Geologic mapping and field observations indicate thin overburden of till on the upland and relatively thin stratified drift (sand and gravel) deposits in the valleys. Well #6 is located within the stratified drift deposits of Kinderhook Creek. The stratified drift was deposited during the recession of the glaciers approximately 18,000 years ago. The bedrock is a complex series of folds and faults with rock mapped as phyllite and schist of the Taconic Allocthon. Wells #1 through #5 are drilled into the bedrock. There is no evidence of a confining unit at the locations of any of the wells. Wells located in these conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I, IWPA and Zone II.

The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html), the website for EPA's Envirofacts.

## 2. Discussion of Land Uses in the Protection Areas

There are some land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### Key issues include:

1. **Non-conforming Zone I;**
2. **High Density Residential;**
3. **Hazardous materials handling (maintenance);**
4. **Wastewater treatment plant;**
5. **Underground/Above ground fuel storage; and**
6. **Transportation corridor/parking.**

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use or activity in the IWPA of the wells, as seen in Table 2. However, only wells 01 and 02G have high threat activities in the protection areas.

**1. Non-conforming Zone I** – Wells #1 and #2 have non-conforming Zone I with respect to activities within the Zone I. Ski trails and a lift line are located within the Zone I of Well #5. There is a ski lift and lines within the Zone I of Well #1 and condominiums in the Zone I of Well #2.

#### Recommendations:

- ✓ Although it is impossible to remove all activities within the non-conforming Zone Is, continue to work toward prohibiting/limiting activities in close proximity to the wells and using BMPs to protect the water supplies.

**2. High Density Residential/Commercial Land Uses** – The Zone I and/or IWPA for Wells #1 through #5 have high-density residential land use and other resort activities. If managed improperly, activities associated with residential and resort areas can contribute to drinking water contamination. Many of the newer facilities utilize propane for fuel. The older main lodge area has two fuel oil USTs. The maintenance facility has a new above ground storage tank. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at

<http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

#### Residential Land Use Recommendations:

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and online at the MA DEP website - [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- V Continue the use and maintenance of BMPs for activities within close proximity to the wells.
- V Do not use pesticides or fertilizers within the Zone I of the wells. Consider the use of Integrated Pest Management to minimize the use of pesticides and nutrients in fertilizers.
- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

#### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

Copies of this assessment have been made available to the public water supplier and town boards.

- V Promote BMPs for stormwater management and pollution controls and continue monitoring and managing stormwater runoff, directing it away from the wells.

**3. Hazardous Materials Storage and Use** – The facility utilizes hazardous materials and generates hazardous waste. The new maintenance garage has floor drains that are followed by oil water separators and discharge to a tight tank. The Bureau of Waste Prevention regulates the management of hazardous waste. Spill kits and signs designating areas of storage were noted during the visit. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground. It should be noted that vehicle washing is a restricted activity under the UIC regulations. Review requirements for vehicle washing as appropriate or contact the UIC staff (Tony Zaharias 413-755-2122 or Rick Larson 413-755-2207) regarding additional information about vehicle washing activities.

**Hazardous Materials Storage and Use Recommendations:**

- V Continue current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.

**4. Wastewater Treatment Plant** – The Wastewater Treatment Plant discharges to the ground within the IWPA of Well #2. Activities associated with wastewater treatment involve storage and use of hazardous materials such as chlorine and other treatment chemicals. Municipal wastewater contains contaminants including bacteria, viruses, metals and volatile chemicals. Spills, leaks or mismanagement of wastewater, hazardous materials and stormwater at the plant are potential sources of contamination.

**Wastewater Treatment Plant Recommendations:**

- ✓ Ensure the wastewater treatment facility is operated and maintained according to DEP requirements.
- ✓ Work to have stormwater drains and the drainage system around the wastewater treatment plant mapped.
- ✓ Use best management practices for proper handling of materials and in containing spills and leaks.

**5. Underground and Above Ground Storage Tanks (UST)** – There are two USTs and one AST located at the facility within the IWPA of Well #1 and/or Well #2. The AST at the maintenance garage is new and the two USTs contain fuel oil.

**Recommendations:**

- V USTs in close proximity to the water supply should be closely monitored for signs of leaking or failure and during deliveries. Review stormwater flow direction and anticipate control of a potential spill during delivery. Replace and upgrade tanks as appropriate.
- V Continue to evaluate and consider a replacement well location and use of alternative fuel, as is feasible.
- V Any upgrades and modification to fuel storage facilities must meet current construction standards and be done consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.
- V Require fuel lines to be sleeved to protect from leaks or have appropriate protection.
- V Review construction details for the tanks to ensure that they include overfill protection. Retrofit those without containment, as is feasible.
- V Ensure that a spill response plan is included in the emergency response plans and ensure spill containment equipment is available. Include plans of storm drain systems in the emergency response plan.

**6. Transportation corridor and parking** – The access and parking areas for the facilities are within Zone I of Well #2 and the IWPA of Wells #2 through #5. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets.

**Recommendations:**

- V Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they area aware of the location of your well.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the sources' susceptibility to contamination. Jiminy Peak is commended for recent development of wells that are in compliance and is encouraged to use diligence in monitoring activities within and near protection areas. The water supplier should review and adopt the key recommendations above.

#### **Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

### 4. Attachments

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Hancock Elementary School

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 23, 2003

**Table 1: Public Water System (PWS) Information**

<b>PWS NAME</b>	Hancock Elementary School
<b>PWS Address</b>	Route 43
<b>City/Town</b>	Hancock, Massachusetts
<b>PWS ID Number</b>	1121009
<b>Local Contact</b>	Ms. Jane Roberts
<b>Phone Number</b>	(413) 458-8224

<b>Well Name</b>	<b>Source ID#</b>	<b>Zone I (in feet)</b>	<b>IWPA</b>	<b>Source Susceptibility</b>
Well #1	1121009-01G	100	422	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses in the Protection Areas
3. Protection Recommendations
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Hancock Elementary School is a small, rural school with a total student and staff population of approximately 75 people per day, located on Route 43 in Hancock, Massachusetts. Hancock is a small rural residential, recreational community situated between the Berkshire Hills and the Taconic Range on the New York border in Berkshire County. The Town of Hancock does not have municipal water or sewer; therefore, the school operates a single public water supply well and disposes a wastewater through an on-site septic system. The school uses fuel oil and has a single

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The Zone II** The primary recharge area defined by a hydrogeologic study.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

underground storage tank adjacent to the school and there are three boiler rooms at the facility. Route 43 has infiltration storm drains and a swale along the edge of the road; the swale drains to the Rathburn Brook and eventually to Kinderhook Creek. The school operates a single 8-inch diameter, 137 feet deep bedrock well that was installed in 1970 and has approximately 50 feet of casing. The estimated yield of the well is approximately 5.5 gpm, however the school utilizes less than 1,000 gallons per day.

The Zone I is the protective area immediately surrounding the source and is assumed to contribute recharge to the source. The Zone I for individual wells is a circle centered on the well with a radius ranging from 100 to 400 feet based on the approved withdrawal rate from the well. An Interim Wellhead Protection Area (IWPA) is a primary recharge area designated for a groundwater source when the Zone II has not yet been delineated. The actual recharge area for a well may be significantly larger or smaller than the IWPA. The Zone I and IWPA protective radii for Well #1 are 100 feet and 422 feet respectively based on the maximum, daily water use reported at the school from metered data.

Geologic mapping and field observations indicate the school is located within the narrow Kinderhook Creek valley. The swamp just north of the school appears to be the headwaters of the Kinderhook Creek, which flows south along the east boundary of the schoolyard. The Kinderhook Creek valley is a narrow, relatively shallow buried, bedrock valley that was filled with stratified drift (sand and gravel) deposits. The stratified drift was deposited during the recession of the glaciers approximately 18,000 years ago; recent streams later reworked the sand and gravel and deposited additional alluvium in the valley. The bedrock is a complex series of folds and faults with rock mapped various metamorphic rock types mapped of the Vermont Stockbridge Valley Autochthon and Taconic Allochthon. The bedrock in valley, in the immediate vicinity of the well is mapped as the calcite marble of the Stockbridge Formation. There is no evidence of a continuous confining, clay layer in the immediate vicinity of the well. Wells located in these conditions are considered aquifers with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA.

The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html), the website for EPA's Envirofacts.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Conforming Zone I	-	-	-	Contact DEP prior to conducting any work in Zone I or expanding the system.
Underground storage tank	No	Yes	High	Leaks, spills, or improper handling. Floor drains in the boiler room were sealed and fuel lines were sleeved.
Transportation corridors, parking and stormwater/infiltration	No	Yes	Moderate	Control the use of deicers and coordinate with emergency response personnel.
School	No	Yes	Moderate	Use BMPs for school facilities
Agriculture	No	No	--	Rotation of row crops just outside of the IWPA
Residential	No	Yes	Moderate	One lot partially in IWPA

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

## 2. Discussion of Land Uses in the Protection Areas

There are some land uses and activities within the drinking water supply protection areas that are potential sources of contamination. Although the agricultural activities are outside of the Zone I and IWPA, because the IWPA is not a scientifically determined recharge area, the DEP often identifies activities that are near source.

### Key issues include:

1. **Zone I;**
2. **School and residential;**
3. **Underground fuel storage**
4. **Transportation corridor/parking.**

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use or activity in the IWPA of the well, as seen in Table 2.

**1. Conforming Zone I** – Well #1 has a conforming Zone I with respect to ownership and activities within the Zone I. There is a play structure partially within the Zone I of Well #1. The DEP allows some passive recreation and other non-threatening activities within the Zone I. However, the water supplier does need permission to conduct any additional activities in the Zone I.

### Recommendations:

- ✓ Continue to work toward prohibiting/limiting activities in close proximity to the well and using BMPs to protect the water supplies.

**2. School and residential** – The school facilities and part of a residence are within the IWPA for the well. Elementary schools generally use only household hazardous materials and the recommendations for small schools are similar to those for residents. There are state and federal controls on some activities and products used at schools to promote “healthy schools”. All of the school’s facilities are located within the IWPA of the well. Potential exists for contamination of the well by onsite use of cleaning materials, petroleum from lawn equipment, fertilizers, and pesticides. Storm drains in the parking areas at the school drain directly into the ground. If managed improperly, activities associated with residences and the school can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

### School and Residential Use Recommendations:

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and online at the MA DEP website - [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

Copies of this assessment have been made available to the public water supplier and town boards.

- ✓ Continue the use and maintenance of BMPs for activities within close proximity to the well.
- ✓ Continue to prohibit the use pesticides or fertilizers within the Zone I of the well. Consider the use of Integrated Pest Management to minimize the use of pesticides and nutrients in fertilizers.
- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields across the street. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- ✓ Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Review your emergency response plan regarding accidental releases within the area. Ensuring that emergency responders in town are aware of the locations of your resource areas.
- ✓ Refer to the Massachusetts Public Health Associations Healthy Schools website at the following website [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html) for additional information
- ✓ Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. We recommend that you require your boiler maintenance contractor use containment, have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should also be responsible for the off-site disposal of any boiler blow down generated during maintenance.

**3. Underground Storage Tanks (UST)** – There is one UST at the facility within the IWPA of Well #1. The school had all of the fuel lines sleeved and investigating options for maintenance to the UST leak detection and monitoring system.

#### Recommendations:

- ✓ USTs in close proximity to the water supply should be closely monitored for signs of leaking or failure and during deliveries. Review stormwater flow direction and anticipate control of a potential spill during delivery. Replace and upgrade tanks as appropriate.
- ✓ Evaluate and consider the use of alternative fuel, as is feasible.

- ✓ Any upgrades and modification to fuel storage facilities must meet current construction standards and be done consistent with Massachusetts's plumbing, building, and fire code requirements for storage tanks. Consult with the local fire department or your consultant for any additional local code requirements regarding USTs .
- ✓ Review construction details for the tanks to ensure that they include overfill protection.
- ✓ Ensure that a spill response plan is included in the emergency response plans and ensure spill containment equipment is available. Include plans of storm drain systems in the emergency response plan.

**4. Transportation corridor and parking** – The parking areas for the school and a portion of Route 43 are within the IWPA of the well. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets.

**Recommendations:**

- V Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they are aware of the location of your well.

### **3. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will reduce the sources' susceptibility to contamination. The Hancock School is commended for past development of a source away from most activities and work conducted to sleeve fuel oil lines and sealing of floor drains. The DEP encourages continued diligence in monitoring activities within and near protection areas. The water supplier should review and adopt the key recommendations above. Consider contacting the agricultural property land owner just to make them aware of your water supply and to encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Call the local office of the NRCS in Pittsfield at 413-443-6867 ext. 3 for assistance or review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the program fact sheet. If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

### **4. Attachments**

- Source protection fact sheets

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
PATRIOT RESORTS

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 10, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Patriot Resorts
<i>PWS Address</i>	Brodie Mountain Rd
<i>City/Town</i>	Hancock, Massachusetts
<i>PWS ID Number</i>	1121010

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1121010-01G	374	1,891	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1121010-01G)**

Zone I = 374 ft.  
IWPA = 1,891 ft.

## How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the wastewater system components within the IWPA of the well; however the well is in compliance with DEP Zone I requirements. The **moderate** susceptibility to potential non-microbial threats is based on the local roads within the IWPA.

This source water assessment report is based on information provided by you on your New Source Approval Process reports, Public Water Supply Annual Statistical Report, water quality data and from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report For Beaver Pond Meadows Condominiums

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 12, 2001

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Beaver Pond Meadow Condominium wells serve 27 condominiums (80 bedrooms total) and a swimming pool. Both wells, located near Beaver Pond, are 245-foot deep, 6-inch diameter drilled bedrock wells with approved yields of 32 gallons per minute each. Each well's Zone I and Interim Wellhead Protection Area (IWPA) radii are 350 feet and 1424 feet, respectively. The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. These protective areas have been calculated based on the approved pump rates for the wells; however, the actual recharge area to the well may be significantly larger or smaller than the IWPA.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

USGS mapping shows the bedrock in the area as quartz-mica schist. A hydrogeologic study of Hancock indicates the wells are drilled within an area of shallow surface sand and gravel overburden. This information is based in part on drilling logs. There is no mapped confining, protective clay layer in the immediate vicinity of the wells. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The wells serving the facility have no treatment at this time. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Nonconforming use in Zone Is;**
2. **Low density housing; and**
3. **Septic system.**

The overall ranking of susceptibility to contamination for the wells is moderate, based on the presence of a few moderate threat land uses or activities in the Zone I and IWPA, as seen in Table 2.

**1. Nonconforming use in Zone I** - The Zone Is for both wells are nonconforming with respect to DEP land use restrictions which allow only water supply related activities in the Zone I. Beaver Pond and a portion of one of the condominium buildings are located within the Zone I of the wells. The public water supplier does not own and/or control all land encompassed by the Zone I of the wells. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

#### Recommendations:

- ✓ Do not conduct any additional activities within the Zone I. Contact MA DEP prior to conducting any activities within Zone I.
- ✓ Prepare an emergency response plan for responding to an accidental release.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Septic System	No	Both wells	Moderate	See septic systems brochure attached
Parking lot, driveways & roads	Both wells	Both wells	Moderate	Limit road salt usage and maintain drainage system away from wells
Low density Housing	Both wells	Both wells	Moderate	Monitor parking area for leaks, see attached septic systems brochure

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**2. Low Density Housing --** The Zone I contains a condominium unit with associated parking. The IWPA contains the rest of the condominium units, also with associated parking. The most significant threats from residential areas are the septic systems due to lack of maintenance and improper disposal of non-sanitary waste. Another potential threat from residential users is mismanagement of household waste.

### Recommendations:

- ✓ Monitor roadside for spills and leaks.
- ✓ Encourage residents to utilize local household hazardous waste collection days.
- ✓ Supply residents with information about BMPs for household hazardous waste management and lawn care.

**3. Septic Systems --** The septic system for the entire facility is located within the IWPA. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste.

### Recommendations:

- ✓ Provide residents with information about proper maintenance and disposal practices for septic systems. Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Beaver Pond Meadow Condominiums is commended for using adequate signage denoting the public water supply area. Beaver Pond Meadow Condominiums should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Maintain the road and parking lot drainage system that directs runoff water in the Zone I away from well.
- ✓ Utilize BMPs and restrict activities that could pose a threat to the water supply, especially in the Zone I.

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.

- ✓ Remove all non-water supply activities from the Zone I when possible to comply with DEP's Zone I requirements.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Prohibit public access to the well by locking facilities, gating roads if necessary, and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping and evidence of vandalism.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers and certified operator. Post labels as appropriate on raw materials and hazardous waste.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

- V Post drinking water protection area signs at key visibility locations.

### Facilities Management:

- V Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property. Do not use fertilizer, herbicides, or pesticides in the Zone I.
- V Septic system components should be located, inspected, and maintained on a regular basis.
- V Protective collars around wellheads should slope away from well.

### Planning:

- V Work with local officials in Hancock to develop a protection district with bylaws and include Beaver Pond Meadow Condominiums IWPA's in an Aquifer Protection District Bylaws to assist you in improving protection.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Funding:

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response application package for the Grant program (RFR). On or about May 1 the new RFR is available and the application is due back on or about June 31. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## 4. Attachments

- Map of the Public Water Supply (PWS) Protection Area.
- Recommended Source Protection Measures Fact Sheet
- Your Septic System Brochure
- Pesticide Use Fact Sheet
- Wellhead Protection Grant Program Fact Sheet
- Source Protection Sign Order Form

# Source Water Assessment Program (SWAP) Report For Wheelwright Water District

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
January 2, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Wheelwright Water District gets its water supply from two wells (Well #2 & #3) off Church Street in the Village of Wheelwright, located in the Town of Hardwick. The wells are located between Route 32 and the Ware River, east of Route 32 and approximately 500 feet south of Broadmeadow Brook. Well #3 is a replacement well for Well #1. Well #3 is a 12-inch diameter gravel packed well. Well #2 is a 12-inch diameter well which was installed in 1970 to a depth of 55 feet. Each well has a Zone I of 397 feet and a DEP approved Zone II. The geology at the site consists of fine to coarse-grained sand, gravel and cobbles with intermittent layers of sand and clay to a depth of approximately 70 feet below grade. A layer of fine to medium silty sand with trace gravel is found between 65 to 67 feet below grade. The well is located in an aquifer with a high vulnerability to

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II or, in the absence of a Zone II, an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The Zone II** is the larger area that contributes water to the well as defined by a hydrogeologic study.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Zone II.

contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and Zone II. The well serving the facility has no treatment at this time. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Inappropriate Activities in Zone Is;**
2. **An Aboveground Storage Tank (AST) With Heating Oil;**
3. **Railroad Tack;**
4. **Sand and Gravel mining and washing; and**
5. **Transportation Corridor.**

The overall ranking of susceptibility to contamination for the wells is High, based on the presence of at least one high threat land use or activity in the Zone II, as seen in Table 2.

1. **Zone Is** – Currently, the wells do not meet DEP's restrictions, which only allow water supply related activities in Zone Is. The Wheelright Water District's Zone Is contain buildings (elderly housing). The public water supplier does not own and/or control all land encompassed by the Zone I. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Do not use pesticides, fertilizers or road salt within the Zone Is.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	Zone II	Threat	Comments
Fuel Storage Above Ground	Both wells	Both Wells	Moderate	Tank is on cemented surface in the basement.
Railroad track	Both wells	Both wells	High	Spills of hazardous chemicals; pesticide use for vegetation control.
Sand & Gravel mining & washing	Both wells	Both wells	Moderate	
Transportation Corridor	Both wells	Both wells	Moderate	Route 32
Structures	Both Wells	Both Wells	-	Non-water supply structures in Zone I

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

2. **Aboveground Storage Tanks (AST)** – There are ASTs without secondary containment located on cemented floors in the building. If managed improperly, Aboveground Storage Tanks can be a potential source of contamination due to leaks or spills of the chemicals they store.

### Recommendation:

- ✓ The Department recommends that 110% secondary containment for the AST in the buildings be provided. Aboveground storage tanks in your Zone II should be located on an impermeable surface. Comply with all provisions of the regulations regarding AST.
- ✓ Any modifications to the AST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. The Department recommends that you consult with the local fire department for any additional local code requirements regarding AST.

2. **Railroad Track** – A railroad corridor runs through the Zone Is and Zone II. Railroad corridors serving passenger and/or freight trains are potential contaminant sources due to chemicals released during normal use, track maintenance, and accidents. Normal maintenance of railroad rights of way can introduce contaminants to a water supply through herbicide application for vegetation control. Accidents can release spills or engine fluids and commercially transported chemical.

### Recommendation:

- ✓ Contact your local Board of Health to ensure that the Zone II is included in right of way pesticide management planning.
- ✓ Contact local fire department to ensure that the Zone II is included in Emergency Response Planning

3. **Sand and gravel mining** – A sand and gravel mining operation is located within the Zone II. Sand and gravel mining is a potential source of contamination due to the possibility of spills or leaks from heavy equipment, fuel storage, and clandestine dumping.

### Recommendations:

- ✓ Use Best Management Practices for storage, use, and disposal of hazardous materials such as fuel.
- ✓ Inspect the Zone II for signs of clandestine dumping on a regular basis.

## 4. Transportation Corridor

leaks or spills of fuels and other hazardous materials during accidents.

### Recommendation:

- ✓ Contact local fire department to ensure that the Zone II is included in Emergency Response Planning

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Wheelright Water District should review and adopt the key recommendations above and the following:

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact **Josephine Yemoh-Ndi** in DEP's **Worcester Office** at **(508) 792-7650 x 5030** for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier and town boards.

### Zone I:

- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Check any above ground tanks for leaks, etc.
- ✓ Since the houses in the Zone I are currently in use and will continue to be in use, use BMPs and restrict activities that could pose a threat to the water supply.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.
- ✓ Do not use pesticides, fertilizers or road salt within the Zone I.

### Training and Education:

- ✓ Train staff on emergency response and best management practices; include custodial staff, groundskeepers, and certified operator. Post labels as appropriate on raw materials and hazardous waste.

### Facilities Management:

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.

### Planning:

- ✓ Work with local officials in Hardwick to include the Wheelwright Water District Zone II in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## 4. Attachments

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitelist.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
2-0011737	2011 BARRE RD.	HARDWICK	Oil

For more location information, please see the attached map. The map lists the release sites by RTN.

# Source Water Assessment Program (SWAP) Report For Eagle Hill School

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
April 6, 2001

Well #1	2124003-01G	217	533	Moderate
Well #2	2124003-02G	217	533	Moderate

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? inventory land uses within the recharge areas of all public water supply sources;
- ? assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## INTRODUCTION

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. DESCRIPTION OF THE WATER SYSTEM

The Eagle Hill School obtains its water from two rock wells. Well #1 is located near the swimming pool and is 450 feet deep. Well #2 is located behind the cafeteria, and is 360 feet deep. Well #2 supplies water to the cafeteria and the gymnasium and Well # 1 supplies the rest of the school. Each well has a Zone I of 217 feet and an Interim Wellhead Protection Area (IWPA) of 571 feet. The wells are located in a sand and gravel aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone Is and IWPAs. The wells serving the facility have no treatment at this time. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

## 2. DISCUSSION OF LAND USES IN THE PROTECTION AREAS

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

**Key issues include:**

1. **Inappropriate activities in Zone Is,**
2. **Aboveground storage tank (AST) with fuel oil,**
3. **Septic system,**
4. **Graphics lab/small printing; & Science lab,**
5. **Transportation corridor; and**
6. **Storm water drain.**

The overall ranking of susceptibility to contamination for the well is High, based on the presence of at least one high threat land use or activity in the IWPA, as seen in Table 2.

**1. Zone I**– Currently, the well does not meet DEP's restrictions, which only allow water supply related activities in Zone I. The facility's Zone Is contain a swimming pool, buildings, roads and parking area. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

**2. Aboveground Storage Tanks** – There are three ASTs with heating oil within the IWPA. The 275 gallon double-walled tanks are encased in cement, and located adjacent to the dormitory.

**3. Septic system** – The septic system is located in the IWPA of both wells. Staff and students should be trained on proper disposal of hazardous materials. The septic system was installed in 1998, and is pumped once or twice per year.

**4. Graphics/Science labs** – Projects carried out are limited in size. Projects include silk screenings, small amounts of printing, and some photography.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
School	Aboveground storage tanks	No	Well #2	Moderate	Fuel oil tanks in cement encasement
	Building and grounds maintenance facility	No	Both Wells	Moderate	Storage shed
	Parking areas & driveway	Both Wells	Both Wells	Moderate	Limit road salt usage and provide drainage away from wells
	Septic System	No	Both Wells	Moderate	See septic systems brochure attached
	Graphics lab/small printing & woodworking shop	No	Both Wells	High	Waste from these areas are not alloed to be discharged to a septic system as per Title 5
	Classroom building	No	Both Wells	Moderate	Include science & art classrooms -use of acrylic paints, varnishes & nontoxic clay
	Transportation corridor	No	Well #1	Moderate	Local road.
	Storm water drain	Well #1	Both Wells	Low	In the parking area, downgradient of the well.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Recommendations:

- ✓ The facility is encouraged to have a working neutralization system to handle the wastes from the laboratories.
- ✓ Discharge from photographic, art, and science classrooms must go to a DEP approved tight tank or sewer (with permission of the sewer authority), and staff and students should be trained on proper disposal of hazardous materials and waste.

