Use** – The facility utilizes hazardous materials for maintenance. Hazardous materials such as paint, thinners, petroleum products, etc. should be kept in containment and used with caution. Cleaning and disposal should not be through the septic system. Spill kits and signs designating areas of storage should be available. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, or floor drain leading directly to the ground.

### Hazardous Materials Storage and Use Recommendations:

- ✓ Review current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.
- ✓ Use BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the well's susceptibility to contamination. The DEP commends the effort shown in current protection practices of not using pesticides and fertilizers in the Zone I.

Please review and adopt the key recommendations listed above and as follows:

### Priority Recommendations:

- ✓ Consider modifying the access to the pit for safer access.

### Zone I and IWPA:

- ✓ Prohibit any new non-water supply activities from Zone I.
- ✓ Conduct regular inspections of the Zone I and IWPA.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider relocating the wells.
- ✓ Post drinking water supply signs in key location such as along the access road and in the parking areas but away from the well.
- ✓ Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, pesticides and household hazardous waste.

**Training and Facilities Management:**

- V Staff should be instructed on the proper disposal of spent chemicals. Include custodial staff, groundskeepers, and certified operator.

**Planning:**

- V Work with local officials to develop an Aquifer Protection District Bylaw that includes the well's IWPA and to assist you in continued protection of the water supply.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- V Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## Introduction

We are all concerned about the quality of the water we drink. Many potential contaminant sources, including septic systems, road salt and improperly disposed of hazardous materials may threaten the quality of water from drinking water wells. Citizens and local officials can work together to better protect drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Granby Heights Condominium complex is located south of Route 116 and consists of two buildings with a total of 76 units that are heated by electric heat. Currently, approximately 135 people reside at the complex. The facilities include a tennis court, a swimming pool, parking, lawn and wooded areas. The facility is served by onsite septic disposal. Granby does not have a municipal water supply, however, South Hadley's water system extends to within one-quarter mile of the facility. The complex is served by two wells, Wells #1 (01G) and #2 (02G) that pump simultaneously to the storage tank.

The Zone I and Interim Wellhead Protection Area radii for Wells #1 and #2 are 221 feet and 543 feet, respectively. The protective radii were based on metered usage for the two highest months on record for the wells. Please refer to the attached map that shows the

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Zone I and IWPA radii. The Zone I is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wells may be larger or smaller.

Well #1 is a 6-inch diameter well drilled into the bedrock aquifer. Well #1 is located in a concrete pit in the parking area and is nearly flush with the floor of the pit. The pit has a watertight manhole access port and is approximately six feet deep. There is no drain in the pit. Although there was moisture approximately 18-inches up on the wall of the pit, there was no obvious evidence of flooding in the pit. Well #2 is located adjacent to the swimming pool and extends approximately 12-inches above grade. At the time of the assessment, the cover of Well #2 was not secure and the slope on the hillside was slumping allowing for ponding of water around the wellhead.

The complex is located on an upland area believed to be underlain by till and shallow bedrock. The bedrock is mapped as Mesozoic sedimentary and volcanic units consisting of conglomerate, sandstone and basalt. There are no detailed records of the well construction or of the materials encountered during drilling. However, records do indicate Well #1 is approximately 300 feet deep and Well #2 is approximately 290 feet deep. Pumps in both wells are set at 260 feet. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

The Granby Heights Condominium well water does not require and does not have treatment at this time. For current information on monitoring results, please review the Consumer Confidence report (CCR) that is issued annually by the water supplier or refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

A number of land uses and activities within the drinking water supply protection areas are potential sources of contamination. Therefore, the overall ranking of susceptibility to contamination for the wells is moderate, based on the presence of moderate threat land use or activity in the Zone I and IWPA, as seen in Tables 2 and 3.

**Table 2: Table of Activities Common to the Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Parking lots and driveways	Both Wells	Both Wells	Moderate	Limit road salt usage and provide drainage away from wells
Transformers (above and below grade)	Both Wells	Both Wells	Moderate	Potential release of MODF
Septic system components	Both Wells	Both Wells	Moderate	Lines and tank in Zone I, leachfield in IWPA
Pool and related chemical storage and backwash discharge	Well #1	Well #2	Moderate	Use Best Management Practices, containment

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Table 2: Table of Activities Common to the Protection Areas (Continued)**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Residential homes, lawns and parking	Well #1	Both Wells	Moderate	Household hazardous materials, pesticides and herbicides
Storm drains	Both Wells	Both Wells	Low	Road salt, spills and runoff

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Key Land Use Issues for the Wells include:**

1. Non-conforming activities in the Zone I
2. Wellhead sanitary seal
3. Residential homes

**1. Non-conforming activities in the Zone Is** – The Zone I for both Wells #1 and #2 are non-conforming with respect to MA DEP land use restrictions, which allow only water supply related activities in Zone Is. The Zone I for Wells #1 and #2 contain all activities associated with the facility: parking, roadways, transformers and residential buildings. Please note that systems not meeting DEP Zone I requirements must receive DEP approval and address Zone I issues prior to increasing water use, modifying systems or conducting any activities within Zone I.

**Recommendations:**

- ✓ Do not conduct any additional activities within the Zone I. Contact MA DEP prior to conducting any activities within Zone I.
- ✓ Prepare an emergency response plan for responding to an accidental release.
- ✓ Encourage residents to utilize Granby's household hazardous waste collection days.
- ✓ Monitor parking lots for spills and leaks.

**2. Wellhead integrity** – There is a watertight manhole cover for Well #1 and there is no apparent sanitary seal on Well #2.

**Recommendations:**

- ✓ Inspect the integrity of the watertight manhole gasket at least four times per year. Be diligent in setting the gasket properly.
- ✓ Install watertight seals on all wellhead connections in Well #1. Continue the current practice of monitoring the vault periodically to be sure that groundwater does not enter the vault.
- ✓ Install a sanitary seal on Well #2.

**3. Residential homes** – Residential development includes the condominium complex and an abutting residential neighborhood. Normal residential activities pose minimal threat to the water quality of the public water supply as well as their own private supply provided homeowners are aware of the potential hazards of household waste, lawn care chemicals, animal waste and septic systems and they utilize best management practices.

**Recommendations:**

- ✓ Provide residents with information about protecting the facilities resources. Include information on Best Management Practices (BMPs) for the use of pesticides, household hazardous waste and septic system maintenance and disposal practices.
- ✓ Encourage residents to utilize Granby's household hazardous waste collection days and paint exchange program.

Other activities identified in the protection areas are stormwater discharges located within the Zone I and IWPA of the wells. The condominium should use BMPs and include periodic cleaning of catch basins and street sweeping. Street sweepings and catch basin cleanings are considered solid waste and should be handled as described in the DEP's policy.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

Work with the DEP, State highway and local officials regarding protecting the water supplies through emergency response coordination, especially with respect to spills and accidental releases that may be discharged through storm drains.

## 3. Protection Recommendations

To reduce the system's susceptibility to contamination, the Granby Heights Condominium should review and adopt the following recommendations:

### Zone I and IWPA:

- ✓ Keep all new non-water supply activities out of the Zone I.
- ✓ Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use, modifying their system or conducting any additional non-conforming activities in Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Prohibit public access to the wells by locking facilities and posting signs at the facility entrance. Check the integrity of the well caps regularly and replace as necessary.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any aboveground tanks for leaks, etc.
- ✓ Consider alternative sites for a new well and protect that land for future use through purchase or conservation restriction that would prohibit potentially threatening activities.
- ✓ Work with the local fire department, DEP, State highway, and local officials regarding protecting the water supplies through emergency response coordination.
- ✓ Be sure that the town is aware that your facility is a public water supply so that you can be notified of any accidents or threats from accidents. Ask that your facility be included in Town wide water supply protection efforts.

### Training and Education:

- ✓ Continue staff training on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, certified operator, and other appropriate staff.
- ✓ Maintain the drinking water protection area signs at key visibility locations.

### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of any hazardous materials at the facility. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/bwp/dhm/dhmpubs.html](http://www.state.ma.us/dep/bwp/dhm/dhmpubs.html).
- ✓ Continue utilizing Best Management Practices (BMPs) for the use of fertilizers pesticides on facility property.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. Especially the transformers in Zone I. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Work with local officials in town to include the facility IWPA in an Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at

[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws)

including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, and the local media.

it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Granby Jr./Sr. High & East Meadow School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared  
October 16, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Granby Jr/Sr High & East Meadow School (the school) is located in the central section of Granby on East State Street (State Route 202). The facility consists of two separate school building located adjacent to each other. The total school student and staff population is approximately 800 people per day. The school is served by one potable supply well (Well #1). The school also maintains a second emergency well (Well #2). Well #2 is a shallow, gravel well that is disconnected from the system and will not be further addressed in this report. Well #1 is located in the front lawn of the

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

school approximately 150 feet from the road and 300 feet from the school. The well is an 8-inch diameter, 24-foot deep, gravel developed well. There is no municipal wastewater sewer system in Granby; therefore, the school and surrounding facilities are served by on-site septic disposal.

Geologic mapping in the area indicates overburden deposits of greater than 50 feet of sand with some amount of till over bedrock at the school. The school is located in an area that is mapped as a potential, medium yield, sand and gravel aquifer. The area is a bedrock valley that was filled with stratified drift (sand and gravel) during the recession of the glaciers some 14,000 to 18,000 years ago. The bedrock in the area is mapped as gneiss of the Belchertown Complex.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The well has a Zone I protective radius of 232 feet and an IWPA protective radius of 569 feet. These protective radii were calculated based on the metered water use from the two highest months of use. Please refer to the attached map that shows the Zone I and IWPA. The Zone I area for the well is not conforming to current DEP requirements. The Zone I area for Well #1 includes part of the school parking area and a small portion of Route 202. The IWPA includes both schools, parking, fuel oil tanks, residential homes, a portion of a cornfield and components of septic systems.

The well is a relatively shallow well and there is no evidence of a continuous, protective confining clay layer in the vicinity of the well. Wells drilled in these conditions are considered highly vulnerable to potential contamination from activities on the ground

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Fuel Oil Storage	No	Yes	High	UST w/leak detection at school
Floor Drains in Boiler Rooms	No	Yes	Moderate	Consult with UIC program regarding compliance
Agriculture/Athletic fields	No	Yes	Moderate	Continue prohibiting the use of pesticides/fertilizers on school fields. Refer farmers to DAR and NRCS regarding IPM
School facilities, parking and infiltration catchbasins	Yes (6 spaces)	Yes	Moderate	Limit road deicing usage, use BMPs for household hazardous materials and monitor parking areas and control stormwater
Low density residential housing	No	Yes	Moderate	Septic systems, household hazardous materials, home heating fuel
Transportation Corridor	Yes	Yes	Moderate	Route 202
Septic systems components	No	Yes	Moderate	Residential and part of the school leachfield are in the IWPA
Hazardous materials	No	Yes	High	Maintenance hazardous materials/laboratory waste
Transformers	No	Both	Low	Monitor transformers for potential leaks

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer. The pH of the water is adjusted for corrosion control prior to distribution. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Underground storage tanks;**
3. **Floor drains in boiler rooms;**
4. **School facilities and athletic fields;**
5. **Transportation corridors and parking; and**
6. **Hazardous materials.**

There are several activities within the Zone I and IWPA that pose a significant threat to the water supply. The overall ranking of susceptibility to contamination for the well is high based on at least one high threat activity within the protection areas. Please refer to Table 2.

**1. Non-conforming Zone I** – The water supplier does not own or control the entire Zone I area for either well. Systems not meeting DEP Zone I requirements for ownership or control, or non-conforming activities within Zone I must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Zone I Recommendations:

- ✓ Prohibit any additional activities within Zone I and, where feasible, remove non-conforming activities within the Zone I areas.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
- ✓ Monitor all fuel oil deliveries and parking areas.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

**2. Underground fuel oil storage** – There are three fuel oil USTs located within the IWPA. If managed improperly, fuel oil tanks can be a potential source of contamination due to leaks or spills of the materials they store.

### Recommendation:

- ✓ Any modifications to the tank must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs and USTs.
- ✓ Monitor all activities associated with the fuel oil especially delivery.
- ✓ Have spill containment/absorbent materials available on-site

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

**3. Floor Drains in Boiler Room** – There are floor drains in the boiler room, that are assumed to discharge to the septic system. However, the discharge point is not known. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry wells in areas where hazardous materials or petroleum may enter the floor drain. The floor drain must be protected to prevent boiler blow down, oil or other prohibited discharges through the floor drain.

#### Recommendations:

- ✓ Be sure that the floor drains are in compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207 or Tony Zaharias 413-755-2122).
- ✓ Containment to prevent accidental releases to the floor drain may be an option. Contact the regional DEP contact for the UIC program listed above. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. We recommend that you require your boiler maintenance contractor use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.
- ✓ Seal all cracks in the floor and the floor drain if it cannot be adequately protected to prevent a prohibited discharge.

**4. School facilities and athletic fields** – Elementary and middle schools generally use only household type hazardous materials. However, high school laboratory and photo labs can use potentially harmful materials and the school does not have a tight tank for the laboratory waste. There are state and federal regulations controlling some of the activities and products used at schools to promote “healthy schools”. All of the school’s facilities are located within the Zone I or IWPA of the well. Potential exists for contamination of the well by onsite use of fertilizers, pesticides, all of which can be of concern. Storm drains in the parking areas at the school drain directly into the ground. The high school does use micro-pipeting techniques to minimize laboratory waste.

#### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields across the street. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- ✓ Investigate Integrated Pest Management and Best Management Practices within the IWPA as necessary.
- ✓ Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or deicing materials within Zone I.
- ✓ Review the handling of laboratory wastes to determine if a tight tank is appropriate.
- ✓ Review your emergency response plan regarding to accidental releases within the area. Ensuring that emergency responders in town are aware of the locations of your resource areas.
- ✓ Refer to the Massachusetts Public Health Associations Healthy Schools website online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html) for additional information.

**5. Residential Land Use** – There are two residences within the IWPA protection area. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Residential Land Use Recommendations:**

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**6. Transportation corridor** – Route 202 is located within the Zone I and IWPA along with the access and parking areas for the facility. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets.

**Recommendations:**

- V Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they area aware of the location of your well.
- V Monitor the sodium levels in the water. MA Highway Department has designated the area as reduced salt use area.

**7. Hazardous Materials Storage and Use** – The school utilizes hazardous materials for maintenance. Hazardous materials such as paint, thinners, petroleum products, etc. should be kept in containment and used with caution. Cleaning and disposal should not be through the septic system. Spill kits and signs designating areas of storage should be available. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground. Review the attached fact sheet for additional information regarding the thresholds for triggering a very small quantity hazardous waste generator.

**Hazardous Materials Storage and Use Recommendations:**

- V Continue current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.
- V Continue to use BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the well’s susceptibility to contamination. The DEP commends the effort shown in current protection practices of not using pesticides and fertilizers in the Zone I. The school district should comment to the various town boards regarding developments that may impact the school’s wells.

Please review and adopt the key recommendations listed above and as follows:

**Priority Recommendations:**

- V Communication with the Town boards regarding the location of the wells and the protection areas.

**Zone I and IWPA:**

- V Prohibit any new non-water supply activities from Zone I.
- V Conduct regular inspections of the Zone I and IWPA.
- V Monitor activities and if there is evidence of increased activity or access, consider relocating the well.

- V Post drinking water supply signs in key location such as along the access road and in the parking areas but away from the well.
- V Provide information to staff and pertinent school organizations about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- V Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, pesticides and household hazardous waste.

#### **Training and Education:**

- V Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies).
- V Staff should be instructed on the proper disposal of spent chemicals. Include custodial staff, teachers, groundskeepers, and certified operator.

#### **Facilities Management:**

- V Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator. The school is currently not registered as a generator of hazardous waste or waste oil. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" and register to participate, if necessary.
- V Contact the UIC coordinator to evaluate compliance for the floor drains in the boiler room and waste disposal.

#### **Planning:**

- V Work with local officials to develop an Aquifer Protection District Bylaw that includes the school well's IWPA and to assist you in continued protection of the water supply.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- V Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

#### **Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for West Street Elementary School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared  
October 16, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Granby West Street Elementary School (the school) is located near the center of Town on West Street. The total school student and staff population is approximately 350 people per day. The school is served by one potable supply well (Well #1) which is located immediately behind the building and is a 6-inch diameter, 125-foot deep, bedrock well. There is no municipal wastewater sewer system in Granby; therefore, the school and surrounding facilities are served by on-site septic disposal.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

Geologic mapping in the area indicates overburden deposits of less than 50 feet of sand with some amount of till over bedrock at the school. The surficial deposits in the area are sand and gravel that was likely deposited during the recession of the glaciers some 14,000 to 18,000 years ago. The bedrock in the area is mapped as gneiss of the Belchertown Complex.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water or non-threatening activities are allowed. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The well has a Zone I protective radius of 193 feet and an IWPA protective radius of 492 feet. These protective radii were calculated based on the metered water use from the two highest months of use. Please refer to the attached map that shows the Zone I and IWPA. The Zone I area for the well is not conforming to current DEP requirements. The Zone I area for Well #1 includes part of the school and some parking. The IWPA includes all school facilities (except the leachfield), parking, residential homes, UST fuel oil tank and components of septic systems.

There is no evidence of a continuous, protective confining layer in the vicinity of the well. Wells drilled in these conditions are considered highly vulnerable to potential contamination from activities on the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer. The water from the well does not require treatment prior to distribution. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Fuel Oil Storage	No	Yes	High	UST w/leak detection at school
Floor Drains in Boiler Rooms	Yes	Yes	Moderate	Consult with UIC program regarding compliance
Athletic fields	No	Yes	Moderate	Continue prohibiting the use of pesticides/fertilizers on school fields.
School facilities, parking and infiltration catchbasins	Yes	Yes	Moderate	Limit road deicing usage, use BMPs for household hazardous materials and monitor parking areas and control stormwater
Low density residential and hobby farming/animals	No	Yes	Moderate	Septic systems, household hazardous materials, home heating fuel and manure management
Transportation Corridor	No	Yes	Moderate	West Street
Septic systems components	No	Yes	Moderate	Residential leachfields are in the IWPA
Transformers	No	Both	Low	Monitor transformers for potential leaks

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas that are potential sources of contamination.

**Key issues include:**

1. **Non-conforming Zone I,**
2. **Underground storage tanks,**
3. **Floor drains in boiler rooms,**
4. **School facilities and athletic fields, and**
5. **Transportation corridors and parking.**

There are several activities within the Zone I and IWPA that pose a significant threat to the water supply. The overall ranking of susceptibility to contamination for the well is high based on at least one high threat activity within the protection areas. Please refer to Table 2.

**1. Non-conforming Zone I** – The water supplier does not own or control the entire Zone I area. Systems not meeting DEP Zone I requirements for ownership or control, or non-conforming activities within Zone I must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Zone I Recommendations:

- ✓ Prohibit any additional activities within Zone I and where feasible remove non-conforming activities within the Zone I areas.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
- ✓ Monitor all fuel oil deliveries and parking areas.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ The well is located within a pit and the casing should be extended above grade with a secure watertight cap, sanitary seal around the casing, and appropriate grading to prevent ponding of water near the well.

**2. Underground fuel oil storage** – There is one fuel oil UST located within the IWPA. If managed improperly, fuel oil tanks can be a potential source of contamination due to leaks or spills of the materials they store.

### Recommendation:

- ✓ Any modifications to the tank must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs and USTs.
- ✓ Monitor all activities associated with the fuel oil especially delivery.
- ✓ Have spill containment/absorbent materials available on-site.

**3. Floor Drain in Boiler Room** – There are floor drains in the boiler room, that are assumed to discharge to the septic system. However, the discharge point is not known. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

wells in areas where hazardous materials or petroleum may enter the floor drain. The floor drain must be protected to prevent boiler blow down, oil or other prohibited discharges through the floor drain.

#### Recommendations:

- V Be sure that the floor drains are in compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207 or Tony Zaharias 413-755-2122).
- V Containment to prevent accidental releases to the floor drain may be an option. Contact the regional DEP contact for the UIC program listed above. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. We recommend that you require your boiler maintenance contractor use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.
- V Consider determining the discharge location of the drains. Seal all cracks in the floor and the floor drain if it cannot be adequately protected to prevent a prohibited discharge.

**4. School facilities and athletic fields** – Elementary schools generally use only household type hazardous materials. There are state and federal controls on some activities and products used at schools to promote “healthy schools”. All of the school’s facilities are located within the Zone I or IWPA of the well. Potential exists for contamination of the well by onsite use of cleaning materials, petroleum from lawn equipment, fertilizers, and pesticides. Storm drains in the parking areas at the school drain directly into the ground.

#### Recommendations:

- V Continue the use of Best Management Practices for all activities at the school and at the athletic fields across the street. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- V Investigate Integrated Pest Management and Best Management Practices within the IWPA as necessary.
- V Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- V Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or deicing materials within Zone I.
- V Review the handling of laboratory wastes to determine if a tight tank is appropriate.
- V Review your emergency response plan regarding accidental releases within the area. Ensuring that emergency responders in town are aware of the locations of your resource areas.
- V Refer to the Massachusetts Public Health Associations Healthy Schools website online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html) for additional information.

**5. Residential Land Use** – There are two residences within the IWPA protection area. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. There is also some hobby farming or animals within the IWPA. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of

contamination.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Residential Land Use Recommendations:**

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- V Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

**6. Transportation corridor** – West Street along with the access and parking areas for the facility are located within the Zone I and IWPA. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets. Parking lot storm runoff is discharged through infiltration catchbasins.

**Recommendations:**

- V Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they area aware of the location of your well.
- V Monitor the sodium levels in the water. If the levels begin to increase, consider contacting the local highway department regarding potentially reducing salt use area near the well.

**7. Hazardous Materials Storage and Use** – Any household hazardous materials such as paint, thinners, petroleum products, etc. should be kept in containment and used with caution. Cleaning and disposal should not be through the septic system. Spill kits and signs designating areas of storage should be available. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground. Review the attached fact sheet for additional information regarding the thresholds for triggering a very small quantity hazardous waste generator.

**Hazardous Materials Storage and Use Recommendations:**

- V Continue current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.
- V Continue to use BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the well’s susceptibility to contamination. The DEP commends the effort shown in current protection practices of not using pesticides and fertilizers in the Zone I. The school district should comment to the various town boards regarding developments that may impact the school’s wells.

Please review and adopt the key recommendations listed above and as follows:

**Priority Recommendations:**

- V Protect the wellhead from surface water runoff and monitor activities around the well.

**Zone I and IWPA:**

- V Prohibit any new non-water supply activities from Zone I.

- V Conduct regular inspections of the Zone I and IWPA.
- V Monitor activities and if there is evidence of increased activity or access, consider relocating the well.
- V Post drinking water supply signs in key location such as along the access road and in the parking areas but away from the well.
- V Provide information to staff and pertinent school organizations about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- V Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, pesticides and household hazardous waste.

### **Training and Education:**

- V Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies).
- V Staff should be instructed on the proper disposal of spent chemicals. Include custodial staff, teachers, groundskeepers, and certified operator.

### **Facilities Management:**

- V Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator. The school is currently not registered as a generator of hazardous waste or waste oil. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" and consider registering to participate.
- V Contact the UIC coordinator to evaluate compliance for the floor drains in the boiler room and waste disposal.

### **Planning:**

- V Work with local officials to develop an Aquifer Protection District Bylaw that includes the school well's IWPA and to assist you in continued protection of the water supply.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- V Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

- Very Small Quantity Generator (VSQG) information

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
GRANBY MOTEL

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Granby Motel
<i>PWS Address</i>	5 West State St.
<i>City/Town</i>	Granby, Massachusetts
<i>PWS ID Number</i>	1111015

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1111015-01G	128	434	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: Zone I/ IWPA  
EXAMPLE Source  
Protection Area for Well #  
1 (1111015-01G)**

Zone I = 128 ft.  
IWPA = 434 ft.

### How Was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the sewer lines within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your 1999 Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, Annual Statistical Reports, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- inspect the Zone I and IWPA regularly;
- work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- do not use pesticides, fertilizers or road salt within the Zone I;
- address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report For Inter All Corporation

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Inter All Corporation is a small manufacturer of pressure sensitive (glue-on) and iron-on embroidered emblems located in Granby. New, computer guided sewing machines were installed within the last year. The older machines, that utilized machine oils, although still on site, are no longer utilized. The facility currently employs approximately 20 people and is served by a single groundwater supply well #1. Currently available data indicate the well is a 10-inch diameter, 240 feet deep bedrock well with an estimated yield of approximately 37 gpm. The Zone I and Interim Wellhead Protection Area (IWPA) radii are 100 feet and 405 feet, respectively based on the maximum water use determined from metered water volumes. The Zone I is the

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA.

There is a sanitary sewer line on Route 202 and a Town sewer easement through the Zone I of Inter All Corp.'s well connecting the neighborhood north of the facility. Inter All Corp. and all of the residential homes within the IWPA are connected to the sewer. We were unable to determine if the sewer is double lined. Inter All Corp. has converted fully to natural gas and has removed the aboveground oil tank. The building housing Inter All Corp. had previously housed a dry cleaner and had a confirmed release of hazardous materials. However, a Class C, Release Action Outcome (RAO) Statement has been filed for the site. In addition, there is a gasoline station located south and east of Inter All Corp. on Route 202 that is a confirmed release site. That station is located outside of the IWPA and appears to be located hydraulically downgradient from the Inter All Corp. Contact the Department's Bureau of Waste Site Cleanup for additional information about these sites.

The well is located within an area mapped as sand and gravel overburden of unknown depth. The wellhead is approximately 24-inches above grade and the ground around the wellhead is graded to prevent ponding. There is no record of a confining, protective clay layer in the vicinity of the well. The bedrock is mapped as sedimentary sandstones (Mesozoic red beds) of the Jurassic Period. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The well serving the facility has no treatment at this time, although they do maintain a sediment filter. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination. Inter All Corp. has already taken measures to protect its water supply.

#### Key issues include:

1. **Non-conforming activities in the Zone I;**
2. **Sewer line; and**
3. **Confirmed hazardous materials/oil release site.**

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Sewer and pumping station (IWPA)	Yes	Yes	High	Monitor easement for evidence of leaks
Parking and transportation corridors	Yes	Yes	Moderate	Direct runoff away from the well, monitor for leaks and spills
Hazardous materials/oil confirmed release site – Gasoline station	No	No	--	Refer to Appendix A and DEP - BWSC for additional information**
Transportation corridor	No	Yes	Moderate	Establish communication with Town for emergency response.

- For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).
- For more information on confirmed release sites - please see <http://www.state.ma.us/dep/bwsc/bwschome.htm>

The overall ranking of susceptibility to contamination for Inter All corporation's well is moderate, based on the presence of several moderate threat land uses or activities in the Zone I and IWPA, as seen in Table 2.

**1. Non-conforming activities in the Zone I** – Although the water supplier does own the entire Zone I area, there are structures and activities not related to the water supply located within the Zone I. The Zone I requirements prohibit any activity from the Zone I that is not directly related to the water supply. Please note that systems not meeting DEP Zone I requirements, must receive DEP approval prior to increasing water use or modifying systems. Structures, sewer line and parking lots are within the Zone I.

#### Recommendations:

- ✓ Control access to the wellhead area. Monitor for vandalism and consider installing a fence if necessary.
- ✓ Use Best Management Practices for handling chemicals and monitor vehicles used to access the area.
- ✓ Do not use/store pesticides, fertilizers or road salt within the Zone I.
- ✓ Prepare an emergency plan for responding to an accidental release. Include contact with the local authorities.
- ✓ Do not conduct any additional activities within the Zone I. Contact MA DEP prior to conducting any new or modifying any existing activities within Zone I.
- ✓ Monitor the parking area and shipping and receiving area for leaks and be sure runoff is directed away from the wellhead. Inform employees of the necessity to minimize leaks and accidental spills.

**2. Sewer and pumping station** – There is a sewer line within the Zone I and a sewage pumping station along Route 202 within the IWPA. It could not be ascertained whether the sewer is double lined. All of the residents and facilities in the Zone I and IWPA are connected to the sewer rather than utilizing on-site septic disposal.

#### Recommendation:

- ✓ Establish communication with the Town to be sure they are aware that you are a public water supplier and that the sanitary sewer is located in close proximity to your well. In this way the Town can be informed if a break occurs or if repairs are needed on the line.

Other activities noted within the Zone I and IWPA are parking and Route 202. Continue

monitoring water quality and activities within the Zone I and IWPA and establish communication with the Town regarding notification in the event of an emergency such as a break in the sewer line or an accidental release along Route 202. The Granby Pizza Palace is also located within the IWPA. The facility is connected to the municipal sewer and utilizes natural gas, although the parking lot is also within the IWPA. An electrical transformer is located on the pole in front of Inter All Corp. Contact the electrical utility to ensure that non-PCB oil is in the transformers. Continue to comply with all requirements established for the Class C RAO for the facility. Contact the Department's BWSC for information regarding the site on the south side of Route 202.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the susceptibility to contamination. Inter All Corporation is commended for taking measures to protect the water quality of your well such as berming the wellhead, connecting to the sewer and converting to natural gas.

#### Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

Please review and adopt the key recommendations above and the following to further enhance the protection measures you have already taken.

### Priority Recommendations:

- ✓ Monitor activities within the Zone I.

### Zone I:

- ✓ Keep new non-water supply activities out of the Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Prohibit public access to the well by locking facilities and installing a fence if necessary, and posting signs.
- ✓ Conduct regular inspections of the Zone I and IWPA. Look for illegal dumping, evidence of vandalism, spills, etc.
- ✓ Use BMPs and control activities that could pose a threat to the water supply.
- ✓ Direct road and parking lot drainage in the Zone I away from well.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### Training and Education:

- ✓ Train staff on proper hazardous (even household type) material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste. Utilize local household hazardous waste collection days.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

### Facilities Management:

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Work with local officials in Granby to establish and include Inter All's IWPA in a water Supply Protection District to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## 4. Attachments

- Map of the Public Water Supply (PWS) Protection Area.
- Recommended Source Protection Measures Fact Sheet
- Wellhead Protection Grant Program Fact Sheet
- Source Protection Sign Order Form

## 5. Appendix

- A. Table of DEP Regulated Chapter 21E Hazardous Materials Release Sites

Y:/swqrt/wero/1111017

## Appendix A

### Bureau of Waste Site Cleanup - Tier Classified Oil and/or Hazardous Material Sites within or proximal to the Water Supply Protection Areas

DEP's data layer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitellst.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1: Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)**

RTN	Release Site Address	Classification	Town	Contaminant Type
1-0012344	Getty Service Station	Tier IC – Phase IV	Granby	Oil
1-0000646	Inter All Corp.	Class C - RAO	Granby	--

For more location information, please see the attached map. The map lists the release sites by RTN.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
CINDY'S DRIVE IN

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 3, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Cindy's Drive In
<i>PWS Address</i>	455 East State St.
<i>City/Town</i>	Granby, Massachusetts
<i>PWS ID Number</i>	1111020

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1111020-01G	100	422	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1111020-01G)**

Zone I = 100 ft.  
IWPA = 422 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **high** susceptibility to potential non-microbial threats is based on the agricultural activities within the Zone I and the IWPA. Other moderate threats include local roads and parking areas within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your 1999 Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- inspect the Zone I and IWPA regularly;
- work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- do not use pesticides, fertilizers or road salt within the Zone I;
- address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Crescent Valley Condominiums

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 9, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Crescent Valley Condominiums
<i>PWS Address</i>	Pleasant Street
<i>City/Town</i>	Granby, Massachusetts
<i>PWS ID Number</i>	1111025
<i>Local Contact</i>	Mr. John Sullivan
<i>Phone Number</i>	(413) 238-5344

<i>Source Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1111025-01G	210	520	Moderate
Well #2	1111025-02G	210	520	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Crescent Valley Condominium complex is located north of Route 202 and consists of two buildings with a total of 26 two-bedroom condominium units that are heated by a natural gas fuel source. Currently, approximately 78 people reside at the complex. Granby does not have a municipal water system or municipal sewer. However, South Hadley's sewer system has been extended into Granby along Route 202. In 1996, the condominium connected to the municipal sewer system, severed the lines to and abandoned their septic system. Since there is no available municipal water system, the

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

complex is served by two wells, Wells #1 (01G) and #2 (02G). Well #2 serves as the primary source and Well #1 is used as a back-up or supplemental source.

The Zone I is the area immediately around the wellhead, while the Interim Wellhead Protection Area (IWPA) is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wells may be smaller or much larger than the IWPA. The Zone I and IWPA radii for Wells #1 and #2 are 210 feet and 520 feet, respectively. The protective radii were based on approved withdrawal rates for the wells as determined through the New Source Approval Process pumping tests and property ownership. Please refer to the attached map that shows the Zone I and IWPA radii.

Well #1 is a 560 feet deep, 6-inch diameter well drilled into the bedrock aquifer; Well #2 is a 510 feet deep, 6-inch diameter well drilled that is approximately 50 feet from Well #1 and also drilled into the bedrock aquifer. Wells #1 and Well #2 are located in a field approximately 230 feet from the buildings and the casings extend greater than 18-inches above grade.

Mapping shows the complex is underlain by relatively thin (less than 50 feet) sand and gravel deposits over bedrock. The bedrock is mapped as Jurassic aged sedimentary rocks, conglomerate and arkose of the Portland Formation. There is no evidence of a protective till or clay layer in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

The Crescent Valley Condominium well water does not require and does not have treatment at this time. For current information on monitoring results, please review the Consumer Confidence report (CCR) that is issued annually by the water supplier or refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

There are land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Zone I	-	-	-	Contact DEP before expanding or modifying the system. DEP approved the Zone I with the concrete encased sewer line and/or the natural gas in the Zone I.
Transportation corridors/parking	No	Both Wells	Moderate	Continue to manage stormwater and limit road salt usage. Inspect for leaks and spills.
Sewer line/natural gas line	Both Wells	Both Wells	Moderate	Two sewer lines encased in cement are within Well #1's Zone I. The natural gas line is in the zone I of both wells. DEP the Zone Is.
High density/low density residential	No	Both Wells	Moderate	Provide BMPs for household hazardous waste management. Use IPM for lawn maintenance.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Key issues include:

1. **Zone I;**
2. **Transportation corridors/parking; and,**
3. **Residential development.**

The overall ranking of susceptibility to contamination for the springs is moderate, based on the presence of at least one moderate threat land use or activity in the Zone I and/or IWPA, as seen in Table 2.

**1. Zone I –** Zone I restrictions allow only water supply related activities or non-threatening activities in Zone I. Currently, the system does meet DEP's Zone I requirements as the system was approved with a natural gas line and a concrete encased sewer line on the edge of the Zone I.

## Recommendations:

- ✓ Do not allow any additional no-water supply activities in the Zone Is.
- ✓ Keep the immediate area around the wells clear of brush and inspect the casings regularly to ensure the integrity of the cap and seal and to ensure there is no standing water near the casing. Install a berm sloping away from the casing if water is evident.

**2. Transportation corridor/parking –** The internal transportation and parking are located within the IWPA. Accidents and normal use and maintenance of corridors and parking areas may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills, as well as, waste from wildlife and pets.

## Recommendations:

- ✓ Prepare an Emergency Response Plan that includes coordination among town emergency responders to be sure they are aware of the location of your wells.
- ✓ Continue to manage on-site stormwater to ensure it flows away from the Zone Is.

**3. Residential Land Uses –** The condominium uses the municipal sewer and natural gas for fuel. However, it is unknown what fuel sources and wastewater disposal method the surrounding residences utilize. If managed improperly, activities

Figure 1: Example of how a well could become contaminated by different land uses and activities.

associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available on the following DEP website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), and in attached to this report, which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will help to reduce the wells' susceptibility to contamination. Crescent Valley Condominium is commended for current practices of limiting access to the wellhead area and the original facility design. Review and adopt the key recommendations above and the following:

#### Facilities Management:

- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

#### Planning:

- ✓ Work with your community to ensure develop a Wellhead Protection District and include your IWPA in the District along with other public water supplies in town.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Consider long term planning for the system that includes maintenance of the system.

#### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Each program year, if funds are available, the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at the DEP website: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Source Water Assessment Program (SWAP) Report For Granville Center Water Company

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Cistern	1112000-03G	304	912	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Granville Center Water Company serves a small rural community supplying 37 residential and municipal connections that all utilize on-site septic disposal. The system consists of one bedrock well that can pump directly into the distribution system and to the storage cistern. The well (02G) for Granville Center Water Company is an 8-inch diameter bedrock well drilled to a depth of at least 150 feet (reported to be 210 feet) in 1950, located off of Blandford Road. The well has a Zone I of 304 feet and an Interim Wellhead Protection Area (IWPA) of 912 feet; both are based on metered water usage data. The Zone I is the protected area immediately around the wellhead; the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

larger or smaller than the IWPA. The public water system for the facility also includes a spring (01G), an emergency source that has been physically disconnected from the system and is located approximately 20 feet from the storage cistern. This report does not address the emergency spring source (01G). The cistern (03G) is a partially lined, belowground storage cistern; under certain hydraulic conditions, groundwater is contributed to the cistern. The DEP and water supplier are investigating methods of lining the cistern in order to eliminate groundwater contribution so that in the future, the cistern will act solely as a storage tank.

The well and cistern are located in an area USGS has mapped as a till and bedrock. There is no evidence of thick overburden in the vicinity. The bedrock geologic mapping identifies the bedrock as heterogeneous layering of amphibolite, gneiss, and schist with the thickest layers in the gneiss fraction. This type of aquifer has a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA. Chlorine is added to the water at the wellhead serving the facility as a disinfectant. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Nonconforming use in Zone I (02G)**
2. **Low Density Housing**
3. **Electrical Transformers**

The overall ranking of susceptibility to contamination for the well is moderate based on the presence of at least one moderate threat land use or activity in the IWPA, as seen in Table 2. The cistern is not lined and is in close proximity to natural springs and surface water drainage and is therefore potentially susceptible to influence from surface water. The cistern has not been determined to be groundwater under the influence of surface water. Unless the cistern is lined additional water quality testing may be required. Based on that additional potential threat, the overall ranking of susceptibility to contamination for the cistern is high.

1. **Nonconforming use in Zone I-** The Zone I for Well #1 is nonconforming with respect to DEP land use restrictions, that allow only water supply related activities in the

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Low density housing with parking and septic systems; roadways	Well	Cistern and Well	Moderate	Prohibit parking along road, see septic systems brochure attached
Electrical Transformers	Well	Well	Moderate	Request information regarding PCB in MODF from your electric company

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Zone I. The public water supplier does not own and/or control all land encompassed by the Zone I of the well. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Do not conduct any additional activities within the Zone I. Contact MA DEP prior to conducting any activities within Zone I.
- ✓ Prepare an emergency response plan for responding to an accidental release.

**2. Low Density Housing --** The Zone I for Well #1 contains Blandford Road and three residences with associated parking and septic systems. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste. Another potential threat from residential users is mismanagement of household waste.

### Recommendations:

- ✓ Provide residents with information about proper maintenance and disposal practices for septic systems. Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.
- ✓ Monitor roadside for spills and leaks.
- ✓ Encourage residents to utilize local household hazardous waste collection days.
- ✓ Supply residents with information about BMPs for household hazardous waste management and lawn care.

**3. Electrical Transformer --** Electrical transformers contain Mineral Oil Dielectric Fluids (MODF). Although the use of PCBs is banned in new transformers, historically, PCBs were used in some transformers.

### Recommendations:

- ✓ Contact the local utility to determine if the transformers contain PCBs. If PCBs are present, urge their immediate replacement.
- ✓ Keep the area near the transformers free of tree limbs that could endanger the transformer in a storm.

Other activities noted within the IWPA are aquatic wildlife and pet wastes. These are listed as low potential threats to ground water sources and are of minimal concern.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Granville Center Water Company is commended for discontinuing the use of the spring (01G) as a primary source. Granville Center Water Company should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- V Line the cistern as expeditiously as possible to eliminate all potential surface infiltration and groundwater contribution.
- V Consider well relocation of Well #1 if Zone I threats cannot be mitigated.

### Zone I:

- V Keep non-water supply activities out of the Zone I.
- V Prohibit public access to the well and pump house by locking facilities, gating access roads, and posting signs.
- V Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism; check any above ground tanks for leaks, etc.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba of the Western Regional Office at 413-755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations.

### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Work with local officials in Granville to develop Aquifer Protection District Bylaws and to assist you in improving protection to the well and IWPA.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.
- ✓ Consider obtaining a conservation restriction for any land within Zone I that cannot be purchased.

### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note that each program year, on or about May 1 the Department posts a new Request for Response (RFR), grant application form. Generally, the applications are due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## 4. Attachments

- Map of the Public Water Supply (PWS) Protection Area.
- Recommended Source Protection Measures Fact sheet
- Your Septic System Brochure
- Pesticide Use Fact sheet
- Wellhead Protection Grant Program Fact Sheet

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report For DEM GRANVILLE STATE FOREST

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 12, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	DEM Granville State Forest
<i>PWS Address</i>	323 West Hartland Rd
<i>City/Town</i>	Granville, Massachusetts
<i>PWS ID Number</i>	1112002

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Halfway Campground Well	1112002-02G	172	467	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for  
Halfway Campground Well  
(1112002-02G)**

Zone I = 100 ft.  
IWPA = ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **high** susceptibility to potential non-microbial threats is based on the storage of hazardous materials such as heating oil within the Zone I and the IWPA. Other moderate threats include parking areas within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ seal or protect floor drains from potential spills of hazardous materials such as heating oil;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report For Granville Village School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 3, 2001

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas
5. Appendix

## 1. Description of the Water System

The Granville Village School is a small, rural elementary school located on the south side of Route 57 in the center of town, with a total staff and student population of approximately 300. The well for the Granville Village School is located within the basement of the oldest section of the school building. Although the well was preliminarily tested to estimate the safe yield of the well, the Zone I of 148 feet and Interim Wellhead Protection Area (IWPA) of 446 feet, are based on actual water usage determined from metered data for the two highest months on record. The IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. Please refer to the attached map of the Zone I and IWPA.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. The 6-inch diameter well was drilled to a depth of 236 feet in 1933. Recent well inspection and investigations conducted as part of the site spill remediation have determined the effective well depth as 187 feet due to siltation. USGS has mapped this site as a sand and gravel aquifer; however, based on the depth of the well, it is assumed that the well is completed in the bedrock aquifer. Geologic mapping identifies the bedrock as heterogeneous layering of amphibolite, gneiss, and schist with the thickest layers being gneiss.

At the time this report was prepared, the Granville Village School well water does not require and does not have treatment. The DEP requires public water suppliers to monitor the quality of the water. For current monitoring results, please refer questions to the local contact identified in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming uses in Zone I;**
2. **An Underground Storage Tank (UST) With Heating Oil;**
3. **Confirmed Hazardous Materials/Oil Release Site;**
4. **Improper Storage of Hazardous Materials;**
5. **Floor Drains in Boiler Room; and**
6. **Septic System**

The overall ranking of susceptibility to contamination for the well is high, based on the presence of at least one high threat land use or activity in the IWPA, as seen in Table 2.

1. **Non-conforming uses in Zone I** – Currently, the well does not meet DEP's restrictions, which only allow water supply related activities in Zone Is. The facility's Zone I contains school buildings, athletic fields, roads, parking areas, and recreational activities. State highway Route 57 is within the Zone I, which is the only part of the Zone I not owned and/or controlled by the public water supplier. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Confirmed release site	Yes	No	**	RTN 1-0000842, Tier 2. See Appendix A
Fuel Storage - Below Ground (UST)	Yes	No	High	10,000 gallon heat oil tank
Storage of hazardous materials	Yes	No	High	Remove hazardous materials and old boiler components near wellhead
Automotive repair and sales	No	Yes	High	VSQG and auto storage
Floor drain in boiler room	Yes	No	Moderate	Bring the floor drains into compliance with Department Regulations
Septic System	No	Yes	Moderate	See septic systems brochure in the appendix
School Structures, athletic fields	Yes	Yes	Moderate	Restrict fertilizer, pesticides, and salt use
Parking lot & roads	Yes	Yes	Moderate	Work with local officials to insure maintenance

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/). \*\* - See Appendix A.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to  $\frac{1}{2}$  mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Recommendations:

- ✓ Do not conduct any new activities within Zone I.
- ✓ Consider developing a new well that is in compliance with Zone I requirements.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

**2. Underground Storage Tank (UST)** – There is a UST located on the southwest side of the school near the building, with a maximum content of 10,000 gallons of oil. The tank is a double walled tank with monitoring, installed in about 1990.

## Recommendation:

- ✓ USTs in close proximity to the water supply should be closely monitored especially during deliveries. Any upgrades and modification must meet current construction standards and be done consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.

**3. Confirmed Oil Release Site** - The Zone I contains a DEP Tier II Confirmed Oil and/or Hazardous Material Release Site, indicated on the map as Release Tracking Number 1-0000842. The release was discovered in July of 1990 during the removal of an oil tank. Although contaminated soils were removed from the site, some impacted soils remain beneath the foundation of the building. A Response Action Outcome and an Activities and Usage Limitation have been submitted to the Department's Bureau of Waste Site Cleanup (BWSC). The drinking water program requires regular water quality monitoring including specific analyses to detect petroleum byproducts. For information regarding the location of this site refer to the attached map. Appendix A includes additional information regarding the Massachusetts Contingency Plan (MCP) and where additional information is available. Contact the BWSC at 413-784-1100 for more information.

## Recommendation:

- ✓ Comply with the requirements of the MCP process and continue monitoring as prescribed by DEP Drinking Water Program.

**4. Improper Storage of Hazardous Materials** -- There is storage of unused chemicals and old boiler components within the Zone I (located about 10 feet from the well head), and storage of uncontained gasoline jugs and floor finishers within the IWPA. In addition there is a portion of the floor that is still dirt (not cemented) from when the site remediation was conducted.

## Recommendations:

- ✓ Remove all hazardous materials from the Zone I.
- ✓ Seal the floor.

**5. Floor Drains in Boiler Room** -- Floor drains are located in the boiler room that discharge to the septic system. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system. The floor drain must be sealed or connected to a tight tank if it cannot be protected so as to guarantee boiler blow down, oil or other prohibited discharges are prevented from entering the floor drain. There must not be hazardous materials stored in the boiler room.

## Recommendations:

- ✓ Bring the floor drains into compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - \* Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207).
  - \* Interim Actions: cease using the floor drains.
- ✓ Oil lines from the tank to the boiler can be sleeved so that any leaks would drain back to the tank or minimal oil could leak to the boiler room.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Western Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

- ✓ Require a policy and plan for maintenance operations, especially when oil filters are changed. We recommend that you require your boiler maintenance contractor to use containment and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.

**6. Septic Systems** -- The school's septic system is located within the IWPA, as are the septic systems of the low density housing within the IWPA. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste.

#### Recommendations:

- ✓ Provide residents with information about proper maintenance and disposal practices for septic systems. Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.

Humphrey's Car Repair is located adjacent to the Granville Village School. Humphries is a registered as a Very Small Quantity Generator of hazardous waste. There are no floor drains and the facility appears to be well managed. There are several cars parked at the facility for sale and service. The school should maintain communication with Humphries and other neighbors located within the IWPA to ensure BMPs are employed to assist in protecting not only the school's water supply but also private wells in the community. Work with the Town to have any stormwater catch basins located within the IWPA inspected, maintained, and cleaned on a regular schedule.

On the outer edge of the IWPA is a crop field historically used for corn. Request that the landowners utilize Best Management Practices for their agricultural practices that include nutrient and pesticide management. Be sure that they are aware that your facility is a public water supply. If they do not already have a farm plan, refer them to the Natural Resource Conservation Service. Alternatively, they may follow a plan developed through the publication *On Farm Strategies to Protect Water Quality: An Assessment and Planning Tool for Best Management Practices*. Information on funding and other resources for agricultural management is available through the Massachusetts Department of Food and Agriculture at (617) 626-1700 or <http://www.massdfa.org/bureaus.htm>.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Granville Village School should review and adopt the key recommendations above and the following:

#### Priority Recommendation:

- ✓ Consider well relocation if Zone I threats cannot be mitigated

#### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Prohibit public access to the well. Posting signs in appropriate, visible locations.
- ✓ Bring floor drains into compliance with UIC and Title 5 regulations.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any above ground tanks for leaks, etc.
- ✓ If the Town intends to continue utilizing the structures in the Zone I, use BMPs and restrict activities that could pose a threat to the water supply.
- ✓ Redirect road and parking lot drainage in the Zone I away from well.
- ✓ Do not use or store pesticides, fertilizers, deicers or hazardous materials within the Zone I.
- ✓ Upgrade to propane or natural gas as an alternate fuel for power sources.

**Training and Education:**

- ✓ Train custodial staff, groundskeepers, certified operator, and food preparation staff on proper hazardous material use, disposal, emergency response, and BMPs. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Incorporate groundwater education into school curriculum (K-6 and 7-12 curricula available; contact DEP for copies).
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

**Facilities Management:**

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, refer to <http://www.state.ma.us/dep/bwp/dhm/files/sqgsum.pdf> for the Requirements for Small Quantity Generators. The facility is currently not registered as a generator of hazardous waste or waste oil.
- ✓ Eliminate non-sanitary wastewater discharges to on-site septic systems. Seal floor drains in the boiler room or connect to a tight tank. (See attachment)
- ✓ Remove hazardous materials from near the wellhead.
- ✓ As tanks age, upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ Concrete pads should slope away from well and well casing should extend above ground.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

**Planning:**

- ✓ Work with local officials to develop Aquifer Protection District Bylaws and include the facility's IWPA in the district.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Agricultural:**

- ✓ Encourage farmers in the IWPA to seek assistance from the DFA and Natural Resource Conservation Service (NRCS) in addressing nutrient and pesticide management issues.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

**4. Attachments**

- Recommended Source Protection Measures Fact Sheet
- Your Septic System Brochure
- UIC Fact Sheet
- Healthy Schools Fact Sheet
- Wellhead Protection Grant Program Fact Sheet
- Source Protection Sign Order Form

**5. Appendix**

Table of DEP Regulated Chapter 21E Hazardous Materials Release Sites

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Great Barrington Fire District**

### What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Great Barrington Fire District
<i>PWS Address</i>	20 Castle Street
<i>City/Town</i>	Great Barrington
<i>PWS ID Number</i>	1113000
<i>Local Contact</i>	Mr. Michael Vincent
<i>Phone Number</i>	413-528-0133

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

## What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

## Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

**Zone II #:** 472

**Susceptibility:** High

Well Names	Source IDs
Well #1	1113000-01G

Great Barrington is a mid-size rural community in southwestern Massachusetts. The Town is located within the Housatonic River Valley in the heart of the Berkshires. The Great Barrington Fire District supplies water to some parts of the town of Great Barrington. The District owns and operates one groundwater source (1113000-01G), the main supply, and one surface water source (1113000-01S) that is designated for emergency use only. This report does not address the emergency, surface water supply. The groundwater source is an infiltration gallery located off of Hurlburt Road about 130 feet from the Green River. The infiltration gallery is a concrete chamber 226-feet in length, 4 feet wide with a gravel pack outside of the gallery. The water level in the Green River is somewhat controlled by a stone dam approximately 500 feet downstream of the gallery. The aquifer is a shallow sand and gravel aquifer along the Green River with no evidence of a confining clay unit in the vicinity of the source. The aquifer is therefore, considered highly vulnerable to contamination due to the absence of hydrogeologic barriers (i.e. clay) that can prevent contaminant migration from the ground surface.

The Zone I for the "well" is an oval protection area, 250 radial feet from the outside edges of the infiltration gallery. The Zone II was delineated through the SWAP program utilizing empirical data gathered from an extended duration pumping test, geological mapping and analytical modeling. Please refer to the attached map to view the boundaries of the Zone II.

Water from the source is chlorinated prior to distribution. For current information on monitoring results and treatment, please refer questions to the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The Zone II for Great Barrington Fire District is a mixture of residential, agricultural, and forested land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Non-conforming Zone I
2. Residential land uses
3. Transportation corridors
4. Hazardous materials storage and use
5. Oil or hazardous material contamination sites
6. Agricultural activities
7. Comprehensive wellhead protection planning

The overall ranking of susceptibility to contamination for the system is high,

based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Non-conforming Zone I** – The Zone I for the infiltration gallery is an oval shaped area with a radial distance of 250 feet from the edges of the gallery. An active corn/hay field, the District's motor control, chemical feed and storage buildings are all located within the Zone I of the source. Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Although only water supply activities are allowed by regulation in the Zone I, many public water supplies were developed prior to the Department's regulation and contain non water supply activities such as homes, agriculture and public roads. The District does not have legal control over the activities within Zone I but does have a verbal agreement with the land owner to not utilize fertilizers or pesticides within the Zone I area.

#### Zone I Recommendations:

- ✓ Enter into Right-of-First Refusal or a Memorandum of Understanding agreement with the owner or purchase conservation restrictions to protect the area from development and land uses that may threaten the water supply. Agreement Options - Until land or funding is available for outright land purchase, attempt to obtain a Memorandum of Understanding or a Right of First Refusal. A Memorandum of Understanding (MOU) is an agreement between the landowner and public water supplier in which the landowner agrees not to engage in specific threatening activities. The MOU should be specific to the land use or activity. For instance, if the land is residential with a septic system the owner could agree not to place chemicals, petroleum products, or other hazardous or toxic substances, including septic system cleaners, into the septic system, and agree that the system will be pumped at a specific frequency. Understanding how an activity threatens drinking water quality is an important component of developing an effective MOU.

A Right of First Refusal is a legal document that gives the water supplier the first chance to purchase land when it becomes available. Refer to the information about a Right of First Refusal in the Appendices.

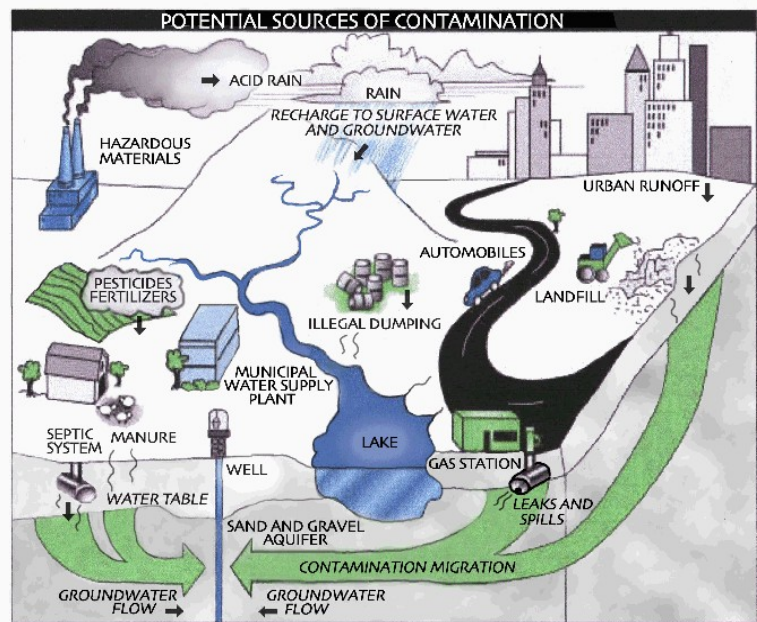

- ✓ To the extent possible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Contact the property owner to be sure they are aware they are within the Zone I and Zone II of the well. Provide

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

Modified from © 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

information about BMPs and monitor for compliance with the agreement to not use pesticides and fertilizers.