**5. Transportation Corridor** – Old Petersham Road runs in front of the property, within the IWPA. The location and the volume of traffic increase the chances of contamination from accidents, spills and road salt.

**6. Stormwater drains** – One stormwater drain located within the Zone I of Well #1 is downgradient of the well. The remainder of the storm water drains are located within the IWPA's of both wells #1 and #2.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. PROTECTION RECOMMENDATIONS

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Eagle Hill School should review and adopt the following recommendations at the facility:

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements. Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying their system.
- ✓ Consider well relocation if Zone I threats cannot be mitigated. Please note that DEP permit approvals must be obtained prior to the installation of a new well.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Incorporate groundwater education into school curriculum.
- ✓ Work with your community to ensure that storm water runoff is directed away from the well and is treated according to DEP guidance.

### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, see the hazardous materials guidance manual at

### **For More Information:**

Contact Josephine Yemoh-Ndi in DEP's Worcester Office at (508) 792-7650 x 5030 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

Copies of this assessment have been provided to the water department, town boards, the town library and the local media.

<http://www.dep.state.ma.us/dep/bwp/dhm/dhmpubs.htm>

Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices.

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachment for more information regarding septic systems.

### **Planning:**

- ✓ Work with local officials in Hardwick to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Source Water Assessment Program (SWAP) Report For HARDWICK ELEMENTARY SCHOOL (Draft)

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date DRAFT Prepared:  
June 6, 2001

**Table 1: Public Water System (PWS) Information**

<i>PWS NAME</i>	HARDWICK ELEMENTARY SCHOOL
<i>PWS Address</i>	LOWER ROAD
<i>City/Town</i>	HARDWICK
<i>PWS ID Number</i>	2124008
<i>Local Contact</i>	Bill Burnett
<i>Phone Number</i>	(978) 355-4668

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	2124008-01G	186	483	Moderate

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? inventory land uses within the recharge areas of all public water supply sources;
- ? assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? publicize the results to provide support for improved protection.

## Maintaining Your Good Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The well, an 8 inch diameter bedrock well, is 410 feet deep. The well is located about 225 feet from the building, in the field. The well has a Zone I of 186 feet and an Interim Wellhead Protection Area (IWPA) of 483 feet. The site is underlain by a dense to very dense silty sand, with some gravel, cobbles, and boulders. The till is capped in some areas by well-stratified sands and gravels with a trace of some silt in a compact condition. This material is probably associated with the post-glacial Ware River. The topsoil at the site is underlain by loose orange – brown silty sand and gravel, which is probably slope wash debris from the slopes to the north and west. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

The well serving the facility has no treatment at this time. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above.

## 2. Discussion of Land Uses in the Protection Areas

There are land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

Key issues include:

### -Inappropriate activities in the Zone I.

The overall ranking of susceptibility to contamination for the well is Moderate, based on the presence of at least one moderate threat land use or activity in the IWPA.

**Zone I-** Currently, the well does not meet DEP's restrictions, which only allow water supply related activities in Zone Is. The facility's Zone I contains an athletic field, although the activities are very limited, and a local road. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Ensure that stormwater runoff from the local road is directed away from the Zone I.
- ✓ Continue to not use any fertilizers or pesticides on the field within the Zone I.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

## 3. Protection Recommendations

Hardwick Elementary School should review and adopt the following recommendations at the school:

**Table 2: Table of Activities within the Water Supply Protection Areas**

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
School	Local road	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
	Athletic Field	Yes	Yes	Low	No fertilizer use

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements. Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying their system.
- ✓ Consider well relocation if Zone I threats cannot be mitigated. Please note that DEP permit approvals must be obtained prior to the installation of a new well.

### Training and Education:

- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Incorporate groundwater education into school curriculum

### Facilities Management:

- ✓ Although the septic system is located outside of the IWPA, its components should be located, inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.

### Planning:

- ✓ Work with local officials in Hardwick to include the school's IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

**For More Information:**

Contact **Josephine Yemoh-Ndi** in DEP's **Worcester Office** at **(508) 792-7650 x 5030** for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

Copies of this assessment have been provided to the water department, town boards, the town library and the local media.

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Hatfield Water Department**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Section 1: Description of the Water System

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

### Groundwater Sources

Zone II #: 463

Susceptibility: High

Well Name	Source ID#
West Hatfield Well (01G)	1127000-01G

Zone II # 275

Susceptibility: High

Well Name	Source ID#
Omasta Well (02G)	1127000-02G

### Surface Water Sources

Source Name	Susceptibility: Moderate
Running Gutter Brook Reservoir	1127000-01S

Hatfield Water Department operates and maintains two wells and one reservoir. The two wells for the Hatfield Water Department are located west of I-91; 01G is in the south section of town near the border with Northampton and 02G is in the north section near the border with Whately. Wells 01G and 02G are both 12-inch diameter, gravel developed wells screened at 124 and 166 feet in depth, respectively. Each well has a Zone I radius of 400 feet. The Conceptual Zone II for each well was delineated as part of the SWAP program and based on an historical pumping rate of 250 gpm for Well 01G and an approved pumping rate of 275 for well 02G. The Zone II area for well 01G is within Hatfield and Northampton; the Zone II area for Well 02G is within northern Hatfield and Whately. The wells are located in a deep buried valley aquifer, filled with sand and gravel deposited during the recession (melting) of the glaciers some 12,000 to 18,000 years ago. At that time, Glacial Lake Hitchcock was formed in this area leaving a thick layer of lake clay in some areas overlying the deeper sand and gravel aquifer. The Hatfield wells are screened in a sand and gravel deposit that is overlain by the clay layer that is estimated to become thicker to the east and thinner to the west. There is some evidence that the clay layer "pinches out" to the west where much of the aquifer recharge is likely to occur.

The wells are located in aquifers with a high vulnerability to contamination. Although there is a confining clay unit in a portion of the Zone II, the confining unit is not contiguous throughout the area and therefore, due to the absence of

hydrogeologic barriers (i.e. confining clay layer) that can prevent contaminant migration from the ground surface, the aquifer is considered vulnerable. Please refer to the attached map for the Zone II delineation outlines.

The Running Gutter Brook Reservoir for the Hatfield Water Department is located in the northwest corner of Hatfield, near the borders with Whately and Williamsburg. A portion of the water supply protection areas for the reservoir extends in to the town of Whately. Please refer to the attached map of the watershed.

The water from the reservoir is filtered and disinfected. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web at <http://www.epa.gov/safewater/ccr1.html>

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

## Section 2: Land Uses in the Protection Areas

The Zone IIs and watershed for Hatfield are primarily forested, with smaller portions consisting of agriculture, residential, and commercial/industrial land uses (refer to the attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Activities in Zone I
2. Activities in Zone A
3. Residential Land Uses
4. Transportation Corridors
5. Hazardous Materials Storage and Use
6. Agricultural activities
7. Oil or Hazardous Material Contamination Sites
8. Comprehensive Wellhead Protection Planning

The overall ranking of susceptibility to contamination for the system is high,

based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Activities in Zone I** – The Zone I for each of the wells is a 400 foot radius around the wellhead. Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. However, many public water supplies were developed prior to the Department's regulations and contain non-water supply activities such as homes and public roads. The following non-water supply activities occur in the Zone Is of the system wells:

**Well 01G** - There are dirt bike trails and 1 residential property within the Zone I.

**Well 02G** - There are 2 residential properties within the Zone I, and Interstate 91

passes through the Zone I.

### Zone I Recommendations:

- ✓ To the extent possible, remove all non water supply activities from the Zone Is to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non-water supply activities out of the Zone I.

**2. Activities in Zone A** - Land use activities within a Zone A may have an impact on surface water sources. Wild animals and domestic pets can be carriers of waterborne diseases such as Giardia, Cryptosporidium, Salmonella, etc. Human activities also can pose significant threats. The following activities occur in the Zone As of the system's reservoirs:

**Running Gutter Brook Reservoir (01S)** - There is a local road within the Zone A of the reservoir and a road that crosses one of the tributaries. Some of the trails and roads throughout the watershed are utilized for recreation. Little impact has been noted from these activities by the watersupplier.

### Zone A Recommendations:

- ✓ Closely monitor all activities within the Zone As.
- ✓ Keep any new prohibited activities out of the Zone A.

**3. Residential Land Uses** – Approximately 21% of the Zone II for 01G, 9% of the Zone II for Well 02G, and less than 1% of the Running Gutter Brook

### What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

### For More Information

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier and town boards.

watershed consist of residential areas. All of the areas use septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to manage new residential developments in the water supply protection areas.

**4. Transportation Corridors** - Interstate 91 runs through the protection areas for Well 02G. Local roads are present in the protection areas of the Zone IIs and watershed. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include contaminants from automotive leaks, maintenance, washing, or accidents.

Railroad tracks run through the edge of the Zone II for Well 02G. Rail corridors serving passenger or freight trains are potential sources of contamination due to chemicals released during normal use, track maintenance, and accidents. Accidents can release spills of train engine fluids and commercially transported chemicals.

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

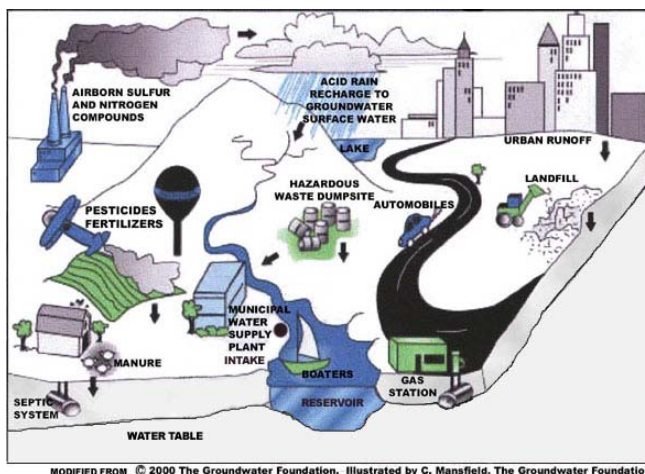

Figure 1: Sample watershed with examples of potential sources of contamination

#### Transportation Corridor Recommendations:

- ✓ Continue to regularly inspect watershed and Zone IIs for illegal dumping and spills.
- ✓ Work with local emergency response teams to ensure that any spills within the protection areas can be effectively contained.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Regular street sweeping reduces the amount of potential contaminants in runoff.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

(Continued on page 6)

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Well Source ID	Watershed Source ID	Potential Contaminant Sources*
<b>Agricultural</b>					
Forestry Operation	1	M	-	01S	Herbicides or pesticides, equipment maintenance materials: leaks, spills, or improper handling; road building
Nurseries	2	M	02G	-	Fertilizers, pesticides, and other chemicals: leaks, spills, improper handling, or over-application
<b>Commercial</b>					
Auto Repair Shops	5	H	02G	-	Spills, leaks, or improper handling of automotive fluids, and solvents
Cemeteries	1	M	02G	-	Over-application of pesticides: leaks, spills, improper handling; historic embalming fluids
Repair Shops (Engine, Appliances, Etc.)	1	H	01G	-	Engine fluids, lubricants, and solvents: spills, leaks, or improper handling or storage, Uncontrolled underground injection of hazardous materials.
Railroad Tracks and Yards	1	H	02G	-	Over-application or improper handling of herbicides, leaks or spills of transported chemicals and maintenance chemicals; fuel storage
Sand And Gravel Mining/Washing	2	M	01G, 02G	-	Heavy equipment, fuel storage, clandestine dumping: spills or leaks. Pit in Zone II for 01G not active.
<b>Residential</b>					
Fuel Oil Storage (at residences)	Numerous	M	01G, 02G	-	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	01G, 02G	-	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	01G, 02G	-	Hazardous chemicals: microbial contaminants, and improper disposal

Land Uses	Quantity	Threat**	Potential Contaminant Sources*
<b>Miscellaneous</b>			
Oil or Hazardous Material Sites	1	--	Tier Classified Oil or Hazardous Materials Sites are not ranked due to their site-specific character. Individual sites are identified in Appendix B.
Transmission Line Rights-of-Way Type: gas line	1	L	Construction and corridor maintenance, over-application or improper handling of herbicides
Transportation Corridors	Numerous	M	Accidental leaks or spills of fuels and other hazardous materials, over-application or improper handling of pesticides
Underground Storage Tanks	2	H	Spills, leaks, or improper handling or storage of hazardous materials and waste
Utility Station Transformers	1	L	Chemicals and other materials including PCBs: spills, leaks, or improper handling

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - Where there are two rankings, the first is for surface water, the second for groundwater sources. The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Work with local officials during their review of the railroad right of way Yearly Operating Plans to ensure that water supplies are protected during vegetation control.

**5. Hazardous Materials Storage and Use** – Less than 5 % of the Zone IIs for Hatfield’s wells is commercial or industrial land uses. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure “Industrial Floor Drains” for more information.

**6. Agricultural Activities** – There are farms throughout the protection areas. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.

**7. Presence of Oil or Hazardous Material Contamination Sites** – The Zone II for Well 02G contains a DEP Tier Classified Oil and/or Hazardous Material Release Site indicated on the map as Release Tracking Number 1-00048. Refer to the attached map and Appendix 3 for more information.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.

**8. Protection Planning** – Protection planning protects drinking water by managing the land area that supplies water to a well or reservoir. Currently, the Town does not have water supply protection controls that meet DEP's Wellhead Protection regulations 310 CMR 22.21(2) or Surface Water Protection regulations 310 CMR 22.20 (b) and (c). Wellhead Protection and Surface Water Supply Protection Plans coordinate community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. Although Hatfield does have a Surface Water Supply Protection Plan. Plans must be updated to reflect changes within the system and activities within the watershed. There are resources available to help communities develop and modify plans for protecting drinking water supply sources.

**Top 5 Reasons to Develop a Local Wellhead and Surface Water Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

The Hatfield Water has sold Conservation Restrictions (CR) to the MA DEM to allow public access to the watershed. Although the CR limits allowable activities, it does not specify control measures within the watershed. Wellhead Protection and Watershed Protection Plans coordinate community efforts, identifies protection strategies,

establishes a timeframe for implementation, and provides a forum for public education and outreach, and can help to pass a bylaw for control regulations. The development of successful Plans are outlined in five steps in DEP's "Developing a Local Wellhead Protection Plan" and in "Developing a Local Watershed Protection Plan" (see Appendix A for the full report) as:

- Establish a protection committee or team
- Define the Water Source Protection Areas
- Identify potential sources of contamination
- Protect and manage the source protection areas
- Conduct ongoing public education and outreach

An access control and monitoring plan should be an integral part of a watershed protection plan. The assessment of potential impacts of public access to the watershed are critical in protecting the water supply and for long and short term planning for the Water Department.

Please use the guidance booklets included in the appendix to help create your plan. Compile the information supplied in the Zone II reports, this and other reports; include copies of maps outlining the protection areas (Zone I, Zone II, Zone A, Zone B, and Zone C) and detail the protection measures in place. Outline a plan with a time line for completion of the various plan components. Submit your written report to the DEP Regional office and/or Boston office for approval.

#### **Protection Planning Recommendations:**

- ✓ Create and formalize an access management plan for the watershed and update your Watershed Protection Plan.
- ✓ Develop a Wellhead Protection Plan. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Coordinate efforts with local officials in Hatfield, Whately, and Northampton to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21(2). If they do not meet the current regulations, adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ If local controls do not regulate floor drains, be sure to include floor drain controls that meet 310 CMR 22.21(2).
- ✓ Include provisions for controlling public access to the Zone Is and watershed in any future planning.
- ✓ Because so much of the water supply protection areas are forested, review current strategies for best management of forested lands.
- ✓ If there are no local surface water supply protection controls or they do not meet the current regulations, adopt controls that meet 310 CMR 22.20 (b) and (c). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.

Other land uses and activities within the Zone IIs and watershed that are potential sources of contamination are included in Table 2. Refer to Appendix B for more

information about these land uses. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone II and watersheds contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Daily inspections of Zone II and watershed lands.
- Purchase of additional watershed land.
- The preparation of a Watershed Protection Plan for the watershed.

*(Continued on page 9)*

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II.
2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Prepare and implement an Access management plan for land under conservation restrictions that allow public access. Lack of control and monitoring of public access may result in negative impacts to the water supply and infrastructure.
- ✓ Continue to inspect the Zone Is and As regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your protection areas and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Develop and implement a Wellhead Protection Plan.

**Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community.

The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

**Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>YES</b>	Continue to inspect and protect open space in the Zone 1. Where land is not available for purchase, consider the use of conservation restrictions.
Are the Zone I and II posted with “Public Drinking Water Supply” Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>YES</b>	Monitor activities in Zone I.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2) ?	<b>NO</b>	Work with the Planning Board and the Board of Health to compare land use controls to see that they meet current requirements of 310 CMR 22.21(2). Refer to <a href="http://mass.gov/dep/brp/dws/">mass.gov/dep/brp/dws/</a> for model bylaws and health regulations, and current regulations. Whately does have hazardous Materials Handling by laws
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>N/A</b>	
<b>Planning</b>		
Does the PWS have a local wellhead protection plan?	<b>In the process</b>	Develop a wellhead protection plan. Follow “Developing a Local Wellhead Protection Plan” available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a watershed and wellhead protection committee?	<b>YES</b>	Encourage past committee to reconvene, and also include representatives from citizens’ groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	There are no commercial or industrial activities in the watershed, but there are some that should be inspected within the Zone IIs. For more guidance see “Hazardous Materials Management: A Community’s Guide” at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide watershed protection education?	<b>NO</b>	Currently outreach is mainly to school groups. Increase residential outreach through bill stuffers, Drinking Water Week activities, and coordination with local groups. Aim additional efforts at commercial, industrial and municipal uses within the Zone IIs.

## APPENDIX B: REGULATED FACILITIES NEAR THE WATER SUPPLY PROTECTION AREA

**Note:** All of these facilities are outside of the Zone IIs for the system wells. However, they are within the Zone III, very near the border of the Zone II, and so runoff from a spill or leak at these facilities could drain to the Zone II.

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class
131813	West Track, Inc	164 West St Rte 5	Hatfield	Generator of Hazardous Waste	Very Small Quantity Generator
35129	Town of Hatfield Highway Department	10 Straits Rd	Hatfield	Generator of Hazardous Waste	Very Small Quantity Generator
205621	Federal Express Corp	173 West St Route 5 & 10	Hatfield	Generator of Hazardous Waste	Very Small Quantity Generator
328650	Hatfield Equipment Co	Mountain Rd	Hatfield	Generator of Hazardous Waste	Very Small Quantity Generator
	Truck & Auto Repair (not currently registered)	Coles Meadow Road	Hatfield/ Northampton	Generator of Hazardous Waste	To be determined

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitelist.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0000488	361 West St	Hatfield	Oil and Hazardous Material
1-0010136*	Depot Road	Hatfield	Oil and Hazardous Material

\* Site is just outside of the Zone II area.

For more location information, please see the attached map, which has the release sites located by RTN and refer to <http://www.state.ma.us/dep/bwsc/sitelist.htm> for additional site information.

# Source Water Assessment Program (SWAP) Report for Heath Elementary School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
September 21, 2001

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Heath Elementary School
<i>PWS Address</i>	18 Jacobs Road
<i>City/Town</i>	Heath, Massachusetts
<i>PWS ID Number</i>	1130002
<i>Local Contact</i>	Mr. Philip O'Reilly
<i>Phone Number</i>	413-337-4742

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1130002-01G	136	436	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Heath Elementary School is a rural elementary school located on the south side of Jacobs Road in Heath. The school student and staff population is approximately 135 people per day and is served by a single potable supply well (Well #1) located north of the school.

The well has a Zone I protective radius of 135 feet and an Interim Wellhead Protection Area (IWPA) radius of 438 feet based on an approved daily withdrawal rate. The well was tested under the New Source Approval Process and approved for a withdrawal rate of 1,728 gallons per day, (gpd) or 1.2 gallons per minute, (gpm). The 6-inch diameter

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

well is drilled to a depth of approximately 500 feet below ground. The driller's log states bedrock was encountered 42-inches below grade. The bedrock was apparently highly weathered and the casing, grouted into place, extended to 66-feet below grade. Bedrock outcrops were observed during the site visit confirming the shallow depth of bedrock. The geologic mapping of the area identified the bedrock as black to green colored amphibolite, greenstone, feldspathic schists and granulite of the Hawley Formation dating from the Ordovician. Although there are stratified drift, sand and gravel deposits nearby, there is little to no soil over the bedrock in the immediate vicinity of the well. The water does not require and is, at the time this report was prepared, not treated. You may request additional information regarding the quality of the water from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone Is and IWPAs and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, very few land uses and activities within the drinking water supply protection areas were identified as potential sources of contamination.

### Key issues include:

1. **Underground fuel oil storage tank (UST)**
2. **Septic System**
3. **Floor drain in boiler room**
4. **Parking and roadway**

The source is fairly well protected. The Town owns the entire Zone I area and there are no identified land use activities within the Zone I other than passive recreation (walking trail). However, the well is located in an aquifer with a high vulnerability to contamination due to the absence of a significant hydrogeologic barrier to prevent contaminant migration from the surface. The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of at least one moderate threat land use or activity in the IWPA, as seen in Table 2.

1. **Underground fuel oil storage tank** – The school's underground fuel oil tank and propane tank are located within the IWPA of the school well. The oil tank is located 405 feet from the well and is double walled with a monitoring system. The propane tank, also located within the IWPA, poses a minimal threat to water quality because of

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Underground Storage Tank (UST, fuel oil)	No	Yes	Moderate	Double walled tank with monitoring, edge of IWPA
Septic System components (not the leach field)	No	Yes	Moderate	Refer to the attached septic system fact sheet.
Floor Drain in the boiler room to septic system	No	Yes	Moderate	Floor drain must be protected from accidental spills
Parking area and roadway	No	Yes	Moderate	Grassy drainage swales

- **-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).**

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

its gaseous nature if released.

### Recommendations:

- ✓ Diligently monitor the status of the tanks and the delivery of oil.
- ✓ Consider long term planning of replacing the UST after its useful life with an above ground storage tank with containment.

**2. Septic system components in the IWPA** - The septic tank, grease trap, pipeline and distribution box are all within the IWPA of the well. A very small portion of the leach field is also on the perimeter of the IWPA. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Improper disposal of household hazardous chemicals to septic systems or discharge from the boiler room are also potential sources of contamination to the water supply.

### Recommendations:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator. The school is currently not registered as a generator of hazardous waste or waste oil. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" to determine regulatory requirements.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.

**2. Floor drain in the boiler room** – Floor drains may be required in boiler rooms to provide drainage in the event of a plumbing failure. If there is a potential for hazardous materials to flow accidentally into the floor drain, however, preventive measures should be taken. Floor drains in an area that contains hazardous materials must be discharged to a sewer or a tight tank. The boiler room at the Heath Elementary School has a floor drain that is assumed to discharge to the septic system.

### Recommendations:

- ✓ Oil lines from the tank to the boiler can be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. A written policy and plan should be in place during maintenance operations, especially when oil filters are changed.

- ✓ Require your boiler maintenance contractor to use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. Please note that boiler blow down generated during routine maintenance cannot be discharged through the floor drain and must be disposed of off site.

**3. Parking and roadway** - The parking area and roadway are within the IWPA of the well. Bedrock outcrops were observed along the side of Jacobs Road with the road drainage consisting of an earthen swale. Drainage from the school is discharged approximately 200 feet from the well to an area that topographically drains away from the wellhead.

### Recommendations:

- ✓ Use minimal road salt and deicers.
- ✓ Request that the Town consider paving the drainage swale along Jacobs Road, immediately adjacent to the Zone I of the well to minimize the potential impact to the well from direct infiltration of road salt and road runoff into the exposed bedrock.
- ✓ Monitor the parking lot for spills and leaks.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, and the local media.

Other activities that were noted during the assessment were the agricultural activities within and just outside of the IWPA. Request that the landowners utilize Best Management Practices for their agricultural practices that include nutrient management. Be sure that they are aware that your facility is a public water supply. If they do not already have a farm plan, refer them to the Natural Resource Conservation Service. Alternatively, they may follow a plan developed through the publication *On Farm Strategies to Protect Water Quality: An Assessment and Planning Tool for Best Management Practices*. Information on funding and other resources for agricultural management is available through the Massachusetts Department of Food and Agriculture at (617) 626-1700 or <http://www.massdfa.org/bureaus.htm>.