**2. Residential Land Uses** – Approximately 12% of the Zone II consists of residential areas. That area does not have public sewers therefore, all residential areas within the Zone II utilize septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins and drainage swales transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with Planning Boards and Boards of Health in Great Barrington and Egremont to manage new residential developments in the water supply protection areas. Work with the community to foster support and protection for the recharge areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Transportation Corridors** - Route 71 runs through the Zone II just south of the well and local roads are common throughout the Zone II. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catchbasins.

*(Continued on page 6)*

**What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**For More Information**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

**Source Protection Decreases Risk**

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Potential Contaminant Sources*
<b>Agricultural</b>			
Dairy Farms	2	M	Manure (microbial contaminants), pesticides: equipment improper handling
Livestock Operations	1	M	Manure (microbial contaminants), pesticides: equipment improper handling. Numerous small hobby farmers.
Manure Storage or Spreading	2	H	Manure (microbial contaminants), pesticides: equipment improper handling
Fertilizer and Pesticide use	Numerous	H	Cropland uses. Over application. None applied within Zone I area.
<b>Commercial</b>			
Airports	1	H	Fuels, de-icers, salt, and other hazardous chemicals: spills, leaks, or improper handling
Body Shops	1	H	Vehicle paints, solvents, and primer products: improper management
Service Stations/ Auto Repair Shops	2	H	Automotive fluids and solvents: spills, leaks, or improper handling
Cemeteries	2	M	Over-application of pesticides: leaks, spills, improper handling; historic embalming fluids
Furniture Stripping and Refinishing	1	H	Hazardous chemicals: spills, leaks, or improper handling
Medical Facilities	1	M	Biological, chemical, and radioactive wastes: spills, leaks, or improper handling or storage
Paint Shops	1	H	Paints, solvents, other chemicals: spills, leaks, or improper handling or storage
Sand And Gravel Mining/Washing	2	M	Heavy equipment, fuel storage, clandestine dumping: spills or leaks. Numerous small operations throughout Zone II.
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Residential</b>			
Septic Systems / Cesspools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
<b>Miscellaneous</b>			
Aboveground Storage Tanks	Numerous	M	Materials stored in tanks: spills, leaks, or improper handling
Fishing/Boating	River	L	Microbial contaminants, trash
Road and Maintenance Depots	1	M	Deicing materials, automotive fluids, fuel storage, and other chemicals: spills, leaks, or improper handling or storage
Schools, Colleges, and Universities	2	M	Fuel oil, laboratory, art, photographic, machine shop, and other chemicals: spills, leaks, or improper handling or storage
Small quantity hazardous waste generators	1	M	Hazardous materials and waste: spills, leaks, or improper handling or storage
Transportation Corridors	Numerous	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Underground Storage Tanks	12 (Possibly more)	H	Stored materials: spills, leaks, or improper handling
Very Small Quantity Hazardous Waste	3	L	Hazardous materials and waste: spills, leaks, or improper handling or storage
Waste Transfer/ Recycling Station	1	M	Water contacting waste materials: improper management, seepage, and runoff
<b>Notes:</b> <ol style="list-style-type: none"> <li>When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.</li> <li>For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.</li> <li>For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.</li> </ol> <p>* <b>THREAT RANKING</b> - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.</p>			

#### **Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Where applicable, contact the state or local highway departments to request that drains discharge stormwater outside of the Zone II.
- ✓ Consult with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Continue working with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.

- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.
- ✓ Work with local officials during their review of the right of way Yearly Operating Plans to ensure that water supplies are protected during vegetation control. Notify City and town officials of potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP).
- ✓ Notify community officials of potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Bruce Philbrick, at the local office in Pittsfield office at 413-443-6867 (his e-mail address is [bruce.philbrick@mapittsfi.fsc.usda.gov](mailto:bruce.philbrick@mapittsfi.fsc.usda.gov)). Review the fact sheet available on line and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Visit DEP's Nonpoint Source Pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**4. Hazardous Materials Storage and Use** – Less than one percent of the land area within the Zone II is commercial or industrial land uses. Many businesses and industries, including small businesses, use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in USTs/ASTs. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground. The airport is of the greatest concern in the Great Barrington Fire District Zone II, with a high potential for leaks of hazardous materials such as jet fuel. Also there are a few facilities such as auto body shops, furniture strippers, a sawmill and gravel mining operations that may utilize hazardous materials and are currently not registered.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Work with planning agencies and/or communities to educate local small

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

businesses on best management practices for protecting water supplies. Distribute the fact sheet "Businesses Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.

- ✓ Work with local Boards of Health and businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Work with local Boards of Health and businesses to review Massachusetts floordrain requirements. Refer to the brochure "Industrial Floor Drains" for more information and request Floor Drain regulations if they do not exist.

**5. Presence of Oil or Hazardous Material Contamination Sites** – The Zone II or areas immediately adjacent to the Zone II contain a DEP Tier Classified Oil and/or Hazardous Material Release Site indicated on the map as Release Tracking Numbers 1-0014368. Refer to Appendix 3 for more information.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination site.

**6. Agricultural Activities** – There are several farms within the Zone II, including dairy farms, hay, vegetable, fruit and corn fields. Pesticides and

fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

#### **Agricultural Activities Recommendation:**

- ✓ Continue to work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service Farm Plan. They should also be aware of the Department of Food & Agriculture's regulation regarding the use of certain types of pesticides within a Zone II groundwater supply protection areas.
- ✓ Provide information to hobby farmers regarding Best Management Practices. Refer them to <http://www.state.ma.us/dep/brp/dws/protect.htm> for BMPs.
- ✓ Provide information about potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Bruce Philbrick, at the local office in Pittsfield office at 413-443-6867 (his e-mail address is [bruce.philbrick@mapittsfield.fsc.usda.gov](mailto:bruce.philbrick@mapittsfield.fsc.usda.gov)). Review the fact sheet available online and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Visit DEP's Nonpoint Source Pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**7. Protection Planning** – Currently, the Towns of Egremont and Great Barrington do not have water supply protection controls that meet DEP's Wellhead Protection regulations 310 CMR 22.21(2). However, the District maintains communication with all host communities for the Zone II and Zone III areas. Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells.

#### **Protection Planning Recommendations:**

- ✓ Develop a Wellhead Protection Plan. Establish a protection team that includes the various water suppliers in Great Barrington and Sheffield's Water Company, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan". Work with the town Boards to develop comprehensive water supply protection and planning.
- ✓ Work with the Sheffield Water Company to coordinate protection measures for one another's communities. Include Egremont in the planning process to gain support for comprehensive protection of resources. Please refer to the enclosed map for areas of overlapping Zone IIs.
- ✓ Coordinate efforts with local officials to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21 (2). Encourage adoption of controls that minimally meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ Request that the Boards of Health adopt floordrain controls that meet 310 CMR 22.21(2).

Other land uses and activities within the Zone II that are potential sources of contamination are included in Table 2. Refer to Appendix B for more information about these land uses. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- The acquisition of land and fostering a relationship with abutters.
- The cooperative efforts with Alford and Egremont with respect to emergency response.
- The agreements for use of land within the Zone I area and the gentlemen's agreement not to use pesticides and fertilizers. However, this type of agreement should be formalized. Refer to the first item under Source Protection recommendations below.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Enter into Right-of-First Refusal or a Memorandum of Understanding agreement with the owner or purchase conservation restrictions to protect the area from development and land uses that may threaten the water supply. Agreement Options - Until land or funding is available for outright land purchase, attempt to obtain a Memorandum of Understanding or a Right of First Refusal. A Memorandum of Understanding (MOU) is an agreement between the landowner and public water supplier in which the landowner agrees not to engage in specific threatening activities. The MOU should be specific to the land use or activity. For instance, if the land is residential with a septic system the owner could agree not to place chemicals, petroleum products, or other hazardous or toxic substances, including septic system cleaners, into the septic system, and agree that the system will be pumped at a specific frequency. Understanding how an activity threatens drinking water quality is an important component of developing an effective MOU. A Right of First Refusal is a legal document that gives the water supplier the first chance to purchase land when it becomes available. Refer to the information about a Right of First Refusal in the Appendices.
- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Continue working with emergency response teams to ensure that they are aware of the Zone II and to cooperate on responding to spills or accidents and contact you.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination site.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies. Work with hobby farmers to educate them and supply guidance regarding BMPs.
- ✓ Work with the community to develop and implement a Wellhead Protection Plan.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

#### **➤ Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships between businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

➤ **Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to groundwater contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained, and animal waste could be a potential source of microbial contamination.

➤ **Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located; what types of land uses and activities pose threats; and how their efforts can enhance protection.

➤ **Plan for the Future:**

One of the most effective means of protecting water supplies is local planning, include adoption of local controls to protect land use, regulations related to watersheds and ground water protection. These controls may include health ordinances/regulations, discharge prohibitions, general ordinances, and zoning by-laws that prohibit or control potential sources of contamination within the protection areas.

➤ **Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available on line and call the local office (Pittsfield 413-443-6867) of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf>. Contact Bruce W. Philbrick the District Conservationist at 413-443-6867 or e-mail at [bruce.philbrick@mapittsfiie.fsc.usda.gov](mailto:bruce.philbrick@mapittsfiie.fsc.usda.gov)

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone I/Zone II area posted with appropriate signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>YES</b>	Continue monitoring non-water supply activities in Zone Is.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21 (2)?	<b>NO</b>	Although the District has met DEP's best efforts for well-head protection, the protection area should be expanded and bylaws revised as recommended in the SWAP Zone II report. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model by-laws and health regulations, and current regulations.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>NO</b>	Work with the neighboring municipalities of Egremont and Alford to develop wellhead protection controls and include the Zone II and III in a water supply protection district.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Develop a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> . Consider working with the Sheffield Water company to develop a comprehensive wellhead protection plan in Great Barrington and Egremont.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams. The District already is on the "to be notified list" for all emergencies in Great Barrington and Egremont.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Establish committee; include representatives from citizens' groups, neighboring communities, and the business community. Work with the Sheffield Water Company to promote comprehensive protection in Great Barrington and with the Towns of Egremont and Alford.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>Partial</b>	Aim additional efforts at commercial, industrial and municipal uses within the Zone II.

1-0014368

## APPENDIX B:

### REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREA

#### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
185822	Simons Rock Of Bard College	84 Alford Street	Great Barrington	VSQG	Hazardous Waste Generator	College
	Autobody/Repair	78 Egremont Plain Road	Great Barrington	VSQG	Hazardous Waste Generator	Autobody/Repair
	Egremont DPW* and Transfer Station*	171 Egremont Plain Road	Egremont	VSQG	Hazardous Waste Generator	DPW/Transfer Station

\* Note: This facility is just outside of the Zone II.

#### Underground Storage Tanks:

Facility Name	Address	Town	Description	Tank Type	Tank Leak Detection	Capacity (gal)	Contents
Berkshire Aviation Enterprises	Egremont Plain Road	Great Barrington	Airport	1 Wall	Approved In Tank Monitor	20,000	Gasoline
				1 Wall	Approved In Tank Monitor	4,000	Gasoline
Agar Oil*	154 Hurlbert Road	Great Barrington	Fuel distributor	1 Wall	Approved In Tank Monitor	10,000	Kerosene
				1 Wall	Approved In Tank Monitor	10,000	Diesel

				1 Wall	Approved In Tank Monitor	20,000	Fuel Oil
				1 Wall	Approved In Tank Monitor	20,000	Gasoline
				1 Wall	Approved In Tank Monitor	20,000	Gasoline
				1 Wall	Approved In Tank Monitor	20,000	Fuel Oil
				1 Wall	Approved In Tank Monitor	10,000	Diesel
				2 Wall	Approved In Tank Monitor	500	Gasoline
				2 Wall	Approved In Tank Monitor	500	Diesel
				1 Wall	Interstitial Monitoring	1,000	Fuel Oil

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

\* Agar Fuel Storage facilities are just outside of the Zone II area

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitellst.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0014386	50 Prospect Lake Road	Egremont	Oil

For more location information, please visit the DEP website for Bureau of Waste Site Cleanup <http://www.state.ma.us/dep/bwsc/sitelist.htm>.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for

**Housatonic Water Works Company**

**What is SWAP?**

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

**Susceptibility and Water Quality**

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Housatonic Water Works Company
<i>PWS Address</i>	80 Maple Avenue
<i>City/Town</i>	Great Barrington
<i>PWS ID Number</i>	1113003
<i>Local Contact</i>	Mr. James J. Mercer
<i>Phone Number</i>	413-528-1780

**Introduction**

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

**Purpose of this report:**

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

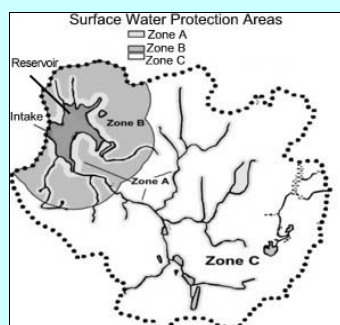

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

**This report includes the following sections:**

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

## Glossary Protection Zones

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

## Section 1: Description of the Water System

### Surface Water Source

System Susceptibility

Moderate

Source Name:	Source ID	Susceptibility
Long Pond	1113003-01S	Moderate

Housatonic Water Company is a small, private water company that supplies water to Housatonic, a village located in the northwestern section of the towns of Great Barrington, Stockbridge and West Stockbridge. Great Barrington is a moderately sized town in South Berkshire County that is historically an industrial, agricultural and residential community located along the Housatonic River valley in the heart of Berkshires. The Housatonic Water Company owns and operates Long Pond Reservoir (1113003-01S) located southwest of village of Housatonic. Long Pond has a surface area of 115 acres and a storage capacity of 263 million gallons. The watershed area is primarily wooded with minor agricultural activity. A small percentage, (2%) of the land use is low density residential and institutional. Please refer to the attached map to view the boundaries of the protective zones.

Water from the reservoir is treated through a slow sand filtration plant then disinfected prior to distribution. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

Due to the nature of surface water supplies, the sources are considered highly vulnerable to potential contamination. Land uses and activities that are considered potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Zone A activities
2. Residential
3. Institutional Use
4. Forestry/Watershed Management
5. Protection Planning
6. Agricultural Activities
7. Presence of Beavers in Watershed

The overall ranking of susceptibility to contamination for the system is moderate, based on the presence of moderate threat land uses within the water supply protection areas, as seen in Table 2.

**1. Zone A activities** – The Zone A for Long Pond is the land area 400 feet away from the shoreline. The reservoir appears to be spring fed as there are no feeder streams into the reservoir. The protective by-law for Great Barrington provides restrictions to activities on land within 500 feet of all water bodies in Town, including the reservoir. Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) regulates some of the activities allowed within the Zone

A. The greatest protection of the Zone A is for the water supplier to own or control the Zone A through Conservation Restrictions. The Housatonic Water Company owns approximately 30 acres or 5.5% of the land area in the watershed. According to the owners, the Water Company has rights to an area of 5 to 10 feet along the shoreline around the reservoir. There has been reported activity such as land clearing and recreational activity along the shoreline of the reservoir on land owned by a local conservation group. Only water supply activities are allowed in the Zone A. The Water Company does not own or control the entire Zone A area. However, many public water supplies were developed prior to the Department's regulations were promulgated and contain non-water supply activities.

#### **Zone A Recommendations:**

- ✓ Obtain a Right of First Refusal for acquiring the land within the watershed currently not owned by the Water Company.
- ✓ Consider purchasing the land or acquiring a conservation restriction on the land to minimize potential future threats.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone A.
- ✓ Keep any new non water supply activities out of the Zone A.
- ✓ Contact property owners/conservation group to be sure they are aware they are within the Zone A and watershed. Be sure they understand that access to the water is prohibited and activities in the Zone A are restricted.

**2. Residential Land Uses** – Although the map indicates approximately 13 acres of the watershed consists of residential areas, some of that area is associated with an institutional use. None of these residential areas have public sewers, therefore on-site septic systems are used. The institution's septic system leach field is reportedly outside of the watershed. If managed improperly, activities associated with residential type areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals

to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of

### **Benefits of Source Protection**

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

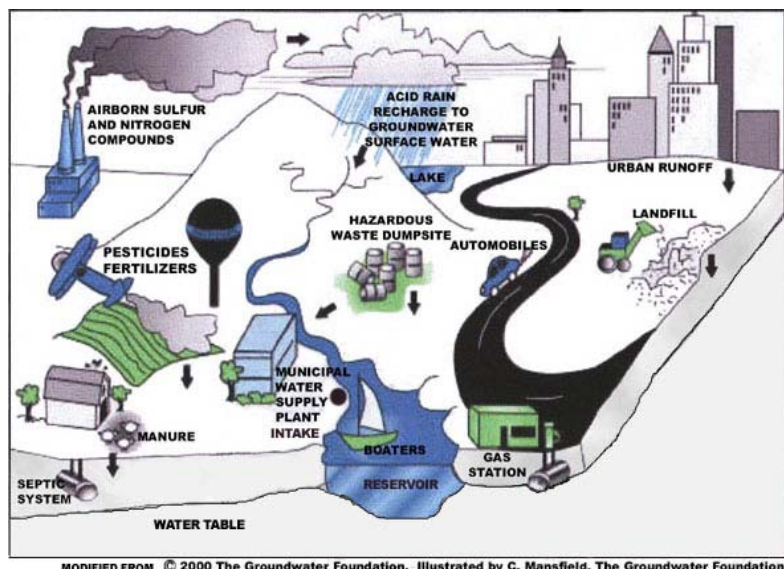

Figure 1: Sample watershed with examples of potential sources of contamination

the fuel oil they store.

- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Consider negotiating a Right of First refusal agreement or conservation restrictions for land not currently owned by the Water Company.

**3. Institutional Use** – An area to the southwest of the reservoir is owned by a small economic research and educational institute. The land use is primarily a conference and residential facility. However, the facility operates a small publishing and printing operation for their materials. The main facilities are located within the watershed. According to the owner of the facility and the site plan, the septic system is southeast of the main facility, outside of the watershed. The site plan for the facility shows a leachfield within the watershed but no distribution piping to that existing leachfield.

The facilities within the watershed consist of residences, offices, power house, “stone mansion” and the main building which houses the printing facilities. There is also a small “Tea house” owned by the institute within the Zone A that is not used. The facility has recently removed all underground fuel oil storage tanks and replaced them with individual Aboveground Storage Tanks located within each building. In addition, the main building has a large boiler room with a floor drain that ties into the building foundation drain. The drain discharges above ground to an area northwest of the main building within the watershed. There are low-use roadways and parking at the facility. De-icing

materials, automotive chemicals and other debris on roadways and in parking areas pose a minor threat to the watershed. The majority of the landholdings of the institute are forested. The Water Company communicates with the facility and it has a connection agreement to provide water to the facility in an emergency. The institute is a public water system, provides its own water and is in the process of developing a new well source.

**Recommendations:**

- ✓ Continue communication with the facility owners and monitor progress of the oil tank replacement at the facility.
- ✓ Consider negotiating a Right of First refusal agreement or conservation restrictions for land not currently owned by the Water Company.
- ✓ Work with local emergency response teams to ensure effective management of potential spills or responses at the facility. The Department discussed the need for an emergency response plan for the facility.

**What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**Source Protection Decreases Risk**

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Potential Contaminant Sources*
<b>Agricultural</b>			
Forestry Operation	1	L	Herbicides or pesticides, equipment maintenance materials: leaks, spills, or improper handling; road building
Haying of Fields	2	L	Equipment maintenance materials: leaks, spills, or improper handling
<b>Commercial</b>			
Printer	1	M	Printing inks and chemicals: spills, leaks, or improper handling or storage
<b>Residential</b>			
Fuel Oil Storage (at residences and Institute)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care/Gardening	4	M	Pesticides: over-application or improper storage and disposal
Septic Systems	4	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Aquatic Wildlife	Historically	L	Microbial contaminants
Transportation Corridors	Low use	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

**4. Forestry/Watershed Management** – There are small scale forestry operations occurring within the watershed on privately held land. In addition, there is land being managed by a conservation group. Reportedly there has been some clearing of land to near the water's edge. Currently the Water Company does not have a watershed/forest management plan.

- ✓ Develop a Watershed Protection Plan and consider including abutting land owners in the plan to evaluate the need for a forest inventory and forest management plan specifically designed for watershed management. Surface Water Supply Protection plans are an eligible activity under the Source Water Protection Grant Program.
- ✓ Evaluate whether there are any impacts associated with current activities and determine what if any, management strategies are required for public access to the watershed.
- ✓ Continue to inspect the watershed regularly.
- ✓ Communicate with neighbors and inform them of the local by-law and the existing M.G.L. regarding water supplies.
- ✓ Clearly delineate and post Water Company land as necessary to protect the resource.

**5. Protection Planning** – The Town of Great Barrington has Watershed Protection Districts and by-laws that regulate activities near surface water bodies in town. The Town is in the process of reviewing those by-laws. A Watershed Protection Plan has not been prepared and submitted for approval to the Department's Boston office for content and procedures. These types of protection plans coordinate community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public education and outreach. The development of a successful Watershed Protection Plan is outlined in DEP's "Developing a Local Watershed Protection Plan" (see Appendix A for the full report).

**Protection Planning Recommendations:**

- ✓ Develop a Watershed Protection Plan. Consider applying for a Source Water Protection Grant and coordinate efforts with other water suppliers in Great Barrington to protect all public water supplies. Work within the community to establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Surface Water Supply Protection Plan".

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

protect.htm for a copy of DEP's guidance, "Developing a Local Surface Water Supply Protection Plan".

- ✓ Coordinate efforts with local officials to compare local watershed protection controls with current MA Watershed Protection Regulation 310 CMR 22.20B & C). If there are no local controls or they do not meet the current regulation, encourage adoption of new controls. For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ If local controls do not regulate floordrains, be sure to include floordrain controls that meet 310 CMR 22.21(2).

**6. Agricultural Activities** – Crop lands (hayfields) make up about 9% in the watershed of Long Pond. Although pesticides and fertilizers often are not utilized on hay fields, if they are, they have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. Machinery used for harvest or maintenance of the fields can leak oils and fluids that can potentially contaminate the water supply.

**Agricultural Activities Recommendation:**

- ✓ Work with landowners in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies. Refer to <http://www.nrcs.usda>.

**Top 5 Reasons to Develop a Local Surface Water Protection Plan**

- ➊ Reduces Risk to Human Health
- ➋ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ➌ Supports municipal bylaws, making them less likely to be challenged
- ➍ Ensures clean drinking water supplies for future generations
- ➎ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

gov . Natural Resource Conservation Service Centers: Berkshire CD(413) 443-6867.

- ✓ Provide information to hobby farmers on Best Management Practices. Distribute or refer land owners to DEP and DFA fact sheets available on the web site <http://www.state.ma.us/dep/brp/dws/protect.htm>.

**7. Presence of Aquatic mammals in Surface Water Watershed** – There is past history of aquatic mammals (beavers and muskrats) living in and near Long Pond but the water supplier inspects the reservoir. Aquatic mammals pose a potential threat of microbial contamination of the source from *Giardia* *Lambli*a and *Cryptosporidium*, pathogens that are identified in the Surface Water Treatment Rule and Enhanced Surface Water Treatment Rule as posing an unacceptable risk to drinking water.

**Presence of Beavers in Surface Water Sources Recommendations:**

- ✓ Monitor the watershed and reservoirs for the presence of aquatic mammals and their proximity to the intake. Monitor raw water quality and assess potential impacts.

Other land uses and activities within the watershed that are potential sources of contamination are included in Table 2. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system's watershed contains a few potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Communication with abutting property owners
- Vigilant inspection and monitoring of activities in the watershed.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Continue inspecting the protection areas regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents and the conservation group on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your watershed and to cooperate on responding to spills or accidents.
- ✓ Work with landowners in your protection areas to make them aware of your water supply and to encourage the use of a best management practices for residential and recreational uses.
- ✓ Develop and implement a Forest Management Plan for water supply protection.

**Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Source Protection Grant Program provides funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring, about May 1, the Department posts a new Request for Response (RFR- the grant application form) for the grant program. Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

#### **For More Information**

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier and local town boards.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the watershed. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

#### **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities in the Protection Area
- C. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone A?	<b>YES</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone A posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone A regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone A?	<b>YES</b>	Continue monitoring non-water supply activities in Zone As.
<b>Municipal Controls</b> (Zoning By-laws, Health Regulations, and General By-laws)		
Does the municipality have Surface Water Protection Controls that meet 310 CMR 22.20C?	<b>YES</b>	The Town Watershed Protection by-law is in compliance DEP's regulations. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model by-laws, health regulations, and current regulations.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>NO</b>	Work with neighboring municipalities to include the watershed in their protection controls.
<b>Planning</b>		
Does the PWS have a local surface water supply protection plan?	<b>NO</b>	Develop a surface water supply protection plan. Follow "Developing a Local Surface Water Supply Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Water Company has sent a copy of their Emergency Response Plan to the local ER team. Update plan as necessary to support joint emergency response with fire department, Board of Health (BOH), DPW, and local and state emergency officials.
Does the municipality have a watershed protection committee?	<b>NO</b>	Work with planners and other water suppliers to establish committee; include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>PARTIAL</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> . Request the BOH adopt floor drain and hazardous materials handling regulations and conduct inspections.
Does the PWS provide watershed protection education?	<b>YES</b>	Aim additional efforts at commercial, industrial and municipal uses within the watershed.

# Source Water Assessment Program (SWAP) Report for Rudolf Steiner School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
June 22, 2001

<b>PWS ID Number</b>	<b>1113013</b>
<b>Local Contact</b>	<b>Director of Operations, Arthur Hildeth</b>
<b>Phone Number</b>	<b>413-528-4015</b>

<b>Well Name</b>	<b>Source ID#</b>	<b>Zone I (in feet)</b>	<b>IWPA (in feet)</b>	<b>Source Susceptibility</b>
South well	1113013-02G	220	540	Moderate
North well	1113013-03G	100	411	High

## INTRODUCTION

We are all concerned about the quality of the water we drink. Many potential contaminant sources, including septic systems, road salt and improperly disposed of hazardous materials may threaten the quality of water from drinking water wells. Citizens and local officials can work together to better protect drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. DESCRIPTION OF THE WATER SYSTEM

### The Wells

Rudolf Steiner School is a rural, private elementary school with buildings located on both the north and south sides of West Plain Road in Great Barrington. The north building serves a student and staff population of approximately 50 people per day while the south building serves approximately 276 people per day. The original shallow well for the south building (well 01G) was abandoned in 1990 when the new South well (02G) was installed, tested and approved in accordance with the DEP's New Source Approval Process. The North well (03G) supplies water to the north building.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The South well has a Zone I protective radius of 220 feet and an Interim Wellhead Protection Area (IWPA) radius of 540 feet based on pumping test data and Zone I restrictions. Following a pumping test, the safe yield of the South Well was calculated to be approximately 37,440 gallons per day, (gpd) or 26 gallons per minute, (gpm). However, since the school and a property line are 220 feet from the well, the approved water withdrawal from the South well is limited to 7,000 gallons per day (5 gpm). Zone I restrictions allow only water supply related structures or activities within the Zone I, and the water supplier must own or control all of Zone I. Passive recreational activities are, with DEP approval, allowed under the Zone I restrictions. The North well has a Zone I radius of 100 feet and an IWPA radius of 420 feet based on daily use estimates from Title 5 septic system design flow criteria.

The South well, a 6-inch diameter well drilled to a depth of approximately 200 feet below ground, is located in the lawn approximately 220 feet from the building and is 550 feet from the Green River. The driller's log states that sand and gravel were noted from ground level to approximately 14 feet below ground, where bedrock was encountered. The bedrock was logged as interlayered beds of sandstone and shale to 41 feet, grading to limestone, the Stockbridge Formation dolomite, to the final well depth of 200 feet. The engineer's notes indicate the 34 feet deep casing was to be extended from 18 inches above ground to 76 feet below ground. The North well, a 6-inch diameter drilled well is located approximately 60 feet from the building. There is no other information about the depth or construction of the well, however it is assumed that the well is completed in the same bedrock formation as the South well.

Please refer to the attached maps of the Zone Is and IWPAs and Tables 2 and 3 for assessment information.

### The Water Quality

For current information on monitoring results, please contact the Public Water System contact person listed above in Table 1.

## 2. DISCUSSION OF LAND USES IN THE PROTECTION AREAS

There are a number of land uses and activities within the drinking water supply protection areas for Rudolf Steiner School, which are potential sources of contamination. The overall ranking of susceptibility to contamination for the North well is high and for the South well is moderate, based on the presence of land uses or activity in the Zone I and IWPA, as seen in Tables 2 and 3.

**Table 2: Table of Activities Common to the Protection Areas of Both Wells**

Potential Sources of Contamination	Zone I	IWPA	Threat	Comments
School buildings	North well	South well	Moderate	Non-water supply structures and activities
Floor drains boiler room	North well	Both Wells	Moderate	Potential release of oil or boiler water to drain
Transportation corridor (West Plain Road)	No	Both wells	Moderate	Road salt, spills and runoff
Parking	No	Both wells	Moderate	Limit deicers, provide proper drainage from wells, and educate staff about leaks
Wastewater pipelines/septic components	No	Both wells	Moderate	Wastewater mains, tank and leachfield

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Table 2: Table of Activities Common to the Protection Areas of Both Wells (continued)**

Potential Sources of Contamination	Zone I	IWPA	Threat	Comments
Aboveground Fuel oil Storage Tank (AST)	No	Both wells	Moderate	Tank in Main (south) building in containment, tank in north building, does not have containment
Agricultural activities	No	Both wells	Low	Haying has minimal impact provided fertilizers are not used
Dairy Farm - Pesticide use (corn/alfalfa)	No	Both wells	High	Commercial application of pesticides
Dairy Farm - Manure spreading	No	Both wells	High	Liquid manure is spread on some of the fields

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Key Land Use Issues for the Wells include:**

1. **Non-conforming uses in Zone I (North Well)**
2. **Floor drains in boiler rooms**
3. **Agricultural Activities – (Dairy Farm)**

1. **Zone I (North well)** – The North well is non-conforming with respect to the DEP land use restrictions, which allow only water supply related activities in Zone I. The Zone I for the North well contains the school building and some sewer lines. Please note that systems not meeting DEP Zone I requirements must receive DEP approval and address Zone I issues prior to increasing water use, modifying systems or conducting any activities within Zone I.

**Recommendations:**

- ✓ Do not conduct any additional activities within the Zone I. Monitor all activities within Zone I, use BMPs and train staff for emergency response. Contact MA DEP prior to conducting any new activities within Zone I.

- ✓ Consider replacement of sources or an alternative source of water if existing land uses cannot be mitigated. Contact the Department to discuss any expansion of the school well in advance of finalizing plans.

2. **Floor drains in boiler rooms** – Floor drains may be required in boiler rooms to provide drainage in the event of a plumbing failure. If there is a potential for hazardous materials to flow accidentally into the floor drain, however, preventive measures should be taken. The boilers at the Steiner school are small, residential size boilers (rather than large industrial boilers) that do not use any water treatment chemicals. The main boiler room in the south building has a floor drain and a 50-gallon oil, day tank in the room; the boiler is between the tank and the floor drain. Boiler room #2 at the south building does not have a floor drain or a day tank. The north building boiler room also has a floor drain. The oil tank at the north facility is located within an adjacent storage room in the north building. The discharge points for the floor drains are unknown but are assumed to be the septic system. The maintenance office also has a floor drain, however, if there are no hazardous materials (such as paints or stains) stored in the office, therefore there is no threat from the drain in the office.

**Recommendations:**

- ✓ In the main boiler room in the South building, it is recommended that a sealed berm of sufficient height (approximately 2 or 3-inches) be placed on the floor between the day tank and the boiler to retain the 50 gallons if a failure occurred. Any holes or cracks in the floor behind the berm should be sealed at the same time. Consider installing a berm around

Figure 1: Example of how a well could become contaminated by different land uses and activities.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to  $\frac{1}{2}$  mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact [Catherine Skiba](#) in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at: [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

the storage tank in the north building to contain 110% of the volume of that tank. If the boiler in the north building is moved to the back of the room (where the old boiler is currently located), consider installing a similar, shallow ( $\pm$  2-inches) berm, between the boiler and the floor drain. Oil lines from the tank to the boiler can be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the bermed boiler. A policy and plan should be in place during maintenance operations, especially when oil filters are changed. Request that your boiler maintenance contractor use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. Please note that boiler blowdown water cannot be disposed of in the sanitary septic system and must be disposed of off site.

3. **Agricultural Activities (Dairy Farm)** – There are agricultural activities of various degrees in and adjacent to the IWPA's of the wells. The activities range from simply haying the fields without any soil improvements to spreading liquid cow manure and applying pesticides on cultivated cropland for the dairy farm. The licensed applicator is responsible for complying with regulations regarding application of products within the IWPA of the school well and additionally, in the Zone II of the Great Barrington Green River Infiltration Gallery.

### Recommendations:

- ✓ Attempt to obtain an agreement from the farm owner/operator that they will:
  - Follow all applicable UMASS recommendations on Integrated Pest Management.
  - Become certified in UMASS/Natural Resource Conservation Service Nutrient Management Certification program.
  - Obtain and follow a Farm Plan through Natural Resource Conservation Service. Alternatively, complete and follow a plan developed through the publication *On Farm Strategies to Protect Water Quality: An Assessment and Planning Tool for Best Management Practices*.

Information on funding and other resources for agricultural management is available through the Massachusetts Department of Food and Agriculture at (617) 626-1700 or <http://www.massdfa.org/bureaus.htm>.

Other activities identified during the assessment that pose a potential threat to the water supplies are residential septic systems and household hazardous waste. Controlling runoff and monitoring parking areas for spills will minimize the potential threat from parking lot runoff.

Implementing the recommendations below will reduce the system's susceptibility to contamination.

## 3. PROTECTION RECOMMENDATIONS

Rudolf Steiner School should review and adopt the following recommendations at the facilities:

### Zone I:

- ✓ Keep all new non-water supply activities out of the Zone I for both wells.
- ✓ Please note that water systems not meeting DEP Zone I requirements (North well), must get DEP approval and address Zone I issues prior to increasing water use, modifying their system or conducting any additional non-conforming activities in Zone I.

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the water supplier, town boards, the town library and the local media.

- ✓ Consider well relocation if Zone I threats cannot be mitigated or water quality is impacted (North well).
- ✓ Prohibit public access to the well and post signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check for accidental spills or leaks, etc.
- ✓ Consider alternative sites for a new well and protect that land for future use through purchase or conservation restriction that would prohibit potentially threatening activities.
- ✓ Install berms and/or containment for oil tanks, sleeve the oil lines and seal any cracks or holes in the floor behind the berm.
- ✓ Request that your maintenance contractor use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance.
- ✓ Maintain drinking water protection area signs at key visibility locations.

### **Training and Education:**

- ✓ Train staff and faculty on proper hazardous material use, disposal, handling, emergency response, and best management practices; include custodial staff, certified operator, faculty and other appropriate staff.

### **Facilities Management:**

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of any potentially hazardous materials, such as paints or stains.
- ✓ Continue the current policy of using Best Management Practices (BMPs) for the use of pesticides on facility property.

### **Planning:**

- ✓ Contact local officials in town to notify them that your facility is currently within the Great Barrington, Green River Infiltration Gallery's Zone II and Aquifer Protection District to assist you in improving protection.

- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Agriculture:**

- ✓ Attempt to obtain an agreement from the farm owner/operator that they will:
  - Follow all applicable UMASS recommendations on Integrated Pest Management.
  - Become certified in UMASS/Natural Resource Conservation Service Nutrient Management Certification program.
  - Obtain and follow a Farm Plan through Natural Resource Conservation Service. Alternatively, complete and follow a plan developed through the publication *On Farm Strategies to Protect Water Quality: An Assessment and Planning Tool for Best Management Practices*.
- ✓ Encourage farmers in the IWPA to seek assistance from the Natural Resource Conservation Service (NRCS) or DFA.

### **Funding:**

- ✓ The Department's Source Water and Wellhead Protection Grant Programs provide funds to assist public water suppliers in addressing Wellhead and other source water protection through local projects. Protection recommendations discussed in this document may be eligible for funding under these Grant Programs. For additional information, please refer to the attached program fact sheets. Please note, the Request for Response (RFR - application forms) for the Grant programs are posted each fiscal year about May 1 and due back about June 30. Contact Catherine V. Skiba at 413-755-2119 for more information on the programs. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussions to assist the water supplier in his efforts to protect and improve the water supply and further review overall local drinking water protection measures.

- ◆ Septic System Brochure
- ◆ Summary of Recommended Source Water Protection Measures
- ◆ *On Farm Strategies to Protect Water Quality: An Assessment and Planning Tool for Best Management Practices*

#### **Additional Reference Documents:**

To help with source protection efforts, more information is available from the Regional Office by contacting Catherine V. Skiba (413) 755-2119 or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws), including:

- ◆ Best Management Practice information, and general water supply protection information
- ◆ MA DEP SWAP Strategy
- ◆ Land Use Pollution Potential Matrix
- ◆ Draft Land/Associated Contaminants Matrix

# Source Water Assessment Program (SWAP) Report for Monument Mountain Regional High School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
June 18, 2001

## INTRODUCTION

We are all concerned about the quality of the water we drink. Many potential contaminant sources, including septic systems, road salt and improperly disposed of hazardous materials may threaten the quality of water from drinking water wells. Citizens and local officials can work together to better protect drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. DESCRIPTION OF THE WATER SYSTEM

### The Wells

Monument Mountain Regional High School is a rural regional school located on the east side of Route 7 in Great Barrington with a staff and student population of approximately 650 people. There are two water supply wells at the school. Well #1 is the main water supply for the school; well #2 supplies water to the greenhouse, its associated classroom and work areas.

Well 1, an 8-inch diameter well drilled to a depth of approximately 225 feet below ground in 1967. School records indicate difficulty drilling the well due to collapse of the formation. Bedrock was encountered at 4 feet below grade but the casing was extended to 200 feet below grade; the well casing extends approximately 18-inches

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

above the floor of a below ground vault. Although there was dampness on the floor, there was no evidence of flooding in the vault. The yield for Well 1 was estimated to be approximately 145 gpm based on a pumping test conducted at the time of construction. Well 2, a 6-inch diameter well is located in a crawl space accessed from the basement of the Plant Science classroom building. There is no information about the depth or construction of the greenhouse well although there is anecdotal information regarding an estimated yield of approximately 200 gallons per minute. This information could not be confirmed.

It is assumed that both wells are completed in bedrock. Geological maps of the area describe the bedrock as the Stockbridge Formation. The bedrock mapped at the greenhouse well is massive dolomite marble while the school well is mapped near the contact between the dolomite marble and layered, impure quartzose, micaceous dolostone. The structural geology map of the site shows fairly complex folding and faulting mapped both east and west of the well locations with nearly vertical bedding planes in the vicinity of the wells. The bedrock aquifer utilized by the two school wells has a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the ground surface into the aquifer.

Well 1 has a Zone I protective radius of 236 feet and an Interim Wellhead Protection Area (IWPA) radius of 579 feet based on metered water usage. Well 2 has a Zone I radius of 100 feet and an IWPA radius of 420 feet based on an daily use estimates from Title 5, septic system design flow criteria. Please refer to the attached maps of the Zone Is and IWPAs and Tables 2 and 3 for more assessment information.

### The Water Quality

For current information on monitoring results, please contact the Public Water System contact person listed above in Table 1.

## 2. DISCUSSION OF LAND USES IN THE PROTECTION AREAS

A number of land uses and activities within the drinking water supply protection areas for Monument Mountain Regional High School wells are potential sources of contamination. The overall ranking of susceptibility to contamination for the wells is high, based on the presence of at least one high threat land use or activity in the Zone I and IWPA, as seen in Tables 2 and 3.

**Table 2: Table of Activities Within the Protection Areas**

Potential Sources of Contamination*	Zone I	IWPA	Threat	Comments
Hazardous materials storage	Well 2	Both Wells	High	Laboratories/auto repair/greenhouse
Transportation corridor (Route 7)	Well 2	Both Wells	Moderate	Road salt, spills and runoff
Parking lots and driveways	Both Wells	Both Wells	Moderate	Limit road salt usage and provide drainage away from wells
Wastewater pipelines/septic components	Both Wells	Both Wells	Moderate	Wastewater mains, tank and leachfield
Stormwater discharge	No	Both Wells	Low	Road salt, spills and runoff
Landfill	No	No	--	The landfill is closed. There is no confirmed impact on the wells from the landfill.

\* - For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Key Land Use Issues for the Wells include:**

1. **Non-conforming uses in Zone I**
2. **Wastewater components**
3. **Hazardous Materials handling**

1. **Zone Is** – Both wells are non-conforming with respect to MA DEP land use restrictions, which allow only water supply related activities in Zone Is. The Zone Is for Wells 1 and 2 contain parking, school buildings and activities, sewer lines, septic tank (Well 1) and leachfield (Well 2), storm drains and Route 7. Please note that systems not meeting DEP Zone I requirements must receive DEP approval and address Zone I issues prior to increasing water use, modifying systems or conducting any activities within Zone I.

**Recommendation:**

- ✓ Do not conduct any additional activities within the Zone I. Monitor all activities within Zone I, use BMPs and training for emergency response.

Contact MA DEP prior to conducting any new activities within Zone I. Consider replacement of sources or an alternative source of water if existing land uses cannot be mitigated. Contact the Department to discuss any expansion of the school well in advance of finalizing plans.

2. **Wastewater components** - The septic tank, kitchen grease trap and sewer lines are within the Zone I of Well 1. The tank for the greenhouse is within the Zone I for Well 2; the leachfield for the school is partially within the IWPA of Well 2. The

Figure 1: Example of how a well could become contaminated by different land uses and activities.

**Table 3: Activities Specific to Well #1**

Potential Sources of Contamination	Zone I	IWPA	Threat	Comments
Underground Heating Oil Storage Tank (UST) (Unused)	Yes	No	High	The USTs is a backup to the propane and is not currently used.
High School	Yes	Yes	Moderate	Non-water supply structures in Zone I. Small quantities of hazardous materials are used and generated.
Floor drains (Underground Injection Control – UIC)	-	-	-	Discharge point for floor drain in auto mechanics shop and boiler room must be investigated and addressed.

**Activities Specific to Well #2 – Greenhouse Well**

Potential Sources of Contamination	Zone I	IWPA	Threat	Comments
Greenhouse - Pesticides and fertilizers	Yes	Yes	High	Containment and use must be managed.
Leachfield	No	Yes	Moderate	Laboratory and art wastes must be eliminated from waste stream.
Lawns and athletic fields	Yes	Yes	Moderate	Do not use pesticides or fertilizers.
Floor drains (Underground Injection Control – UIC)	-	-	-	Discharge point for floor drain greenhouses - investigate and address.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

school currently has until 2003 to acquire a groundwater discharge permit for the large Title 5 system. The school has active high school science (biology and chemistry) laboratories, art classes and an auto mechanics shop with a floor drain. The Plant Science Building also has greenhouses with floor drains. The discharge point for the floor drains is unknown. Title 5 prohibits disposal of non-sanitary wastewater into a Title 5 system. The alternatives for the floor drains include closure, connection to a tight tank or connection to the municipal sewer system with an oil water separator as appropriate. The options for the laboratory and art wastes include, connection to either a tight tank or municipal sewer.

### Recommendations:

- ✓ Review the information attached regarding the proper methods for closure of floor drains (refer to attachment 4 - *Industrial Floor Drain Brochure*). Contact the UIC coordinator for the Western Regional Office of the Department for additional technical assistance - (Rick Larson (413) 755-2207).  
Interim actions:
  - Cease using the floor drain immediately
  - Determine the discharge point of the floor drain, investigate as appropriate
  - The school is currently investigating the feasibility of connecting to the Great Barrington sewer system. Connecting to the sewer will resolve several issues for the school and add significant protection to the water supplies.

3. **Hazardous Materials Handling** – The school has science laboratories, art class studios and an auto shop. The volumes of potentially hazardous materials used and disposed of will likely require the school to register at a Very Small Quantity Generator (VSQG) of Hazardous Waste. Hazardous materials disposed of through the leachfield have the potential to impact the groundwater.

### Recommendations:

- ✓ Review the requirements for registration as a VSQG. To learn more, see the hazardous materials guidance manual at [www.dep.state.ma.us/dep/bwp/dhm/dhmpubs.htm](http://www.dep.state.ma.us/dep/bwp/dhm/dhmpubs.htm)
- ✓ Contact Hillary Eustace of the Massachusetts Office of Technical Assistance at 617-626-1061 or [Hilary.Eustace@state.ma.us](mailto:Hilary.Eustace@state.ma.us). Ms. Eustace will be able to provide assistance in preparing an inventory and plan for managing hazardous materials and waste at the school, specifically art, science and automotive technology products and waste.

Other activities identified during the assessment that pose a potential threat to the water supplies are the landfill, residential septic systems and household hazardous waste. The landfill was extensively studied at the time of closure. There was no confirmed impact on the schools well water quality. For further information regarding the landfill studies, contact the Springfield Office of the DEP's Division of Solid Waste at (413) 784-1100. Storm water discharges are within the IWPA of both wells. Use of BMPs and monitoring of parking areas will minimize the potential threat from parking lot runoff. With respect to the unused underground fuel oil storage tank, it should be determined if there is fuel in the tank. The tank should periodically be monitored or removed if there is no intent to use the tank. If the intent is to have an oil tank for a back-up fuel source, it is recommended to upgrade the tank to current standards. The schools utility transformer(s) are located in the school. Contact the utility to ensure only PCB free oil is in the transformers.

Implementing the recommendations below will reduce the system's susceptibility to contamination.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the water supplier, town boards, the town library and the local media.

### **3. PROTECTION RECOMMENDATIONS**

Monument Mountain Regional High School should review and adopt the following recommendations at the facilities:

#### **Zone I:**

- ✓ Keep all new non-water supply activities out of the Zone I.
- ✓ Consider connecting the facility to the Great Barrington sewer and public water systems.
- ✓ Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use, modifying their system or conducting any additional non-conforming activities in Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Prohibit public access to the well by locking facilities, gating roads, and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check for accidental spills or leaks, etc.
- ✓ Consider alternative sites for a new well and protect that land for future use through purchase or conservation restriction that would prohibit potentially threatening activities.
- ✓ Coordination with the DEP, State highway and local officials regarding protecting the water supplies through emergency response coordination.
- ✓ Well 1 is in a vault/pit. Generally pit installations for water supply wells are not approved by the Department due to the safety concerns associated with confined spaces, as well as the potential for the flooding of the Wellhead that could affect sanitary quality of the water being delivered. Consider extending the Wellhead to 18-inches above the ground as part of future modifications to Well 1. Unless the turbine pump is replaced with a submersible, this change would require the construction of a pump house as well.

- ✓ The unused underground fuel oil storage tank should be inspected, drained and removed if there is no intent to use the tank. Upgrade the tank to current standards if the intent is to have an oil tank for a back-up fuel source.

#### **Training and Education:**

- ✓ Train staff and faculty on proper hazardous material use, disposal, handling, emergency response, and best management practices; include custodial staff, certified operator, faculty and other appropriate staff.
- ✓ Maintain the drinking water protection area signs at key visibility locations.

#### **Facilities Management:**

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/bwp/dhm/dhmpubs.html](http://www.state.ma.us/dep/bwp/dhm/dhmpubs.html). Also, contact Hillary Eustace of the Massachusetts Office of Technical Assistance at 617-626-1061 or [Hilary.Eustace@state.ma.us](mailto:Hilary.Eustace@state.ma.us).
- ✓ Monitor all oil/hazardous material storage tanks to incorporate proper containment and safety practices.
- ✓ Implement Best Management Practices (BMPs) for the use of pesticides on facility property.
- ✓ The utility transformers are located in the basement of the school. Contact the utility company to determine if the MODF has been replaced with PCB free oil. If PCBs are present, urge their immediate replacement.

#### **Planning:**

- ✓ Work with local officials in Great Barrington to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussions to assist the water supplier in his efforts to protect and improve the water supply and further review overall local drinking water protection measures.

#### **4. ATTACHMENTS**

- ◆ Map of the Public Water Supply (PWS) Protection Area.
- ◆ Septic System Brochure
- ◆ Summary of Recommended Source Water Protection Measures
- ◆ The Very Small Quantity Generator of Hazardous Waste – Fact Sheet
- ◆ One Day Hazardous Waste Collections - Fact Sheet

#### **Additional Reference Documents:**

To help with source protection efforts, more information is available from the Regional Office by contacting Catherine V. Skiba (413) 755-2119 or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws), including:

- ◆ Water Supply Protection Guidance Materials such as model regulations
- ◆ Developing a Local Wellhead Protection Plan
- ◆ Best Management Practice information, and general water supply protection information
- ◆ MA DEP SWAP Strategy
- ◆ Land Use Pollution Potential Matrix
- ◆ Draft Land/Associated Contaminants Matrix

# Source Water Assessment Program (SWAP) Report For Simon's Rock of Bard College

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
June 15, 2001

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Simon's Rock of Bard College
<i>PWS Address</i>	84 Alford Street
<i>City/Town</i>	Great Barrington, Massachusetts
<i>PWS ID Number</i>	1113017
<i>Local Contact</i>	Mr. John Verones, Superintendent
<i>Phone Number</i>	413-528-7239

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well 1	1113017-01G	100	406	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Simon's Rock of Bard College is a liberal arts college with a total staff and student population of approximately 400 people. The school is divided into two campuses; the Main Campus and the West Campus. The Main Campus purchases water from the Great Barrington public water system. The West campus contains only two academic buildings, the Leibowitz Building and the Arts and Recreation Center. Well 1 is the sole source of water for the West Campus and is on the north side of the Leibowitz Building approximately 10 feet from the building. The Zone I protective radius for Well 1 is 100

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

feet and the Interim Wellhead Protection Area (IWPA) radius is 406 feet. The protective radii were calculated based on the Title 5 estimated daily water use of 290 gallons per day (gpd). Please refer to the attached map that shows the Zone I and IWPA.

Well 1 is a 6inch diameter well drilled to a final depth of approximately 315 feet. There is no record of final construction of the well or of the materials encountered during drilling. Geologic mapping of the area indicates the overburden material at the well location consists of sand and gravel, stream deposits but does not indicate the depth of the deposits. The bedrock is mapped as carbonate (limestone and dolomite) rocks of the Stockbridge Group. Bedrock wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant barrier to prevent surface contamination from migrating into the bedrock aquifer.

Municipal sewer partially serves the facility. The Leibowitz building is connected to the town sewer while the Arts and Recreation facility utilizes an on-site septic disposal system. According to the facility manager, the school intends to connect to the municipal sewer in the future.

The well falls within the Zone II delineated for the Great Barrington Green River Infiltration Gallery. Therefore, if the Town adopts protective overlay district and bylaws for the Green River source Zone II, the well for Simon's Rock will fall within that district.

### Water Quality

The Simon's Rock of Bard College West Campus well water does not require and does not have treatment at this time. For current information on monitoring results, please refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

A few land uses and activities within the drinking water supply protection areas are potential sources of contamination. The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of at least one moderate threat land use or activity in the Zone I and IWPA, as seen in Table 2.

#### Key issues include:

1. **Nonconforming Activities in Zone I**
2. **Septic System components**

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Parking lot, driveway & roads	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells.
Septic System	No	Yes	Moderate	See septic systems brochure in the appendix.
Very Small Quantity Generator of Hazardous Waste	No	Yes	Low	Art wastes are collected and transported to a hazardous waste storage area on the main campus
Structures	Yes	Yes	-	Non-water supply activities in Zone I
Low Density Residential Uses	No	Yes	Moderate	Residential use of fertilizers, pesticides and household hazardous materials

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-feet to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

1. **Zone Is** – Currently, the well does not meet DEP's restrictions, that allow only water supply related activities in Zone I. The facility's Zone I contains school buildings, roads, parking areas and septic system components. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use, modifying the system or conducting any new non-water supply related activity within the Zone I.

The school has a comprehensive waste management plan prohibiting the disposal of anything other than sanitary waste through the septic system. They routinely collect the waste products from the art studios and dispose of them appropriately.

### Recommendations:

- ✓ Do not conduct any new activities within Zone I.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ If the existing threats cannot be mitigated, and pose increased threat, consider investigating an alternative site for a new well and connection to the Town sewer system.

2. **Parking and roadways** – Parking for the buildings is on a gravel lot within Zone I and there are public roadways in Zone I and the IWPA. Stormwater runoff picks up debris and contaminants from streets, parking areas and lawns. Common potential contaminants in runoff include lawn chemicals, pet waste, leakage from dumpsters, and contaminants from vehicle leaks or accidents.

### Recommendation:

- ✓ Manage storm runoff from parking areas so that it flows away from the well. Consider paving the parking area and installing storm drains with oil water separator and sediment sumps.
- ✓ Minimize automobile parking in Zone I, as feasible.

Other land uses identified during the assessment include Very Small Quantity Generator of Hazardous Waste and low-density residential development. The college has a comprehensive Emergency Response Plan and a hazardous material handling policy and plan. Diligence in compliance with the VSQG requirements and education of staff and students will serve to protect the public water supply. Implementing the following recommendations will also reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the well's susceptibility to contamination. The staff of the Simon's Rock of Bard College is commended for current diligence and the protection measures in place such as the arts material handling and the partial connection to the municipal sewer. The school, in conjunction with local officials should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Connect to municipal wastewater disposal system.
- ✓ Post drinking water protection area signs in visible areas along IWPA. Inform faculty, staff and students regarding appropriate disposal and materials handling.

### Zone I and IWPA:

- ✓ Keep new non-water supply activities out of the Zone I.
- ✓ Monitor all non-compliant activities in the Zone I.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Consider connecting to the Great Barrington sewer system and water system.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check parking areas for accidental leaks, etc.
- ✓ Maintain road and parking lot drainage.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Educate the students and staff about protection of the water supply.