Implementing the previously noted and following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The Heath Elementary School is commended for current protection measures.

Please review and adopt the key recommendations listed above and as follows:

#### Zone I and IWPA:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Direct nature trails away from the wellhead. Look for evidence of unauthorized access. If necessary, fence off the wellhead to prevent access.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider gating the wellhead.
- ✓ Post drinking water supply signs key location such along the access road and in the parking area.
- ✓ Provide information to staff about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Use Best Management Practices (BMPs) for the use of fertilizer lawn care, pesticides and household hazardous waste.

#### Training and Education:

- ✓ Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies).

#### Facilities Management:

- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ Concrete or earthen collars around the wellhead should slope away from well.

#### Planning:

- ✓ Work with local officials to include the school well's IWPA in an Aquifer Protection District Bylaws and to assist you in securing protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the 2001 "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note that each program year, on or about May 1 the Department posts a new Request for Response (RFR), grant application form. Generally, the applications are due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

**4. Attachments**

- Map of the Public Water Supply (PWS) Protection Area.
- Recommended Source Protection Measures Fact sheet

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Ashmere Heights Water Service

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection,  
Drinking Water Program

Date Prepared:  
November 7, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road de-icing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Ashmere Heights Water Service is a residential development located on the shore of Ashmere Lake in the town of Hinsdale, a small, rural, hilltown community in western Massachusetts. The facility is located immediately south of State Route 143. Although there is both a municipal water and sewer system in Hinsdale, only the municipal sewer serves this section of town. Therefore, the system is served by two, on-site water supply wells and wastewater is disposed through the municipal sewer system. The facility serves approximately 59 homes, most of which are seasonal and several are year round residences. During the last few years, more seasonal homes have been converted to year

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

round homes. The system is served by two wells. Well #1 is a 6-inch diameter, 375-feet deep, bedrock well located between two residences approximately 200 feet from the road with 220 feet of casing; Well #2 is a 4-inch diameter, 170-feet deep, bedrock well with 160 feet of casing.

The Zone I is the protection area immediately surrounding the wellhead, while the IWPA provides an Interim Wellhead Protection Area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and IWPA radii for both wells is the same and is based on the maximum average daily pumped volume from the wells. The Zone Is and IWPAs are 182 feet and 478 feet, respectively. Please refer to the attached map of the Zone Is and IWPAs.

Wells #1 and #2 are located in an area of relatively thin overburden material of till. The bedrock is mapped as the Washington Gneiss, rusty weathering schist with layers of blue-quartz conglomerate and dacite. Although the wells have approximately 200 feet of casing, there is no record or evidence of a confining, protective layer such as thick till or clay, in the vicinity of the well. Wells located in this type of geologic setting are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

For information on current water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The protection areas for the wells include Route 143, the apartment buildings and the well for the Ashmere Heights Water Service as well as numerous residences.

### Key issues include:

1. **Non-conforming activities within Zone I**
2. **Transportation corridor**
3. **Residential land use**

The overall ranking of susceptibility to contamination for the Ashmere Heights Water

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridor	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Residential	Yes	Yes	Moderate	Supply BMPs to residents. Monitor activities within the entire IWPA area for potentially hazardous activities near your wells and neighbor's well(s).
Municipal Sewer	Yes	Yes	Low	Notify the Town if leaks are apparent.

\* -For more information, see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

Service supply wells is moderate based on the presence of several moderate ranked potentially threatening land uses or activities in the Zone Is and IWPA's. Please refer any questions about water quality at the facility to the contact person listed in Table 1.

**1. Non-conforming activities within Zone Is** – The Zone I is the area immediately surrounding the wellhead where only activities associated with supplying water or other non-threatening activities are allowed. The water supplier does not own or control the entire Zone I area for either well and there are activities within the Zone I that are not allowed under the current regulations. Systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. The Zone I extends across a public road and includes residential areas.

**Zone I Recommendations:**

✓ Control access to the wellhead areas.

- ✓ Consider relocating the well to a more protected area.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
- ✓ Do not use or store pesticides, fertilizers, and control the use household hazardous materials and road salt within the Zone I.

**2. Residential Land Use** – There are several residences within the Zone I and the IWPA protection areas. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. The municipal sewer serves the area. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Do not allow the accumulation of refuse within the protection areas.
- ✓ Prohibit vehicle maintenance and the use of hazardous materials within Zone I.

**3. Transportation corridor** – The well is located on a state highway that is the main route through the area. The greatest threat from the road is deicing materials, an accidental spill and or illegal access. Although the well is located within a small structure, it is located within 25 feet of the roadway.

**Transportation corridor Recommendations:**

- ✓ Work with the Town to ensure that road runoff is directed where feasible, to an area away from the well.
- ✓ Prepare an Emergency Response Plan that includes coordination between the DEP, the public water supplier, the Town and State Police in the event of an accident near the wellhead.
- ✓ Secure the facilities that the well is in, provide a sanitary seal around the casing to prevent ponding of water and inspect the integrity of the cap and watertight seal regularly

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

## 4. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. The Department commends the Water Service for completing some of the tasks required to protect the sources such as raising the well casings and management of activities near the wells. There is still work needed to fully protect the sources. The Ashmere Heights Water Service should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Monitor and control activities in the Zone I and IWPA areas.
- ✓ Relocate the well if activities cannot be controlled and the water quality is impacted.

### Zone I:

- ✓ Prohibit any new, non-water supply activities from the Zone I.
- ✓ Educate the residents in the area regarding the use BMPs within the Zone I.
- ✓ Continue regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ Redirect road drainage in the Zone I away from the well area.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Protect the well from flooding.

### Training and Education:

- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Educate residents, neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal and septic system maintenance.
- ✓ Keep areas near transformers free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Request that the town develop a Wellhead Protection District and associated bylaws and request that the IWPA for your and other water systems be included in the protection area.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Supplement the SWAP assessment with additional local information, and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Other Funding Sources:

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government agencies, non-governmental organizations and agricultural facilities through programs listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

designed to protect surface and groundwater. Suggest that the town review the fact sheet available online and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

The DEP's Wellhead Protection Grant Program provides funds to assist public water suppliers and their partners in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under this grant program. If funds are available, in the spring, DEP posts a new Request for Response for the grant program (RFR).

These recommendations are only part of your on-going local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

Copies of this report have been forwarded to the water supplier and Town officials.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road de-icing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Ashmere Water Service is a residential development located on the shore of Ashmere Lake in the town of Hinsdale, small, rural, hilltown community in western Massachusetts. The facility is located on Shore Drive, off of George Schnopp Road. Although there is both a municipal water and sewer system in Hinsdale, only the municipal sewer serves this section of town. Therefore, the system is served by one, on-site water supply well and wastewater is disposed through the municipal sewer system. The facility serves approximately 26 homes, several are seasonal homes with more than 15 being year round residences. Within the last few years, the well has experienced

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

diminished capacity and the system is in the process of developing a replacement source. The new well has been installed and a pumping test has been conducted. The preliminary results indicate adequate capacity and water quality, but the well and water testing are not complete by the time this report was prepared. The new well is within 50 feet of the existing source and will be permitted as a replacement source. This report can be updated to include that well once it is complete. However, due to the close proximity of the replacement source to the existing well, the assessment for the new well will be the same as for the existing well. Well #1 is a 6-inch diameter, 360-foot deep, bedrock well located between two residences, 25 feet from the edge of the road and approximately 100 feet from the lake. Well #1 is located within a concrete vault approximately 20 feet from the road.

The Zone I is the protection area immediately surrounding the wellhead, while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii, based on the daily pumped volume from the well are 192 feet and 491 feet, respectively. Please refer to the attached map of the Zone I and IWPA.

Well #1 is located in an area of relatively thin overburden material of till. The bedrock is mapped as the Washington Gneiss, rusty weathering schist with layers of blue-quartz conglomerate and dacite. Although the new replacement source is a free-flowing, artesian, bedrock well, there is no record or evidence of a continuous, confining and protective layer such as thick till or clay, in the vicinity of the well. Wells located in this type of geologic setting are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

For information on current water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 2 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The protection areas for the wells include Route 143, the apartment buildings and well

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridor	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Residential	No	Yes	Moderate	Supply BMPs to residents. Monitor activities within the entire IWPA area for potentially hazardous activities near your wells.
Municipal Sewer	Yes	Yes	Low	Notify the Town if leaks are apparent.

\* -For more information, see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

Figure 1: Example of how a well could become contaminated by different land uses and activities.

for the Ashmere lake Nominee Trust as well as numerous residences.

**Key issues include:**

1. **Non-conforming activities within Zone I**
2. **Transportation corridor**
3. **Residential land use**

The overall ranking of susceptibility to contamination for the Ashmere Water Service supply well is moderate based on the presence of several moderate ranked potentially threatening land uses or activities in the Zone I and IWPA. Please refer any questions about water quality at the facility to the contact person listed in Table 1.

**1. Non-conforming activities within Zone I** – The Zone I is the area immediately surrounding the wellhead where only activities associated with supplying water or other non-threatening activities are allowed. The water supplier does not own or control the entire Zone I area. Systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. The Zone I extends across a public road and includes residential homes.

**Zone I Recommendations:**

- V Control access to the wellhead areas with sanitary seals and secure facilities.
  - V Consider relocating the well to a more protected area.
  - V Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
  - V Do not use or store pesticides, fertilizers, and control the use household hazardous materials and road salt within the Zone I.
- 2. Residential Land Use** – There are several residences within the Zone I and the IWPA protection areas. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. The municipal sewer serves the area. Common potential sources of contamination include:
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
  - **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
  - **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Residential Land Use Recommendations:**

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- V Do not allow the accumulation of refuse within the protection areas.
- V Prohibit vehicle maintenance and the use of hazardous materials within Zone I.

**3. Transportation corridor** – The well is located on a state highway that is the main route through the area. The greatest threat from the road is debris materials, an accidental spill and or illegal access. Although the well is located within a vault, it is located within 20 feet of the roadway.

**Transportation corridor Recommendations:**

- V Work with the Town to ensure that road runoff is directed where feasible, to an area downgradient away from the well.

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

- ✓ Prepare an Emergency Response Plan that includes coordination among the DEP, the public water supplier, the Town and State Police in the event of an accident near the wellhead.
- ✓ Secure the facilities that the well is in, provide a sanitary seal around the casing to prevent ponding of water and inspect the integrity of the cap and watertight seal regularly

## 4. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. The Department commends the Water Service for previously efforts to protect the source but there is still work needed to fully protect the sources. The Ashmere Water Service should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Monitor and control activities in the Zone I and IWPA areas.
- ✓ Relocate the well if activities cannot be controlled and the water quality is impacted.

### Zone I:

- ✓ Prohibit any new, non-water supply activities from the Zone I.
- ✓ Educate the residents in the area regarding the use BMPs within the Zone I.
- ✓ Continue regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ Redirect road drainage in the Zone I, downgradient and away from the well area.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Protect the well casing from flooding.

### Training and Education:

- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Educate residents, neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal.
- ✓ Keep areas near transformers free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Request that the town develop a Wellhead Protection District and associated bylaws and request that the IWPA for your and other water systems be include in the protection area.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Be sure that the local emergency responders know where your sources are located and notify you in the event of an accident in the vicinity of your well.
- ✓ Supplement the SWAP assessment with additional local information, and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Other Funding Sources:

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government agencies, non-governmental organizations and agricultural facilities through programs listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=equip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Suggest that the town review the fact sheet available online and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

The DEP's Wellhead Protection Grant Program provides funds to assist public water suppliers and their partners in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under this grant program. If funds are available, in the spring, DEP posts a new Request for Response for the grant program (RFR).

These recommendations are only part of your on-going local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

Copies of this report have been forwarded to the water supplier and Town officials.

Well #1	1132009-01G	250	623	Moderate
Well #2	1132009-02G	250	623	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Bisselville Estates wells serve 30 mobile homes and a small, seasonal camping area in the rural town of Hinsdale. This community system is served by on-site septic disposal systems. Both wells are 6-inch diameter bedrock wells and are approximately 100 feet apart. Well #1 is approximately 170 feet deep, with an estimated yield of 16.5 gallons per minute. Well #2 is approximately 182 feet deep, with an estimated yield of 35 gallons per minute. The Zone I and Interim Wellhead Protection Area (IWPA) radii are 250 feet and 623 feet, respectively for each well. These values were assigned based on Title 5 estimated use volumes. The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA.

USGS maps of the area describe the bedrock in the area as gneiss. There is no surficial geology map of the area. There is no record of a confining, protective clay layer in the vicinity of the wells. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The wells serving the facility have no treatment at this time. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the wells and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Nonconforming use in Zone I;**
2. **Low density housing and septic system;**
3. **Above-ground Storage Tanks; and**
4. **Electrical Transformers.**

The overall ranking of susceptibility to contamination for the well is moderate, based on more than one moderate threatening land use or activity in the Zone I and IWPA, as seen in Table 2.

**1. Nonconforming use in Zone I** - The Zone Is for both wells are nonconforming with respect to DEP land use restrictions that allow only water supply related activities in the Zone I. The public water supplier does not own and/or control all land encompassed by the Zone I of the well. An old cemetery owned by the town is in both Zone Is. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Do not conduct any additional activities within the Zone I. Contact MA DEP prior to conducting any activities within Zone I.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Low Density housing	Both wells	Both wells	Moderate	Refer to septic system brochure
Roadways	Both wells	Both wells	Moderate	Prohibit parking along road
Electrical Transformers	Both wells	Both wells	Moderate	Request information regarding PCB in MODF change from your electric company
Cemetery	Both wells	Both wells	Moderate	Last interment in late 1920's
Above-Ground Storage Tanks	No	Both wells	Moderate	Upgrade old tanks, maintain existing tanks, and encourage conversion to propane

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

- ✓ Prepare an emergency response plan for responding to an accidental release.
- ✓ Consider raising the wellhead for well #2, as it is located below grade. Secure both wells with watertight sanitary caps, and seal any cracks in the floor.

**2. Low Density Housing --** The Zone Is contain one residence with associated parking, garage, Route 8, and the access road into the park. The IWPA contains the septic system leach field for the entire facility, campsites, and a camping trailer septic pump-out station. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste. Another potential threat from residential users is mismanagement of household waste.

### Recommendations:

- ✓ Provide residents with information about proper maintenance and disposal practices for septic systems. Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.
- ✓ Monitor roadside for spills and leaks.
- ✓ Encourage residents to utilize local household hazardous waste collection days.
- ✓ Supply residents with information about BMPs for household hazardous waste management and lawn care.

**3. Above-ground Storage Tanks (ASTs) --** A kerosene AST for heat and hot water is located within the IWPA at the shower house just outside of the Zone I. This tank is used only during the summer seasonal camping and is therefore only filled approximately 25% of capacity. If managed improperly, ASTs can be a potential source of contamination due to leaks or spills of the chemicals they store.

### Recommendations:

- ✓ Ideally, ASTs in the IWPA should be located in a covered, impermeable containment capable of retaining 110% of the liquid volume, should a spill occur.
- ✓ Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices. Any modifications to the AST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs.
- ✓ At a minimum, all ASTs older than 15 years old should be replaced and mounted on a concrete pad. They should be maintained with paint.
- ✓ Encourage converting to propane. Provide an incentive, if possible.

**4. Electrical Transformer –** Electrical transformers contain Mineral Oil Dielectric Fluids (MODF). Although the use of PCBs is banned in new transformers, historically, PCBs were used in some transformers.

### Recommendations:

- ✓ Contact the local utility to determine if the transformers contain PCBs. If PCBs are present, urge their immediate replacement.
- ✓ Keep the area near the transformers free of tree limbs that could endanger the transformer in a storm.

Other activities found during the inspection of the protection areas included hay fields in the IWPA. If the landowner spreads manure or fertilizer on the hayfields or if they switch to other crop harvesting, request that they utilize Best Management Practices for their agricultural practices which include nutrient management. Be sure that they are aware that your facility is a public water supply. If they do not already

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

have a farm plan, refer them to the Natural Resource Conservation Service. Alternatively, they may follow a plan developed through the publication *On Farm Strategies to Protect Water Quality: An Assessment and Planning Tool for Best Management Practices*. Information on funding and other resources for agricultural management is available through the Massachusetts Department of Food and Agriculture at (617) 626-1700 or <http://www.massdfa.org/bureaus.htm>

Storage of small amounts of oil and gasoline in the garage for lawn maintenance equipment was also noted during the visit. Provide containment for these items to prevent accidents and leaks within the Zone Is. If possible, store these items outside of the Zone I areas. There is an old cemetery within the Zone Is that has been closed to new interring for over 70 years. Arsenic was used as a preservative during embalming prior to 1910. Although arsenic is a highly toxic heavy metal and may pose a threat to your water supply, there was no arsenic reported in Bisselville Estates' 1999 analytical report.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Bisselville Estates should review and adopt the key recommendations above and the following:

#### Priority Recommendations:

- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Raise wellheads above grade and secure the wellhead by sanitary wellcaps and seal all cracks in the floor.

#### Zone I:

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ As feasible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Prohibit public access to the well and pumphouse by locking facilities, gating roads, and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any above ground tanks for leaks, etc.
- ✓ If the facility intends to continue utilizing the structures in the Zone I, use BMPs and restrict activities that could pose a threat to the water supply.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.
- ✓ Redirect driveway and parking lot drainage in the Zone I away from well.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Upgrade to propane or natural gas for back-up power sources.

#### Training and Education:

- ✓ Educate staff, residents and tenants about proper hazardous material use, storage, disposal, emergency response, and best management practices.
- ✓ Post drinking water protection area signs at key visibility locations, such as the entrance to the facility.

#### Facilities Management:

- ✓ Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices. Establish maintenance requirements for ASTs.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.

- ✓ Protective collars around wellheads should slope away from well and casings should extend above ground.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.
- ✓ The facility is currently not registered as a generator of hazardous waste or waste oil. Review enclosed document "A Summary of Requirements for Small Quantity Generators of Hazardous Waste" to determine your status and regulatory requirements, if applicable.

### **Planning:**

- ✓ Work with local officials in Hinsdale to include the Bisselville Estate IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Agricultural:**

- ✓ Encourage farmers in the IWPA to seek assistance from the Natural Resource Conservation Service (NRCS) in addressing manure management issues as appropriate.

### **Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response for the Grant program (RFR). On or about May 1 the new RFR is available and the application is due back on or about June 31. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Ashmere Lake Nominee Trust

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
November 7, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road de-icing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Ashmere Lake Nominee Trust (ALNT) is a two building apartment complex, located on the shore of Ashmere Lake in the town of Hinsdale, a small, rural, hilltown community in western Massachusetts. The facility is located immediately north of State Route 143. Although there is both a municipal water and sewer system in Hinsdale, only the municipal sewer serves this section of town. Therefore, ALNT is served by one water supply well and wastewater is disposed through the municipal sewer system. The buildings house twelve and five apartments, respectively; the system also serves a single family home. The system is served by a single 6-inch diameter, 575-foot deep, bedrock well located approximately 25 feet from the road.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The Zone I is the protection area immediately surrounding the wellhead, while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii, based on the daily pumped volume from the well, are 182 feet and 478 feet, respectively. Please refer to the attached map of the Zone I and IWPA.

Well #1 is located in an area of relatively thin overburden material of till. The bedrock is mapped as the Washington Gneiss, rusty weathering schist with layers of blue-quartz conglomerate and dacite. Although the well has approximately 270 feet of casing, there is no record or evidence of a confining, protective layer such as thick till or clay, in the vicinity of the well. Wells located in this type of geologic setting are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

For information on current water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The protection areas for Well #1 (01G) include Route 143, the five-unit apartment building of the ALNT complex as well as three residences south of Route 143. The remainder of the complex and numerous homes are within the IWPA of the well.

### Key issues include:

1. **Non-conforming activities within Zone I**
2. **Transportation corridor**
3. **Residential land use**

The overall ranking of susceptibility to contamination for the ALNT supply well (01G) is moderate based on the presence of several moderate ranked potentially threatening land uses or activities in the Zone I and IWPA. Please refer any questions about water quality at the facility to the contact person listed in Table 1.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridor	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells.
High density residential	No	Yes	Moderate	Supply BMPs to residents. Manage the property to prevent refuse disposal, parking and hazardous materials and conditions to exist within the Zone I.
Municipal Sewer	Yes	Yes	Low	Notify the Town if leaks are apparent.

\* -For more information, see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

Figure 1: Example of how a well could become contaminated by different land uses and activities.

**1. Non-conforming activities within Zone I** – The Zone I is the area immediately surrounding the wellhead where only activities associated with supplying water or other non-threatening activities are allowed. The water supplier does not own or control the entire Zone I area. Systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. The Zone I extends across a public road and includes residences.

**Zone I Recommendations:**

- ✓ Continue to control access to the wellhead area.
- ✓ Consider relocating the well to a more protected area.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

**2. Residential Land Use** – There are several residences within the Zone I and the IWPA protection areas. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. The municipal sewer serves the area. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Do not allow the accumulation of refuse within the protection areas under your control.
- ✓ Prohibit vehicle maintenance and the use of hazardous materials within Zone I.

**3. Transportation corridor** – The well is located on a state highway that is the main route through the area. The greatest threat from the road is deicing materials, an accidental spill and or illegal access. Although the well is located within a small structure, it is located within 25 feet of the roadway.

**Transportation corridor Recommendations:**

- ✓ Work with the Town to ensure that road runoff is directed where feasible, to an area downgradient and away from the well.
- ✓ Prepare an Emergency Response Plan that includes coordination between the DEP, the public water supplier, the Town and State Police in the event of an accident near the wellhead.
- ✓ Secure the facilities that the well is in, provide a sanitary seal around the casing to prevent ponding of water and inspect the integrity of the cap and watertight seal regularly.

**4. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

and minimize its susceptibility to contamination. The Ashmere Lake Nominee Trust should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Monitor activities in the Zone I and IWPA areas.
- ✓ Relocate the well if activities cannot be controlled and the water quality is impacted.

### Zone I:

- ✓ Prohibit any new, non-water supply activities from the Zone I.
- ✓ Use BMPs within the Zone I.
- ✓ Continue regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ Redirect road drainage in the Zone I away from the well area.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Protect the well from flooding.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Educate residents, neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal and septic system maintenance.
- ✓ Keep areas near transformers free of tree limbs that could endanger the transformer in a storm.
- ✓ Manage the property appropriately to prevent hazardous materials and conditions from existing near the well.

### Planning:

- ✓ Request that the town develop a Wellhead Protection District and associated bylaws and request that the IWPA for your and other water systems be include in the protection area.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Supplement the SWAP assessment with additional local information, and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Other Funding Sources:

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government agencies, non-governmental organizations and agricultural facilities through programs listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Suggest that the town review the fact sheet available online and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

The DEP's Wellhead Protection Grant Program provides funds to assist public water suppliers and their partners in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under this grant program. If funds are available, in the spring, DEP posts a new Request for Response for the grant program (RFR).

These recommendations are only part of your on-going local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

Copies of this report have been forwarded to the water supplier and Town officials.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Holyoke Water Works**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

### Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Section 1: Description of the Water System

### What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

### Glossary Protection Zones

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

### System Susceptibility:

*Moderate*

### Source Name:

### Source ID

### Susceptibility:

McLean Reservoir	1137000-03S	Moderate
Manhan Reservoir	1137000-05S	Moderate

Holyoke Water Works maintains two active reservoirs for their drinking water supply. The Manhan Reservoir (1137000-05S) also known as the Tighe-Carmody reservoir, supplies approximately 95% of the City's water demand. The McLean Reservoir (1137000-03S) provides the balance of the water needs for the Water Works. The Holyoke Water Works maintains a waiver from filtration for both the McLean and Manhan Reservoirs. The Ashley, Whiting and White Reservoirs and the Coronet and Pequot Wells are maintained by the City as Emergency Sources of water. Emergency Sources will not be further assessed in this report.

The watershed for Holyoke Water Works' Manhan Reservoir is located in the Berkshire foothills towns of Southampton, Westhampton, Huntington and Montgomery. The White Reservoir was the main reservoir prior to the construction of the larger, Manhan Reservoir located downstream of the White Reservoir. Presently, the White Reservoir is essentially a flow through reservoir with the dam gates left open. The watershed has steeply sloping hillsides and broader stream valleys. The overburden material consists of till on the dominant uplands and glacially derived stratified drift deposits or recent stream (alluvium) deposits of sand and gravel in the narrow valleys. The bedrock in the watershed is predominantly metamorphosed sedimentary and volcanic rocks of the Waits River Formation and the Goshen Formation with mapped intrusions of the Williamsburg Granodiorite. The structural geology of the eastern part of the Berkshire Massif is described as a complex series of folds and faults. The watershed is 92% forest with the remaining land use residential and agricultural. The Water Works owns approximately 52% of the watershed and another 4% is protected through Town, state ownership or conservation restrictions.