### Training and Education:

- ✓ Continue staff training on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, faculty groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Incorporate groundwater education into school curriculum as appropriate.
- ✓ Communicate with your community to ensure that stormwater runoff from roads is directed away from the well and is treated according to DEP guidance.

### Facilities Management:

- ✓ Maintain current standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/brp/dws/dwspubs.html](http://www.state.ma.us/dep/brp/dws/dwspubs.html).
- ✓ Continue to ensure non-sanitary wastewater discharges do not go to the on-site septic systems. An alternative to pick-up and disposal for art studios is discharge to a tight tank or connect to a sanitary sewer.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.
- ✓ Septic system components should be inspected and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ Concrete, surface sanitary seals around wellheads should slope away from well and the well casing should extend above ground.

### Planning:

- ✓ Contact local officials in Great Barrington to be sure they are aware that your well is located within the Zone II of the Town's supply. Any Aquifer Protection District Bylaws would also assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Funding:

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the 2001

"Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response (grant application) for the Grant program (RFR). The RFR is generally available and due back into the DEP on or about May 1 and June 30, respectively. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

- Your Septic System Brochure
- Pesticide Use Fact sheet
- Wellhead Protection Grant Program Fact Sheet
- Source Protection Sign Order Form

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Eagleton School Main Campus

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
November 14, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses in the Protection Areas
3. Protection Recommendations
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Eagleton School is located in Great Barrington, a medium sized town in south Berkshire County. The school is a residential school for boys age 9 through 22 with emotional and/or learning difficulties. The staff and student population is presently approximately 60 people per day. Great Barrington does have a municipal water system and wastewater treatment facility however, they do not serve this section of town. Therefore the school is

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

served by three, on-site water supply wells and an on-site wastewater disposal system. The school's three wells are located on the north side of Monterey Road; the Kitchen/Classroom Well 01G, is located immediately adjacent to the pool and a parking area; the T-House Well 02G, is located next to a day use building east of the parking area; the Mountain Well 03G, is located remote from the facility and was developed and tested through the New Source Approval Process. However, Well #3 has not yet been activated for use in the system.

The facility is located on the side of a brook valley where the bedrock rises sharply with numerous locations of bedrock outcrop. Geologic mapping in the area indicates shallow overburden of till. The bedrock mapping shows a contact through the site between the carbonate rocks of the Stockbridge Formation and the metamorphic rocks of the Berkshire Highlands/Green Mountain Core.

The Zone I is the area immediately around the well where only activities associated with supplying water or other non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The Zone I radius and IWPA radii of well 01G are 138 feet and 440 feet; the Zone I and IWPA radii for well 02G are 125 feet and 433 feet; and the Zone I and IWPA radii for well 03G are 235 feet and 576 feet. There is no evidence of a confining clay layer or a thick till layer at the site. In fact, as noted previously, there are numerous locations of exposed, fractured bedrock on-site. Therefore, the Department has determined that the wells are located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone Is and IWPAs.

The wells serving the facility have no treatment at this time. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Fuel Oil Storage (at residences)	No	All Wells	Moderate	Spills, leaks, or improper handling of fuel oil from surrounding residences
Lawn Care / Gardening	01G & 02G	All Wells	Moderate	Over-application or improper storage and disposal of pesticides and fertilizers
Septic Systems Components	01G & 02G	All Wells	Moderate	Microbial contaminants, and improper disposal of hazardous chemicals
School/parking	01G & 02G	All Wells	Moderate /High	Fuel oil, laboratory, art, photographic, machine shop, and other chemicals: spills, leaks, or improper handling or storage
Transportation Corridor	No	All Wells	Moderate	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Key issues include:

1. **Non-conforming Zone Is;**
2. **Residential Land Uses;**
3. **School; and**
4. **Transportation Corridor.**

The overall ranking of susceptibility to contamination for the wells is moderate, based on the presence of at least one moderate threat land use or activity in the IWPA's, as seen in Table 2. The proximity of Well #1 to parking and other activities prompted the Department to consider the school and parking a moderate to high threat to well #1. The Department's conditional approval for Well #3 is that Well #1 must be abandoned as a source of water.

1. **Non-conforming Zone Is** – Currently the wells do not meet DEP's restrictions, which only allow water supply related activities or other non-threatening activities in the Zone I. The school's Zone Is (except 03G) contain school buildings, roads/driveways, parking areas, a recreational pool, and pool chemicals. Systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

## Recommendations:

- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements, as is reasonable.
  - ✓ Do not store pool chemicals within the Zone I unless they are within containment. Do not use or store pesticides, fertilizers, or road salt within Zone I.
  - ✓ Restrict automobile parking within the Zone I of Well 02G and direct runoff away from the well.
2. **Residential Land Uses** – Portions of several residential properties fall within all of the IWPA's. All of the residences have on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:
    - ♦ **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they can be a potential source of microbial contamination.

**Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.

- ♦ **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- ♦ **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

## Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

"Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

- ✓ Promote BMPs for stormwater management and pollution controls.

3. **School** – Activities associated with schools commonly involve hazardous materials such as fuel oil and laboratory, art, photographic, machine shop, and other chemicals. These hazardous materials have the potential to impact drinking water supplies if they are improperly handled, stored, or materials are improperly disposed into septic systems.

#### School recommendations:

- ✓ Implement BMPs that can be used to reduce the risk of contamination.
- ✓ Provide source protection education for maintenance staff, food preparation staff, teachers and students.
- ✓ Provide appropriate disposal for all cleaning and household hazardous waste at the school.

4. **Transportation Corridor** – Monterey Road (Route 23) is located within the IWPA's. Major roads are potential sources of contamination due to salting of roadways and leaks or spills of fuels and other hazardous materials during accidents.

#### Recommendation:

- ✓ Contact the local fire department to ensure that the IWPA's are included in Emergency Response Planning.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Eagleton School is commended for development of Well #3 and for the use of a propane generator. Eagleton School Main Campus should review and adopt the key recommendations above and the following:

#### Priority Recommendations:

- ✓ Do not use or store pesticides, fertilizers, road salt, or pool chemicals within the Zone I.
- ✓ Redirect road and parking lot drainage in the Zone I away from well.

#### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.

- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ If the school intends to continue utilizing the structures in the Zone I, use BMPs and restrict activities that could pose a threat to the water supply.

#### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Incorporate groundwater education into the school curriculum.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

**Facilities Management:**

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, refer to <http://www.state.ma.us/dep/bwp/dhm/files/sqgsum.pdf> for the Requirements for Small Quantity Generators.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on school property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

**Planning:**

- ✓ Work with local officials in town to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. If funds are available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Massachusetts Department of Environmental Protection Source Water Assessment Program (SWAP) Report for American Institute for Economic Research

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 14, 2003

## Introduction

We are all concerned about the quality of the water we drink. Groundwater sources may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

American Institute for Economic Research (AIER) is a facility located in the northeast corner of Great Barrington in south Berkshire County. The facility consists of several buildings that include office space and a small printing operation to publish their literature. The regular staff population is approximately 30 people per day but AIER also conducts seminars and is staffed by student interns. The facility is presently served by a single potable supply spring source (1113028-01G) located north of the facility in Alford. Periodically the spring source has inadequate yield to satisfy the water requirements at AIER. Under those conditions the facility used untreated water from the

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

adjacent Housatonic Water Company's Long Pond Reservoir. The intake for AIER was prior to the Housatonic Water Company's treatment facility and therefore, the Department has prohibited the use of untreated water from Long Pond. Prompted by the inadequate supply from the spring and the determination, through microscopic particulate analysis (MPA), that the spring source was under the influence of surface water and would require treatment, AIER is pursuing development of a new well source. At the time this report was prepared, the new source permitting process was near completion. Once that source (Well #1) is approved to come on-line, this report will be updated to include Well #1.

The Zone I for a spring is a square area while the Interim Wellhead Protection Areas (IWPA) is a radial area centered on the source. The size of the protection areas are calculated based on the measured or estimated volume of water used from the source. The estimated daily water use at the facility is 3,000 gallons per day. The length of the sides of the square Zone I area is 343 feet while the radius of the IWPA around the spring is 467 feet. The entire Zone I and IWPA area is forested with no other land use activities. All spring sources are considered to be vulnerable to activities on the land surface and all springs are considered to be subject to influence of surface water. You may request additional, current information regarding the quality of the water, from the local contact listed in Table 1. Please refer to the attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

There are few land uses and activities within the drinking water supply protection areas that are potential sources of contamination. The physical nature of the spring source makes it susceptible to natural microbial contaminants.

### Key issues include:

#### 1. Wildlife/Natural microbial activity

The spring is located in an aquifer with a high vulnerability to contamination due to the absence of a significant hydrogeologic barrier to prevent contaminant migration. The overall ranking of susceptibility to contamination for the spring is moderate, based on the presence of one moderate to high ranking threat land use or activity in the IWPA, as seen in Table 2.

**1. Wildlife/Natural microbial activity** – Though the area is relatively remote, the spring source was determined to be under the influence of surface water and therefore vulnerable to microbial contamination. Wild animals, farm animals and domestic pets can be carriers of waterborne diseases such as *Giardia*, *Cryptosporidium*, *Salmonella*, etc. Microorganisms are microscopic creatures such as bacteria, viruses, and protozoa. Because some microorganisms are known pathogens, or disease causing agents, microbial contamination of public drinking water supplies poses a serious threat to human health.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Wildlife	Yes	Yes	Moderate	The potential threat to this source is from natural sources and not anthropogenic land use.

- -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Some known contaminants of concern in drinking water include: Bacteria, Escherichia coli (E.coli), Viruses, and Protozoa. Bacteria, viruses, and protozoa when ingested in drinking water can cause a number of infectious waterborne diseases such as cholera, typhoid, hepatitis, and infectious gastrointestinal diseases like cryptosporidiosis and giardiasis. Symptoms of waterborne disease may include fever, fatigue and weight loss (common in viral cases), vomiting, abdominal cramping, diarrhea, and stomachaches. In the most severe cases waterborne diseases can prove lethal.

### Recommendations:

- ✓ Some microbial contaminants can be removed by water treatment coagulation and filtration processes. Disinfection has been proven effective against bacteria and viruses, but protozoa, such as Cryptosporidium, are very resistant to chlorination alone. Other treatment methods are necessary to address Cryptosporidium such as ozonation, UV disinfection, or filtration.
- ✓ Continue the process of development of the new well.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the spring's susceptibility to contamination. The American Institute for Economic Research is commended for current protection measures including the active search to locate a new water source.

Please review and adopt the key recommendations listed above and as follows:

### Zone I and IWPA:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I. Look for evidence of unauthorized access.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider fencing and gating the immediate area around the spring.

### Facilities Management:

- ✓ Concrete protective seals on the spring (earthen or concrete) should slope away from the source and surface runoff should be directed around the spring.

### Planning:

- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
PEPPERMILL RESTAURANT & LOUNGE

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Peppermill Restaurant & Lounge
<i>PWS Address</i>	999 South Main St
<i>City/Town</i>	Great Barrington, Massachusetts
<i>PWS ID Number</i>	1113030

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well	1113030-01G	159	455	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well  
(1113030-01G)**

Zone I = 159 ft.  
IWPA = 455 ft.

### How Was My Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and/or the IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the parking and local roads within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you during a site visit, water quality data and/or from other sources of information.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Greenfield Water Department**

### What is SWAP?

The Source Water Assessment and Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

<i><b>Local Contact</b></i>	Ms. Sandra Shields
<i><b>Phone Number</b></i>	413-772-1539

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

## Class B River Intakes

Class B water sources do not have Zone A , B and C protection areas as the Class A sources do. For the purposes of this report, an "Emergency Planning Zone" has been delineated. The **Emergency Planning Zone** is the land area within 400 feet of both sides of the river including all tributary streams and surface water bodies.

## Section 1: Description of the Water System

**Water Sources**  
**System Susceptibility:** **High**

**Ground Water Sources:** **Susceptibility: High**

**MA GIS Zone II ID#: 145**

<b>Source Name:</b>	<b>Source ID</b>
GP Well #1	1114000-04G
GP Well #2	1114000-05G
GP Well #3	1114000-06G

**Surface Water Sources:** **Susceptibility: High**

<b>Source Name:</b>	<b>Source ID</b>
Leyden Glen Reservoir	1114000-01S
Green River	1114000-03S

Greenfield is a middle sized industrial, agricultural and residential community located in northwestern Massachusetts near the Vermont border. Greenfield's water supplies are all located within the Green River basin. The Green River flows south into the Deerfield River which forms a portion of the southern border of the town; the Deerfield River flows into the Connecticut River which forms a portion of the eastern border of Greenfield. Greenfield Water Department maintains and operates five public water supply sources. The three Millbrook Wells: Wells #1 (1114000-04G), #2 (1114000-05G), and #3 (1114000-06G) are located in close proximity to each other and withdraw water from the same, semi-confined, deep buried valley, sand and gravel aquifer. In addition, there are two surface water sources: the Leyden—Glen Brook Reservoir (1114000-01S) and the Green River intake (1114000-03S). The surface water supplies are located in the uplands, north of Greenfield. The bedrock in the vicinity of the reservoirs is generally described as part of the upper Leyden formation composed of metamorphosed argillite with interbeds of quartzite.

The wells are located in the northeast section of the City. The wells draw water from a confined to semi-confined, sand and gravel aquifer located within a buried, bedrock valley. The bedrock valley, comprised primarily of metamorphic and sedimentary rocks, was deepened by advancing glaciers and later filled in with sand and gravel from the receding glaciers and overlain by silt and clay from glacial Lake Hitchcock and Lake Lawrence some 12,000 years before present. Recent alluvial deposits cover the entire valley area. The confining clay layer is primarily contiguous through the center of the buried valley with the clay layer pinching out toward the edges of the aquifer allowing significant recharge along the basin boundaries.

Each well has a Zone I radius of 400 feet. The Zone II for the wells (#145) includes an area of about 293 acres extending north into the Town of Bernardston. The Zone II, funded through the Aquifer Land Acquisition program, was delineated utilizing pumping test data, analytical modelling and aquifer mapping. The Zone II watershed area is 29% forested and 50% crop or pasture.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

About 50% of the land area is protected from development, primarily through municipal ownership and agricultural restrictions. The watershed for the Leyden Glen Reservoir includes over 3000 acres of land, much within the community of Leyden. Approximately 70% of the watershed is forested and 56% is protected open space through methods such as municipal or state ownership, conservation or agricultural restrictions or other development limiting restrictions.

The Green River is classified as a Class B water body, though the Massachusetts Department of Environmental Protection (the Department) is presently reviewing its Class B status. A Class B water body source such as the Green River does not have Zone A, B and C protection areas, as does the Leyden Reservoir, a Class A water body source. For the purposes of the SWAP assessments, a 400 foot setback area along the river and all feeder streams has been delineated for Class B water body sources that is referred to as an "Emergency Planning Zone". Land uses and activities within this zone are of particular concern for source protection and emergency planning because of their proximity to the water supply.

The portion of the Green River source watershed that is in Massachusetts, includes 4,075 acres in Leyden and Colrain; 80% of that watershed area is

forested and 50% is the total area is protected open space through either municipal or state ownership or through Conservation or Agricultural Restrictions that may be held by private land owners. The remainder of the watershed is located in the southern Vermont communities of Halifax and Guilford. The watershed in Vermont is primarily low density rural residential and forested. Please refer to the attached maps that illustrate the protection area boundaries. Massachusetts Department of Environmental Protection would like to thank the staff of the U.S. Environmental Protection Agency for their assistance and the Vermont Agency of Natural Resources which supplied the maps and land use information for the watershed in Vermont.

Water from the Green River flows through roughing filters and is then filtered along with the water from the Leyden Reservoir through a slow sand filtration plant and disinfected prior to distribution. The water from the wells is pH

adjusted and treated for corrosion control prior to distribution. The Water Department also maintains the capability to chlorinate the well water, if necessary. For current information on monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

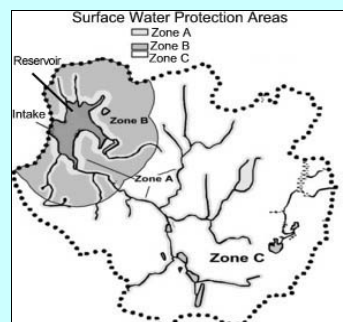

## Section 2: Land Uses in the Protection Areas

The Zone II of the Millbrook Wells and the watersheds for the Leyden Glen Reservoir and the Green River intake are primarily forested with some residential and agricultural land uses. Rural residential and a small percentage of commercial and light manufacturing land uses are also noted in the watersheds. One facility within the Green River source Emergency Planning Zone was identified on the land use map as an industrial facility based on aerial photograph review. The facility is actually an indoor, sport, shooting range with containment facilities; there is no manufacturing conducted at that facility.

The Zone II area of the wells consists primarily of rural residential and agricultural uses with some light manufacturing, interstate Route 91, State Route 5 and an active railroad line run through the entire recharge area. The aquifer is partially confined meaning that there is a confining (protective) clay layer overlying the productive sand and gravel. The clay layer provides some protection from contamination at the ground surface, however, the clay layer is not continuous throughout the entire valley and is discontinuous along the edges and the headwaters of the valley. Therefore the aquifer is considered to be

### What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C or and Emergency Planning Zone for Class B intakes.

highly vulnerable to contamination. Surface water bodies are by their nature considered highly vulnerable to contamination.

Greenfield Water Department has been very proactive in water supply protection. They have purchased Conservation Restrictions for some of the agriculture land within the Zone II, conduct land use and UST inventories within the protection areas and participate with watershed teams in Vermont to protect watershed lands in Vermont. The Water Department conducts frequent inspections of watersheds and recharge areas and provides household hazardous waste disposal for residents within the Zone II from neighboring communities. The Greenfield Water Department actively pursued and was awarded a Source Water Protection Grant to further their protection efforts in the Leyden Reservoir watershed.

Please refer to the attached maps to review land uses in the protection areas.

Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### Key Land Uses and Protection Issues include:

1. Nonconforming Activities in Zone I - 400 foot radius around wells
2. Activities in Zone A/Emergency Planning Zone
3. Residential land uses
4. Transportation corridors
5. Hazardous materials storage and use
6. Agricultural activities
7. Comprehensive wellhead protection planning
8. Railroad Right-of-way

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Non-conforming activities in the Zone I** – The Zone I is a 400 foot radial area around each wellhead. Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through some other mechanism such as a conservation restriction. Only water supply

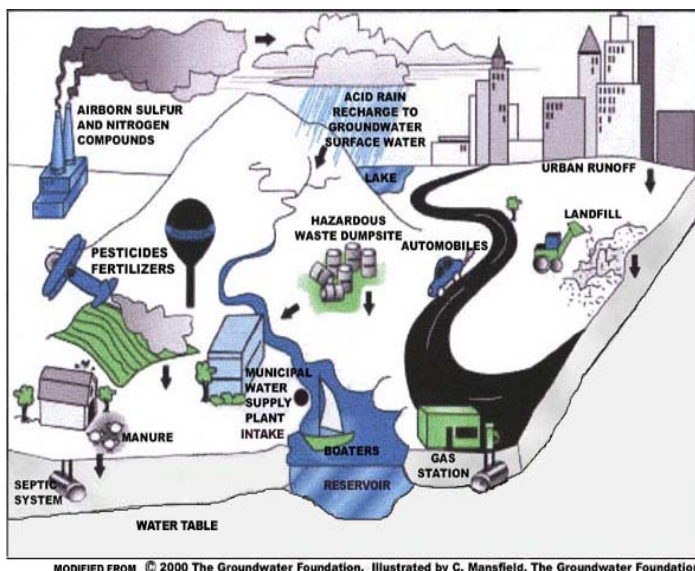

Figure 1: Sample watershed with examples of potential sources of contamination

activities are allowed in the Zone I. Many public water supplies were developed prior to the Department's regulations and contain non-water supply activities such as homes, utilities and public roads. There are local roads, a railroad track and part of a farm within the Zone I of the wells. However, with the exception of the railroad, the City of Greenfield owns or controls through Conservation Restrictions most of the Zone I. In addition, approximately 50% of the Zone II is protected from further development.

#### Zone I Recommendations:

- ✓ To the extent possible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Continue to enforce the conditions of the Conservation Restriction to not use or store

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Uses in the Zone II and Watersheds**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Protection Area	Potential Contaminant Sources*
<b>Agricultural</b>				
Dairy Farms	2	M	Watershed 01S, Zone II	Manure (microbial contaminants): improper handling City has a AR on farm in Zone I and II
Fertilizer Storage or Use	5 ±	M	All	Fertilizers: leaks, spills, improper handling, or over-application. City has a AR on farm in Zone I and II
Forestry Operation	5 ±	L	Watershed 01S, 03S	Erosion, equipment maintenance materials: leaks, spills, or improper handling; road building
Livestock Operations (commercial and recreation)	5 ±	M	All	Manure (microbial contaminants): improper handling City has a AR on farm in Zone I and II
Manure Storage or Spreading	5 ±	H	All	Manure (microbial contaminants): improper handling. City has a AR on farm in Zone I and II
Pesticide Storage or Use	5 ±	H	All	Pesticides: leaks, spills, improper handling, or over-application. City has a AR on farm in Zone I and II
<b>Commercial</b>				
Service Stations/ Auto Repair Shops	1	H	Zone II	Automotive fluids and solvents: spills, leaks, or improper handling
Cemeteries	1	M	Watershed 01S	Application of pesticides: leaks, spills, improper handling; historic embalming fluids
Golf Course (Driving range)	1	M	Zone II	Fertilizers or pesticides: over-application or improper handling (Driving Range)
Junk Yard	1	H	Watershed 01S	Automotive chemicals, wastes, and batteries: spills, leaks, or improper handling (Private Farm)
Railroad Tracks	1	H	Zone II	Transported chemicals, and maintenance chemicals: leaks or spills—Tracks are marked as watershed protection area
Repair Shops (Sales and Service)	1	H	Zone II	Engine fluids, lubricants, and solvents: spills, leaks, or improper handling or storage

Land Uses	Quantity	Threat	Protection Area	Potential Contaminant Sources*
<b>Industrial</b>				
Steel Fabricator	1	H	Zone II	Solvents and other chemicals: spills, leaks, or improper handling or storage
<b>Residential</b>				
Fuel Oil Storage (at residences)	15 +	M	All	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	15 +	M	All	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	15 +	M	All	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>				
Aboveground Storage Tanks	15 +	M	All	Materials stored in tanks: spills, leaks, or improper handling
Aquatic Wildlife	Periodic	L	All	Microbial contaminants; wildlife managed by PWS
Road and Maintenance Depots	1	M	Watershed 01S Zone II	Deicing materials, automotive fluids, fuel storage, and other chemicals: spills, leaks, or improper handling or storage
School	1	M	Watershed 01S	Fuel oil, laboratory, art, photographic, machine shop, and other chemicals: spills, leaks, or improper handling or storage
Stormwater Drains/ Retention Basins	Numerous	L	All	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transmission Line Rights-of-Way - Type: <u>Electric</u>	1	L	Watersheds 01S, 03S	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors	Numerous	M	All	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Underground Storage Tanks	Numerous	H/M	All	Stored materials: spills, leaks, or improper handling
Utility Substation Transformers	2	L	All	Chemicals and other materials including PCBs: spills, leaks, or improper handling (Newer – do not contain PCBs)
Very Small Quantity Hazardous Waste Generator	2	L	Watershed 01S Zone II	Hazardous materials and waste: spills, leaks, or improper handling or storage

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - Where there are two rankings, the first is for surface water, the second for groundwater sources. The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

- ✓ pesticides, fertilizers or deicing materials within the Zone I.
- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Continue in your historical and current efforts to acquire and protect land within the Zone A and Emergency Planning Zone in the water supply protection areas.
- ✓ Continue your vigilance and communication with the railroad.

**2. Activities in Zone A of the reservoir—** A Zone A for a reservoir includes all areas within 400 feet of the reservoir shore line and within 200 feet of either side of all streams and feeder ponds that flow into the reservoir. The Emergency Planning Zone is a 400 foot setback on either side of river and all tributaries to a Class B river intake. Land use activities within a Zone A or Emergency Planning Zone may have an impact on surface water sources. Wild animals, farm animal and domestic pet wastes can carry waterborne diseases such as Giardia, Cryptosporidium, Salmonella, etc. while septic systems and road runoff can carry these as well as other contaminants. The City owns the land immediately around the reservoir and the Green River intake and monitors activities within both watersheds. There are roadways and it is assumed that there are a few residential septic systems within the Zone A and the Emergency Planning Zone of the reservoir and intake.

**Zone A Recommendations:**

- ✓ Continue your efforts to protect these areas and to monitor and review activities within the Zone A and Emergency Planning Zone for the Green River source.

**3. Residential Land Uses –** Residential areas make up approximately 5% of the Zone II, 4% of the Leyden Glen Reservoir watershed and 3% of the Green River source watershed. There are no municipal sewers and therefore all areas utilize septic systems for sanitary waste disposal. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater

**Top 5 Reasons to  
Develop a Local Wellhead  
and Surface Water  
Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants

from automotive leaks, maintenance, washing, or accidents.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Make available the fact sheet your department has prepared and other appropriate fact sheets available from the MA DEP which can be found at [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues. Extend education efforts into Leyden and Colrain.
- ✓ Work with Planning Boards and Boards of Health to manage new residential developments in the water supply protection areas and to inform the boards of the resource areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Transportation Corridors** – Interstate 91 and Routes 5 and 10 run through the eastern edge of the Zone II. Local roads are common throughout the Zone II and watersheds of the Leyden Glen Reservoir and the Green River Intake. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catchbasins. The steep topography of the watersheds results in application of de-icing materials to protect public health and safety by keeping the roads passable.

#### **Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II and watersheds.
- ✓ Work with the Towns and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Communicate with local emergency response teams to ensure they are aware of your water supplies and that any spills within the watersheds and Zone II are effectively contained and that the Water Department is notified.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.
- ✓ The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=equip&ct=NRCS>. Contact your local NRCS office to find out more about this funding program.

**4. Hazardous Materials Storage and Use** – Approximately 5% of the land area within the Zone II is commercial or industrial land uses. Although the map for Green River source indicates an industrial use, the facility identified is the shooting range noted previously. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground. Please see Appendix B for a list of businesses within the protection areas known to generate hazardous wastes or use USTs.

#### **Hazardous Materials Storage and Use Recommendations:**

- ✓ Continue working with local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Work with the municipalities of Bernardston, Leyden and Colrain regarding Massachusetts floor drain

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II.
2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

requirements and hazardous materials handling. See brochure “Industrial Floor Drains” for more information. See <http://www.state.ma.us/dep/brp/dws/protect.htm> for information regarding handling and management of hazardous materials.

- ✓ The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>

**5. Agricultural Activities** – Cropland and pasture encompass greater than 50% of the total Zone II land area. This includes hay and corn fields, beef cattle farm, pasture lands, and a small horse farm. Agricultural activity encompasses 22% and 8% of the total land uses in the watersheds of the reservoir and Green River sources, respectively. Pesticides, fertilizers and farm equipment petroleum products have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

**Agricultural Activities Recommendation:**

- ✓ Continue your current work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Continue your current work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.
- ✓ The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater.

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

**For More Information**

Contact Catherine V. Skiba of the DEP's Springfield Office at 413-755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier and the town/City boards.

Review the fact sheet available on line and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

**6. Protection Planning** – The Town of Greenfield has adopted zoning by-laws/ordinances to protect areas around the Millbrook Wells. However, Greenfield's other water supplies and the northern reach of the Zone II are not within Greenfield.

Planning protects drinking water by managing the land area that supplies water to a well or surface water source. Greenfield Water Department communicates and works with the watershed host communities to protect the water supplies. Bernardston would benefit from extending their protection to their own wells' Zone II and to Greenfield's Zone II.

A Wellhead and Watershed Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public education and outreach. The development of a successful Protection Plan is outlined in five steps in DEP's “Developing a Local Wellhead Protection Plan” and in “Developing a Local Watershed Protection Plan” (see Appendix A for the full report) as:

- Establish a protection committee or team
- Define the Protection Areas
- Identify potential sources of contamination
- Protect and manage the protection areas
- Conduct ongoing public education and outreach

Although Greenfield has the majority of the components for a Wellhead and Watershed Protection Plans in place, they do not have a formal plan. Greenfield is currently pursuing the development of a plan and has applied for grant funds to complete the plans.

Compile the information supplied in the Zone II reports, this and other reports; include copies of maps outlining the Zone II and detail the protection measures in place. Outline a plan to complete any components of the plan not in place with a timeline for completion. Submit your written report to the DEP Regional office and/or Boston office for approval. This process should be duplicated for the surface water sources, or combined together for one protection plan incorporating protection measures for the surface water protection zones. Continue your current efforts of including the host communities in the planning process and the pursuit of protective by-laws in the towns of Bernardston, Leyden, Colrain and in Vermont.

**Protection Planning Recommendations:**

- ✓ Formalize the Wellhead Protection Plan and create a separate Watershed Protection Plan, or make one plan outlining protection measures for all sources. Refer to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan" and "Developing a Local Watershed Protection Plan" (see Appendix A).
- ✓ Continue to work with Bernardston, Colrain and Leyden to adopt protective by-laws and regulations for your protection areas extending into their communities. The Department will be instrumental in assisting Greenfield in this effort.

**7. Railroad Right-of-Way** – The railroad transects the Zone I and Zone II of the wells. Rail corridors that serve passenger and/or freight trains are a potential source of contamination due to chemicals released during normal use, track maintenance, and accidents. Normal maintenance of a railroad right-of-way can introduce contaminants to a water supply through herbicide application for vegetation control. Leaks or spills of transported chemicals or train/track maintenance chemicals are also potential sources of contamination to the water supply.

**Railroad Right of Way Recommendations:**

- ✓ Continue reviewing the railroad right-of-way Yearly Operating Plan to ensure Best Management Practices are implemented with regard to vegetation control in the Zone II, and that the utility has accurate information regarding the locations of the wells and the Zone I. Review the maps the utility uses.
- ✓ Work with local fire departments to review emergency response plans. Updates to this plan should include the railroad rights-of-way including coordination with the owner/operator of the track and trains using the right-of-way. Request emergency response teams to coordinate Emergency Response Drills and practice containment of potential contaminants from train accidents within the Zone II, which should attempt to include representatives from the owner/operator of the trains utilizing the right-of-way.

Other land uses and activities within the Zone II that are potential sources of contamination are included in Table 2. Refer to Appendix B for more information about these land uses. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

As with many water supply protection areas, the system's Zone II and watersheds contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Implementing a hazardous waste collection plan in its watershed host community
- Proactive policy to acquire land within the protection areas
- Developing a good working relationship with the communities

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I/A and Emergency Planning Zone regularly; when feasible, remove any non-water supply activities.

- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams in Bernardston, Leyden, Colrain and Greenfield to ensure that they are aware of the stormwater drainage in your Zone II and watersheds to facilitate cooperation and awareness in responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

#### ➤ **Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships between businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

#### ➤ **Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to groundwater contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained, it could be a potential source of microbial contamination. Animal waste is also a source of microbial contamination.

#### ➤ **Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located; what types of land uses and activities pose threats; and how their efforts can enhance protection.

#### ➤ **Plan for the Future:**

One of the most effective means of protecting water supplies is local planning, include adoption of local controls to protect land use, regulations related to watersheds and ground water protection. These controls may include health ordinances/regulations, discharge prohibitions, general ordinances, and zoning by laws that prohibit or control potential sources of contamination within the protection areas.

#### ➤ **Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available on line and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination

and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II and watersheds. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

#### **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I/Zone A?	<b>NO</b>	Follow Best Management Practices (BMPs) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Investigate purchasing, or obtaining Right of First Refusal of the remaining Zone A land.
Is the Zone I/Zone A posted with “Public Drinking Water Supply” Signs?	<b>NO</b>	Use “No Trespassing” signs only. Economical signs are available from the Northeast Rural Water Association: (802) 660-4988.
Is the Zone I/Zone A regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply related activities the only activities within the Zone I/Zone A?	<b>NO</b>	Continue monitoring non-water supply activities in Zone I/A.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Water Supply Protection Controls that meet 310 CMR 22.21(2) or 310 CMR 22.20 C?	<b>SOME</b>	The Town of Greenfield has Zoning Bylaws that meet 310 CMR 22.21(2), but do not meet 310 CMR 22.20 C. Bernardston, Leyden and Colrain do not. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws, health regulations, and current regulations.
Do neighboring communities protect the areas of the watershed extending into their communities?	<b>NO</b>	Continue working with neighboring municipalities to include surface water protection areas in their water supply protection controls. Encourage these communities to protect these resources. The Department may be of assistance.
<b>Planning</b>		
Does the PWS have Local Source Water Protection Plans (Wellhead and Surface Water)?	<b>SOME</b>	Follow “Developing a Local Wellhead Protection Plan” and other guidance available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> to create a formal, written plan. Submit up-to-date plan to DEP for approval.
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	<b>YES</b>	Augment and update plan by developing a joint emergency response plan with fire department, Board of Health, DPW, departments of surrounding communities, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a water supply protection committee?	<b>NO</b>	Establish committee; include representatives from citizens’ groups, neighboring communities, and the business community.
Do the Boards of Health conduct inspections of commercial and industrial activities?	<b>SOME</b>	Continue working with host communities.
Does the PWS provide water supply protection education?	<b>YES</b>	Aim education at schools, commercial, and municipal uses within the watershed. Extend these education practices into the host communities of the surface water supplies.

## APPENDIX B: REGULATED FACILITIES WITHIN OR IMMEDIATELY ADJACENT TO WATER SUPPLY PROTECTION AREA

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
	Repair garage *		Leyden	Generator Of Hazardous Waste		Auto Repair
	Highway DPW *		Leyden	Generator Of Hazardous Waste		DPW
	Barton's Garage	Brattleboro Road	Leyden	Generator Of Hazardous Waste	Very Small Quantity Generator	Auto Repair
36641	West Track, Inc.	627 Barton Road	Greenfield	Generator Of Hazardous Waste	Very Small Quantity Generator	Auto – Sales And Service
**Mad985270 537	Barton's Garage	Brattleboro Road	Greenfield	Generator Of Hazardous Waste Oil	Very Small Quantity Generator	Auto Repair

\*\* EPA Identification Number

\* Facility was not registered but had very good hazardous materials management. Registration materials left at facility.

### Underground Storage Tanks

Facility Name	Address	Town	Description	Tank Type	Tank Leak Detection	Capacity (Gal)	Contents
Indoor Action	1385 Bernardston Road	Greenfield	Sports Center	Unknown	Unknown	1000	Fuel Oil
				Unknown	Unknown	1000	Fuel Oil
				Unknown	Unknown	1000	Fuel Oil
D & S Pump Supply	1203 Bernardston Road	Greenfield	Pump Sales & Service	Unknown	Unknown	1000	Fuel Oil

Merriam Graves	1159 Bernardston Road	Greenfield	Welding Supplies	Unknown	Unknown	10000	Fuel Oil
----------------	-----------------------------	------------	---------------------	---------	---------	-------	----------

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies, as well as those noted during assessments by the water supplier. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Hadley Highway and Water Department**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i><b>PWS Name</b></i>	Hadley Highway and Water Department
<i><b>PWS Address</b></i>	P.O. Box 406
<i><b>City/Town</b></i>	Hadley

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

### Table 2 Water Supply Protection Area

Mount Warner Well #1	1117002-01G
Mount Warner Well #2	1117002-02G

Callahan Well #1	1117002-03G
Callahan Well #2	1117002-04G

Hadley is an agricultural and growing, rural residential community in western Massachusetts. Hadley Highway and Water Department maintains four wells for the town's drinking water supply: Mount Warner Wells #1 and #2 (1117002-01G, and 1117002-02G, Zone II #200) and the Callahan Wells #1 and #2 (1117002-03G and 1117002-04G, Zone II #462). The Mount Warner wells are 12-inch diameter gravel developed wells that pump water from a confined aquifer located in the central part of town. The wells have a combined pumping capacity of approximately 1,400 gallons per minute (gpm) and serve as the main supply. Well #1 was installed in 1954 and Well #2 was installed in 1963 at depths of greater than 200 feet. The Callahan wells pump water from an unconfined aquifer south of the Mt. Warner Wells. The Callahan Wells are 16-inch gravel developed wells installed in 1978. Due to the presence of manganese in the water from the Callahan wells, the Callahan wells are used only to supplement the Mt. Warner wells. Each of the Callahan wells has an approved withdrawal rate of 1,050 gpm. Approved withdrawal rates are based on results from extended duration pumping tests. The Zone II for the Callahan wells was delineated through the SWAP program; the Zone II for the Mt. Warner wells was delineated previously by the Town's consultant.

Both wells are located within glacially deepened, bedrock valleys that were buried with sand, gravel and in some areas clay during the recession (melting) of the glaciers some 10,000 before present. Glacial Lake Hitchcock was formed through much of the Connecticut River valley from southern Vermont to central Connecticut. Sediment laden meltwater formed deltas into the lake leaving coarse grained materials at the deltas and along the shoreline. Fine grained deposits were carried to deeper quiescent waters and settled to the lake bottom. Although there is evidence that some portions of the Callahan well aquifer Zone II has a confining clay layer, there is no confining unit in the vicinity of the Callahan wells. The Mt. Warner wells are located within the confined portion of an adjacent aquifer although there is evidence of a delta within the Mt. Warner well Zone II. Both protective areas are considered to be highly vulnerable to contamination because the confined portions of the aquifer are discontinuous and not defined in detail.

Each well has a 400 feet protective Zone I radius. Aquifer parameters were determined from multiple, extended duration pumping tests and the Zone II for the wells was delineated based on conceptual and analytical modeling in

conjunction with geological mapping. Please refer to the attached map to view the boundaries of each Zone II. Water from the Callahan wells and the Mt. Warner Wells is not treated prior to distribution. For current information on water quality monitoring results, please refer questions to the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The land uses within the Zone IIs for Hadley Highway and Water Department's wells are a mixture of light industrial, commercial, residential and agricultural areas (refer to attached map for details). Some locations within the protection are served by the Town municipal sewer system while other areas are served by on-site septic disposal. Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Tables of Regulated Facilities attached in Appendix B.

### Key Land Uses and Protection Issues include:

1. Non-conforming Zone I
2. Residential land uses
3. Transportation corridors
4. Hazardous materials storage and use
5. Confirmed release sites of hazardous materials or oil
6. Protection Planning
7. Agricultural activities
8. Sewer Pipeline and Wastewater Treatment Facility

Although there are many safeguards on place, the overall susceptibility ranking to contamination of the groundwater supplies is high, based on the presence of numerous high ranking threat land uses within the Zone II water supply protection areas, as seen in Table 2.

**1. Non-conforming Zone I** – Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to control the Zone I through ownership or some other mechanism such as a conservation restriction. Only water supply activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and contain non-water supply activities such as homes and public roads. Hadley Highway and Water Department does not own the entire Zone I for any source. The Mt. Warner Zone I has floor drain sump at the pump house and above-ground diesel storage tanks (within secondary containment) for emergency power at the pump house; the Callahan well Zone I has a portion of a state highway within Zone I.

### Zone I Recommendations:

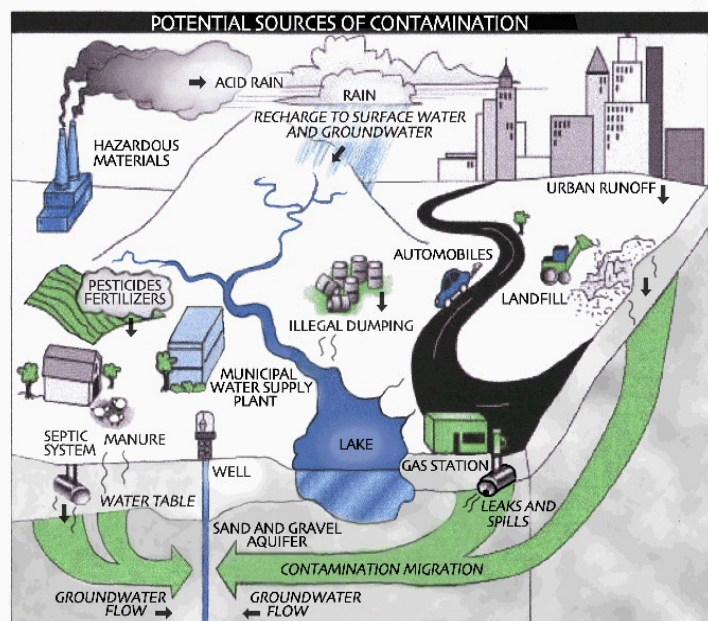

- ✓ Obtain a Right-of-First Refusal for acquiring the land within the Zone I

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

Modified from © 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

- ✓ currently not owned by the Department.
- ✓ Consider purchasing the land or acquiring a conservation restriction on the land to minimize potential threats.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Contact the property owner to be sure they are aware they are within the Zone I and Zone II of the well. Provide information about BMPs.

**2. Residential Land Uses** – Approximately 25% of the Zone II #200 consists of residential areas. The Zone II #462 has about 12% of the land use as residential. Although some of the community is served by municipal sewer, there are several areas, including agricultural and residential areas within the Zone IIs that utilize on-site septic disposal. If managed improperly, activities associated with residential use can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper maintenance and disposal of household hazardous chemicals to septic systems is a potentially a significant source of contamination to the groundwater because septic systems discharge directly to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include petroleum products for automotive and lawn care, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to manage and control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls. Continue catch basin cleaning routines.

**3. Transportation Corridors** – Both Zone IIs have numerous local roads throughout. State Routes 9 and 47 run through Zone II #462 and Route 116 runs through #200 along the eastern edge. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes and de-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash into catch basins.

**Transportation Corridor Recommendations:**

**What are "BMPs?"**

Best Management Practices are structural (i.e. oil & grease trap catch basins), nonstructural (i.e. hazardous waste collection days) or managerial measures that are used to protect and improve surface water and groundwater quality.

- ✓ **Emergency Response** Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ **Low Salt Areas** - Submit a formal request to MA Highway Department to establish Low Salt Areas along Route 9. Hadley maintains Route 47 and should continue to use a moderate sand/salt mixture for ice control on local Hadley roads and monitor water quality. Educate employees and private contractors of the restrictions in designated Low Salt Areas if they are designated.
- ✓ **Planning and Developing** - Be aware of EPA’s Intermodal Surface Transportation Efficiency Act. The Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991 contains provision for the planning and developing of highway systems and transportation enhancement activities,

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Uses and Activities in the Protection Area**

For more information, refer to Appendix 2: Regulated Facilities within the Water Supply Protection Area

Activities	Quantity	Threat*	Zone II	Potential Source of Contamination
<b>Agricultural</b>				
Dairy Farms	4	M	462	Manure (microbial contaminants): improper handling
Fertilizer Storage or Use	Numerous	M	Both	Fertilizers: leaks, spills, improper handling, or over-application
Livestock Operations	1	M	462	Manure (microbial contaminants): improper handling
Landscaping	1	M	462	Fertilizers and pesticides: leaks, spills, improper handling, or over-application
Manure Storage or Spreading	Numerous	H	Both	Manure (microbial contaminants): improper handling
Nurseries	2	M	462	Fertilizers, pesticides, and other chemicals: leaks, spills, improper handling, or over-application
Pesticide Storage or Use	Numerous	H	200	Pesticides: leaks, spills, improper handling, or over-application
<b>Commercial</b>				
Cemeteries	3	M	200	Over-application of pesticides: leaks, spills, improper handling; historic embalming fluids
Dry Cleaners	1	H	462	Solvents and wastes: spills, leaks, or improper handling
Medical Facilities	4	M	462	Biological, chemical, and radioactive wastes: spills, leaks, or improper handling or storage
Paint Shops	1	H	462	Paints, solvents, other chemicals: spills, leaks, or improper handling or storage
Printer Shops	1	M	462	Printing inks and chemicals: spills, leaks, or improper handling or storage
Office Research Laboratories	1	M	200	Laboratory chemicals and wastes: spills, leaks, or improper handling or storage

Activities	Quantity	Threat*	Zone II	Potential Source of Contamination
Sand And Gravel Mining/Washing	1	M	200	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
<b>Residential</b>				
Fuel Oil Storage (at residences)	Numerous	M	Both	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Both	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Both	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>				
Aboveground Storage Tanks	Numerous	M	Both	Materials stored in tanks: spills, leaks, or improper handling
Clandestine Dumping	1	H	462	Debris containing hazardous materials or wastes
NPDES Locations	1	L	462	Hazardous material and wastes: improper disposal
Oil or Hazardous Material Sites	2	--	462	Tier Classified Oil or Hazardous Materials Sites are not ranked due to their site-specific character.
Pipeline (Sewer)	1	M	462	Oil or sewage: spills or leaks
Road Maintenance Depots	2	M	462	Deicing materials, automotive fluids, fuel storage, and other chemicals: spills, leaks, or improper
Schools	1	M	462	Fuel oil, laboratory, art, photographic, machine shop, and other chemicals: spills, leaks, or improper handling or storage
Small quantity hazardous waste	Numerous	M	Both	Hazardous materials and waste: spills, leaks, or improper handling or storage
Stormwater Drains/ Retention Basins	Numerous	L	Both	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transportation Corridors	Numerous	M	Both	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper
Underground Storage Tanks	6	H	462	Stored materials: spills, leaks, or improper handling
Wastewater Treatment Plant/Collection	1	M	462	Treatment chemicals or equipment maintenance materials: improper handling or storage; wastewater:

**Table 2 Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

including the mitigation of water pollution due to highway runoff. Through ISTEA, states are able to use a portion of their federal funding allotment for runoff pollution control devices and other BMPs to prevent polluted runoff from reaching their lakes, rivers, and bays. Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets, parking areas and lawns. Common potential contaminants include lawn chemicals, pet waste, leakage from dumpsters, household hazardous waste, and contaminants from vehicle leaks, maintenance, washing or accidents.

**Stormwater Catch Basins – Recommendations:**

- ✓ **Mapping** - If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to prioritize and investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ **Inspect, Maintain, and Clean** - Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Additionally, street and parking lot sweeping reduces the amount of potential contaminants in runoff. Note: Catch basin cleanings are classified as solid waste by DEP and must be handled and disposed in accordance with all regulations, policies, and guidance. In the absence of written approval from DEP, catch basin cleanings must be taken to a facility permitted by DEP to accept solid waste. For information on DEP's Nonpoint Competitive Grants Program Upcoming Funding Opportunity see: <http://www.state.ma.us/dep/brp/mf/mfpubs.htm#wpa>.
- ✓ **Best Management Practices** - Work with the Town to develop Best Management Practices that are the most effective, practical means of preventing or reducing pollution from nonpoint sources. Information is available at <http://www.epa.gov/OWOW/NPS/roads.html>.
- ✓ **Local Controls** - Encourage local officials to develop a local stormwater ordinance. For more information see <http://www.epa.gov/owow/nps/ordinance/stormwater.htm>.
- ✓ **Storm Drain Stenciling Program** - Work with local watershed groups to institute a Storm Drain Stenciling Program. For more information on how to develop a storm drain stenciling program go to <http://www.earthwater-stencils.com>.
- ✓ **Wellhead Protection Grants** - Continue working towards applying for a Wellhead Protection Grant from DEP for the purpose of addressing stormwater drainage in the Zone II, and for working with the Town to address the "Phase II Stormwater Regulations".

**4. Hazardous Materials Storage and Use** – Commercial or industrial land uses make up about 4% of the entire #462 Zone II, and less than 1% of the #200 Zone II. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store quantities of hazardous materials. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet "Businesses Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.

- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Work with the local Board of Health to educate local businesses on Massachusetts' floordrain requirements. See brochure "Industrial Floor Drains" for more information.

**5. Presence of Oil or Hazardous Material Contamination Sites** – The Zone II #462 contains two open-ended DEP Tier Classified Oil and/or Hazardous Material Release Sites indicated on the map as Release Tracking Numbers 1-0010026, and 1-0014233. Refer to the attached map and Appendix 3 for more information.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.

**6. Protection Planning** – The town is currently working on a protection plan. Hadley has many of the components for completion of the plan. Hadley does have an Aquifer Protection By-law Review Committee that has proposed and presented revisions to the protective by-law for approval at Town Meeting. Protection plans coordinate community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public education and outreach. The development of a successful Wellhead Protection Plan is outlined in five steps in DEP's "Developing a Local Wellhead Protection Plan" (see Appendix A for the full report) as:

- Maintain a protection committee or team
- Define the Wellhead Protection Area
- Identify potential sources of contamination
- Protect and manage the wellhead protection area
- Conduct ongoing public education and outreach

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

The Town does have an Aquifer Protection District Bylaw, adopted in 1985 and revised in 2001. The by-law substantially complies with water supply protection control regulations 310 CMR 22.21(2) with a few exceptions to the older sections of the by-law.

**Protection Planning Recommendations:**

- ✓ Develop a Wellhead Protection Plan. Maintain a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Coordinate efforts with local officials to periodically review and compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>. Submit current by-laws to the MA DEP for review for compliance.
- ✓ If local Board of Health regulations do not regulate floordrains, be sure to include floordrain controls that meet 310 CMR 22.21(2).

**7. Agricultural Activities** – Crop and pasture lands make up the largest land use percentage of each Zone II: 48% of #200 and 54% of #462. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water. Improper

management of hazardous materials also pose a potential threat to the groundwater. In some instances, farmers have on-site irrigation wells or use town water for animals or crops.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Where appropriate, ensure farmers use back-flow prevention devices for connections to public water supplies but also for on-site wells. Inform farmers of BMPs for sanitary seals and back flow prevention for any on-site wells.
- ✓ Work with hobby farmers to ensure that they also are aware of the necessity of back flow prevention for any on-site wells and water use. Offer information about BMPs from NRCS, MA Department of Food and Agriculture and the MA DEP web site.

**8. Sewer pipelines and Wastewater Treatment Plant** – The Zone II contains the Hadley Wastewater Treatment Plant that discharges into the Connecticut River as well as gravity and force mains. Activities associated with wastewater transmission and treatment involve sewage leaks and the storage and use of hazardous materials such as treatment chemicals, chlorine and fuel. Municipal wastewater contains contaminants including bacteria, viruses, metals and volatile chemicals. Spills, leaks or mismanagement of wastewater, hazardous materials and stormwater at the plant is a potential source of contamination.

**Wastewater Treatment Plant Recommendations:**

- ✓ Ensure wastewater treatment facility is operated, upgraded and maintained according to DEP requirements.
- ✓ Work to have stormwater drains and the drainage system around the wastewater treatment plant mapped.
- ✓ Work with plant to be sure that best management practices are used for proper handling of materials and in containing spills and leaks.
- ✓ Work with plant to be sure emergency planning includes notification for Hadley Highway and Water Department.
- ✓ Ensure that the plant's underground storage tank has monitoring and is maintained properly.

Other land uses and activities within the Zone II that have potential for contamination include auto repair shops, gas stations, plant nurseries, and medical facilities. Refer to Table 2 and Appendix 2 for more information about these land uses.

### Section 3: Source Water Protection Conclusions and Recommendations

**Current Land Uses and Source Protection:**

Although the Zone II contains numerous existing and potential sources of contamination, awareness and source

**For More Information**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, town boards, and the local media.

protection measures reduces the risk of actual contamination, as illustrated in Figure 2. Identifying additional potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those listed above and below should be used to better protect your water supply.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and watersheds when responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling,

- ✓ and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Communicate with owners/operators of the rights-of-way to ensure Best Management Practices are being used
- ✓ Develop and implement a Wellhead Protection Plan.

#### **Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships between businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

#### **Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to groundwater contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained, it could be a potential source of microbial contamination. Animal waste is also a source of microbial contamination.

#### **Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located; what types of land uses and activities pose threats; and how their efforts can enhance protection.

#### **Plan for the Future:**

One State and of the most effective means of protecting water supplies is planning, local include such as the adoption of local controls to protect land use regulations related to watersheds and ground water., These controls may include health ordinances/regulations, no discharge prohibitions general ordinances, and zoning bylaws that prohibit potential sources of contamination from wellhead protection areas.

Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. These recommendations are only part of your ongoing local drinking water source protection.

#### **Resources for Drinking Water Source Protection:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR). Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

#### **Conclusions:**

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>YES</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>YES</b>	Continue monitoring non-water supply activities in Zone Is.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21 (2)?	<b>Partially</b>	The Town's "Aquifer Protection District" bylaw has recently been updated and substantially meets DEP's best efforts for wellhead protection. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws and health regulations, and current regulations for any future updates. Submit by-laws for review
Do neighboring communities protect the Zone II areas extending into their communities?	<b>NO</b>	Work with neighboring municipality Amherst to include portions of the Zone III along the Fort River in their well-head protection controls.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Develop a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams. And inform ER teams of the location of the Zone IIs.
Does the municipality have a wellhead protection committee?	<b>YES</b>	Encourage the continuation of the committee and include modification and improvement of existing by-laws as appropriate.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>YES</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>YES</b>	Aim additional efforts at commercial, industrial and municipal uses within the Zone II.

## APPENDIX B:

### REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREA

#### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
30533	Allards Farms, Inc.	41 S. Maple Street	Hadley	Generator of Hazardous Waste	Very Small Quantity Generator	Farm
				Generator of Hazardous Oil Waste	Small Quantity Generator	Farm
				Handler	Recycling – A	Farm
36688	Valley Starter and Alternator	3 Isabel Court	Hadley	Generator of Hazardous Waste	Very Small Quantity Generator	Automotive Repair
37540	Jiffy Lube	347 Russell Street	Hadley	Generator of Hazardous Waste	Very Small Quantity Generator	Automotive Maintenance
				Toxic Waste User	BLW-TU (Below Threshold)	Automotive Maintenance
50407	Montgomery Rose Company, Inc.	350 Russell Street	Hadley	Generator of Hazardous Waste and Waste Oil	Very Small Quantity Generator	Industrial
				Plant	RES Application Approved	Industrial
				DISCH	IWWSC	
				Plant	ASB-AQ	Industrial
50158	Montgomery Rose Company, Inc.	319 River Drive	Hadley	Air Handler	Synthetic Source (SM450)	Industrial

251565	Performance Motoring, Inc.	315 Russell Street	Hadley	Generator of Hazardous Waste	Very Small Quantity Generator	
				Generator of Hazardous Waste Oil	Small Quantity Generator	
				Non Permitted Action (Non-Notifier)	Requires change of use or permit

## Underground Storage Tanks

Facility Name	Address	Town	Description	Tank Type	Tank Leak Detection	Capacity (gal)	Contents
Allards Farms, Inc.	41 S Maple Street	Hadley	Farm	2 Wall	Interstitial Space Monitor	10000	Diesel
Kicza Lumber Company, Inc.	303 Russell Street	Hadley	Lumber Yard	1 Wall	Removed?	1000	Diesel
				1 Wall	Removed?	1000	Waste Oil
Montgomery Rose Company	350 Russell Street	Hadley		2 Wall	Interstitial Space Monitor	4000	Diesel
Town of Hadley Highway Department	South Middle Street	Hadley	DPW	2 Wall	Interstitial Space Monitor	10000	Diesel
				2 Wall	Interstitial Space Monitor	10000	Gasoline

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitellst.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0010026	169 Bay Road	Hadley	Oil
1-0014233	25 East Hadley Road	Hadley	Oil

For more location information, please see the attached map. The map lists the release sites by RTN.