The watershed for the in-town, McLean Reservoir is located entirely in Holyoke along the ridgeline of the Holyoke Range. The topography is steep or sloping with exposed bedrock or thin till covering the bedrock throughout the watershed. The bedrock is composed of the columnar, Holyoke Basalt. The watershed is approximately 99% forest or water while the remaining land area is open land, wetland, residential use or transportation corridor. The Holyoke Water Works owns approximately 73% of the McLean Reservoir watershed. Please refer to the attached map to view the boundaries of the protective zones.

The water from the reservoirs is disinfected with chlorine and chloramines, fluoride is added and the water is treated for corrosion control prior to distribution. For current information on monitoring results and treatment, please refer questions to the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

There are few activities that pose significant anthropogenic threats to the reservoirs. However, due to the nature of surface water supplies, the sources are considered highly vulnerable to potential contamination. The Holyoke Water Works' active reservoirs are reasonably well protected, in part, because of the remote location and the proactive measures taken by the Water Works, such as ownership or protection of nearly 56%. The overall ranking of susceptibility is moderate based on the presence of at least one moderate threat land use activity in the watershed. Land uses and activities that are considered potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Activities in Zone A
2. Residential land use
3. Transportation corridors (legal and illegal)
4. Forestry/Watershed Management
5. Protection Planning
6. Utility Line Right-of-Way

**1. Activities in Zone A** - The Zone As for the reservoirs includes all areas within 400 feet of the reservoirs and within 200 feet of either side of all streams that flow into the reservoirs. Land use activities within a Zone A may have an impact on surface water sources. Wild animals, farm animals and domestic pets can be carriers of waterborne diseases such as Giardia, Cryptosporidium, Salmonella, etc., while stormwater run off from roadways can carry other contaminants. There is beaver activity and there are local roads, Route 202, a small parking area, a few residential areas with non-commercial agricultural activities and part of the treatment facility within the Zone A of the system's reservoirs.

### Zone A Recommendations:

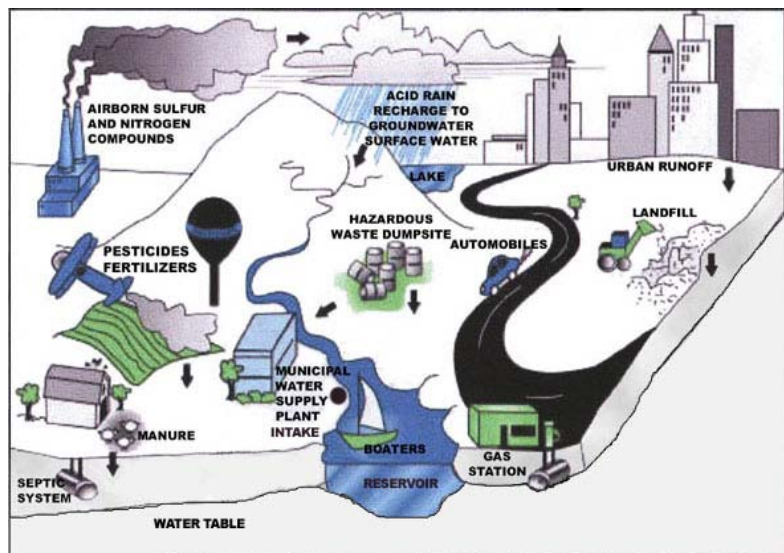

- ✓ Continue to monitor and protect the Zone As. Prohibit new activities from the Zone As.
  - ✓ Continue to monitor activities at the treatment facility to protect the Zone A especially activities associated with chemicals and wastewater at the facility.
  - ✓ Maintain the current practice of wildlife management in the reservoirs and Zone As.
  - ✓ Follow the watershed protection plan for prioritizing land within the Zone As and acquire and/or protect the land as prescribed in the plan. Consider alternatives to fee simple purchase such as Memorandum of Understanding, Right of First Refusal, and Conservation Restrictions.
- 2. Residential land use** – Approximately 70 acres of the Manhan Reservoir watershed consists of residential land uses and approximately 1.0 acre in the McLean Reservoir watershed. Municipal sewers are not available in either watershed, therefore on-site septic systems are used. If managed improperly, activities associated with

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

MODIFIED FROM © 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

Figure 1: Sample watershed with examples of potential sources of contamination

residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they may be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and surface waters. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.
- **Agricultural activities** – Even non-commercial agricultural activities can pose a potential threat to surface water supplies. The improper management of manure from farm animals and horses may result in contamination of feeder streams.

#### Residential Land Use Recommendations:

- ✓ Continue implementation of the Watershed Resource Protection Plan (WRPP) by providing information to residents regarding best management practices (BMPs) for protecting water supplies. Utilize the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Copies of this report and the technical assistance documents will be forwarded to the Board of Health and Planning Board in the communities within which your water supply protection areas are located. Continue your ongoing efforts to encourage those boards to adopt protection controls in their communities and to provide fact sheets to residents as appropriate.
- ✓ Continue your current practice of reviewing development proposals in the communities that your watershed protection areas are located within and through that process, comment on proposed projects as appropriate, to protect the public water supply. Refer the appropriate boards to the MA DEP website at the following address for information on manure management, pesticide and fertilizer BMPs and other aspects of water supply protection <http://www.state.ma.us/dep/brp/dws/protect.htm>, as applicable.
- ✓ Local Boards of Health and Conservation Commissions should make available to hobby farmers, information about protecting their

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### Source Protection Decreases Risk

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watersheds**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Areas

Land Uses	Quantity	Threat	Source	Potential Contaminant Sources*
<b>Residential</b>				
Fuel Oil Storage (at residences)	Few	M	03S, 05S	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Few	M	03S, 05S	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Few	M	03S, 05S	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>				
Aquatic Wildlife	Actively managed	M	All	Microbial and organic contaminants
Domestic Animals/ non-commercial farming	Several	M	05S	Microbial and organic contaminants from manure, possibly pesticides, petroleum products
Clandestine Dumping	Historical	M	05S	Debris containing hazardous materials or wastes
Stormwater Drains/ Retention Basins	Numerous	L	03S, 05S	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transmission Line Right-of-Way	1	L	03S	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors including trails (legal and illegal)	Numerous	M	All	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling. Erosion and illegal access to water.
<b>Notes:</b> <ol style="list-style-type: none"> <li>When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.</li> <li>For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.</li> <li>For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/ or Hazardous Material Sites.</li> </ol> <p>* <b>THREAT RANKING</b> - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.</p>				

own wells and the public water supply by encouraging the use of BMPs. Board members and land owners should refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for resources.

**2. Transportation Corridors** – There are many local roads located throughout the watersheds of the reservoirs, including many that are dirt roads. A section of State Route 202 runs through the Zone A of the McLean Reservoir. The storm drains along Route 202 through the McLean Reservoir watershed reportedly discharge outside of the watershed. Though most roadways throughout the Manhan Reservoir watershed are low-use, due to the close proximity of some of the roads to the reservoir and Zone A, even typical roadway maintenance and use pose a potentially significant source of contamination from accidents and washouts along the dirt road. De-icing materials, petroleum chemicals, and other debris on roads within the watershed, are picked up by stormwater, discharged into brooks and streams and ultimately into the reservoirs.

There are numerous unpaved, ways as well as legal (authorized) and illegal (unauthorized) trails throughout the watersheds. Most of these roads and trails are not maintained at all or are minimally maintained. The resulting erosion poses a significant threat to water quality in areas that are proximal to feeder streams and the reservoirs, potentially resulting in additional water treatment costs if they continue unchecked. Uncontrolled erosion contributes sediment, various contaminants and pathogens into the contributing waters and reservoirs. Access to the reservoirs was observed and anecdotal information indicates evidence of recreating near the reservoirs and throughout the watersheds. Unmanaged access may result in vandalism, illegal dumping and access to the reservoir resulting in water quality impairment.

The Holyoke Water Works has adopted an aggressive watershed inspection and patrol program as part of the watershed protection. Patrols by the Water Works staff and the local police have notably decreased the number of trespassers in the watershed.

#### **Transportation Corridor Recommendations:**

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

- ✓ As stipulated in the WRPP, continue to inspect stormwater drainage along the local roads and trails in the watershed. As proposed, consider various strategies to detain/slow the flow, redirect runoff out of the watershed or retain/detain sediments from roads within the watershed. If any significant stormwater threats are identified within the watersheds located outside of Holyoke, the Water Works should foster a relationship with the communities to evaluate and mediate those erosion threats. Consider coordinating efforts for work and cost sharing with the local communities on issues potentially impacting the reservoirs.
- ✓ If your on-going work identifies specific trails, roads or ways as sources of erosion or trespassing, continue to evaluate all options for access management. This may include investigating the legal disposition of all roads, ways and “trails” to facilitate efforts to control access in the watershed. Options may include continuing full access, where it may be feasible, closing roads to all traffic, closing roads to all commercial traffic and limiting access only to residents with a locked gate and key for residents only.
- ✓ Continue the aggressive patrols of watershed land and enforce existing policies for no trespassing or limited access on city-owned land.
- ✓ Continue to inspect, maintain, and clean catchbasins or BMPs on a regular schedule as stipulated in the WRPP.
- ✓ Continue to inspect and evaluate existing conditions throughout the watershed

#### **Top 5 Reasons to Develop a Local Surface Water Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

with respect to current illegal use of watershed land, specifically by ATVs. Determine where access is being gained and what are the destination points and, as noted previously, determine status of the access ways to assist in your strategy to eliminate and/or control access. Other utilities have reported some success in controlling access by increasing no trespassing signage at identified access points and periodically impounding the vehicles of trespassers.

- ✓ Continue working with local emergency response teams to ensure effective management of potential spills.
- ✓ Communities within your watershed may be eligible for USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.rurdev.usda.gov](http://www.rurdev.usda.gov) or call the Rural Development Manager at the local office in Hadley at 413-585-1000. Board members from rural communities should review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the NRCS office in Amherst 413-253-4350 for assistance and for information. Erosion control is a goal identified in the WRPP; these sources of funding may be able to provide funding for mitigation of stormwater issues to protect the Holyoke Water Works resource.

**3. Forestry/Watershed Management** – The Holyoke Water Work’s WRPP includes a proposal to update the forest management plan as the current plan is outdated. The Water Works Superintendent recently reported that they will be updating and implementing the plan. Logging in a forest without a well-designed plan may result in poor water quality and an unhealthy forest. However, with the use of a properly designed watershed forest management plan and the enforced use of BMPs, forest management may enhance the water production and quality of the raw water. Higher quality raw water can result in reduced treatment cost. Unmanaged forests may result in an even aged forest that is susceptible to fires and disease. Aquatic wildlife such as birds, beavers or muskrats, are currently being managed in the watershed on an as needed basis.

**Forestry/Watershed Management Recommendations:**

- ✓ As discussed in the WRPP, prepare a water supply forest management plan and include in the plan, an evaluation of existing conditions, a forest inventory and forest management plan specifically designed for water supply management. Require the use of BMPs and/or minimize forest roads that may exacerbate public access issues.
- ✓ Continue to implement the WRPP through regular watershed inspections and enforcement of policies. As necessary, exploring aggressive enforcement efforts such as impoundment of off road vehicles and issuance of citations for violators to control the use of ATVs.

**4. Protection Planning** – The Watershed Resource Protection Plan has been updated and the Water Works maintains a waiver from filtration for the Manhan and McLean Reservoirs. These types of protection plans coordinate community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public education and outreach. Currently, the host communities of Westhampton and Huntington do have some protective bylaws in place. However, Southampton and Montgomery do not have Watershed Protection Districts or Bylaws. As noted, the Water Works owns approximately greater than 50% of the watersheds so that they are partially “protected.”

Protection planning should include minimizing the potential threat to the groundwater at the Water Works unused well sites. Those sources, although unused by the Water Works could pose a potential liability and hazard unless managed

properly and the Water Works should continue current efforts to inspect and ensure the well sites are secure.

**Protection Planning Recommendations:**

- ✓ Continue to implement the watershed protection plan and update the plan as necessary. Watershed access, forest management and roads/dirt roads maintenance should be addressed, especially at brook crossings and proximal to the reservoirs. Establish a protection team, and utilize <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP’s guidance, “Developing a Local Watershed Protection Plan” on ways to include local officials.
- ✓ Encourage local officials to compare local watershed protection controls with current MA Watershed Protection Regulations 310 CMR 22.21(2) and to adopt controls that comply with 310 CMR 22.21(2) if they do not. For more information on DEP land use controls, see <http://mass.gov/dep/brp/dws/protect.htm>.

**For More Information**

Contact Catherine V. Skiba in DEP’s Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, town boards, and the local media.

- ✓ Water suppliers already have established a protocol to be made aware of major developments and projects proposed for communities within which the watershed is located. As development pressures increase in hilltown communities, small, residential developments may also increase. When locals boards notify the Water Works of projects in the watershed, continue your current practice of reviewing and commenting on those plans as appropriate.
- ✓ Continue to implement the land acquisition strategies set forth in the WRPP and consider alternative, less costly strategies to a fee simple purchase of land. Consider negotiating a Memorandum of Understanding, Right of First Refusal agreement or purchasing conservation restrictions for land not currently owned by the Water Works.
  - A Memorandum of Understanding (MOU) is an agreement between the landowner and public water supplier in which the landowner agrees not to engage in specific threatening activities. The MOU should be specific to the land use or activity. For example, if the land is residential with a septic system the owner could agree not to place chemicals, petroleum products, or other hazardous or toxic substances, including septic system cleaners, into the septic system, and agree that the system will be pumped at a specific frequency. Understanding how an activity threatens drinking water quality is an important component of developing an effective MOU. An MOU should be recorded on the property deed.
  - A Right of First Refusal is a legal document that gives the water supplier the first chance to purchase land when it becomes available. See Right of First Refusal in the Appendices.
  - Purchasing the development rights on land is equivalent to paying to apply Conservation Restrictions or Easements. This option allows the land owner to retain ownership of the land but limit usage on some of the land. This is a legal document that can be executed in various forms.

**5. Utility Line Right-of-Way** – A natural gas line runs through the McLean Reservoir watershed. Normal maintenance of a right-of-way can introduce contaminants to a water supply through herbicide application for vegetation control. The over-application or improper handling of herbicides on a right-of-way is a potential source of contamination. Leaks or spills of chemicals used for maintenance of the line are also potential sources of contamination to the water supply.

**Right of Way Recommendations:**

- ✓ Review the right-of-way Yearly Operating Plan (YOP) from the utility company to ensure it has accurate information regarding the locations of the Zone A and that only mechanical methods are used for vegetation control. If the utility has not provided the Water Works with a copy of the YOP, they may have sent it to the Holyoke Conservation Commission. Review, or request that the Conservation Commission review the maps the utility uses for accuracy. If the maps are not accurate, provide them with maps from your records. The Water Works should only need to do this one time and it may be accomplished by sending a copy of the watershed map to the utility. It is the responsibility of the utility to comply with regulations governing vegetation control in rights-of-way.

Land uses and activities within the watershed that are potential sources of contamination are included in Table 2. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system's watershed contains potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Preparing and implementing a Watershed Resource Protection Plan.
- Actively pursuing watershed protection throughout hiring staff to conduct inspections, control wildlife activities and enforce watershed rules.
- Previous efforts to purchase and protect watershed land critical to protection of the reservoir.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Continue to implement the WRPP and update the plan as milestones are achieved or changes occur in the watershed.
- ✓ Continue to implement the land acquisition and protection strategy as outlined in the WRPP. Consider alternate strategies to fee simple land purchase to protect critical land near the reservoirs and feeder streams.
- ✓ Continue inspection of the protection areas regularly, and when feasible, remove any non-water supply activities.
- ✓ Continue efforts to control access to the watersheds, through patrols, public education and controlling watershed access points.
- ✓ Continue the education of residents on ways they can help you to protect drinking water sources.
- ✓ Work with landowners in your protection areas to make them aware of your water supply and to encourage the use of best management practices for residential and recreational uses.
- ✓ Encourage the communities of Westhampton, Southampton, Huntington and Montgomery to adopt water supply protection bylaws/regulations, to provide information to residents regarding the use of BMPs and to encourage residents to participate in local household hazardous waste collection days.
- ✓ Develop and implement a Forest Management Plan for water supply protection.
- ✓ Review stormwater management and access management on ways closest to the reservoirs and feeder streams.

### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection efforts. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. Grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office (Hadley 413-585-1000) of the NRCS for assistance.

The Massachusetts Department of Food and Agriculture's Agricultural Environmental Enhancement Program (AEEP) provides funding to farmers to install a variety of water quality protection practices. For more information on the program contact the coordinator, Susan Phinney, at (617) 626-1772, [Susan.Phinney@state.ma.us](mailto:Susan.Phinney@state.ma.us).

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the watershed. Use this information to set priorities, target inspections, focus education efforts, and to update your long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone A?	<b>YES</b>	Follow Best Management Practices (BMPs) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone A posted with “Public Drinking Water Supply” Signs?	<b>NO</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone A regularly inspected?	<b>YES</b>	Continue inspections of drinking water protection areas. Increase frequency when possible. Investigate access controls.
Are water supply related activities the only activities within the Zone A?	<b>YES</b>	Continue monitoring non-water supply activities in Zone A and throughout watershed.
<b>Municipal Controls (Zoning Bylaws, Health Regulations, and General Bylaws)</b>		
Does the municipality have Surface Water Protection Controls that meet 310 CMR 22.20 C?	<b>YES</b>	Holyoke has protective ordinances and erosion control ordinances.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>NO</b>	Request that Planning Boards, Boards of Health and/or Conservation Commissions consider adopting protection controls within the watershed. Consider providing examples of Holyoke’s Erosion Control Ordinance to communities.
<b>Planning</b>		
Does the PWS have a local Surface Water Protection Plan?	<b>YES</b>	Review and update the plan as necessary. Continue efforts to establish and update a forest management plan, inspect erosion controls and access issues. Follow “Developing a Local Surface Water Protection Plan” available at: <a href="http://www.state.ma.us/dep/brp/dws">www.state.ma.us/dep/brp/dws</a> for guidance on how to include local officials in protection strategy.
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	<b>Partial</b>	Continue working jointly with emergency response teams including fire and police departments, local Boards of Health, and local and state emergency officials. Continue to coordinate emergency response drills with local teams.
Does the municipality have a watershed protection committee?	<b>NO</b>	Consider establishing a committee and include representatives from citizens’ groups, neighboring communities, and the business community as is appropriate to assist in protection of the watershed land.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>N/A</b>	
Does the PWS provide watershed protection education?	<b>YES</b>	Continue providing education at schools and include boards of communities within the watershed.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for

## Huntington Water Department

### What is SWAP?

The Source Water Assessment Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Huntington Water Department
<i>PWS Address</i>	Route 20, P.O. Box 301
<i>City/Town</i>	Huntington
<i>PWS ID Number</i>	1143000
<i>Local Contact</i>	Mr. Bernard St. Martin
<i>Phone Number</i>	413-667-8861

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

**System Susceptibility;**

**Susceptibility: High**

Well Names	Source IDs
Well #1	1143000-01G
Well #2	1143000-02G

The Town of Huntington is primarily an agricultural and rural residential community in Western Massachusetts. The Water Department owns and maintains two groundwater supply wells and a reservoir. The reservoir is maintained as an Emergency source only and is not assessed in this report. There are two wells serving the Water Department of Huntington (1143000-01G and 1143000-02G). The source was initially developed in 1930 as a tubular series of six shallow, 2½-inch diameter wells, which were replaced in 1978 with two, 8-inch diameter, gravel developed wells, 50 feet apart and approximately 43-feet and 40-feet deep, respectively. The two wells have a combined, approved withdrawal rate of 300 gpm. The wells are located within the shallow bedrock valley of the West Branch Westfield River, that was filled with glacial and later alluvial sand and gravel. There is no evidence of a confining (protective) clay layer in the vicinity of the well. Wells located in an unconfined aquifer are considered to have a high vulnerability to potential contamination due to the absence of hydrogeologic barriers (i.e. clay) that can prevent contaminant migration into the aquifer from the surface. Each of the wells has a Zone I protective radius of 400 feet. The Zone II recharge area for the wells was delineated as part of the SWAP program utilizing empirical data developed during an extended duration pumping test, analytical modeling and hydrogeologic mapping. The wells are located immediately southeast of the Chester town line and the Zone II is almost entirely in the town of Chester. Please refer to the attached map to view the boundaries of the Zone I and Zone II.

Huntington adds sodium carbonate for pH adjustment and polyphosphate to the water for corrosion control. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The land uses in the Zone II area of Huntington's wells consist primarily of residential and agricultural uses (refer to attached map for details). Land uses and activities that have been identified as issues of concern are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Nonconforming Zone I
2. Residential land uses
3. Transportation corridors
4. Agricultural activities
5. Hazardous waste generator
6. Right of Way: Electric and Railroad

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Non-conforming Zone I** – The Zone I for each well is a 400-foot radius around the wellhead. Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Only water supply activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and contain non water supply activities such as homes and public roads. The Water Department does not own the entire Zone I radius; there are activities such as a railroad track and roads within the Zone I.

#### Zone I Recommendations:

- ✓ To the extent possible, remove all non-water supply activities from the Zone Is to comply with DEP's Zone I requirements and continue to monitor those that cannot be removed.
- ✓ Continue current use of BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Investigate and enter into an agreement of right-of-first refusal for the potential future purchase of the Zone I land or a conservation restriction to control any future activities within the Zone I land as feasible.

**2. Residential Land Uses** – Approximately 6% of the Zone II consists of residential areas. Huntington does not have a public sewer; therefore, all residences are assumed to use septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals

to septic systems is a potential source of contamination to the groundwater because septic systems fail or are not properly maintained they can be a potential source of microbial contamination.

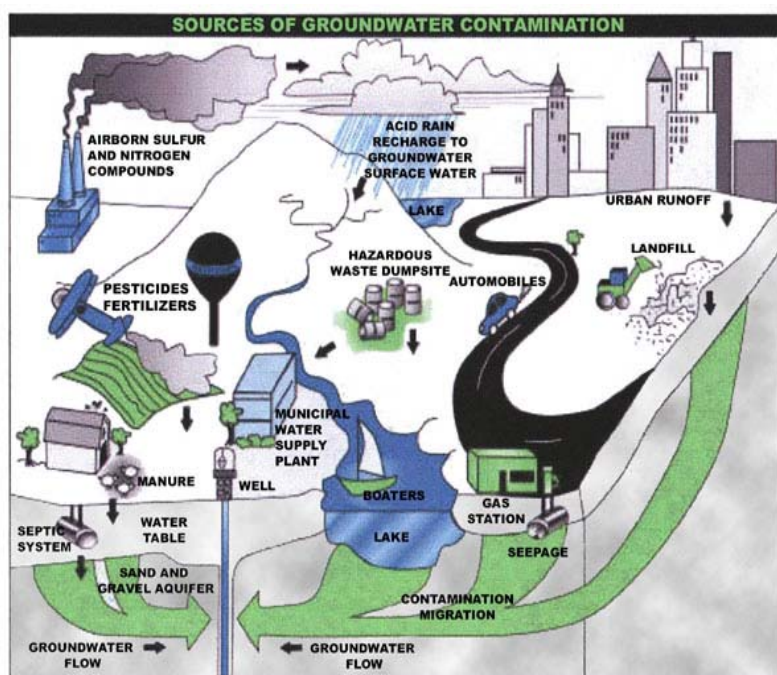

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

© 2000 The Groundwater Foundation. Illustrated by G. Mansfield, The Groundwater Foundation

stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Transportation Corridors** - Local roads are common throughout the Zone II. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash into catch basins.

#### **Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Storm Drain Stenciling Program - Work with local watershed groups to institute a Storm Drain Stenciling Program. For more information on how to develop a storm drain stenciling program go to <http://www.earthwater-stencils.com>
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff. For information on DEP’s Nonpoint

Competitive Grants Program Upcoming Funding Opportunity refer to: <http://www.state.ma.us/dep/brp/mf/mfpubs.htm#wpa>.

- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren’t yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping. For additional information, refer to the Stormwater Management Information at <http://www.state.ma.us/dep/brp/ww/wwpubs.htm#storm>
- ✓ Notify town officials of potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). Review the fact sheet available on line and call the local office (Amherst 413-253-4350) of the

(Continued on page 6)

#### **What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### **For More Information**

Contact Catherine Skiba in DEP’s Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

#### **Source Protection Decreases Risk**

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Activities	Quantity	Zone II	Threat*	Potential Source of Contamination
<b>Agriculture</b>				
Fertilizer Storage or Use	Several	Yes	M	Fertilizers: leaks, spills, improper handling, or over-application
Farm animals (hobby)	1	Yes	M	Manure (microbial contaminants): improper handling
Manure Storage or Spreading	Several	Yes	M	Manure (microbial contaminants): improper handling
Crops	1	Yes	M	Fertilizers, pesticides, and other chemicals: leaks, spills, improper handling, or over-application
Pesticide Storage or Use	Several	Yes	H	Pesticides: leaks, spills, improper handling, or over-application
<b>Miscellaneous</b>				
Railroad Tracks	1	Yes	H	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills
Hazardous Materials Storage (registered—Zone III and unregistered Zone II)	2	Yes	H	Hazardous materials: spills, leaks, or improper handling or storage
Illegal junkyards (Just outside of Zone II)	1	-	-	Debris containing hazardous materials or wastes
<b>Residential</b>				
Fuel Oil Storage (at residences)	Numerous	Yes	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	Yes	M	Pesticides: over-application or improper storage and disposal
Septic Systems	Numerous	Yes	M	Hazardous chemicals: microbial contaminants, and improper disposal

Activities	Quantity	Zone II	Threat*	Potential Source of Contamination
<b>Miscellaneous</b>				
Transmission Line Rights-of-Way	2	Yes	L	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors	Several	Yes	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
<b>Notes:</b> <ol style="list-style-type: none"> <li>1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.</li> <li>2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.</li> <li>3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.</li> </ol> <p>* <b>THREAT RANKING</b> - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.</p>				

NRCS for assistance <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf>.

**4. Agricultural Activities** – Croplands and pasture lands make up 6% of the land uses in the Zone II. There are corn and hayfields in the Zone II, as well as blueberry orchards. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water. There are several agricultural uses in the Zone II. If they are commercial facilities Department of Food and Agriculture and the US Natural Resources Conservation Service can provide technical assistance and potential funding to assist them. If they are hobby farmers, provide them with information available from DEP on BMPs.

**Agricultural Activities Recommendation:**

- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Notify hobby farmers that they are within the Zone II and provide information on BMPs or refer them to the DEP, Farm Bureau or Conservation District for assistance.
- ✓ The USDA has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. Additional information is available on the web site [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Paul D. Geoffroy, Rural Development Manager at the local office in Hadley at 413-585-1000 ex.4.

**5. Hazardous Waste Generator** – Due to their daily operations at some facilities, very small quantities of hazardous waste are generated. Banish Lumber (which is outside of the Zone II but within the Zone III) has appropriate permits, and they contract with a licensed hauler to remove the hazardous waste. Hazardous waste is a potential source of contamination if it is improperly handled or stored. There is however a small business within the Zone II that may be a very small quantity generator of regulated hazardous materials but is not registered.

**Hazardous Waste Generator Recommendation:**

- ✓ Inform businesses of their proximity to the Zone II and encourage businesses to maintain their current good practices to handle hazardous waste in compliance with regulations. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.

- ✓ There is at least one small business located in the Zone II that appears to use and store hazardous materials such as petroleum that is currently not registered as a generator of hazardous waste or waste oil. Request that the Chester Board of Health review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" and visit the facility to help them determine their status and regulatory requirements. Enclosed is a registration form for you to supply to the Board of Health.

**6. Right-of-Ways** – The railroad and an electricity right of way run through the Zone II. Rail corridors that serve passenger and/or freight trains are a potential source of contaminants due to chemicals released during normal use, track maintenance, and accidents. Normal maintenance of any right-of-way can introduce contaminants to a water supply through herbicide application for vegetation control. The over-application or improper handling of herbicides on right-of-ways is a potential source of contamination. Leaks or spills of transported chemicals or train/track maintenance chemicals are also potential sources of contamination to the water supply.

**Railroad Right of Way Recommendations:**

- ✓ Continue your current practice of reviewing the railroad right-of-way Yearly Operating Plan to ensure Best Management Practices are implemented with regard to vegetation control in the Zone II, and that the utility has accurate information regarding the locations of the wells and the protection zones. Review the maps the utilities use.
- ✓ Notify Western Massachusetts Electric Company of the right-of-way within the Zone II of your source. Supply them with accurate maps and request notification from the utility should they resume use of the right-of-way. Review the right-of-way Yearly Operating Plan from the electric company, and request their continued use of Best Management Practices with regard to vegetation control on the right-of-way in the Zone II.
- ✓ Work with your local fire department to review emergency response plans. Updates to this plan should include the railroad right-of-ways including coordination with the owner/operator of the track and trains using the right-of-way. Request emergency response teams to coordinate Emergency

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ➊ Reduces Risk to Human Health
- ➋ Cost Effective! Reduces or Eliminates Costs Associated With:
  - Increased groundwater monitoring and treatment
  - Water supply clean up and remediation
  - Replacing a water supply
  - Purchasing water
- ➌ Supports municipal bylaws, making them less likely to be challenged
- ➍ Ensures clean drinking water supplies for future generations
- ➎ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

Response Drills and practice containment of potential contaminants from train accidents within the Zone II, which should attempt to include representatives from the owner/operator of the trains utilizing the right-of-way.

Other land uses and activities within the Zone II that are potential sources of contamination are included in Table 2. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

**Section 3: Source Water Protection Conclusions and Recommendations**

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce

*(Continued on page 8)*

the risk of actual contamination, as illustrated in Figure 2. The Huntington Water Department is commended for their proactive stance on water supply protection demonstrated by the following:

- Detailed knowledge of activities in the protection areas and active monitoring
- Applying for Wellhead Protection Grants
- Constructing a building to contain hazardous water supply chemicals
- Preparing a Wellhead Protection Plan
- Fencing the wellheads

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Continue educating residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with abutting communities and local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Supply BMPs to land owners that are hobby farmers to control, fertilizer, pesticide and manure management.
- ✓ Make regular updates to the Wellhead Protection Plan.
- ✓ Continue efforts of working with Chester's Town Boards

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. As you are aware, the Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

#### **Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available on line and call the local office (Amherst 413-253-4350) of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf>.

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

#### **Section 4: Appendices**

- A. Protection Recommendations
- B. Registered Facilities within the Protection Area
- C. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	When possible, purchase Zone I lands, pursue conservation restrictions, or otherwise work to keep non-water supply activities out of the Zone Is.
Is the Zone I posted with “Public Drinking Water Supply” Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue monitoring non-water supply activities in Zone Is.
<b>Municipal Controls</b> (Zoning By-laws/Ordinances, Health Regulations, and General By-laws/Ordinances)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>YES</b>	Huntington does have controls that meets DEP’s requirements for wellhead protection.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>NO</b>	Continue working with Chester to prepare and bring to Town Meeting wellhead protection controls through Zoning or Health regulations and include the Huntington Zone II.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>YES</b>	Implement tasks identified in the wellhead protection plan and update the plan as required.
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	<b>YES</b>	Develop a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams in Chester.
Does the municipality have a wellhead protection committee?	<b>YES</b>	Continue with the committee to implement to plan; include representatives from citizens’ groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For more guidance see “Hazardous Materials Management: A Community’s Guide” at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>YES</b>	Aim efforts at residential, commercial, and municipal uses within the Zone II.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
KNIGHTVILLE DAM WATER SYSTEM

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 10, 2004

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Knightville Dam Water System
<i>PWS Address</i>	39 Knightville Dam Road
<i>City/Town</i>	Huntington, Massachusetts
<i>PWS ID Number</i>	1143011

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1143011-01G	165	460	High	Moderate
Well #2	1143011-02G	100	401	High	Moderate
Well #4	1143011-03G	100	413	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1143011-01G)**

Zone I = 165 ft.  
IWPA = 460 ft.

### How was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic leach fields within the Zone Is and the IWPAs of the wells. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and parking areas within the Zone Is and the IWPAs.

This source water assessment report is based on information provided by you on your 1999 Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, Annual Statistical Reports, water quality data and from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- inspect the Zone I and IWPA regularly;
- work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- do not use pesticides, fertilizers or road salt within the Zone I;
- address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
NORWICH LAKE FARM LOWER SYSTEM

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
Revised  
April 20, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	NORWICH LAKE FARM LOWER SYSTEM
<i>PWS Address</i>	87 SEARLE RD
<i>City/Town</i>	HUNTINGTON, MASSACHUSETTS
<i>PWS ID Number</i>	1143013

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1143013-01G	268	693	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1143013-01G)**

Zone I = 268 ft.  
IWPA = 693 ft.

## How Was my Well's Susceptibility Determined?

Well #1's **high** susceptibility to potential microbial threats is based on the presence of septic system components within the IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your 1999 Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
NORWICH LAKE FARM UPPER SYSTEM

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
April 20, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Norwich Lake Farm Upper System
<i>PWS Address</i>	87 Searle Rd
<i>City/Town</i>	Huntington, Massachusetts
<i>PWS ID Number</i>	1143014

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #2	1143014-01G	178	473	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #2  
(1143014-01G)**

Zone I = 268 ft.  
IWPA = 693 ft.

### How Was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I / IWPA. The **high** susceptibility to potential non-microbial threats is based on the agricultural activities within the Zone I and/or the IWPA. Other moderate threats include local roads within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your 1999 Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Lanesborough Fire & Water District**

### What is SWAP?

The Source Water Assessment Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i><b>PWS Name</b></i>	Lanesborough Fire & Water District
<i><b>PWS Address</b></i>	Bridge Street, P.O. Box 1504
<i><b>City/Town</b></i>	Lanesborough
<i><b>PWS ID Number</b></i>	1148000
<i><b>Local Contact</b></i>	Mr. Theodore Nylic
<i><b>Phone Number</b></i>	(413) 499-5916

### Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

## Section 1: Description of the Water System

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

### System Susceptibility

**High**

**Zone II #: 476**

**Susceptibility: High**

Well Names	Source IDs
GP Well #1 Bridge Street	1148000-01G
Well #2 Town Brook (Miner Road ) Well	1148000-02G

The town of Lanesborough is a small, rural community in northwestern Massachusetts. Lanesborough was settled in the mid-1700's and developed into a small industrial and agricultural community in the 1800's. The Town is bordered on the east by part of the Hoosac Range and on the west by Potter Mountain of the Taconic Range. The ranges meet at the northern end of town through a series of lesser hills at the base of Mt. Greylock. Lanesborough is primarily within the Housatonic River valley with the southeast corner within the Hoosic/Hudson River valley. The town developed primarily in the valley that widens slightly to the south of town toward Pittsfield. Today, Lanesborough is predominantly rural and residential with the main development along Route 7. The Lanesborough Fire & Water District (the District) maintains two active water supply wells GP Well #1 Bridge Street Well (01G) and Well #2 (02G) Town Brook (Miner Road) Well.

Well #1 is a 12 x 18-inch diameter, gravel packed well, 52 feet deep installed in 1954 and is used as a back-up or supplemental source. Well #2, used as the main supply, is an 18 x 24-inch diameter, gravel packed well, approximately 57 feet deep installed in 1964. In 1997, Well #2 was rehabilitated due to a deteriorating screen and pump; a new 12-inch diameter screen was inserted in the original 18-inch screen with gravel installed between the new 12-inch and the original 18-inch screen. Wells #1 and #2 are located within the same, relatively narrow, unconfined, sand and gravel aquifer, along the Town Brook valley, west of Route 7. Since they are located within the same hydrogeologic regime, they also share the same Zone II contribution area, although Well #2 is located 4,600 feet downgradient from Well #1. The Town Brook aquifer is a semi-confined, (leaky-confined) sand and gravel aquifer.

The Town Brook aquifer is a glacially deepened, bedrock valley that was filled in with sand and gravel deposited during the recession (melting) of the glaciers some 12-18,000 years ago. Streams and rivers have reworked and eroded the glacial deposits and recent streams have deposited additional alluvial material. Boring logs, seismic data and maps of the valley area indicate fine to coarse sand and gravel deposits approximately 50 to 60 feet deep and in some areas up to 70 feet in depth. These deeper areas within the valley may be due to karst sinkholes in the bedrock. Boring log and seismic data indicate the silt and clay confining layer is discontinuous along the edges of the southern reaches of the valley and pinches out, even in the center of the valley north of Miner Road just south of Putnam Road. Therefore, the aquifer responds as a confined aquifer at Well #2 initially, but over time, the area of contribution, expands to the unconfined portion of the recharge area. Well #1 (Bridge Road Well) is in an unconfined portion of the aquifer with no protective clay layer. The clay layer was deposited during the glacial recession when a dam was formed blocking the melt water flow and causing the formation of a temporary lake; the clay layer represents the

lake bottom sediments. Eventually the dam was breached and the lake drained. The effect of this hydrogeologic regime is that although the aquifer may be protected from some land uses immediately adjacent to the confining clay layer, the aquifer is vulnerable to contamination from activities conducted in the unconfined portions of the recharge area.

The bedrock in the area is a complex series of folded and faulted metamorphic rocks predominantly Berkshire schist in the highland and carbonate rocks of the Stockbridge group and quartzite in the valley floor and valley walls. A northerly plunging anticline lies beneath the valley floor. The Kitchen Brook dolomite is mapped along the southern portion of the valley at Well #1 and the Claredon Springs dolomite is mapped in the vicinity of Well #2; the Bascom formation dolomite is mapped north of the Claredon Springs formation. There is also a high angle reverse fault trending NNE/SSW along the western edge of the valley. It is speculated that the bedrock aquifer, as well as the overburden (water table) aquifer, may contribute considerable recharge to the aquifer under pumping conditions.

Each well has a Zone I protective radius of 400 feet immediately around the wellhead. The Zone II was delineated through the SWAP program by consultants for the Department utilizing geologic mapping and analytical modeling. Data for the analysis were gathered from extended duration pumping tests, boring logs and previous studies. The aquifer is considered to be highly vulnerable to contamination from activities conducted on the ground surface due to the absence or discontinuous nature of the hydrogeologic barriers (i.e. clay) that can prevent contaminant migration from activities on the land surface. Please refer to the attached map to view the boundaries of the Zone II.

The water is not currently treated but there is a stand-by chlorinator available if the need should arise to disinfect the water. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

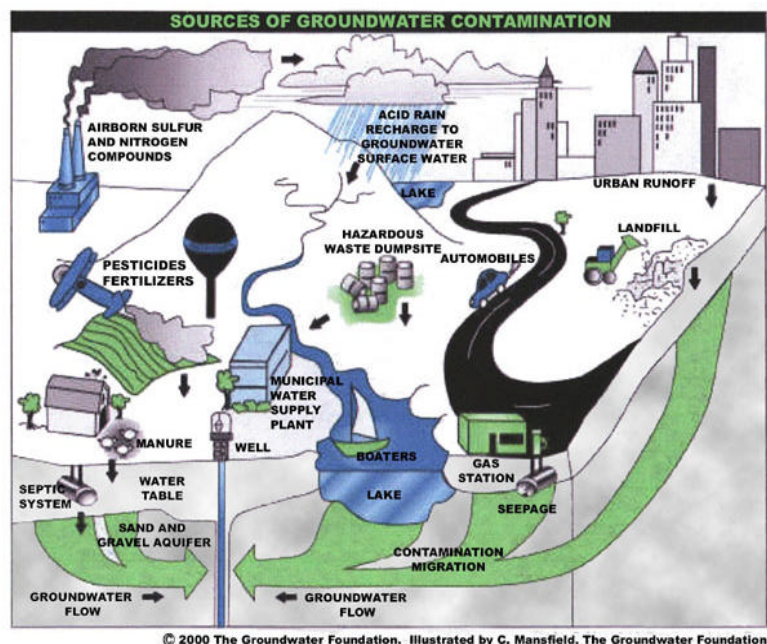

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

## Section 2: Land Uses in the Protection Areas

The land use within the Zone II of the Lanesborough Fire & Water District wells is a mixture of open land, wetland, forest, cropland, and residential, with a small portion of commercial land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Non-conforming Zone I
2. Residential land uses
3. Hazardous materials storage and use

4. Transportation corridors
5. Agricultural activities
6. Confirmed hazardous waste release sites
7. Comprehensive wellhead protection planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Non-conforming Zone Is** – The Zone I for each of the wells is a 400 foot radius around the wellhead. Currently, the Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction, Memorandum of Understanding or other legal mechanism as approved by the DEP. The public water supplier does not own or control the entire Zone I for either of the wells. Only activities directly related to the water supply, or other non-threatening activities, as determined by the DEP, are allowed in the Zone I. Transportation corridors, and a portion of a farm are within the Zone Is. Numerous water sources were developed prior to the 400-foot Zone I requirement and are therefore grandfathered. The Department encourages grandfathered systems to acquire ownership or control of the Zone I. Activities within Zone Is are as follows:

**Well #1 Bridge Street Well (01G):** The District office, the District's garage, the tight tank for the bathroom and portions of a residential yard are all located within the Zone I of Well #1. The access road is not paved and there are floor drains in the garage that discharge to the ground. Vehicles, equipment and supplies, including small quantities of hazardous materials are stored in the garage. Although small quantities of hazardous materials (petroleum products) are stored in the garage, according to the District, there is no regular maintenance conducted on the vehicles at the garage. Hazardous materials that are improperly stored, used, or disposed, become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain or allowed to spill directly to the ground. Floor drains located in areas that have the potential for hazardous materials to discharge to the ground are illegal. The DEP has required the District to address the floor drains and DEP recommends that the District develop a plan for hazardous materials handling for all equipment and materials that will remain in the garage. Vehicle washing is a restricted activity under the UIC regulations. Review the attached fact sheet for additional information about vehicle washing activities.

**Well #2 Miner Road Well (02G):** Miner Road is located within the Zone I of the source. The District applied for and was awarded a source water protection grant to fund the installation of a sedimentation basin and other Best Management Practices (BMPs) as part of a road improvement project conducted during 2001.

#### **Zone I Recommendations:**

- ✓ Remove all petroleum/hazardous products from the Zone I. Any products required to be on-site should be stored in containment and handled with extreme care and a management and spill control plan should be prepared.
- ✓ Address the floor drains in the garage in accordance with DEP requirements. Floor drains must either be seal in accordance with DEP regulations and procedures or connected to the tight tank. Inspect the garage floor to prevent accidental release to the ground and have emergency response and spill cleanup materials on hand.
- ✓ As part of the long term planning for the District, consider the feasibility of relocating the District garage.
- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Continue your current efforts to purchase land and/or negotiate a conservation restriction for land

#### **What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### **Source Protection Decreases Risk**

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Areas

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Agriculture</b>			
Fertilizer/Pesticide Storage or Use	2	M/H	Fertilizers: leaks, spills, improper handling, or over-application
Livestock Operations (non-commercial)	5	M	Manure (microbial contaminants): improper handling
<b>Residential</b>			
Fuel Oil Storage (residential)	Numerous	M/H	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Commercial</b>			
Gasoline Station	1	H	Materials stored in tanks: spills, leaks, or improper handling
Cemetery	1	M	Lawn fertilizers/pesticides, embalming
Service station/body shop	2	H	Hazardous materials: spills, leaks, or improper handling
Highway maintenance depot	1	M	Hazardous materials: spills, leaks, or improper handling
<b>Miscellaneous</b>			
Underground Storage Tanks	5 confirmed	H	Releases of products, spills, overfills
Transportation Corridors	Numerous	M	Corridor maintenance with pesticides, stormwater runoff, accidental release of hazardous materials
Confirmed Hazardous Waste/Oil Release Sites	2	**	RTN 1-12693, 1-000789, (1-0000106—RAO)
Stormwater Drains/ Retention Basins	Numerous	L	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Aboveground storage tanks	1	M	Spills, accidental release

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Miscellaneous</b>			
Furniture Stripping	1	H	Solvents: spills, leaks, or improper handling
Very Small Quantity Generators	2	L	Stored materials: spills, leaks, or improper handling
Transformers	Several	L	MODF and possibly PCBs: spills, leaks, or improper handling. Contact the electric company to ensure no PCBs are within the transformers.

**Table 2 Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the protection areas may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

within the Zone I.

- ✓ Agreement Options - Until land is available for acquisition or restriction, attempt to obtain a Memorandum of Understanding and Right of First Refusal.

- A Memorandum of Understanding (MOU) is an agreement between the landowner and public water supplier in which the landowner agrees not to engage in specific threatening activities. The MOU should be specific to the land use or activity. For example, if the land is residential with a septic system, the owner could agree to not place chemicals, petroleum products, or other hazardous or toxic substances, including septic system cleaners, into the septic system, and agree that the system will be pumped at a specific frequency. As another example, the portions of fields within the Zone I would not have manure, fertilizers

or pesticides spread on them. Understanding how an activity threatens drinking water quality is an important component of developing an effective MOU.

- A Right of First Refusal is a legal document that gives the water supplier the first chance to purchase land when it becomes available. Please refer to the example of the Right of First Refusal documents attached in the Appendices.

The Department recommends that the Water Department establishing a program for planning to acquire ownership or control of property within the areas critical to protecting water quality. If there is no other reasonable method to secure rights and protect these sources, the District may wish to consider taking necessary water supply land by eminent domain to protect the sources. This recommendation is not only for the existing sources but also should be considered for future development of sources if they are needed.

**2. Residential Land Uses** – Approximately 19% of the Zone II land use consists of residential areas. The Zone II area is not connected to municipal sewer and therefore utilize on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Inventory the Zone II for residential USTs and outdoor ASTs. Encourage homeowners to provide containment for ASTs and remove USTs. Consider ways to partner with homeowners to encourage UST removal if you find that there are any residential USTs within the protection areas.

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

#### **Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ➊ Reduces Risk to Human Health
- ➋ Cost Effective! Reduces or Eliminates Costs Associated With:
  - Increased groundwater monitoring and treatment
  - Water supply clean up and remediation
  - Replacing a water supply
  - Purchasing water
- ➌ Supports municipal bylaws, making them less likely to be challenged
- ➍ Ensures clean drinking water supplies for future generations
- ➎ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

**3. Hazardous Materials Storage and Use** – Six percent of the land area within the Zone II is commercial land use. The District garage is located within the Zone I of the Bridge Street Well and small quantities of hazardous materials are stored in the garage, in containment. A gasoline station, the Fire Department, Police Department and Highway Department and several businesses that handle hazardous waste or materials are located within the Zone II. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. As you are keenly aware, hazardous materials that are improperly stored, used, or disposed, become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain or allowed to spill directly to the ground. As noted in Item 1.—vehicle washing is a restricted activity under the UIC regulations. Review the attached fact sheet for additional information about vehicle washing activities.

#### **Hazardous Materials Storage and Use Recommendations:**

- ✓ All hazardous materials should be removed from the garage and any that must remain should be stored in containment and used with caution to prevent an accidental release.
- ✓ Coordinate with the Fire Department to inventory all USTs and ASTs in the Zone II and Zone III areas. Consider developing a strategy to minimize the risk from hazardous materials stored in the protection areas. This may include a

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

hazardous materials use and storage regulation in town and cost sharing for the removal of USTs.

✓ Continue current efforts to educate and work with local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.

✓ Work with local businesses to ensure that the District is included in their emergency response plans for notification of any release that may impact the groundwater or surface water of the Town Brook. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.

✓ Educate and assist the community on promulgation of a hazardous materials handling and floordrain regulation and inspection program. Refer to the brochures regarding “Industrial Floor Drains” and Hazardous Waste Handling for more information.

**4. Transportation Corridors** - State highways and local roads are common throughout the Zone II. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other

potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash into catchbasins. The final stormwater mitigation design on Miner Road was an improvement at that location.

#### **Transportation Corridors and Stormwater Recommendations:**

- ✓ Identify stormwater drains and the drainage system along all transportation corridors. Wherever possible, ensure that storm drain systems discharge stormwater outside of the Zone II. If storm drainage maps are available, review the maps with emergency response teams. If maps aren’t yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping. Request that the MA Highway Department provide a copy of the storm drain plans for Rt. 7 to the local emergency response team.
- ✓ Contact the Town and State to ensure catchbasins are inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ Communicate with the Highway Department regarding all maintenance and stormwater improvements within the Zone I of the Miner Road well.
- ✓ Actively participate in and communicate with the Lanesborough Highway Department and the State Highway Department to ensure the use and maintenance of BMPs to protect the aquifer. Ensure that the state and local highway departments know the Zone II boundary to assist them in the proper design of BMPs.

**5. Agricultural Activities** – There are several farms (hobby, hay and crops) and agricultural activities (haying and non-commercial animals) throughout the Zone II. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water supplies. In addition, farms and large commercial facilities often conduct their own maintenance on their equipment and have storage of hazardous materials and waste. There are several non-commercial (hobby) farms within the Zone II and Zone III areas.

#### **Agricultural Activities Recommendation:**

- ✓ If appropriate, work with the Department to negotiate a Conservation Restriction or Memorandum of Understanding for activities on farm land.
- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS in Pittsfield at (413) 443-6867 ext. 3 for assistance.