# Source Water Assessment Program (SWAP) Report for Mary Lyon Nursing Home

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge **areas** of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared  
October 8, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Mary Lyon Nursing Home
<i>PWS Address</i>	34 Main Street
<i>City/Town</i>	Hampden, Massachusetts
<i>PWS ID Number</i>	1120001
<i>Local Contact</i>	Mr. Nelson Richmond
<i>Phone Number</i>	413-566-5511

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1120001-01G	256	645	High
Well #2	1120001-02G	236	580	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

Mary Lyon Nursing Home is located on Main Street in Hampden. The activities and land uses consist of all facilities associated with a 100-bed nursing home including parking, kitchen, laundry, boiler, maintenance, and hairdressing facilities. The nursing home is also located immediately adjacent to the Scantic River. Hampden does not have municipal water or wastewater systems and therefore the facility is served by two, on-site water supply wells and a septic system for wastewater disposal. Natural gas is utilized for the boilers but there are 2, 275-gallon, AST, diesel fuel tanks for the back-up generator.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

Both wells were installed in 1969 and are 6-inch diameter, bedrock wells. Well #1 is located in the courtyard, is approximately 180 feet deep and based on metered data is capable of producing 11,000 gpd. Well #2 is located on the south side of the facility immediately adjacent to the laundry, the generator and an electrical transformer. Well #2, was originally drilled to a depth of 245 feet but in 1986 was over drilled to a total current depth of 420 feet. In 1991, the Department approved a withdrawal rate of 5.6 gpm based on pumping test data. Geologic mapping in the area indicates overburden deposits of up to approximately 30 feet of sand with approximately 50 feet depth of till over bedrock. The facility is located immediately east of the approximate location of the eastern border fault between the sedimentary rocks of the Connecticut River valley and the volcanic and metamorphic rocks of the uplands to the east. The bedrock valley was filled with stratified drift (sand and gravel) during the recession of the glaciers some 12,000 to 18,000 years ago and the nursing home is located at the edge of the valley. Bedrock at the site is mapped as schist of the Erving Formation.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water are allowed to occur or activities that are non-threatening. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The Zone I protective radii for the Wells #1 and #2 are 256 feet and 236 feet, respectively. The IWPA radii are 645 feet and 589 feet, respectively. These protective radii were calculated based on metered water use from Well #1 and an approved withdrawal rate for Well #2. Please refer to the attached map that shows the Zone I and IWPA.

The Zone I area for the well is not conforming to current DEP requirements. The Zone I includes all or part of the nursing home facility including the parking areas and the septic system, an adjacent residence and Main Street. Additional commercial facilities

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Transportation corridors/parking	Yes	Yes	Moderate	Petroleum products, hazardous materials spilled during accidents and stormwater runoff
Landscaping	Yes	Yes	Moderate	Do not use pesticide/fertilizers
Office facilities and parking	Yes	Yes	Moderate	Limit road salt usage. Use BMPs for household hazardous materials. Monitor parking areas
ASTs (diesel for generator)	Yes	Yes	High	Petroleum products – accidental release. Ranking increased to high due to proximity to Well #2 and condition of the tanks.
Nursing home	Yes	Yes	Low	Septic systems and household hazardous materials
Inappropriate discharge to septic (floor drain – boiler room/janitor's closet)	Yes	Yes	-	Comply with UIC regulations
Electrical transformer	Yes	Yes	Moderate	Ranking increased due to proximity to Well #2
Residential land use	Yes	Yes	Moderate	Septic systems and household hazardous materials

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

are included in the IWPA.

There is no evidence of a continuous, protective confining clay layer in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer.

The pH of the water is adjusted with potassium carbonate for corrosion control prior to distribution. You may request additional information regarding the quality of the water, from the local contact listed in Table 1. Please refer to the following section, attached map of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I**
2. **Nursing Home**
3. **Floor drains**
4. **Residential housing**
5. **Aboveground storage tank**
6. **Transportation corridor/parking**

There are several activities within the Zone I and IWPA that pose a significant threat to the water supply. The overall ranking of susceptibility to contamination for the system is high based on the types of activities and the proximity of those activities to the wells.

The Mary Lyon Nursing Home administration is proposing an expansion of the facility and is presently negotiating with the Department regarding strategies to develop a more protected source of water for the facility.

**1. Non-conforming activities within Zone I** – The water supplier does not own or control the entire Zone I area for either well. Systems that do not meet DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership and non-conformance, prior to increasing water use or modifying systems.

### Zone I Recommendations:

- ✓ Prohibit any additional activities within Zone I and where feasible remove non-conforming activities within the Zone I areas.
- ✓ Locate a new well and remove as is feasible, non-conforming activities.
- ✓ Replace the diesel generator with a propane generator or replace the tanks and provide containment.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
- ✓ Monitor all deliveries of hazardous materials.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

**2. Nursing Home** - All of the facility is located within the Zone I or IWPA of the well. Potential exists for

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

contamination of the well by onsite use of cleaning materials, household hazardous materials, fertilizers, and pesticides, all of which can be of concern. The facility should be using applicable BMPs to eliminate any potential non-sanitary waste from the wastewater stream.

#### Recommendations:

- V Use of Best Management Practices for all activities at the facility. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required. Do not use or store pesticides, fertilizers or deicing materials within Zone I.
- V Investigate Integrated Pest Management and Best Management Practices within the IWPA as necessary.
- V Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- V Review your emergency response plan regarding accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- V Monitor roadside and parking areas for spills and leaks. This is particularly important since the storm drains discharge directly to the ground.

**3. Floor Drains in Boiler Room** – There are floor drains in the boiler room, that discharge to a dry well and janitors sinks that discharge to the septic system. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry wells in areas where hazardous materials (boiler blowdown) may enter the floor drain. The floor drain must be protected to prevent boiler blowdown or other prohibited discharges through the floor drain.

#### Recommendations:

- V Be sure that the floor drains are in compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached). Ensure that that the renovation designs are in compliance.
  - Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207 or Tony Zaharias 413-755-2122).
- V Seal all cracks in the floor and the floor drain if it cannot be adequately protected to prevent a prohibited discharge.
- V Install a tight tank for disposal of non-sanitary wastewater.

**4. Residential housing** – Residential development in general poses minimal threat to public and private water supplies provided there is proper management of household hazardous materials and maintenance of septic systems. Septic systems are located within the IWPA of the wells. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the water supply.

#### Recommendations:

- V Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems and supply this information to the Town to distribute to residents.
- V Work with the town to promote household hazardous waste collection days.

**5. Aboveground Storage Tank (AST)** – The diesel ASTs are located immediately adjacent to Well #2, are not within containment and appear to be deteriorating. If managed improperly, ASTs can pose a risk of contamination due to leaks or spills of the chemicals they store.

#### Recommendations:

- V Consider replacing the diesel generator with a propane generator.
- V Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices. Any modifications to the AST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs.

- ✓ Remove or relocate the ASTs from the Zone I, or provide 110% secondary containment for the AST. Comply with all provisions of the regulations regarding AST. Any modifications to the AST must be accomplished in a manner consistent with Massachusetts's plumbing, building, local regulations and fire code requirements.

**6. Transportation corridor/parking** – Main Street and Wilbraham Road are located within the Zone I and IWPA of the wells. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets.

**Recommendations:**

- ✓ Monitor and manage stormwater from parking areas to protect Well #2.
- ✓ Work with the Town Highway Department to determine the location and discharge points of road runoff as is feasible. If reasonable, discharge stormwater to discharge downgradient of the well.
- ✓ The town should review their eligibility for potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). For more information, call the local office in Hadley at 413-585-1000 or visit the U.S.D.A. web site at [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov). Fact sheets are available online - <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf>.
- ✓ Prepare an Emergency Response Plan that includes coordination with the town emergency responders in the event of an accident near the wellhead.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the well's susceptibility to contamination.

Please review and adopt the key recommendations listed above and as follows:

**Zone I and IWPA:**

- ✓ Pursue source replacement.
- ✓ Provide drainage controls around the casing at Well #2 to prevent parking lot runoff from inundating the casing.
- ✓ Remove the dumpster from Zone I.
- ✓ Prohibit any new non-water supply activities from the Zone I.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Post drinking water supply signs in key location such as along the access road and in the parking area away from the well.
- ✓ Prohibit the use of pesticides on the lawns in Zone I.
- ✓ Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, pesticides and household hazardous waste.

**Training and Education:**

- ✓ Maintenance staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator.
- ✓ Provide information regarding the proper disposal and maintenance of septic systems.

**Facilities Management:**

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator.
- ✓ Incorporate an Integrated Pest Management (IPM) approach into your pest/lawn management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.

**Planning:**

- V Work with local officials to develop an Aquifer Protection District Bylaw that includes all public water supply IWPA's and to assist you in continued protection of the water supply.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- V Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. If funds are available, each program year, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

**4. Attachments**

- Recommended Source Protection Measures Fact Sheet

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Hampden Housing Authority

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the **recharge** areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The well for Hampden Housing Authority is located toward the west end of Spring Meadow Road. There are no municipal water or wastewater facilities in Hampden. Therefore, the Hampden Housing Authority is served by one on-site well and on-site septic disposal. The well is a 277-foot deep bedrock well located in the center of the facility.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water or other non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The well has a Zone I radius of 239 feet and an Interim Wellhead Protection Area radius of 587 feet based on metered water use at the facility. The entire facility is located within either the Zone I or the IWPA protection area including septic components, parking, transformers, maintenance shed and all residential facilities.

Geologic mapping in the area indicates overburden deposits of between 50 and 100 feet of sand and gravel. The facility is located in an area mapped as a potential, medium yield, sand and gravel aquifer. The area is a bedrock valley that was filled with stratified drift (sand and gravel) during the recession of the glaciers some 12,000 to 18,000 years ago. The bedrock is mapped as the Jurassic Age, sedimentary redbeds of the Connecticut River valley. The eastern valley border fault is east of the facility. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA.

The well serving the facility has no treatment at this time. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Non-conforming Zone I;**
2. **Residential Land Uses; and,**
3. **Building and Grounds Maintenance**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of at least one moderate threat land use or activity in the IWPA, as seen in Table 2.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-	-	Contact DEP before expanding or modifying the system.
Driveways, road and parking areas	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Fuel Storage Above Ground	Yes	Yes	Moderate	Conduct proper maintenance and upgrades to fuel oil tanks and lines to prevent releases from occurring. Manage petroleum in the storage shed.
Septic System	Yes	Yes	Moderate	See septic systems brochure in the appendix, relocate septic systems outside of Zone I
Lawn Care/Gardening	Yes	Yes	Moderate	Encourage residents in proper storage, disposal, and application of pesticides.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

1. **Non-conforming Zone I** – Currently, the well does not meet DEP's restrictions, which only allow water supply related or other non-threatening activities in Zone I. The Zone I contains driveways, roads, parking spaces, a backup diesel generator with storage tank, and residences. Systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ When upgrading or replacing the backup diesel, convert the generator to propane.
- ✓ If the generator cannot be converted consider relocating it and the diesel tank outside of the Zone I, keeping the tank on an impervious surface with secondary containment to prevent an accidental release or spill from entering the groundwater.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Direct driveway and parking lot drainage in the Zone I away from the well.

2. **Residential Land Uses** – The residences have on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - Although Hampden Housing Authority heats by electricity, the other private residences within the northern portion of the IWPA may heat with fuel oil or diesel fuel. If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store.
- **Stormwater** – Catchbasins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.

3. **Building and Grounds Maintenance** – A storage shed in the IWPA contains a drum of oil for a tractor plus a few five-gallon gasoline containers. Spills or leaks of these petroleum products could potentially impact the aquifer.

### Recommendations:

- ✓ Consider adding a berm along the interior perimeter of the shed to prevent releases of petroleum products from exiting the shed.
- ✓ Provide secondary containment for the gasoline containers and the oil drum.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### **For More Information:**

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

### **3. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Hampden Housing Authority is commended for raising the elevation of the casing above grade. Hampden Housing Authority should review and adopt the key recommendations above and the following:

#### **Priority Recommendations:**

- ✓ If possible relocate septic system tanks outside of the Zone I.
- ✓ Direct driveway and parking lot drainage in the Zone I away from the wells.

#### **Zone I:**

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Restrict use of salt within Zone I and drain stormwater away from well.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

#### **Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, and certified operator. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations.

#### **Facilities Management:**

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility properties.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm. Consider long term plans to raise the transformers above ground.

#### **Planning:**

- ✓ Work with local town officials to establish an Aquifer Protection District with bylaws and to include the facility's IWPA in the District.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the wells and is treated according to DEP guidance.

#### **Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection

recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at the following MA DEP website: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

### **4. Attachments**

- Wellhead Protection Grant Program Fact Sheet

# Source Water Assessment Program (SWAP) Report for Thornton Burgess Middle School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared  
October 16, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	<b>Thornton Burgess Middle School</b>
<i>PWS Address</i>	<b>Wilbraham Road</b>

Well #1	1120006-01G	159	455	Moderate
Well #2	1120006-02G	155	452	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Thornton Burgess Middle School (the school) is located in the west-central side of Hampden. The school student and staff population is approximately 350 people per day and the school is served by two potable supply wells (Well #1 and Well #2). Well #1 is located southwest of the school near the tennis court and Well #2 is located near Wilbraham Road northeast of the school. There is no municipal wastewater sewer system in Hampden; therefore, the school and surrounding facilities are served by on-site septic disposal.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

The wells both have 6-inch diameter casings however little is known about the wells. Well #2 was installed prior to construction of the school and Well #1 was installed during school construction. Well #1 is a bedrock well and is approximately 380 feet deep; Well #2 is approximately 94 feet deep. Geologic mapping in the area indicates overburden deposits of 85 feet of sand with 14 feet of till over bedrock at the school. It is unclear if Well #2 is in the overburden or in bedrock. The school is located in an area that is mapped as a potential, medium yield, sand and gravel aquifer. The area is a bedrock valley that was filled with stratified drift (sand and gravel) during the recession of the glaciers some 14,000 to 18,000 years ago. The school is located immediately in the vicinity of the eastern valley border fault that separates the Jurassic sedimentary beds of the Connecticut River valley from the metamorphic (schist) rocks of the eastern highlands. There is some stratified drift along the flank of the hills to the east but only thin till covering on the uplands with numerous bedrock outcrops mapped.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water or non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The wells have Zone I protective radii of 159 and 155 feet, respectively and (IWPA) radii of 455 and 452 feet, respectively. These protective radii were calculated based on the metered water use from the two highest months of use. The wells are used alternately to meet school demand. Please refer to the attached map that shows the Zone I and IWPA. The Zone I areas for the wells are not conforming to current DEP requirements. The Zone I area for 01G includes the school boiler room and fuel oil, a residential lot with a home, recreational facilities and components of septic systems; the Zone I for 02G includes Wilbraham Road. The IWPAs include additional residential development and part of a golf course.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Fuel Oil Storage	Well #1	Both	Moderate	AST w/containment at school
Floor Drains in Boiler Rooms	Well #1	Both	Moderate	Consult with UIC program regarding compliance
Athletic fields	No	Well # 1	Moderate	Continue current practice of prohibiting the use of pesticides/fertilizers on fields
School facilities and parking	Well #1	Both	Moderate	Limit road deicing usage, use BMPs for household hazardous materials and monitor parking areas and control stormwater
High to medium density residential housing	Well #1	Both	Moderate	Septic systems, household hazardous materials, home heating fuel
Transportation Corridor	Well #2	Both	Moderate	Wilbraham Road
Septic systems components	Both	Both	Moderate	School leachfield in the IWPA, force main in Zone I – Well #1
Golf Course	No	Both	Moderate	Pesticides and hazardous materials from equipment used on course. Golf course has an Integrated Pest Management plan.

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

There is no evidence of a continuous, protective confining clay layer in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from activities on the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer. The water does not require and is, at the time this report was prepared, not treated. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone Is and IWPAs and Table 2 for additional assessment information. Please note that the land use descriptions are limited and the school area is described as Urban Open space for lack of a better descriptor.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Floor drains in boiler rooms;**
3. **School facilities and athletic fields;**
4. **Residential housing; and**
5. **Golf course.**

There are several activities within the Zone I and IWPA that pose a significant threat to the water supply. The overall ranking of susceptibility to contamination for the well is moderate based on several moderate threat activities within the protection areas. Please refer to Table 2.

**1. Non-conforming Zone I** – The water supplier does not own or control the entire Zone I area for either well. Please note that systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. The Zone I for Well #2 extends across a

public road and includes the school and part of one home.

### Zone I Recommendations:

- ✓ Prohibit any additional activities within Zone I and, where feasible, remove non-conforming activities within the Zone I areas.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
- ✓ Monitor all fuel oil deliveries.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

**2. Aboveground fuel oil storage tank** – A fuel oil AST is located within the Zone I of Well #1. It is in the building and within containment. The school has a backup generator that is fueled by propane. If managed improperly, fuel oil tanks and the fuel lines can be a potential source of contamination due to leaks or spills of the materials they store.

### Recommendation:

- ✓ Any modifications to the tank must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

fire department for any additional local code requirements regarding ASTs.

- ✓ Monitor all activities associated with the fuel oil, especially delivery.
- ✓ Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room.

**2. Floor Drains in Boiler Room** – There are floor drains in the boiler room, that are assumed to discharge to the septic system. However, the discharge point is not known. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry wells in areas where hazardous materials or petroleum may enter the floor drain. The floor drain must be protected to prevent boiler blow down, oil or other prohibited discharges through the floor drain.

#### Recommendations:

- ✓ Be sure that the floor drains are in compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - ◆ Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207 or Tony Zaharias 413-755-2122).
- ✓ Containment to prevent accidental releases to the floor drain may be an option. Contact the regional DEP contact for the UIC program listed above. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. We recommend that you require that your boiler maintenance contractor use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.
- ✓ Seal all cracks in the floor and the floor drain if it cannot be adequately protected to prevent a prohibited discharge.

**3. School facilities and athletic fields** - Middle schools generally use only household hazardous materials for cleaning. There are state and federal regulations controlling some if the activities and products used at schools to promote “healthy schools”. All of the school’s facilities are located within the Zone I or IWPA of the wells. Potential exists for contamination of the well by onsite use of fertilizers or pesticides. Storm drains in the parking areas at the school drain directly into the ground.

#### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields across the street. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- ✓ Investigate Integrated Pest Management and Best Management Practices within the IWPA as necessary.
- ✓ Use secondary containment for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or deicing materials within Zone I.
- ✓ Review your emergency response plan regarding accidental releases within the area. Ensuring that emergency responders in town are aware of the locations of your resource areas.
- ✓ Refer to the Massachusetts Public Health Associations Healthy Schools website online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html) for additional information.

**4. Residential Land Use** – There are several residences within the IWPA protection areas and one partially within the Zone I of Well #2. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic

disposal of chemical products used in homes are potential sources of contamination.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catchbasins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**5. Golf Course** – The Hampden Country Club is located adjacent to the school. The club is a PWS and has a water withdrawal permit under the Water Management Act. The club has submitted a plan for Integrated Pest Management and the Department of Agricultural Resources regulates the use of pesticides.

- ✓ Encourage golf course managers to utilize the Integrated Pest Management (IPM) approach. IPM is an ecologically based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Promote the use of BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.

### **3. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will further reduce the well’s susceptibility to contamination. The DEP commends the current protection practice of not using pesticides and fertilizers in the Zone I. The school district should comment to the various town boards regarding developments that may impact the school’s wells. As an example, the subdivision built partially within the Zone I of Well #2 may have been modified to be more protective.

Please review and adopt the key recommendations listed above and as follows:

#### **Priority Recommendations:**

- ✓ Communication with the Town boards regarding the location of the wells and the protection areas.
- ✓ Contact the UIC coordinator to evaluate compliance for the floor drains in the boiler room.

#### **Zone I and IWPA:**

- ✓ Prohibit any new non-water supply activities from Zone I.
- ✓ Conduct regular inspections of the Zone I and IWPA.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider relocating the wells.
- ✓ Post drinking water supply signs in key location such as along the access road and in the parking areas but away from the wells themselves.
- ✓ Provide information to staff and pertinent school organizations about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, pesticides and household hazardous waste.

#### **Training and Education:**

- ✓ Incorporate groundwater education into the school curriculum (K-6 curricula available; contact DEP for copies).
- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator.

#### **Facilities Management:**

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the

school must be registered as a Very Small Quantity Generator. The school is currently not registered as a generator of hazardous waste or waste oil. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" and register to participate, if necessary.

**Planning:**

- V Work with local officials to develop an Aquifer Protection District Bylaw that includes the wells' IWPA and to assist you in continued protection of the water supply.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- V Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

- Recommended Source Protection Measures Fact Sheet
- UIC/Industrial Floor Drain
- Very Small Quantity Generator (VSQG) information

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Green Meadow School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared  
October 28, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Green Meadow School (the school) is located in central Hampden. The school student and staff population is approximately 400 people per day and is served by a single potable supply well (Well #1). Currently the school is undergoing a renovation and expansion. As part of that project, a new well, (Well #2) is being developed. The well is being permitted through the New Source Approval process. Once that well is approved and added to the system, this report will be updated to include Well #2.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Well #1 was installed at the time of the original construction of the school and is located in a pit, immediately adjacent to (east of) the school. There is no municipal wastewater sewer system in Hampden; therefore, the school and surrounding facilities are served by on-site septic disposal. Well #1 is a bedrock well with a 6-inch diameter casing and is approximately 95 feet deep. The school is located east of the valley border fault that separates the Jurassic sedimentary beds of the Connecticut River valley from the metamorphic (schist) rocks of the eastern highlands. The geologic map for the area identifies the bedrock at the school site as the Ammonoosac Volcanics, an amphibolite – gneiss.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water or non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The well has a Zone I protective radius of 100 feet and an IWPA radius of 418 feet. These protective radii were calculated based on the metered water use from the two highest months of water use. Please refer to the attached map that shows the Zone I and IWPA. The Zone I area for Well #1 is not conforming to current DEP requirements. The Zone I area for 01-G includes the school, the boiler room and fuel oil, a storm drain, the dumpster and some school parking. The IWPA includes the entire school including the septic system and leachfield, the ball fields and parking.

The school is located in an area of faulted and folded bedrock uplands. The surficial maps indicate thin till deposits overlying the upland bedrock. There is no evidence of a continuous, protective confining clay layer in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer. The water does not require and is, at the time this report was prepared, not treated. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone Is and IWPAs and Table 2 for additional assessment information.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Fuel Oil Storage	Yes	Yes	Moderate	AST w/containment at school
Floor Drains in Boiler Rooms	Yes	Yes	Moderate	Consult with UIC program regarding compliance. Ensure that the new boiler room has a tight tank.
Athletic fields	Yes	Yes	Moderate	Continue current practice of prohibiting the use of pesticides/fertilizers on fields
School facilities and parking	Yes	Yes	Moderate	Limit road deicing usage, use BMPs for household hazardous materials and monitor parking areas and control stormwater
Septic systems components	Yes	Yes	Moderate	School leachfield in the IWPA

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brn/dws/](http://www.state.ma.us/dep/brn/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Aboveground fuel oil tank;**
3. **Floor drains in boiler room;**
4. **School facilities and athletic fields; and**
5. **Residential housing**

There are several activities within the Zone I and IWPA that pose a significant threat to the water supply. The overall ranking of susceptibility to contamination for the well is moderate. Please refer to Table 2. The school is commended for its proactive approach to source protection by applying for and being awarded a Wellhead Protection Grant to address source protection issues for Well #1. Additional source protection measures will be undertaken as part of the school renovations including the development of a new well.

**1. Non-conforming Zone I** – The water supplier owns the entire Zone I area. However, there are numerous activities in the Zone I that are not allowed. DEP requires that only water supply related activities or non-threatening activities occur within Zone I. Systems not meeting DEP Zone I requirements, must get DEP approval and address Zone I issues prior to increasing water use or modifying systems. The school is in the process of developing a new well as part of a school expansion.

### Zone I Recommendations:

- ✓ Prohibit any additional activities within Zone I and, where feasible, remove non-conforming activities within the Zone I areas.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
- ✓ Monitor all fuel oil deliveries.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

**2. Aboveground fuel oil storage tank** – A fuel oil AST is located within the Zone I. It is in the building and within containment. The school uses propane and has kept the oil tank as an emergency backup. If managed improperly, fuel oil tanks can be a potential source of contamination due to leaks or spills of the materials they store.

### Recommendation:

- ✓ Any modifications to the tank must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs.
- ✓ Monitor all activities associated with the fuel oil especially delivery.

**3. Floor Drains in Boiler Room** – There are floor drains in the boiler room, that discharge to the stormdrain system. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry wells in areas where hazardous materials (boiler blow down) or petroleum may enter the floor drain. The floor drain must be

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

protected to prevent boiler blow down, oil or other prohibited discharges through the floor drain. The floor drains for the new boiler will be directed to a tight tank.

### Recommendations:

- V Be sure that the floor drains are in compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached). Ensure that the renovation designs are in compliance.
  - Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207 or Tony Zaharias 413-755-2122).
- V Seal all cracks in the floor and the floor drain if it cannot be adequately protected to prevent a prohibited discharge.

**4. School facilities and athletic fields** – Elementary schools generally use only household hazardous materials for cleaning. There are state and federal regulations controlling some of the activities and products used at schools to promote “healthy schools”. All of the school’s facilities are located within the Zone I or IWPA of the well. Potential exists for contamination of the well by onsite use of fertilizers or pesticides. Stormdrains in the parking areas at the school drain directly into the ground.

### Recommendations:

- V Continue the use of Best Management Practices for all activities at the school and at the athletic fields across the street. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- V Investigate Integrated Pest Management and Best Management Practices within the IWPA, as necessary.
- V Use secondary containment for any petroleum products kept for maintenance and lawn care equipment.
- V Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or deicing materials within Zone I.
- V Review your emergency response plan regarding accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- V Refer to the Massachusetts Public Health Associations Healthy Schools website online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html) for additional information.

**5. Residential Land Use** – There are a few residences on the edge of the IWPA protection area. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catchbasins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants

include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

### Residential Land Use Recommendations:

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the well's susceptibility to contamination. The DEP commends the practice of not using pesticides and fertilizers in the Zone I and having a propane backup generator. The school district should comment to the various town boards regarding developments that may impact the well.

Please review and adopt the key recommendations listed above and as follows:

#### **Priority Recommendations:**

- ✓ Communication with the Town boards regarding the location of the well and the protection areas.
- ✓ Contact the UIC coordinator to evaluate compliance for the floor drains in the boiler room and ensure that the school renovation designs include a tight tank for the boiler room.