- ✓ Encourage farmers and property managers to incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Promote the use of BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.
- ✓ Work with farmers, and include nurseries to ensure that pesticides and fertilizers are being stored within a structure designed to prevent runoff. Farmers should be aware that state and federal regulations govern the use of pesticides in Zone II.
- ✓ The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS for assistance.
- ✓ Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs especially with regard to manure management. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

**6. Presence of Oil or Hazardous Material Contamination Sites** – The Zone II contains DEP Tier Classified Oil and/or Hazardous Material Release Sites indicated on the map as Release Tracking Numbers 1-0012693 and 1-0000789. Refer to the attached map and Appendix B for more information. A Release Action Outcome statement (RAO) indicating the site has been remediated was recently submitted for the site 1-0000106. Another site, 1-0012693, is been classified as a default Tier 1B site with the owner having established financial inability to remediate the site. The DEP has conducted some state funded clean-up actions at the site but additional work is required. Please refer questions to the Bureau of Waste Site Cleanup at the Springfield Regional Office of the DEP at (413) 784-1100.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Continue to participate in the monitoring of progress and commenting on the ongoing remedial action conducted at the confirmed release sites.

**7. Comprehensive Wellhead Protection Planning** – Currently, the Town of Lanesborough has water supply protection controls. However, they do not meet the minimum requirements of the Department's Wellhead Protection regulations 310 CMR 22.21(2). The Zone II report detailed recommendations for modifying the bylaws to be in compliance with 310 CMR 22.21(2). A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells.

Activities within the Zone III may also pose a potential threat to the water supply. Specifically, under pumping conditions Town Brook contributes water to the aquifer. If stormwater, farm runoff or other accidental releases occur to the brook, they may pose a threat to water quality. This report does not include facilities located within the Zone III except the gasoline station. Please inventory activities along Rt. 7 to be aware of all potential threats.

**Protection Planning Recommendations:**

- ✓ Inventory facilities within the Zone III and incorporate any potentially high threat facilities into your Emergency Response Action Plan such as the gasoline stations and auto repair facilities that may be just outside of the Zone II or within the Zone III.
- ✓ Consider preparing a Wellhead Protection Plan. Establish a protection team that includes participation from Town officials and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Refer the Planning Board to the recommendations detailed in the Zone II report for modifications to the local bylaws and regulations. Coordinate efforts with local officials to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21(2) to adopt controls that meet requirements of that regulation. For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>. The Department can assist you in these efforts.

- ✓ Local controls do not regulate floordrains; request that the Board of Health adopt floordrain controls and hazardous materials handling regulations.

Other land uses and activities within the Zone II are listed in Table 2. Refer to Table 2 and Appendix 2 for more information about these land uses.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### Section 3: Source Water Protection Conclusions and Recommendations

#### Current Land Uses and Source Protection:

As with many water supply protection areas, the system Zone II contains potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Proactively pursuing funding to improve stormwater controls in the Zone I,
- Working with the Planning Board to adopt protective zoning bylaws to the town. Please continue that effort by requesting that the Planning Board adopt the recommendations included in the SWAP Zone II report and this report.

#### Source Protection Recommendations:

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities; remove all hazardous materials from the Zone I.
- ✓ Continue monitoring the hazardous release sites in and adjacent to the Zone II.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Continue working with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Consider inventorying USTs within the Zone II and Zone III.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Develop and implement a Wellhead Protection Plan.

#### Conclusions:

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant

Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. If funds are available each spring DEP posts a new Request for Response for the grant program (RFR).

#### For More Information

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source

protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the protection areas. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

#### **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Areas
- C. Confirmed Hazardous Materials/Oil Release Sites
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Continue working with land owners to negotiate a Conservation Restriction, Memorandum of Understanding and other forms of protection. Work with the DPW when they are proposing work in the Zone I.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Prohibit other land uses within the Zone Is. Address the issues at the District garage related to the floor drains, hazardous materials handling and storage, and vehicle parking. Continue working with land owners to negotiate a Conservation Restriction and other forms of protection.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>PARTIAL</b>	Modify protection measures as appropriate to fully comply with regulation.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>N/A</b>	
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Prepare a plan following "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment the plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> Work with neighboring communities to adopt floor drain regulations and work with industries to protect water supplies.
Does the PWS provide wellhead protection education?	<b>YES</b>	Aim additional efforts at commercial, industrial and municipal uses within the Zone II and, as appropriate, Zone III.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
THE BROOK PUB & GRILL

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 10, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	The Brook Pub & Grill
<b>PWS Address</b>	55 Williamstown Rd
<b>City/Town</b>	Lanesborough, Massachusetts
<b>PWS ID Number</b>	1148010

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well #1	1148010-01G	126	433	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1148010-01G)**

Zone I = 126 ft.  
IWPA = 433 ft.

## How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The system disinfects the water prior to distribution. The **moderate** susceptibility to potential non-microbial threats is based on the parking and local roads within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Berkshire Spring**

### What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Berkshire Spring
<i>PWS Address</i>	Summer Street
<i>City/Town</i>	Lanesborough
<i>PWS ID Number</i>	1148015
<i>Local Contact</i>	John Olander
<i>Phone Number</i>	(413) 442-1167

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate Best Management Practices (BMPs) and drinking water source protection measures.

Refer to Section 3 for recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses in the Protection Areas
3. Protection Recommendations
4. Attachments

## Section 1: Description of the Water System

**Zone II #: 595**

**Susceptibility:** Moderate

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

Well Names	Source ID
Spring #1	1148015-01G

Berkshire Spring is a spring located on Summer Street in the town of Lanesborough, a rural, small town in Berkshire County. Berkshire Spring receives its water from one (groundwater) spring source. The source supplies water to the general public through a free flowing tap located along the side of the road, to several private homes north of Summer Street and to the public water system Berkshire Village Cooperative (1148001). Berkshire Village Cooperative water system supplies water to 32 residences, one business and two churches. Spring #1 is located south of Summer Street, approximately 300 feet west of the intersection with Old State Road in Lanesborough, Massachusetts.

The source is a spring vault located at the base of a hill with some evidence of thin sand and gravel deposits overlying bedrock noted in nearby outcrops. The USGS, as part of the SWAP program, delineated the Zone II area of contribution to the spring and identified the contributing source as the dolomite bedrock. The Zone I is the area immediately surrounding the source. Spring #1 has a Zone I area that is square shaped with each side measuring 800 feet in length and oriented in the direction of groundwater flow. The Zone II area extends south along a bedrock ridge. Flow from the source is estimated to be greater than 50 gallons per minute. The spring is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers (i.e. clay). Although there is evidence of some overburden, there are also numerous bedrock exposures in the Zone II area. Please refer to the attached map to view the boundaries of the Zone I and Zone II areas.

Currently the water does not receive treatment. For current information on water quality monitoring results, customers of Berkshire Spring should contact the Public Water System contact person listed above in Table 1. However, customers of Berkshire Village Cooperative, which receives its water from Berkshire Spring, should instead contact Mary Jane Dilego at (413) 499-0455 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data are also available on the web at <http://www.epa.gov/safewater/ccr1.html>.

### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

## Section 2: Land Uses in the Protection Areas

The land uses for the Zone II for Berkshire Spring are predominantly residential, with some commercial uses, including portions of the Berkshire Mall. Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the attached Table of Regulated Facilities.

### Key Land Uses and Protection Issues include:

1. Non-conforming Zone I
2. Photo Processing Lab
3. Automobile Repair and Maintenance Shop
4. Residential Land Uses
5. Protection Planning

The overall ranking of susceptibility to contamination for the system is moderate, based on the presence of at least one moderate threat land use within the water supply protection areas, as shown in Table 2.

**1. Non-conforming Zone I** – The Zone I for Spring #1 is square shaped with each side length measuring 800 feet. Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction and allows only water supply related or other non-threatening activities in the Zone I. Many public water supplies were developed prior to the Department's regulations and contain non water supply activities. The following non- water supply activities occur within the Zone I:

**Zone I Activities:** The Zone I contains portions of Summer Street and Old State Road, and private residences.

**Zone I Recommendations:**

- ✓ To the extent possible, limit access to the Zone I area.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.

**2. Photo Processing Lab** – The photo processor at this location is registered through the Environmental Results Program as a photo processor and additionally as a small quantity generator of hazardous waste. The Environmental Results Program (ERP) streamlines existing pollution control requirements for photo processing facilities by replacing individual water pollution control and hazardous waste recycling permits with a minimum statewide silver discharge limit; monitoring; and simplified operating and maintenance rules. Most automated photo processing equipment produces silver-bearing waste.

**Recommendation:**

- ✓ The photo processor should review its Environmental Results Program (ERP) certification and the *Photo Processor Environmental Certification Workbook* for photo processors that covers DEP's industrial wastewater management, and hazardous waste management requirements for photo processing operations. The workbook explains the standards, and provides tips on how to comply. Some facilities may be subject to additional state, federal or local environmental standards that are not covered by the ERP compliance certification. The photo processor must still comply with these requirements, even though they are not included as part of the ERP certification.

**3. Auto Repair and Maintenance Shop**– An automobile repair/maintenance shop is located within the Zone II. If handled improperly, leaks and spills of automotive fluids and cleaning solvents can potentially contaminate the water supply.

**Recommendations:**

- ✓ Educate the neighboring auto repair shop about the location of the well and Zone II.
- ✓ Encourage the shop to use BMPs for the storage, handling, and disposal of all hazardous chemicals.
- ✓ If the auto body facility has floor drains, ensure that the floor drains lead to a tight tank or municipal sewer as required by the plumbing code and

## Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

**4. Residential Land Uses** – None of the residential land uses in the protection areas have public sewers available. Therefore, all discharge wastewater through on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed

improperly, Underground and Aboveground Storage Tanks (UST and AST) and their associated fuel lines, can be potential sources of contamination due to leaks or spills of the fuel oil they store.

- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix C and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

### For More Information

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

### Source Protection Decreases Risk

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix A: Regulated Facilities within the Water Supply Protection Areas

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Commercial</b>			
Photo Processors	1	Moderate	Photographic chemicals: spills, leaks, or improper handling and storage.
Automobile Repair Shops	1	Moderate	Automotive fluids and solvents: spills, leaks, or improper handling and storage.
<b>Residential</b>			
Fuel Oil Storage	Numerous	Moderate	Fuel oil: spills, leaks, or improper handling.
Lawn Care	Numerous	Moderate	Pesticides: over-application or improper storage and disposal.
Septic Systems	Numerous	Moderate	Hazardous chemicals and microbial contaminants: improper disposal.
<b>Miscellaneous</b>			
Stormwater Drains/Retention Basins	Few	Low	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns.
Small Quantity Hazardous Waste Generator	2	Moderate	Hazardous materials and waste oils: spills, leaks, or improper handling or storage.
Utility Substation Transformer	1	Low	Chemicals and other materials including PCBs: spills, leaks, or improper handling.
Wastewater Treatment Plant	1	Moderate	Treatment chemicals or equipment maintenance materials: improper handling or storage; wastewater: improper management.
<b>Notes:</b> <ol style="list-style-type: none"> <li>When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.</li> <li>For more information on regulated facilities, refer to Appendix A: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.</li> <li>For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix B: Tier Classified Oil and/or Hazardous Material Sites.</li> </ol> <p>* <b>THREAT RANKING</b> - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.</p>			

(Continued from page 4)

- ✓ Promote BMPs for stormwater management and pollution controls. Visit DEP's web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.
- ✓ Supply BMPs to home owners for fuel storage.

**5. Protection Planning** – Currently, the Town does have water supply protection controls, however they do not meet DEP's Wellhead Protection regulations 310 CMR 22.21(2). Additionally, the protection area only covers the Zone II for the Lanesborough Fire District wells. Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells.

**Recommendations:**

- ✓ Request that the town include the protection areas in the Town Water Supply Protection District.

In addition to the land uses discussed above there are also Small Quantity and Very Small Quantity Generators of Hazardous Waste and/or Waste Oil, a utility substation transformer, a wastewater treatment plant, and stormwater drains located within the Zone II. Most of these activities are associated with the Berkshire Mall that is located in the extreme upstream edge of the Zone II. Implementing the following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Berkshire Spring should review and adopt the key recommendations above and the following:

- ✓ Educate residents within the Zone II on ways they can help you to protect the drinking water source, including regular inspection and maintenance of their septic systems.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Contact the electric utility to determine if PCBs have been replaced in any transformers that are identified within the Zone II. If PCBs are present, urge their immediate replacement. Keep the area near any transformer free of tree limbs that could endanger the transformer in a storm.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under that program. For additional information, please refer to DEP's web site. Other funding opportunities are described in *Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation* at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>. Berkshire Spring should use this SWAP report to encourage discussion of local drinking water protection measures.

#### Top 5 Reasons to Develop a Local Wellhead Protection Plan

- ➊ Reduces Risk to Human Health
- ➋ Cost Effective! Reduces or Eliminates Costs Associated With:
  - Increased groundwater monitoring and treatment
  - Water supply clean up and remediation
  - Replacing a water supply
  - Purchasing water
- ➌ Supports municipal bylaws, making them less likely to be challenged
- ➍ Ensures clean drinking water supplies for future generations
- ➎ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
HIDDEN VALLEY CAMPGROUND

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 3, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	Hidden Valley Campground
<b>PWS Address</b>	15 Scott Rd.
<b>City/Town</b>	Lanesborough, Massachusetts
<b>PWS ID Number</b>	1148016

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well #1	1148016-01G	226	554	High	Moderate
Well #2	1148016-02G	167	462	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1148016-01G)**

Zone I = 226 ft.  
IWPA = 554 ft.

### How was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic leach fields within the IWPA of Well #2 and system components in the Zone Is of both wells. The **moderate** susceptibility to potential non-microbial threats for Well #1 is based on the vehicle parking within the Zone I and the IWPA, and for Well #2 is based on the parking and local roads within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your 1999 Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, Sanitary Survey, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- 3 inspect the Zone I and IWPA regularly;
- 3 work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- 3 restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- 3 make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- 3 remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- 3 do not use pesticides, fertilizers or road salt within the Zone I;
- 3 address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- 3 water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/den/hrn/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Lee Water Department**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Lee Water Department
<i>PWS Address</i>	32 Main Street
<i>City/Town</i>	Lee
<i>PWS ID Number</i>	1150000
<i>Local Contact</i>	Mr. Kenneth LaBier
<i>Phone Number</i>	413-243-5526

### Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential contaminant sources, including stormwater runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

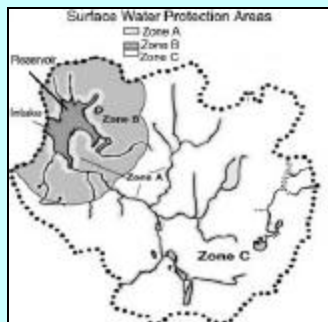

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

## Glossary Protection Zones

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

## Section 1: Description of the Water System

### System Susceptibility:

*Moderate*

### Source Name

### Source ID

### Susceptibility

Leahey Reservoir	1150000-01S	Moderate
Vanetti Reservoir	1150000-02S	Moderate
Schoolhouse Reservoir	1150000-03S	Moderate

Lee is a small, rural industrial and residential community located in the Housatonic River valley in southwestern Massachusetts. Lee was incorporated in the late 1700s starting as an agricultural community. Industrial development commenced with the textile industry and expanded to include marble quarrying and the mainstay industry of paper manufacturing. The developed portions of town are along the Housatonic River valley with the valley bounded on the west by the Taconic Range and on the east by the Berkshire Massif. The reservoirs are located in East Lee and the town of Washington.

Lee Water Department maintains three water supply reservoirs: Leahey Reservoir (01G), Vanetti Reservoir (02G) and Schoolhouse Reservoir (03G). Schoolhouse Reservoir was developed to supplement the Lee and Lenox water supplies with Lee having rights to 51% of the available yield. The Water Department also maintains the Vanetti Reservoir (02G) as an inactive source and has rights to water from October Mountain Lake (04G) as an emergency source of water. The DEP has previously incorrectly referred to 04G as Washington Mountain Lake but has corrected all of its records. The emergency source of water will not be assessed in this report.

The Leahey and Vanetti Reservoirs are located in East Lee; the watersheds extend into Washington. The Schoolhouse Reservoir and its watershed are located on October Mountain in the town of Washington. The topography of the watersheds is steep sloped valleys. The overburden material within the watersheds is predominantly a thin cover of glacial till, often referred to as hard pan, with significant areas of exposed bedrock; the brook valleys have limited deposits of recent alluvium and swamp deposits. The bedrock in the watershed is mapped as several formations consisting of metamorphic rocks and intrusive rocks of the Berkshire Massif (paragneiss, metavolcanics and orthogneiss). The structural geology of the region is highly complex with several stages of folding, faulting and significant structural movement. The watershed is located within an area of highly folded and faulted rocks. In fact, the major faults in the immediate area are identified as the Upper Reservoir and October Mountain faults.

One hundred percent (100%) of the Leahey and Schoolhouse Reservoirs' watersheds are protected from development through ownership by the water supplier or as state owned park land. Seventy-six percent (76%) of the Vanetti Reservoir watershed is owned by the Lee Water Department with the remainder of the watershed privately held forest. According to the Water Department, the landowner is proposing to conduct forest cutting at some time in the future. Nearly 100% of all of the watersheds are forest, water or wetlands. The land use map identifies an industrial land use within the Vanetti Reservoir watershed. The

facility identified is the Lee Water Department Water Treatment Plant. The water treatment plant is connected to the sewer and is located partially within and partially outside of the inactive Vanetti Reservoir watershed. Please refer to the attached map to view the boundaries of the protective areas.

Water from all of the reservoirs is treated through a Krofta filtration system, a dissolved air flotation filtration system, then chlorinated for disinfection and pH adjusted with soda ash for corrosion control. For current information on water quality monitoring results and treatment processes, please refer questions for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

There are few activities that pose significant anthropogenic threats to the reservoirs. However, due to the nature of surface water supplies the sources are considered highly vulnerable to potential contamination threats. Land uses and activities that are considered potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Activities in Zone A
2. Transportation/recreation corridors
3. Water Treatment Facility
4. Forestry and protection planning

The overall ranking of susceptibility to contamination for the system is moderate, based on the presence of at a least one moderate threat land use within the water supply protection areas, as seen in Table 2.

**1. Activities in Zone A** - The Zone A for a reservoir includes all areas within 400 feet of the reservoir shoreline and within 200 feet of either side of all streams and feeder ponds that flow into the reservoir. The Zone A is the area closest to the reservoir and its tributaries. Therefore, land uses within the Zone A are of particular concern. Activities that could potentially threaten water quality if improperly managed are restricted by 310 CMR 22.20B. Activities that store, use, or dispose of hazardous materials can be potential sources of contamination if improperly managed. Wild animals, farm animals and domestic pets can be carriers of waterborne diseases such as *Giardia*, *Cryptosporidium*, *Salmonella*, etc. It is reported that beavers periodically populate the watersheds.

There are numerous unpaved ways as well as legal (authorized) and illegal (unauthorized) trails throughout the watersheds. Most of these roads and trails are not maintained at all or are minimally maintained. The most active area is within October Mountain State Forest

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

Figure 1: Sample watershed with examples of potential sources of contamination

along Lenox Whitney Place Road, County Road, Schoolhouse Road extension and Schoolhouse Trail. Some of these areas are remote from the reservoirs while others are immediately adjacent to the Schoolhouse Reservoir and/or cross feeder brooks. The Schoolhouse Trail and County Road converge near Schoolhouse Reservoir where there is an open area actively utilized by all terrain vehicles (ATVs). Reportedly there is no activity on the face of the dam. Uncontrolled access may result in erosion that poses a significant threat to water quality in areas that are proximal to feeder streams and the reservoirs, potentially resulting in additional water treatment costs if they continue unchecked. Uncontrolled erosion contributes sediment, various contaminants and pathogens into the contributing waters and reservoirs. Access to the reservoirs was observed and anecdotal information indicates evidence of camping near the reservoirs and throughout the watersheds. Unmanaged access may result in vandalism, illegal dumping and access to the reservoir resulting in water quality impairment.

#### **Transportation/recreation Corridor Recommendations:**

- ✓ Consider preparing a watershed management plan to address stormwater management and erosion control on town-owned property and throughout the watershed. Include an inventory of the existing conditions within the watershed and determined numerous areas of uncontrolled access and erosion problems. Specifically, review all activities adjacent to the Schoolhouse Reservoir. Address public access and ATV use at the reservoir with respect to access to Zone A, protection of the infrastructure and erosion into the reservoir from activities near the reservoir.
- ✓ Investigate disposition of all roads, ways and "trails".
- ✓ Increase patrols of watershed land and enforce no trespassing.
- ✓ Evaluate all options for management of access to ways. Include evaluation of continuing current practice of full access, closing roads to all traffic, closing road to all commercial traffic and limiting access only to residents with a locked gate and key for residents only. Communicate with Selectmen or the State (for old county roads) regarding abandonment, control and other access issues for town roads.
- ✓ Evaluate stormwater drainage along the few local roads in the watershed. Consider various strategies to detain/slow the flow, redirect runoff out of the watershed or retain/detain sediments from roads within the watershed. Since these roads are in neighboring communities, the Water Department should foster a relationship with the communities to evaluate and mediate stormwater threats identified within the watershed. Coordinate efforts for work and cost sharing with the Town of Washington as appropriate.
- ✓ Evaluate existing conditions throughout the watershed with respect to current illegal use of watershed land. Determine where illegal access is being gained and what are the destination points. Develop a strategy and management plan to eliminate or control access. Coordinate with the communities for management strategies.
- ✓ Coordinate with local emergency response teams to ensure effective management of

#### **What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watersheds**

Activities	Quantity	Threat*	Source ID	Potential Source of Contamination
<b>Agricultural</b>				
Forestry Operations	Few	M	01S	Leaks and spills, improper handling of petroleum products in equipment. Erosion.
Water Treatment Plant	1	M	02S	Fuel oil household hazardous materials: spills, leaks, or improper handling.
Transportation/ recreation corridor (legal/illegal)	Few	M	01S	Petroleum products accidental leaks or spills; illegal access to the reservoir. Potential for erosion and access to Zone A.
Underground Storage tank (fuel oil)	1	M	02S	The tank is double lined with an alarm system. Leaks and spills from breaks and/or overfills are the potential threat.

#### Notes:

- When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
- For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
- For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

- potential spills.
- ✓ Contact MA DCR regarding uncontrolled and advertised access to abutting DCR land to develop an effective strategy to eliminate, control and/or manage access as appropriate through the watershed, especially in areas proximal to the Zone A. Request an access and management plan for all lands within the Schoolhouse Reservoir watershed including BMPs as appropriate.
- ✓ The Department has a policy for responding to beavers that may threaten water quality in a watershed. Please refer to the website for guidance at <http://www.state.ma.us/dep/brp/dws/protect.htm>.
- ✓ Work with local emergency response teams to ensure that any spills within the protection areas can be effectively contained.
- ✓ Inspect roadways to determine if improvements to the road are required to prevent stormwater runoff and erosion to the reservoir. If it is determined that road improvements are necessary, develop a plan and implement improvements. USDA funding may be available for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.rurdev.usda.gov](http://www.rurdev.usda.gov) or call the Rural

Development Manager at the local office in Hadley at 413-585-1000. Alternatively, review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf> or call the NRCS office in Pittsfield 413-443-6867 ext. 3 for assistance.

- ✓ Visit the DEP Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm> for more information on other grants and loans.

**3. Water Treatment Facility** - The Lee Water Treatment Facility is located within the Zone A of the upper reservoir. The facility is served by municipal sewer and drainage from the facility is reportedly directed outside of the watershed. Activities associated with water treatment involve storage and use of hazardous materials such as chlorine, sodium hydroxide and fuel oil for the generator. In fact there is a 4,000 gallon underground storage tank for fuel oil at the facility. The tank is double lined with an alarmed leak detection system. All water treatment chemicals are stored above ground in secondary containment. Stormwater from the facility reportedly discharges outside of the watershed. Spills or leaks of hazardous materials during handling and delivery and stormwater are a potential source of contamination.

**Water Treatment Facility Recommendations:**

- ✓ Ensure that the water treatment facility is operated and maintained according to DEP requirements.
- ✓ Ensure that stormwater drains and the drainage system around the treatment plant do drain outside of the watershed. Maintain stormwater system and catchbasins as necessary.
- ✓ Continue current use of best management practices for proper handling of materials and in containing spills and leaks.
- ✓ Update emergency plans as necessary.

**4. Forestry and Protection Planning** – The Water Department does not have an approved Water Supply Protection Plan (WSPP). The watersheds are primarily woodland and the Water Department owns nearly 100% of the Leahey watershed with the state and private land owners owning the rest of the forest land. Good forest management of watershed land can beneficially impact water quality and health of the watershed forests. Forest management includes recreational activities as well as forest cutting.

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

**Forestry Protection Planning Recommendations:**

- ✓ Establish active watershed protection planning and forest management for water supply protection in a comprehensive watershed plan. Prepare a comprehensive watershed and forest management plan specifically designed for a water supply watershed. Contact DCR to discuss a comprehensive plan that will incorporate active management of recreational activities in the immediate vicinity of the reservoirs and Zone A. Implement the plan and include BMPs for wetlands and stream crossings and in compliance with forestry regulations as appropriate.
- ✓ Encourage and support efforts by private land owners to actively manage forests for water supply protection, as appropriate.
- ✓ Continue to monitor all activities on Town, state and privately held land within the watershed.