#### **Zone I and IWPA:**

- ✓ Prohibit any new non-water supply activities from Zone I.
- ✓ Conduct regular inspections of the Zone I and IWPA.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider relocating the well.
- ✓ Post drinking water supply signs in key location such as along the access road and in the parking areas but away from the well.
- ✓ Provide information to staff and pertinent school organizations about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, pesticides and household hazardous waste.

#### **Training/Education and Facilities Management:**

- ✓ Incorporate groundwater education into the school curriculum (K-6 curricula available; contact DEP for copies).
- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator. The school is currently not registered as a generator of hazardous waste or waste oil. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" and register to participate, if necessary.

#### **Planning:**

- ✓ Work with local officials to develop an Aquifer Protection District Bylaw that includes the school well's IWPA and to assist you in continued protection of the water supply.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- ✓ Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

#### **Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For White Birch Garden

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 15, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	White Birch Garden
<i>PWS Address</i>	359 Main Street
<i>City/Town</i>	Hampden, Massachusetts

<i>Local Contact</i>	Robert Bergmann
<i>Phone Number</i>	(413) 598-8899

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well No. 1	1120015-01G	151	449	Moderate
Well No. 2	1120015-02G	151	449	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

White Birch Gardens are an apartment complex located in central Hampden. The wells for White Birch Garden are located north of Main Street and the facilities main buildings. Hampden does not have a municipal wastewater sewer system or a municipal water system. Therefore, the apartments are served by on-site septic disposal and two wells. Well No.1 and Well No. 2 were installed at the time of the original construction. Well No. 2 was recently, successfully hydrofractured to increase the yield. Both well are located north of and immediately adjacent to the buildings. Well #1 is a bedrock

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

well with a 6-inch diameter casing and is greater than 450 feet deep. Well #2 is also a 6-inch diameter well that is greater than 330 feet deep.

The apartments area located east of the valley border fault that separates the Jurassic sedimentary beds of the Connecticut River valley from the metamorphic (schist) rocks of the eastern highlands. The bedrock is mapped as a schist of the Erving Formation. Geologic mapping also indicates sand and gravel deposits in the immediate vicinity less than 50 feet deep. The sand and gravel is likely glacially outwash deposits that have been reworked and had recent alluvium deposited along the river valley.

The wells have Zone I radii of 151 feet and Interim Wellhead Protection Area radii of 449 feet. The IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the wells may be significantly larger or smaller than the IWPAs. The wells are located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone Is and IWPAs.

The wells serving the facility have no treatment at this time. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

Key issues include:

1. **Non-conforming Zone I;**
2. **Residential Land Uses; and,**
3. **Roads**

The overall ranking of susceptibility to contamination for the wells is moderate, based on

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Driveways/road and parking areas	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Fuel Storage Above Ground	No	Yes	Moderate	Proper maintenance and upgrades to fuel oil tanks to prevent releases from occurring
Septic System	Yes	Yes	Moderate	See septic systems brochure in the appendix, relocate septic systems outside of Zone I
Lawn Care/Gardening	Yes	Yes	Moderate	Encourage residents in proper storage, disposal, and application of pesticides.
Stormwater Drains/Retention Basins	Yes	Yes	Low	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

the presence of at least one moderate threat land use or activity in the Zone Is and IWPAs, as seen in Table 2.

**1. Non-conforming Zone I** – Currently, the wells do not meet DEP's restrictions, which only allow water supply related activities or non-threatening activities in Zone Is. The wells' Zone Is contains floor drains, driveways, parking spaces, and residences. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Direct driveway and parking lot drainage in the Zone I away from the wells.
- ✓ If possible relocate septic systems outside of the Zone I.

**2. Residential Land Uses** - The residences have on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** - Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in

Appendix A and on the MA DEP website page [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Roads** - Major roads are potential sources of contamination due to salting of roadways and leaks or spills of fuels and other hazardous materials during accidents.

### Recommendation:

- ✓ Contact local fire department to ensure that the IWPAs are included in Emergency Response Planning.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

contamination. White Birch Garden is commended for raising the elevation of the wellheads, posting signs in the Zone I, and educating tenants on wellhead protection issues. White Birch Garden should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Develop an updated Emergency Response Plan and submit a copy to the DEP.
- ✓ Relocate septic systems outside of the Zone I, as is feasible.
- ✓ Direct driveway and parking lot drainage in the Zone I away from the wells.

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Continue to protect the wellheads from damage.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, and certified operator. Post labels as appropriate on raw materials and hazardous waste.

### Facilities Management:

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility properties.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Work with local officials in town to include the facility's IWPA's in Aquifer Protection District Bylaws if the town establishes such bylaws in the future.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the wells and is treated according to DEP guidance.

### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. If funds are available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding

opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at the MA DEP website: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## Source Water Assessment Program (SWAP) Report

### for

## 2 Allen Street Professional Building

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

#### SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared  
November 5, 2003

#### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

### 1. Description of the Water System

The 2 Allen Street Professional Building is located on the corner of Allen Street and Wilbraham Road in Hampden. The facility consists of two separate buildings that house professional offices and a day care center. The system is served by single, 6-inch diameter bedrock well drilled to approximately 199 feet with an estimated yield of approximately 7 gallons per minute (gpm). The facility on average uses approximately 1,630 gpm. Geologic mapping in the area indicates overburden deposits of 85 feet of sand with 14 feet of till over bedrock at the school. The school is located in an area that is mapped as a potential, medium yield, sand and gravel aquifer. The area is a bedrock valley that was filled with stratified drift (sand and gravel) during the recession of the

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

glaciers some 12,000 to 18,000 years ago. The facility is located in an area where the bedrock is mapped as the Jurassic Age, sedimentary redbeds of the Connecticut River valley.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water or other non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The well has a Zone I protective radius of 142 and an IWPA radius of 418 feet. These protective radii were calculated using an estimate of water use based on Title 5 usage estimates of 1,900 gallons per day. Current metered water use data indicate maximum usage is approximately 1,700 gpd. Please refer to the attached map that shows the Zone I and IWPA.

The Zone I area for the well is not conforming to current DEP requirements. The Zone I includes the all or part of two office buildings and associated parking, Wilbraham Road, a residential property and the facility septic system including the leaching pits. The facility is heated with natural gas. Additional office buildings, residential and commercial uses are included in the IWPA.

The surficial maps indicate a relatively thick (>40 feet) sequence of sand and gravel deposits in the valley where the facility is located and there is no evidence of a continuous, protective confining clay layer in the vicinity of the well. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer. The water does not require and is, at the time this report was prepared, not treated. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached map of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	--	--	--	Contact DEP before expanding or modifying your system.
Transportation corridors	Yes	Yes	Moderate	Petroleum products, hazardous materials spilled during accidents and stormwater runoff.
Landscaping	Yes	Yes	Moderate	Do not use pesticide or fertilizers.
Office facilities and parking	Yes	Yes	Moderate	Limit road salt usage use BMPs for household hazardous materials. Monitor parking areas.
Medium density residential housing	Yes	Yes	Moderate	Septic systems and household hazardous materials.

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I,**
2. **Office facilities,**
3. **Residential housing, and**
4. **Transportation corridor.**

There are several activities within the Zone I and IWPA that pose a significant threat to the water supply. The overall ranking of susceptibility to contamination for the well is moderate. Please refer to Table 2.

**1. Non-conforming Zone I** – The water supplier does not own or control the entire Zone I area for either well. Please note that systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. The Zone I extends across a public road and includes one of the office buildings.

### Zone I Recommendations:

- ✓ Prohibit any additional activities within Zone I and, where feasible, remove non-conforming activities within the Zone I areas.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Inspect the well regularly to ensure integrity of the cap and the sanitary seal. Inspect drainage around the well at the same time.

**2. Office facilities** - Generally day care and office facilities use only household hazardous materials for cleaning. All of the facility is located within the Zone I or IWPA of the well. Potential exists for contamination of the well by onsite use of fertilizers or pesticides. The dentist office should be using BMP applicable to that profession to eliminate any potential non-sanitary waste from the wastewater stream.

### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the facility. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required. Do not use or store pesticides, fertilizers or deicing materials within Zone I.

- ✓ Investigate Integrated Pest Management and Best Management Practices within the IWPA as necessary.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
- ✓ Review your emergency response plan regarding accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- ✓ Monitor roadside and parking areas for spills and leaks. This is particularly important since the storm drains discharge directly to the ground.
- ✓ Ensure that the dentist is using BMPs to manage wastewater appropriately.

**3. Residential housing** – Residential development in general poses minimal threat to public and private water supplies provided there is proper management of household hazardous materials and maintenance of septic systems. Septic systems are located within the Zone I and IWPA of the well. If a septic system fails or is not properly maintained it could be a potential

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

### Facilities Management:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator

### Planning:

- ✓ Work with local officials to develop an Aquifer Protection District Bylaw that includes the well's IWPA and to assist you in

source of microbial contamination. Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the water supply.

### Recommendations:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems and supply this information to the Town to distribute to residents.
- ✓ Work with the town to promote household hazardous waste collection days.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.

**4. Transportation corridor** – Allen Street and Wilbraham Road are located within the Zone I and IWPA. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets.

### Recommendations:

- ✓ Work with the Town Highway Department to determine the location and discharge points of road runoff, as is feasible. If reasonable, direct stormwater discharge downgradient of the well.
- ✓ The town should review their eligibility for potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). For more information, call the local office in Hadley at 413-585-1000 or visit the U.S.D.A. web site at [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov). Fact sheets are available online - <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Prepare an Emergency Response Plan that includes coordination with the town emergency responders in the event of an accident near the wellhead.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the well's susceptibility to contamination.

Please review and adopt the key recommendations listed above and as follows:

### Zone I and IWPA:

- ✓ Prohibit any new non-water supply activities from the Zone I.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Monitor activities and if there is evidence of increased activity or access.
- ✓ Post drinking water supply signs in key location such as along the access road and in the parking area away from the well.
- ✓ Provide information to staff about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, pesticides and household hazardous waste.
- ✓ Request that the dentist office use BMPs for waste management as appropriate.

continued protection of the water supply.

- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- V Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

#### **Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. If funds are available, each program year, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

#### **4. Attachments**

# Source Water Assessment and Protection (SWAP) Report for Scantic Valley Water District

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department  
of Environmental Protection,  
Bureau of Resource  
Protection,  
Drinking Water Program

Date Prepared:  
October 28, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS NAME</i>	Scantic Valley Water District
<i>PWS Address</i>	Hampden
<i>City/Town</i>	Hampden, Massachusetts
<i>PWS ID Number</i>	1120023
<i>Local Contact</i>	Mr. Michael Framarin
<i>Phone Number</i>	413-624-3349

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1120023-01G	240	592	Moderate
Well #2	1120023-02G	275	728	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road de-icing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Hampden is a town in southern western Massachusetts along the Connecticut border. The Scantic Valley Water District is a small municipal district with 10 service connections serving residential homes and one educational/nature center. Hampden does not have a municipal wastewater system and therefore all facilities utilize on-site septic disposal systems. The District operates two 6-inch diameter, gravel developed wells located within the watershed of Big Brook. Based on the results of 48-hour pumping tests conducted in 1998 and 1999, the sources have estimated yields of

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

approximately 15 gallons per minute. However, because of Zone I land use restrictions, the approved withdrawal rates for the wells are 6 gpm and 10.25 gpm, respectively.

The Zone I is the protection area immediately surrounding the wellhead, while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I radii, based on the approved daily pumped volume from the wells are 240 feet and 275 feet, respectively. The IWPA radii are 592 and 728 feet, respectively. Please refer to the attached map of the Zone I and IWPA.

Wells #1 and #2 are located within an unconfined sand and gravel deposit. The upland immediately adjacent to the wells is part of an eroded glacial outwash delta and stream terrace deposit. The well logs for the wells did not indicate a confining, protective clay layer in the vicinity of the wells. The deposits were laid down in a bedrock valley during the recession (melting) of the glaciers some 12,000 year ago. More recent alluvial deposits have been laid in the floodplain of Big Brook. The bedrock underlying the area is mapped as the Glastonbury Gneiss. Wells located in this type of geologic setting are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

For information on current water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The protection areas for wells #1 and #2 are in compliance with the Zone I requirements and do not have any activities except passive recreation within it. The Zone I is owned and controlled by the Audubon Society but there is a conservation restriction on the land that was approved by the DEP. The IWPA includes low-density residential development and the Audubon nature center along with the associated parking, septic systems and activities. It is likely that if the Zone II were delineated for the wells, it may not include some of the identified threats within this report. There are few potential sources of contamination within the mapped drinking water supply protection areas.

#### Key issues include:

1. **Transportation corridor**
2. **Residential land use**

**Table 2: Table of Activities within the Water Supply Protection Areas for Both Sources**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridor	No	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Residential	No	Yes	Moderate	Supply BMPs to residents
Institutional – nature center	No	Yes	Moderate	Septic system and parking

\* -For more information, see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website- [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

The overall ranking of susceptibility to contamination for the Scantic Valley Water District wells is moderate based on the presence of a few moderate ranked potentially threatening land uses or activities in the IWPA. As noted, the actual recharge area for the wells may be somewhat different than the IWPA and the District may wish to consider delineating the Zone II to assist in the long-term protection of the wells. Please refer any questions about water quality at the facility to the contact person listed in Table 1.

**1. Transportation corridor** – The well is located on a rural residential road that is relatively lightly traveled. The greatest threat from the road are deicing materials, an accidental spill and/or illegal access. The area has been fenced recently to control access.

**Transportation corridor Recommendations:**

- ✓ Work with the Town to ensure that road runoff is directed where feasible, to an area downgradient of the well.

**Glossary**

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

- ✓ Prepare an Emergency Response Plan that includes coordination between the DEP, the Water Department the Town and State Police in the event of an accident near the wellhead.

**2. Residential Land Use** – There are several residences within the IWPA protection area. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

#### **For More Information:**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

### **3. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. The Scantic Valley Water District should review and adopt the key recommendations above and the following:

#### **Priority Recommendations:**

- ✓ Continue efforts to control access to Zone I and monitor activities in the IWPA area.
- ✓ Consider delineating the Zone II for the wells to better focus protection on the actual recharge areas for the wells.

#### **Zone I:**

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Use BMPs within the Zone I for treatment chemicals.
- ✓ Continue regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.

#### **Planning:**

- ✓ Consider investing in the delineation of a Zone II contribution area to improve protection planning for the well. In the meantime, work with local planning and Board of Health officials to develop Aquifer Protection District Bylaws and to include the IWPA in that district.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Supplement the SWAP assessment with additional local information, and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your on-going local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

Copies of this report have been forwarded to the water supplier and Town officials.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
HAMPDEN SENIOR CENTER

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 2, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Hampden Senior Center
<i>PWS Address</i>	104 Allen Street
<i>City/Town</i>	Hampden, Massachusetts
<i>PWS ID Number</i>	1120024

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1120024-01G	272	711	Low	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1120024-01G)**

Zone I = 272 ft.  
IWPA = 711 ft.

### How was my Well's Susceptibility Determined?

Your well's **low** susceptibility to potential microbial threats is based on the absence of septic system components within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and parking areas within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
ANNIE'S PLACE

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 10, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Annie's Place
<i>PWS Address</i>	546 Main Street
<i>City/Town</i>	Hampden, Massachusetts
<i>PWS ID Number</i>	1120026

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1120026-01G	205	512	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1120026-01G)**

Zone I = 205 ft.  
IWPA = 512 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I. The **high** susceptibility to potential non-microbial threats is based on the storage of hazardous materials such as fuel oil within the IWPA. Other moderate threats include local roads and parking areas within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your 2001 Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
CFI DBA DAILY MART

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	CFI DBA Daily Mart
<i>PWS Address</i>	500 Main St
<i>City/Town</i>	Hampden, Massachusetts
<i>PWS ID Number</i>	1120028

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1120028-01G	100	411	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1120028-01G)**

Zone I = 100 ft.  
IWPA = 411 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and the IWPA. The **high** susceptibility to potential non-microbial threats is based on a waste oil underground storage tank and the local roads within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

Protection Area for WELL  
#1 (1120030-01G)**

Zone I = 100 ft.  
IWPA = 413 ft.

## How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and the IWPA. The **high** susceptibility to potential non-microbial threats is based on the local roads and parking areas within the Zone I and the IWPA and hazardous materials storage within the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

## Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Shaker Heights Association

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
November 19, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS NAME</i>	Shaker Heights Association
<i>PWS Address</i>	Skyline Drive
<i>City/Town</i>	Hancock, Massachusetts
<i>PWS ID Number</i>	1121001
<i>Local Contact</i>	Mr. William Enser

Well #1	1121001-01G	190	489	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road de-icing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Shaker Heights Association is a residential development located in Hancock, a small rural, hilltown in western Berkshire County on the New York state border. The community consists of 20 homes on the western slope of Mt. Lebanon and some lesser, unnamed hills of the Taconic Range. Hancock does not have municipal water and sewer systems; therefore, the community is served by two, on-site water supply wells and wastewater is discharged through individual on-site septic systems. The wells are located topographically upgradient of the development.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Well #1 is a 6-inch diameter, 250-feet deep, bedrock well located approximately 190 feet from one of the homes of the community. Well #2 is located 40 feet from Well #1 and is a 6-inch diameter, 570-feet deep, bedrock well. Well #1 works as the main source and Well #2 pumps as a back-up to supply water at times of peak demand. Water from the wells is pumped to a storage tank near the wells.

The geologic mapping of the area indicates thin overburden material of till with numerous exposures of bedrock. Geologic mapping also identifies the bedrock as metamorphic equivalents of the sedimentary and volcanic rocks of the Taconic Allochthon, predominantly a chloritoid-rich schist and phyllite.

The Zone I is the protection area immediately surrounding the wellhead, while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii, based on the Title 5 estimated volume from the wells, are 190 feet and 489 feet, respectively. Metered data for the last three years ranges from 1500 gallons per day to 6800 gallons per day; these data are inconsistent and unreliable to confirm actual water use at the Association. The Department suggests that you read the meter regularly to determine actual water usage and utilize the data to manage the system. The Department may revise the Zone I and IWPA based on actual use. Please refer to the attached map of the Zone I and IWPA.

There is no record or evidence of a continuous, confining and protective layer such as thick till or clay, in the vicinity of the well. Wells located in this type of geologic setting are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

For information on current water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 2 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The well is fairly remote and the protection areas include a hiking trail, forest and two residences on the edge of the IWPA.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-	-	Remove all non-conforming activities from Zone I.
Tractor storage shed/storage of woodchips and other debris	Yes	Yes	High	The tractor contains petroleum products and recently there are debris and woodchips stored in the Zone I.
Residential	No	Yes	Moderate	Supply BMPs to residents.

\* -For more information, see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Key issues include:**

1. **Non-conforming Zone I;**
2. **Maintenance shed; and**
3. **Residential land use.**

The overall ranking of susceptibility to contamination for the Shaker Heights supply wells is high based on the presence of at least one high ranked potentially threatening land use or activity in the Zone I and IWPA. Please refer any questions about water quality at the facility to the contact person listed in Table 1.

1. **Non-conforming Zone Is** – Currently the wells do not meet DEP’s restrictions, which only allow water supply related activities or other non-threatening activities in the Zone I. The Zone Is contain a tractor shed and the 190 feet Zone I is just on the edge of one of the homes. As noted previously, the Zone I may in fact be larger or smaller than the 190 feet but it cannot be determined with the currently available

meter data. Recently it has been noted that storage of debris and woodchips is occurring adjacent to the tractor garage. This activity is not permitted in the Zone I. In addition it appears that the Zone I is not entirely owned by the Association. However, the Zone I area to the east that is not owned by the Association is owned by the Department of Conservation and Recreation and is unlikely to be developed. Systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

**Recommendations:**

- ✓ Remove all non-water supply activities from the Zone I to comply with DEP’s Zone I requirements.
- ✓ Do not store debris or any other materials within Zone I.
- ✓ Restrict automobile access to Zone I.
- ✓ Control access to the wellhead areas with sanitary seals and secure facilities.
- ✓ Inspect the wells regularly to ensure the integrity of the cap, sanitary seal and the drainage around the well is directed away from the wells.

2. **Tractor shed** – The tractor is stored in a garage within the Zone I. The only petroleum products stored in the garage are those in use within the equipment.

**Recommendations:**

- ✓ Do not store any other fluids in the shed and check regularly for leaks and spills.
- ✓ Prohibit access to the area.
- ✓ Do not allow the accumulation of debris or other items within the protection areas.

2. **Residential Land Use** – There are two residences within the IWPA protection area. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

### Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-feet to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

## 4. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. The Department commends the Association for previous efforts to protect the source such as removing the fuel tank for the tractor from the protection areas, but there is still work needed to fully protect the sources. The water supplier should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Monitor and control activities in the Zone I and IWPA areas.
- ✓ Consider ways to protect the well if activities cannot be controlled.
- ✓ Ensure the integrity of the sanitary caps and seals at the wells.

### Zone I:

- ✓ Prohibit any new, non-water supply activities from the Zone I.
- ✓ Continue regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ Redirect drainage in the Zone I, downgradient and away from the well area.

### Training and Education:

- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Educate residents, neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal.
- ✓ Keep areas near transformers free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Be sure that the local emergency responders know where your sources are located and notify you in the event of an accident in the vicinity of your well.
- ✓ Supplement the SWAP assessment with additional local information, and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Other Funding Sources:

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government agencies, non-governmental organizations and agricultural facilities through programs listed on the USDA web site <http://search.s.c.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Suggest that the town review the fact sheet available online and call the local office of the NRCS for assistance: <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

The DEP's Wellhead Protection Grant Program provides funds to assist public water suppliers and their partners in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

eligible for funding under this grant program. If funds are available, in the spring, DEP posts a new Request for Response for the grant program (RFR).

These recommendations are only part of your on-going local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures. Copies of this report have been forwarded to the water supplier and Town officials.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
BERKSHIRE VISTA RESORT

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 10, 2004

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Berkshire Vista Resort
<i>PWS Address</i>	312 Kittle Rd
<i>City/Town</i>	Hancock, Massachusetts
<i>PWS ID Number</i>	1121002

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1121002-01G	270	700	High	Moderate
Well #2	1121002-02G	140	442	High	Moderate
Well #3	1121002-03G	140	442	High	Moderate
Well #4	1121002-04G	204	509	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1121002-01G)**

Zone I = 270 ft.  
IWPA = 700 ft.

### How was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I of Well #1 and the IWPAs of all of the wells. Wells #2, 3 and 4 are in compliance with Zone I requirements. The **moderate** susceptibility to potential non-microbial threats is based on the local roads within the Zone I of Well #1 and the IWPAs of all of the wells.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Reports, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the wells' Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone Is and IWPAs regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the wells (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone Is;
- ✓ do not use pesticides, fertilizers or road salt within the Zone Is;
- ✓ address septic system issues in Zone Is; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

average of at least 25 individuals daily at least 60 days of the year.

**Massachusetts Department of Environmental Protection**  
**Source Water Assessment and Protection (SWAP) Report**  
**For**  
**Jiminy Peak Resorts, Inc.**

**What is SWAP?**

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

**SWAP and Water Quality**

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

**Introduction**

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

**Purpose of this report:**

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

**This report includes:**

1. Description of the Water System
2. Discussion of Land Uses in the Protection Areas
3. Protection Recommendations
4. Attachments, including a Map of the Protection Areas

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The Zone II** The primary recharge area defined by a hydrogeologic study.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

## 1. Description of the Water System

Jiminy Peak is the largest ski resort in Massachusetts and is located on Potter Mountain. The ski area has operated since 1948 and the facilities have expanded into Jiminy Peak Resorts, Inc., a year-round recreational resort and residential condominium complex in Hancock, Massachusetts. Hancock is a small rural residential community situated between the Berkshire Hills and the Taconic Range on the New York border in Berkshire County. The community includes a full service ski area, seven condominium associations with over 360 units, laundry facilities, restaurants, swimming pools and a health club. The Town of Hancock does not have municipal water or sewer; therefore, Jiminy Peak's Utility Department operates a public water system and a wastewater treatment facility. The system has a groundwater discharge permit for wastewater disposal. Jiminy Peak Resorts, Inc. maintains all of the facilities at the ski area and resort, including the lifts and all of the grooming and maintenance equipment. The facility is registered as a very small quantity generator of hazardous waste and operates a waste oil burner to dispose of the limited amount of waste oil generated.

Jiminy Peak maintains and operates six groundwater supply sources. Wells #1 through #5 are 6-inch diameter wells drilled into bedrock, while Well #6 is a tubular wellfield consisting of 4-2.5-inch diameter wells drilled in a sand and gravel aquifer. The depths and approved withdrawal rates for Wells #1 through #5 are as follows: Well #1 is 300 feet deep with an approved rate of 15 gpm; Well #2 is 245 feet deep with an approved rate of 23 gpm; Well #3 is 150 feet deep with an approved rate of 10 gpm; Well #4 is 440 feet deep with an approved rate of 4 gpm; and Well #5 is 500 feet deep with an approved rate of 5.5 gpm. The wellfield 06G, consists of 4-2.5-inch diameter wells, drilled to 56 feet with a total approved withdrawal rate of 60 gpm.

The Zone I is the protective area immediately surrounding the source and is assumed to contribute recharge to the source. The Zone I for individual wells is a circle centered on the well with a radius ranging from 100 to 400 feet based on the approved withdrawal rate from the well. A wellfield is a series of wells located proximal to each other that are pumped simultaneously. The Zone I for a wellfield is an area defined by a 250 feet radial distance from the outside edges of the wellfield. The Zone I for source 06G terminates downgradient along the Kinderhook Creek and Bentley Brook. The Zone II is the scientifically determined primary recharge area for the source. The Zone II, contribution area for the wellfield 06G, was delineated utilizing empirical data from an extended duration pumping well and an analytical model. An IWPA is a primary

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA/ Zone II	Threat	Comments
Non-conforming Zone I	-	-	-	Wells #1 and #2 – Contact DEP prior to conducting any work in Zone I or expanding the system.
Underground Storage tanks	No	02G	High	Leaks, spills, or improper handling.
Above Ground Storage tanks	No	01G	Moderate	Leaks, spills, or improper handling.
Maintenance garage (hazardous materials)	No	01G	High	Floor drains are connected to a tight tank.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA/ Zone II	Threat	Comments
High density residential	01G & 02G	01G – 04G	Moderate	Potential threats are from nitrates, erosion and microbial contaminants.
Transportation corridors/parking	02G	All	Low/ Moderate	Erosion, stormwater: leaks, spills, or improper handling; road building.
Groundwater discharge	No	02G	Moderate	Potential threats are from nitrates and microbial contaminants.
Storage	06G	06G	Low/ Moderate	Periodically materials are stored within the Zone I and Zone II. Monitor activities and prohibit storage in Zone I.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

recharge area designated for a groundwater source when the Zone II has not yet been delineated. The actual recharge area for a well may be significantly larger or smaller than the IWPA.

The wells #1 through #5 are at various locations throughout the ski area and resort. Wells #1 and #2 are non-conforming with respect to Zone I restrictions. Well #1 is located on a slope with a chairlift and two lift lines in the Zone I. Well #2 is located in front of one of the condominium units. The IWPA's for wells #1 and #2 include most of the facilities at the resort; a lift and liftline are within the Zone I of Well #5. Wells #3, 4, and 6 have conforming Zone Is. The Zone II for well #6 includes the snowmaking pond that is lined with an impermeable liner.