Land uses and activities within the watershed that are potential sources of contamination are included in Table 2. Identifying potential sources of contamination is an important initial step toward protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### Section 3: Source Water Protection Conclusions and Recommendations

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system's watershed contains potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water

supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Detailed knowledge of the watershed and active involvement in inspecting and inventorying land uses in the watershed.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Continue inspection of the Zone A protection areas and watershed regularly, and when feasible, remove or manage any non-water supply activities.
- ✓ Continue cooperation and communication with emergency response teams to ensure that they are aware of the boundaries of the watershed for notification of spills or accidents.
- ✓ Through the implementation of the WSPP, provide information to private landowners in your protection areas to make them aware of your water supply and to encourage the use of best management practices for forest management to protect drinking water sources.
- ✓ As part of the stormwater evaluation and mitigation plans, identify problem area specifically in the Zone A along roads/trails throughout the watershed. Make every effort to ensure stormwater discharge and runoff is detained prior to release to protection areas. Consider various strategies to detain/slow the flow and retain sediments to keep the runoff out of the reservoirs. Direct runoff out of the watershed if feasible. Work with the DCR to review their trails, access policies and management of activities that have the potential to impact the reservoirs.
- ✓ Once the forest management plan has been approved, implement the plan to establish/maintain a healthy and ideal watershed forest, which will buffer anthropomorphic and natural environmental impacts on water quality and quantity.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues, above and in Appendix A.

#### **➤ Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the source protection areas are located, what types of land uses and activities pose threats, and how their efforts can enhance protection.

#### **➤ Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS for

### **Top 5 Reasons to Develop a Local Surface Water Protection Plan**

#### **❶ Reduces Risk to Human Health**

#### **❷ Cost Effective! Reduces or Eliminates Costs Associated With:**

- ♦ Increased monitoring and treatment
- ♦ Water supply clean up and remediation
- ♦ Replacing a water supply
- ♦ Purchasing water

#### **❸ Supports municipal bylaws, making them less likely to be challenged**

#### **❹ Ensures clean drinking water supplies for future generations**

#### **❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.**

### **For More Information**

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, town boards, and the local media.

assistance.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help establish local drinking water protection priorities. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the protection areas. Use this information to establish priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

### **A. General Protection Recommendations**

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone A?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Monitor activities in Zone A.
Is the Zone A posted with "Public Drinking Water Supply" or "No Trespassing" signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone A regularly inspected?	<b>YES</b>	Continue regular inspections of drinking water protection areas. Increase patrols as appropriate and develop a plan to control access in critical areas.
Are water supply-related activities the only activities within the Zone A?	<b>YES</b>	Continue monitoring non-water supply activities in Zone As.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, Ordinances and General Bylaws)		
Do the watershed municipalities have Surface Water Protection Controls that meet 310 CMR 22.20C?	<b>NO</b>	The Water Department or state owns nearly the entire watershed. The small portions of the watershed that are privately held are at this time fully developed.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>N/A</b>	
<b>Planning</b>		
Does the PWS have a local surface water supply protection plan?	<b>NO</b>	Prepare a plan to inventory activities and issues related to stormwater management erosion control, access management and forest management.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Update the plan as appropriate by developing a joint emergency response plan with the Fire Department, DCR and local and state emergency officials.
Does the municipality have a watershed protection committee?	<b>NO</b>	Consider establishing a committee that includes representatives from municipal and citizens' groups.
Do the Boards of Health conduct inspections of commercial and industrial activities?	<b>N/A</b>	
Does the PWS provide watershed protection education?	<b>NO</b>	Consider working with DCR to control access to Zone A and areas that have the to potential to impact the reservoir.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
COLD SPRING

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 25, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Cold Spring
<i>PWS Address</i>	Tyringham Rd
<i>City/Town</i>	Lee, Massachusetts
<i>PWS ID Number</i>	1150002

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I (feet)</i>	<i>Zone II</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1 Spring	1150002-01G	682	Refer to the map	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and a Contribution Area or Zone II. The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The Contribution Area is the larger area that is likely to contribute water to the spring. Refer to **Figure 1** on page 2 for an example of a Zone I and Contribution Area.

The Contribution Area of Zone II is the primary recharge area for the aquifer and the spring source. This area was defined by a hydrogeologic study conducted for the MA DEP SWAP program by the USGS. The Zone II was approved by DEP. Refer to the attached map to determine the land within your Zone II.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Contribution Area (Zone II). Please see the enclosed map for your well's Zone I and Zone II areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I IWPA  
EXAMPLE Source Protection  
Area for WELL #1 SPRING  
(1150002-01G)**

Zone I = 681 ft.  
Refer to map for the  
Contribution Area

### What is a Protection Area?

A spring's water supply protection area is the land around the spring where protection activities should be focused. Each spring has a Zone I protective area and a contribution area (Zone II).

### How Was My Well's Susceptibility Determined?

Your spring's **high** susceptibility to potential microbial threats is based on the construction of the source. The **moderate** susceptibility to potential non-microbial threats is based on the local roads within the Zone I.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Lenox DPW Water Division**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i><b>PWS Name</b></i>	Lenox DPW Water Division
<i><b>PWS Address</b></i>	275 Main Street
<i><b>City/Town</b></i>	Lenox
<i><b>PWS ID Number</b></i>	1152000
<i><b>Local Contact</b></i>	Richard Fuore
<i><b>Phone Number</b></i>	413-637-5525

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Section 1: Description of the Water System

### What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

#### Source Name

#### Source ID

#### Susceptibility

Upper Root	1152000-04S	Moderate
Lower Root	1152000-01S	Moderate

Lenox DPW Water Division utilizes two reservoirs for their drinking water sources, and has the capability to purchase water from Pittsfield and Lee. The Root Reservoirs are in the highlands of western Lenox, north of Baldhead peak and hold a combined storage volume of 169 million gallons. The upper reservoir has two perennial feeder brook and one ephemeral brook. The regional geology of the reservoir site is mapped as biotite-rich quartzose schist, locally rich in pyrite; the remainder of the watershed area includes

areas of quartzose schist, rich in chlorite, garnet and interbedded metaquartzite. The overburden is comprised of glacial till. Reservoir Road runs between the two reservoirs: the Upper (1152000-04S) and Lower (1152000-01S) Root Reservoirs. The watershed for Lenox's reservoirs is primarily forested upland (95%) with the remaining 5% of the watershed consisting of transportation corridors, residential and non-commercial agricultural activities such as pasture land. The Water Department owns approximately 90% of the watershed with other conservation agencies such as Audubon owning a few percent of the remaining watershed. Please refer to the attached map to view the boundaries of the protective zones.

Water from the reservoirs flows to a treatment plant where the processes consist of chemical addition, flocculation, dissolved air flotation, and filtration. The water is chlorinated for disinfection prior to distribution. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

There are few activities that pose significant anthropogenic threats to the reservoirs. However, due to the relatively small size of the reservoir and the nature of surface water supplies, the sources are considered highly vulnerable to potential contamination. Land uses and activities that are considered potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Residential land use in Zone A/C
2. Forest/Watershed management
3. Transportation corridors
4. Public Access

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Residential Land Uses** – Approximately 0.6 acres of the Zone A and C consists of residential areas. None of the areas have public sewers, therefore on-site septic systems are used. However, it appears that the septic systems may be outside of the watershed or remote from the reservoir. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to

### Glossary Protection Zones

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Consider negotiating a Right of First refusal agreement or conservation restrictions for land not currently owned by the Town.

**2. Transportation Corridors** - Reservoir Road, a steep and narrow road is located along the base of the upper reservoir and immediately adjacent to the lower reservoir. Though this is a low-use roadway, the close proximity of the Reservoir Road to the reservoirs, typical roadway maintenance and use can pose a potentially significant source of contamination from accidents and washouts along the dirt road. De-icing materials, automotive chemicals

and other debris on roads are picked up by stormwater washed into catch basins and discharge into the reservoirs. The access road to the filtration plant has a drainage system that directs runoff through a swale and outside of the watershed.

#### Transportation Corridor Recommendations:

- ✓ Evaluate all options for management of access to Reservoir Road. Include evaluation of continuing current practice of full access, closing road to all traffic (abandonment of road), closing road to all commercial traffic and limiting access to residents with a locked gate and key for residents only. Richmond must be involved in discussions regarding access control on reservoir Road.
- ✓ Identify stormwater drains and the drainage system along reservoir road and the filtration plant access road. Evaluate tying the drainage system along

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

MODIFIED FROM © 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

Figure 1: Sample watershed with examples of potential sources of contamination

Reservoir Road into the system along the access road to ensure stormwater discharges outside of the protection areas. Alternatively consider various strategies to detain/slow the flow and retain sediments for both the east and west side of Reservoir Road.

- ✓ Inspect, maintain, and clean catch basins on a regular schedule.
- ✓ Work with local emergency response teams to ensure effective management of potential spills. Include Richmond official in discussions regarding access to Reservoir Road.

**3. Forestry/Watershed management** – The majority of the watershed is logged periodically as recommended by the Town's contract forester; all activities are monitored and managed by the forester. However, there is no watershed/forest management plan at this time. There is no evidence of significant aquatic wildlife such as beavers or muskrats in the watershed at this time. The Northeast Rural Water Association (NeRWA) is commencing the preparation of a Watershed Protection Plan for the Lenox DPW Water Division.

- ✓ Include in the watershed protection plan, an evaluation for the need forest inventory and forest management plan specifically designed for watershed management.
- ✓ Evaluate whether there are impacts associated with access and determine what if any, management strategies required for public access to the watershed.
- ✓ Continue to inspect the watershed regularly.
- ✓ Right of way maintenance should be conducted by mechanical means. Supply all utilities and road maintenance crews with detailed maps of the watershed area where they may be conducting maintenance. Meet with the staff in charge of conducting the maintenance and confirm all stream crossings and Zone A areas are accurately mapped.

**4. Public Access** - Although the Water Department does not allow public access to the watershed, there is significant use of the old roads and trails throughout the watershed by hikers, ATV users and mountain bikers. Uncontrolled use can result in erosion, vandalism and refuse problems in the

watershed. One of the main trails is gated to prevent access by 4WD street vehicles.

- ✓ Evaluate the current extent of public access and include measurable negative or positive impacts.
- ✓ Prepare a plan to control those activities that pose a negative impact e.g. erosion, refuse disposal, threat to infrastructure. The recommendations could include increased patrols, physical barriers, public education or enforcement.

Land uses and activities within the Zone C that are potential sources of contamination are included in Table 2. One additional activity that was identified during the assessment was the potential for private airplanes flying over the reservoir. The Pittsfield Airport, located four miles north of the reservoirs results in frequent flyover of the reservoir. Although the airport is not within the watershed, the reservoir is on the takeoff and approach of the airport and experiences private planes flying over the

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### Source Protection Decreases Risk

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

## Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Potential Sources of Contamination*
<b>Residential</b>			
Fuel Oil Storage (at residences)	1	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	1	M	Pesticides: over-application or improper storage and disposal
Septic Systems	1	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Forestry	Throughout	M	Runoff; mismanaged petroleum products; accidental spills, leaks
Aquatic Wildlife	Throughout	L	Microbial contaminants
Transmission Line Rights-of-Way -Type: Telephone	1	L	Corridor maintenance pesticides: over-application or improper handling
Transportation Corridors	1	M	Fuels and other hazardous materials: accidental leaks or spills; uncontrolled access to the reservoir

### Notes:

- When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
- For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
- For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

reservoir. It is recommended that the emergency response teams coordinate with the airport to establish a clear contact and communication in the event of an accident that may occur within the watershed. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### Section 3: Source Water Protection Conclusions and Recommendations

#### Current Land Uses and Source Protection:

Lenox's water supply is fairly well protected by the remoteness of the source and the percentage of land owned by the Town (90%). Additionally, a conservation group owns a significant portion of the remaining land. Although the system's protection areas contain few potential sources of contamination, the proximity of the activity to the water source increases the risk to the water supply. Implementing source protection measures reduces the risk of actual contamination. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Ownership of over 90% of the watershed,
- Actively pursuing funds to prepare a watershed protection plan.

#### Source Protection Recommendations:

To better protect the sources for the future:

- ✓ Inspect the protection areas regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone C and to cooperate on responding to spills

#### Additional Information

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

or accidents.

- ✓ Work with landowners in your protection areas to make them aware of your water supply and to encourage the use of a best management practices for residential and recreational uses.
- ✓ Develop and implement Forest Management Plan for water supply protection.
- ✓ At a minimum, restrict road access to non-commercial vehicles only to minimize risk of hazardous contaminants.
- ✓ Request that the utility supply you directly with their maintenance plan. Provide AT&T an accurate map of the watershed and meet with their representative to ensure they are working with an accurate map.

#### Conclusions:

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to

#### Top 5 Reasons to Develop a Local Surface Water Protection Plan

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water is a place people want to live and businesses want to locate.

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone A?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone A posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone A regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone A?	<b>YES</b>	Continue monitoring non-water supply activities in Zone As.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Surface Water Protection Controls that meet 310 CMR 22.20C?	<b>YES</b>	The Town owns 90% of the watershed. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws, health regulations, and current regulations adopt further protection.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>NO</b>	Work with neighboring municipalities to include the watershed in their protection controls.
<b>Planning</b>		
Does the PWS have a local surface water supply protection plan?	<b>NO</b>	Develop a surface water supply protection plan. Follow "Developing a Local Surface Water Supply Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>NO</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a watershed protection committee?	<b>NO</b>	Establish committee; include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>YES</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide watershed protection education?	<b>YES</b>	Aim additional efforts at commercial, industrial and municipal uses within the watershed.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report For LEVERETT VILLAGE CO OP

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Leverett Village Co Op
<i>PWS Address</i>	180 Rattlesnake Gutter Rd
<i>City/Town</i>	Leverett, Massachusetts
<i>PWS ID Number</i>	1154000

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1154000-01G	100	417	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1154000-01G)**

Zone I = 100 ft.  
IWPA = 417 ft.

### How Was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on septic system components from several systems located within the Zone I IWPA of the well and the adjacent pasture. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and parking areas located within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data, a Sanitary Survey conducted at your facility, as well as from other sources of information.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report for Leverett Elementary School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 16, 2001

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Leverett Elementary School is a rural, elementary school located on the east side of Montague Road in Leverett. The school student and staff population is approximately 230 people per day and is served by a single potable supply well (Well #1) located west of the school. The school well also supplies potable water for the adjacent Town facilities (Highway and Fire Department Buildings) and is intended to supply the proposed library facility. The school and municipal facilities are undergoing renovation and/or new construction. The school attempted to replace the existing well with a new source located in a more remote location. However, the water from the new well is turbid and has high concentrations of dissolved solids. The estimated cost of treatment may be cost prohibitive and the community is working with the DEP to consider various options for a new supply.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The current well has a Zone I protective radius of 128 feet and an Interim Wellhead Protection Area (IWPA) radius of 434 feet based on an average, maximum daily withdrawal rate from metered usage data. The protective radii were based on the average daily-metered water use for the two highest months on record. Please refer to the attached map that shows the Zone I and IWPA. The Zone I is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wellhead may be larger or smaller.

The 6-inch diameter well is, estimated to be drilled to a depth of approximately 200 feet below ground and utilizes the bedrock aquifer. There is no record of the well construction or the materials encountered during drilling of the well. The geologic mapping of the area indicates stratified drift, sand and gravel deposits in the vicinity of the school although there is no description of the depth of the deposits. The area is located within the Town of Leverett's Aquifer Protection District. The bedrock geological map shows complex bedrock structure in the vicinity of the school and describes various bedrock formations of sulfidic schist, amphibolite and gneiss. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer. The water from the school's current well does not require and is, at the time this report was prepared, not treated. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. Structures in the Zone I
2. Septic System
3. Floor drain in boiler room
4. Parking and roadway

There are activities within Zone I that are not related to water supply and the well is

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Septic System components	No	Yes	Moderate	Refer to the attached septic system fact sheet.
Floor Drain in the boiler room to septic system	Yes	Yes	Moderate	Floor drain must be protected from accidental spills or connected to tight tank.
Parking area and roadway	Yes	Yes	Moderate	Storm water drains away from the wellhead
Aboveground oil tank	No	Yes	Moderate	Covered and in containment
School structure and Fire Station	Yes	Yes	-	Non-conformance with Zone I requirements

- -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

located in an aquifer with a high vulnerability to contamination due to the absence of a significant hydrogeologic barrier to prevent contaminant migration from the surface. The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of at several moderate threat land uses or activities in the Zone I and IWPA, as seen in Table 2.

**1. Nonconforming activities in Zone I** – Currently, the well does not meet DEP's restrictions, which only allow water supply related activities in Zone I. The facility's Zone I contains school buildings, roads and parking areas. The public water supplier does not own and/or control all land encompassed by the Zone I. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Maintain contact with the DEP regarding alternatives to the existing source.
- ✓ Monitor activities within the Zone I and minimize as much as is feasible, activities in Zone I.

**2. Septic system components in the IWPA** - The septic tank, grease trap, pipeline, distribution box and leachfield are all within the IWPA of the well. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Improper disposal of household hazardous chemicals or petroleum products to septic systems or discharge from the boiler room are also potential sources of contamination to the leachfield. The Highway Department is scheduled to have a tight tank installed for the garage.

### Recommendations:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, certified operator, Town Highway and Fire Department personnel. The Town Highway Department is registered as a generator of hazardous waste or waste oil. Continue to diligently monitor use, storage and disposal of hazardous materials.
- ✓ Septic system components should be inspected and maintained on a regular basis.

**3. Floor drain in the boiler room** – Floor drains may be required in boiler rooms to provide drainage in the event of a plumbing failure. If there is a potential for oil or hazardous materials to flow accidentally into the floor drain, however, the floor drain

must be sealed or connected to a tight tank if no sewer is available. The boiler room at the Leverett Elementary School has a floor drain that discharges to the septic system. The boiler is set within a recessed containment structure. At the time of the site visit, there were cracks and holes in the floor of the containment area that could act as conduits to the ground in the event of a release of oil and the old oil lines from the abandoned tank were not drained or capped. Immediately following the visit, the abandoned oil lines were drained and filled. The oil line was bermed so that it would drain to the recessed, cemented containment area that holds the boiler in the event of a line break. All breaks in the floor were cemented and sealed to contain any potential spills.

### Recommendations:

- ✓ Continue current investigation regarding the feasibility of sleeving the oil line from the tank to the boiler.
- ✓ Prepare a written policy and plan for maintenance operations, especially when oil filters are changed. Require your boiler maintenance contractor to use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

conducting routine maintenance. Please note that boiler blow down generated during routine maintenance cannot be discharged through the floor drain and must be disposed of off site.

- ✓ If protection of the floor drain cannot be assured, seal the floor drain or a tight tank must be installed for the floor drain.

**4. Parking and roadway** - The bus drop-off area, Montague Road and parking areas are within the Zone I and IWPA of the well. Drainage from the school is discharged to an area that topographically drains away from the wellhead.

#### Recommendations:

- ✓ Use minimal road salt and deicers.
- ✓ Monitor the parking lot for spills and leaks.
- ✓ Maintain a buffer from parking near the well.

Other land uses observed were portions of the Town complex (Fire Station and Highway Department Garage), pad mounted electrical transformers, residential homes and septic systems all located within or just outside of the IWPA of the well. Store all petroleum products in secondary containment and contact the power utility to ensure that the oil in the transformer does not contain PCBs. Inform residential neighbors of BMPs for septic system management, lawn care and management of household hazardous materials.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The Leverett Elementary School is commended for recent actions and current protection measures.

Please review and adopt the key recommendations listed above and as follows:

#### Zone I and IWPA:

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I and monitor the area for spills and leaks.
- ✓ Monitor oil delivery and storage.
- ✓ Continue working with DEP to regarding the potential for replacement of the well.
- ✓ Post drinking water supply signs key location such along the access road and in the parking area.
- ✓ Provide information to staff about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Do not use fertilizer or pesticides.
- ✓ Use Best Management Practices (BMPs) for hazardous products.

#### Training and Education:

- ✓ Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies).

#### Facilities Management:

- ✓ Septic system components should be maintained on a regular basis. Refer to the

appendices for more information regarding septic systems.

- ✓ Continue staff training in the handling of hazardous materials.

#### Planning:

- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.

- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note that each program year, on or about May 1 the Department posts a new Request for Response (RFR), grant application form. Generally, the applications are due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Hampshire-Franklin Children's Day Care is a rural, childcare facility located on the east side of Long Plain Road, State Route 63 in Leverett. The population of children and staff is approximately 35 people per day and is served by a single potable supply well (Well #1) located west of the building. The facility's heat and hot water are both electric.

The well has a Zone I protective radius of 100 feet and an Interim Wellhead Protection Area (IWPA) radius of 416 feet. The protective radii were based on the average daily-metered water use for the two highest months on record. Please refer to the attached map that shows the Zone I and IWPA. The Zone I is the area immediately around the wellhead where no activity, other than that related to the water supply, is allowed to take place. The IWPA is a larger area that likely contributes water to the wellhead. The

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

IWPA is only an interim protection area; the actual area of contribution to the wellhead may be larger or smaller. The Hampshire-Franklin Day Care facility does have activities within the Zone I that are not related to the water supply and is therefore non-conforming to the Zone I restrictions.

The 6-inch diameter well is reportedly installed in 1987 and drilled to a depth of 520 feet below ground with 20 feet of casing grouted into place. The bedrock geological map shows complex structure in the vicinity of the school and describes various bedrock formations of sulfidic schist, amphibolite and gneiss. The drilling record of the well indicates very shallow depth to bedrock. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer. The water from the well does not require and is, at the time this report was prepared, not treated. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone Is and IWPAs and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Nonconforming activities in Zone I**
2. **Household hazardous materials storage**
3. **Septic systems**
4. **Parking and roadway**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of at several moderate threat land uses or activities in the Zone I and IWPA, as seen in Table 2.

1. **Nonconforming activities in Zone I** – Currently, the well does not meet DEP's restrictions, which only allow water supply related activities in Zone I. The facility's Zone I contains buildings and parking areas. The storage sheds in front and behind the

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Septic System components	No	Yes	Moderate	Refer to the attached septic system fact sheet.
Household hazardous materials storage	Yes	Yes	Moderate	Dispose of unused materials, use containment
Parking area and roadway	Yes	Yes	Moderate	Storm water drains away from the wellhead
Low density residential	Yes	Yes	Moderate	School facility and residential yards

- **-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).**

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

facility contains household hazardous materials. Also note that the well cap was not secure at the time of the site visit. The public water supplier does not own and/or control all land encompassed by the Zone I. Please be aware that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Replace the cap with a secure, watertight cap and grade the area around the wellhead so that water does not flow to or pool around the wellhead.
- ✓ Remove all household hazardous materials from the Zone I. At a minimum, supply secondary containment for all hazardous materials such as gasoline (for the lawn mower) and paint or stain.
- ✓ Monitor activities within the Zone I and minimize activities, as is reasonable.
- ✓ Contact neighbors to be sure they are aware they are within the Zone I of the facility's well and provide information on household BMPs for household hazardous waste, septic system management and lawn care.

**2. Septic system components in the IWPA** - The septic systems for the facility and several neighboring residential homes are within the IWPA. If a septic system fails or is not properly maintained it is a potential source of microbial contamination. Improper disposal of household hazardous chemicals or petroleum products to septic systems are also potential sources of contamination to the groundwater.

### Recommendations:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals.
- ✓ Septic system components should be inspected and maintained on a regular basis.

**3. Improper storage of hazardous household materials** – Paint, wood stains and varnishes were found stored on open shelves in a shed behind the facility.

### Recommendations:

- ✓ Store in area with a sealed floor and within stable, enclosed cabinets.
- ✓ Provide secondary containment for storage of potentially hazardous items.

**4. Parking and roadway** - The parking area is within the Zone I and the road is within the IWPA of the well. The road is topographically downgradient from the wellhead and the drainage on the road is controlled through a stormwater collecting system. Grading around the wellhead should direct flow away from the well.

### Recommendations:

- ✓ Use minimal road salt and deicers.
- ✓ Monitor the parking lot for spills and leaks.
- ✓ Establish a buffer area prohibiting parking immediately adjacent to the well.
- ✓ Be sure that snow is not plowed on top of the wellhead.

Other activities noted during the site visit were residential buildings. Generally a daycare facility and residential uses pose minimal threat to a water supply provide that best management practices are used with respect to management of household hazardous materials, lawn care chemicals and septic disposal.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The Hampshire-Franklin Day Care is commended for current protection efforts (such as the signs on

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

the sinks) and encouraged to review and adopt the key recommendations listed above and the following additional measures.

### Priority Issues:

- ✓ Replace the well cap with a watertight, sealed cap.

### Zone I and IWPA:

- ✓ Prohibit parking in the space immediately adjacent to the wellhead.
- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I and monitor the area for spills and leaks.
- ✓ Post drinking water supply signs at key location such along the access road and in the turnaround near the building, away from the well.
- ✓ Provide information to staff and immediate neighbors about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Continue the current practice of not using fertilizer or pesticides.
- ✓ Use Best Management Practices (BMPs) for household hazardous products.

### Facilities Management:

- ✓ Septic system components should be maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ Do not allow snow to be piled on top of the wellhead.

### Planning:

- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.
- ✓ Request that your IWPA be incorporated into the Leverett Aquifer Protection District.

### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note that each program year, on or about May 1 the Department posts a new Request for Response (RFR), grant application form. Generally, the applications are due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

**Introduction**

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

**Purpose of this report:**

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

**This report includes:**

1. Description of the Water System
2. Discussion of Land Uses in the Protection Areas
3. Protection Recommendations
4. Attachments, including a Map of the Protection Areas

**1. Description of the Water System**

The Pearl Rhodes Elementary School is located in the town of Leyden, a small hilltown in western Massachusetts on the Vermont border. The school has a student and staff population of approximately 100 people. There are no municipal water or wastewater systems in Leyden; therefore the school is served by one on-site water supply well and on-site septic disposal system. The well for the school is located on the east side of Brattleboro Road within the school basement boiler room. The well is a 6-inch diameter, 150 feet deep bedrock well that was hydrofractured in 1991 to enhance water flow to the well.

The area is in the Berkshire/Taconic foothills with relatively steep brook and river

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

valleys. The surficial geology is generally thin till with some minor alluvial deposits in the steam valleys. There are numerous bedrock outcrops in the area. The bedrock is mapped as the Lower Conway formation, a schist, equivalent to the Goshen Formation, with interbeds of quartzite and marble. There is no evidence of a protective clay layer or thick till to prevent activities on the ground surface from threatening the water supply. Therefore, the aquifer is identified as having a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA.

The Zone I is the area immediately around the well that is most vulnerable. The Zone I for a well is the protected area immediately surrounding the wellhead while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual recharge area (Zone II) has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The DEP allows only activities related to supplying water or other non-threatening activities within the Zone I. Many systems that were developed prior to the DEP requirements are grandfathered, but any expansion or changes to the system require DEP approval and compliance with Zone I restrictions. Well No. 1 has a Zone I radius of 177 feet and an Interim Wellhead Protection Area (IWPA) radius of 472 feet. The Zone I was based on the maximum daily water use as determined from metered water data.

The well serving the school has no treatment at this time. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Non-conforming Zone I;**
2. **Elementary School;**
3. **Transportation corridors;**
4. **Fuel oil storage; and**
5. **Residential Land Uses.**

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Fuel Oil Storage	Yes	Yes	Moderate	Spills, leaks, or improper handling of fuel oil from school and surrounding residences
Lawn Care / Gardening	Yes	Yes	Moderate	Over-application or improper storage and disposal of pesticides
Septic Systems / Cesspools	Yes	Yes	Moderate	Nitrates, microbial contaminants, and improper disposal of hazardous chemicals
School	Yes	Yes	Moderate	Fuel oil, laboratory, art, and other chemicals: spills, leaks, or improper handling or storage
Roads	Yes	Yes	Moderate	Fuels and other hazardous materials: accidental leaks or spills; road salt usage
Manure Storage or Spreading	No	Yes	High	Manure (microbial contaminants, nitrates): improper handling/application

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

The overall ranking of susceptibility to contamination for the wells is high, based on the presence of at least one high threat land use or activity in the IWPA, as seen in Table 2.

**1. Non-conforming Zone I** – Currently, the wells do not meet DEP's restrictions, which only allow water supply related or other non-threatening activities in Zone I. The school's Zone I contains school buildings, fuel oil storage, boiler room, roads/driveways, parking areas, and athletic fields. The school does not own and/or control all land encompassed by the Zone 1. Systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Do not use or store pesticides, fertilizers, or road salt within the Zone I.

**2. School** – Activities associated with schools commonly involve hazardous materials such as fuel oil, laboratory, art, and other chemicals. These hazardous materials have the potential to impact drinking water supplies if they are improperly handled, stored, or improperly disposed into septic systems.

### School recommendations:

- ✓ Implement BMPs that can be used to reduce the risk of contamination.
- ✓ Provide source protection education for maintenance staff, food preparation staff, teachers and students.

**3. Transportation Corridors** – Brattleboro Road is located within the Zone I and IWPA. Greenfield Road is also located within the IWPA. Roads are potential sources of contamination due to salting of roadways and leaks or spills of fuels and other hazardous materials during accidents.

### Recommendation:

- ✓ Contact the local fire department to ensure that the IWPA's are included in Emergency Response Planning.
- ✓ Request that the town apply low volumes of salt to those portions of Brattleboro Road and Greenfield Road that are within the IWPA.

### 4. Fuel Oil Storage – Aboveground Storage Tank (AST) –

The UST fuel oil tank was replaced with an AST with containment. If managed improperly, Aboveground Storage Tanks and fuel oil lines can be a potential source of contamination due to leaks or spills of the chemicals they store.

### Recommendations:

- ✓ Any modifications to the AST must be accomplished in a manner consistent with Massachusetts plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs.
- ✓ Monitor deliveries of oil as many spills are related to delivery.

**5. Residential Land Uses** – At least one residential property falls within the IWPA. All residences in the area have on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

include:

- ♦ **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they can be a potential source of microbial contamination.
- ♦ **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- ♦ **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- ♦ **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and online at [www.ma.gov/dep/brp/dws/protect.htm](http://www.ma.gov/dep/brp/dws/protect.htm), the DEP website. The fact sheet provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.

Implementing the following recommendations will reduce the system's susceptibility to contamination. Reportedly there is manure spreading in the protection areas. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure piles and field application are potential sources of contamination to ground and surface water supplies. Work with hobby farmers by supplying them with information regarding protecting their own wells and the public water supply by encouraging the use of BMPs. For additional resources, refer homeowners, conservation commissioners and planners to the DEP websites: <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> resources.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Pearl Rhodes Elementary School is commended for removing the fuel oil underground storage tank (UST) and replacing it with an aboveground tank (AST) with containment. Pearl Rhodes Elementary School is also commended for not using pesticides and fertilizers on its athletic fields. Pearl Rhodes Elementary School should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Do not use or store pesticides, fertilizers, or road salt within the Zone I.
- ✓ Redirect road and parking lot drainage in the Zone I away from well.

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Post the Zone I area with “Public Drinking Water Supply Recharge Area” signs at appropriate locations away from the actual well.
- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.

- ✓ Consider well relocation if Zone I threats cannot be mitigated or if water quality is impacted by activities.
- ✓ If the school intends to continue utilizing the structures in the Zone I, use BMPs and restrict activities that could pose a threat to the water supply.
- ✓ Monitor sodium concentrations in well water and use the sodium concentration trend as an indication as to whether or not increased efforts need to be made to reduce salt usage in the Zone I and IWPA and to work with the town on additional improvements to parking lot and road drainage.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.
- ✓ Consider upgrading the heating system to propane for the purpose of removing fuel oil storage from the Zone I.

### **Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations away from the actual well.
- ✓ Incorporate groundwater education into the school curriculum.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the area and is treated according to DEP guidance.

### **Facilities Management:**

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, refer to <http://www.state.ma.us/dep/bwp/dhm/files/sqgsum.pdf> for the Requirements for Very Small Quantity Generators.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on school property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### **Planning:**

- ✓ Work with local officials in town to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
PIONEER VALLEY YACHT CLUB

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 2, 2004

## What is a SWAP Report?

The Source Water Assessment Program (SWAP) established under the federal Safe Drinking Water Act requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The determinations of susceptibility of your well/source(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Pioneer Valley Yacht Club
<i>PWS Address</i>	260 Anthony Rd
<i>City/Town</i>	Longmeadow, Massachusetts
<i>PWS ID Number</i>	1159001

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1159001-01G	100	403	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant activities* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant activities is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

A well's *susceptibility* to contamination is different from the *risk* of a customer drinking contaminated water. Water suppliers protect against such risk through monitoring and treatment of water supplies, BMPs, and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1159001-01G)**

Zone I = 100 ft.  
IWPA = 403 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the presence of septic leach fields within the Zone I / IWPA. The **high** susceptibility to potential non-microbial threats is based on the storage of oil, underground storage tanks, parking areas, vehicle maintenance areas, local roads, and agricultural activities within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your 1999 Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- inspect the Zone I and IWPA regularly;
- work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- do not use pesticides, fertilizers or road salt within the Zone I;
- address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

## For WESTOVER GOLF COURSE

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

### What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	Westover Golf Course
<b>PWS Address</b>	488 Chapin St
<b>City/Town</b>	Ludlow, Massachusetts
<b>PWS ID Number</b>	1161004

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well #1	1161004-01G	126	433	High	High
Well #2	1161004-02G	100	422	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

### What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

### What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1161004-01G)**

Zone I = 126 ft.  
IWPA = 433 ft.

### How was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic system components within the Zone Is and/or the IWPA's. The **high** susceptibility to potential non-microbial threats is based on the above and underground storage tanks for hazardous materials such as diesel fuel, gasoline and heating oil and storage and use of other hazardous materials such as fertilizers and pesticides. Moderate threat activities that are within the Zone Is and the IWPA's are parking, buildings and access roads.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Monroe Bridge Water District

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 29, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### **Purpose of this report:**

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### **This report includes:**

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Monroe Bridge is a village within the Town of Monroe. Monroe is the smallest town in Franklin County and is relatively isolated in the rugged Berkshire Hills of northwestern Massachusetts on the Vermont border. Monroe developed in the 1800's as an agrarian

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

community until hydroelectric power and the paper industry developed in the late 1800's and early 1900's. Today Monroe is primarily a residential and tourist (recreational) community. The Monroe Bride Water District maintains and operates a single surface water source, Phelps Brook. The system has a dam, ponding the brook to create a small reservoir and serves approximately 31 homes in the village.

Phelps Brook has a relatively small watershed of approximately 517 acres, with steep to very steep sides in the brook valley. The brook discharges into the Deerfield River southeast of the Monroe Bridge intake and just south of the Sherman Reservoir along the Deerfield River. The overburden in the watershed is primarily thin till over bedrock with abundant bedrock outcrops. There are some small deposits of recent alluvium and swamp deposits near the headwaters of the brook where the topography is somewhat less steep. The bedrock in the watershed is mapped as the metamorphic equivalents of allocthonous volcanic and sedimentary rocks east of the Berkshire highlands. The rocks are primarily schist and gneiss of the Hoosac Formation and the structural geology is a complex series of folds and faults. Surface water supplies, by their nature, are considered to be highly vulnerable to contamination from the surface because there is little buffer of protection of the source.

Water from the brook is filtered through a slow sand filter, followed by the addition of soda ash to adjust the pH for corrosion control and chlorine for disinfection prior to distribution. For current information on water quality monitoring results, please refer to the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone A, B and watershed outline and Table 2 for additional information regarding activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Zone A activities,**
2. **Transportation corridors,**
3. **Residential land uses, and**
4. **Agricultural uses.**

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridors	Yes	Yes	Moderate	Limit road salt usage. Investigate and work with the Town to control erosion and runoff
Residential use	No	Yes	Moderate	Septic and household hazardous materials
Agriculture	Yes	Yes	Moderate	Hobby/commercial farming.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

The overall ranking of susceptibility to contamination for the system is moderate, based on the presence of at least one land use or activity ranked as moderate in the Zone A and watershed, as seen in Table 2.

**1. Activities in Zone A** - The Zone A includes all areas within 400 feet around the reservoir and within 200 feet of either side of all streams that flow into the intake reservoir. Land use activities within a Zone A may have an impact on surface water sources. Wild animals, farm animals and domestic pets can be carriers of waterborne diseases such as Giardia, Cryptosporidium, Salmonella, etc. while road runoff can carry other contaminants. There are local roads and small parking areas in the Zone A of the system's reservoir and brook.

### Zone A Recommendations:

- V Continue to monitor and protect the Zone A and prohibit any new threatening activities from the Zone A.
- V Continue the use of Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store petroleum products, pesticides, fertilizers or road salt within the Zone I.
- V Work with local emergency response teams to ensure that any spills within the protection areas, especially the Zone A, can be effectively contained. Be sure that the local emergency response team is aware of the source location.

**2. Residential Land Uses** – There are numerous residences within the watershed. If managed improperly, activities associated with residential areas can contribute to drinking water contamination

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. Groundwater ultimately discharges to surface water bodies – streams, ponds and brooks. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catchbasins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and online at the website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm). The fact

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

sheet provides BMPs for common residential issues.

- V Consider long-term options of negotiating fee simple purchase, Right of First refusal agreement, conservation restrictions and Memorandum of Understanding for land not currently owned or controlled by the District.

**3. Transportation corridors and right-of-way** - There are very steep roads located within the watershed of Phelps Brook. In fact, some of the roads are closed in the winter. De-icing materials, petroleum chemicals and other debris on roads are picked up by stormwater. Roadways can often be sites for illegal dumping of hazardous or other potentially harmful wastes. There is also a utility right-of-way through the watershed that likely is maintained for vegetation control.

Catchbasins and drainage swales transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include contaminants from automotive leaks, maintenance, washing, pet waste, pesticides and fertilizers or accidental spills. Phelps Brook is subject to very flashy response because of the nature of the watershed.

#### Transportation Corridor Recommendations:

- V Regularly inspect Zone A and the watershed for illegal dumping and spills.
- V Work with local emergency response teams to ensure that any spills within the protection areas, especially the Zone A, can be effectively contained. Be sure that the local emergency response team is aware of the source location.
- V Where catchbasins or stormwater structures are installed, work with the municipality or State to have them inspected, maintained, and cleaned on a regular schedule. Regular street sweeping reduces the amount of potential contaminants in runoff.
- V Work with local watershed groups to institute a Storm Drain Stenciling Program. For more information on how to develop a storm drain stenciling program go to <http://www.earthwater-stencils.com>.
- V Promote BMPs for stormwater management and pollution controls.
- V Review potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Rita Thibodeau, at the local office (Greenfield at 413-772-0384 - e-mail address is [rita.thibodeau@magreenfie.fsc.usda.gov](mailto:rita.thibodeau@magreenfie.fsc.usda.gov)). Review the fact sheet online and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- V Visit DEP's Nonpoint Source Pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>

#### Rights-of-way Recommendations:

- V Request that the Conservation Commission or Selectmen reviewing the right-of-way Yearly Operating Plan (YOP) for utilities, ensure they continue use of only manual control of vegetation and that the utility has accurate information regarding the locations of the protection zones. Review the maps that the utilities use with the town officials.
- V Work with local emergency response planners. Be sure that local emergency response teams are aware of the protection areas and coordinate Emergency Response Drills.

**4. Agricultural Activities** – The watershed includes a small percentage, approximately 5%, of land with agricultural activities. Pesticides, fertilizers and manure have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store. Frequently, farms have maintenance garages for equipment and storage tanks.

#### Agricultural Activities Recommendations:

- V Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Review the fact sheet available online at the website - <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.and call the local office of the NRCS in Greenfield for assistance.

- ✓ Encourage farmers to incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Promote the use of BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.
- ✓ Work with farmers to ensure that pesticides and fertilizers are being stored within a structure designed to prevent runoff.
- ✓ The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at the website: <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS for assistance. This recommendation may be appropriate for the Monroe highway superintendent or Selectmen.
- ✓ Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to the websites at <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

### **3. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will reduce the supply's susceptibility to contamination. The District should continue efforts to protect water supplies by reviewing and adopting the key recommendations above and the following:

#### **Priority Recommendations:**

- ✓ Work with the town to address stormwater runoff issues in the watershed.
- ✓ Consider purchase of development rights through Conservation restrictions on land in the Zone A and watershed that are critical for protection.

#### **Zone A:**

- ✓ Prohibit any new non-water supply activities from Zone A areas that are within your control.
- ✓ When feasible, remove all non-water supply activities from the Zone A to comply with DEP requirements.
- ✓ Conduct regular inspections of the Zone A. Look for illegal dumping, evidence of vandalism, check any above ground tanks for leaks, etc.
- ✓ If it is not feasible to purchase privately owned land within the Zone A at this time, consider a conservation restriction or Memorandum of Understanding (MOU) that would prohibit potentially threatening activities or a Right of First Refusal agreement to purchase the property.
- ✓ Periodically inspect road drainage in the Zone A.
- ✓ Do not use or store pesticides, fertilizers, petroleum products or road salt within the Zone A.

#### **Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers and certified operators. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations as appropriate.
- ✓ Work with your community to ensure that stormwater runoff is managed to minimize erosion and is treated according to DEP guidance.

#### **Facilities Management:**

- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

#### **Planning:**

- ✓ Review plans to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.

- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Monson Water and Sewer Department**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i><b>PWS Name</b></i>	Monson Water and Sewer Department
<i><b>PWS Address</b></i>	198 WD Main Street, P.O. Box 388
<i><b>City/Town</b></i>	Monson
<i><b>PWS ID Number</b></i>	1191000
<i><b>Local Contact</b></i>	Craig Jalbert
<i><b>Phone Number</b></i>	413-267-4130

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

## Section 1: Description of the Water System

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

**Zone II #: 558**

**Susceptibility:** High

Well Names	Source IDs
Bethany Road Well	1191000-03G
Lower Palmer Road Well	1191000-04G
Bunyan Road Well	1191000-05G

Monson is a relatively small community of approximately 7,500 in western Massachusetts along the Connecticut border. The town originally developed as a textile center and later added other manufacturing. The community is primarily in the west central Massachusetts highlands with the town center and the majority of the development concentrated along the narrow Chicopee Brook valley that bisects the community running south to north. Monson Water and Sewer Department maintains three active groundwater sources supplying water to approximately half of the town of Monson's population. The Bunyan Road well, the primary source for the town, is in the northern part of town west of Route 32 along the wetland area of Chicopee Brook, and is an 18x24-inch diameter, 80-feet deep, gravel-packed well. The Bethany Road and Palmer Road wells are located about 500 feet apart, north of the center of town, east of Route 32. The Bethany Road well is a 16x24-inch diameter, 54-feet deep, gravel-packed well installed in 1950. The original Palmer Road well is a 16x24-inch, 78-feet deep, gravel-packed well that is used as a back-up source to the Bunyan Road well. Records indicate a 12-inch diameter gravel developed replacement well was installed adjacent to the original Palmer Road well. Each well has a Zone I of 400 feet. All three wells are located within the same buried valley aquifer along the Chicopee Brook and the Zone II, recharge area was delineated for all three wells as part of the SWAP program. The Water and Sewer Department does not own the entire Zone I for the wells. Please refer to the attached map for location details.

The three wells are located within a glacially deepened, bedrock valley along the Chicopee Brook. The stagnant, receding (melting) glacier deposited the overburden materials that filled the bedrock valley some 10,000 years ago. The deposits are a complex series of coarse and fine-grained material referred to as outwash deposits. A temporary glacial lake left thick clay deposits in some areas, while fast moving meltwater left sinuous, coarse gravel deposits (eskers) or flat topped delta or terrace features amid the fine-grained deposits. Recent stream waters have reworked the deposits and deposited alluvium throughout the area. The Bethany and Bunyan Road wells are located within a coarse gravel, esker deposit while the Palmer Road well is located within other, finer grained outwash deposits. There is no evidence of a continuous, protective clay layer through the Zone II. Wells located in this type of aquifer are considered to have a high vulnerability to potential contamination from the surface due to the absence of hydrogeologic barriers (i.e. clay) that can prevent contaminant migration. According to USGS mapping, the area is underlain by Monson Gneiss, a texturally mixed, layered plagioclase-quartz-biotite gneiss. There are also two wells and two surface water sources that are either abandoned or emergency sources, and are not addressed in this report. Please refer to the attached map to view the boundaries of the Zones I and II.

Soda ash is added to the water from the Bunyan Road well to control pH and alkalinity for corrosion control prior to distribution. The water from the other

wells does not require and is not treated at this time. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The Zone II for Monson Water and Sewer Department is a mixture of residential, commercial, agricultural, and light industrial land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B. Please note that the GIS map show a solid waste disposal area on the northwest edge of the Zone II. The Department's Bureau of Waste Prevention conducted a site visit as part of this assessment. The Department did not find any evidence of a waste disposal site in the vicinity and intends to delete the site from the Department's database and map.

### Key Land Uses and Protection Issues include:

1. Nonconforming Zone I
2. Residential land uses
3. Transportation corridors
4. Hazardous materials storage and use
5. Oil or hazardous material contamination sites
6. Comprehensive wellhead protection planning
7. Agricultural activities
8. Railroad Tracks

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Nonconforming Zone Is** – The Zone I for each of the wells is a 400-foot radius around the wellhead. Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Only water supply

activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and contain non-water supply activities such as homes and public roads. Monson Water and Sewer Department does not own the Zone Is for the Bethany Road and Palmer Road wells. The Zone I for the Bethany Road well contains roads and two residences.

### Zone I Recommendations:

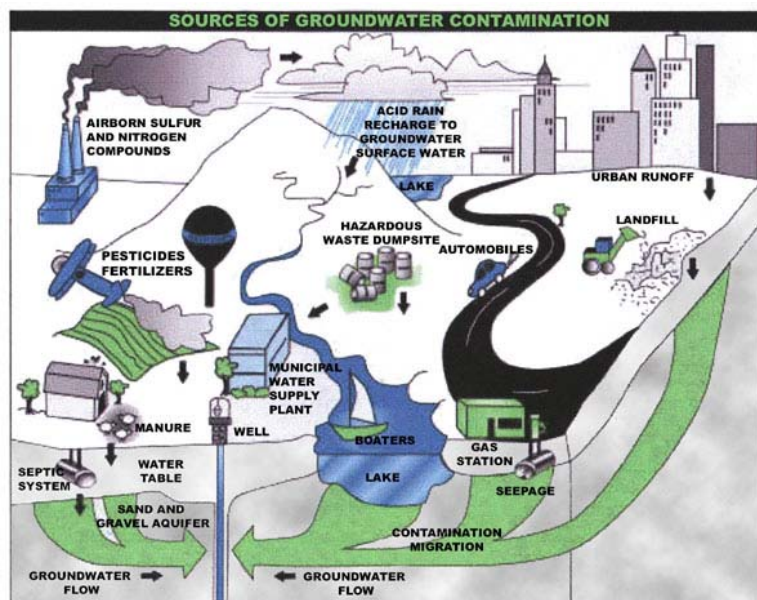

- ✓ To the extent possible, remove all non-water supply activities from the Zone Is to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

© 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non water supply activities out of the Zone I.

**2. Residential Land Uses** – Approximately 27% of the Zone II consists of residential areas. The town's sewer services the northern half of the Zone II, where much of the residential area is located. Septic systems service residences and businesses located south of Cedar Swamp Road and Route 32, the southern half of the Zone II. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Transportation Corridors** - Route 32 runs through the length of the Zone II, and local roads are common

throughout the Zone II. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catchbasins.

**Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.

**What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**Source Protection Decreases Risk**

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Potential Contaminant Sources*
<b>Agricultural</b>			
Fertilizer Storage or Use	2	M	Fertilizers: leaks, spills, improper handling, or over-application
Forestry Operation	1	L	Herbicides or pesticides, equipment maintenance materials: leaks, spills, or improper handling; road building
Livestock Operations	1	M	Manure (microbial contaminants): improper handling
Pesticide Storage or Use	3	H	Pesticides: leaks, spills, improper handling, or over-application
<b>Commercial</b>			
Car/Truck/Bus Washes	1	L	Vehicle wash water, soaps, oils, greases, metals, and salts: improper management (sewered)
Gas Stations	3	H	Automotive fluids and fuels: spills, leaks, or improper handling or storage
Service Stations/ Auto Repair Shops	8	H	Automotive fluids and solvents: spills, leaks, or improper handling
Bus and Truck Terminals	5	H	Fuels and maintenance chemicals: spills, leaks, or improper handling
Cemeteries	6	M	Over-application of pesticides: leaks, spills, improper handling; historic embalming fluids
Funeral Homes	1	L	Hazardous chemicals: spills, leaks, or improper handling
Golf Courses	1	M	Fertilizers or pesticides: over-application or improper handling
Laundromats	1	L	Wash water: improper management (sewered)
Medical Facilities	1	M	Biological, chemical, and radioactive wastes: spills, leaks, or improper handling or storage (sewered)
Railroad Tracks And Yards	Through Zones I & II	H	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills
Repair Shops (Engine, Appliances, Etc.)	1	H	Engine fluids, lubricants, and solvents: spills, leaks, or improper handling or storage
Sand And Gravel Mining/Washing	1	M	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
<b>Industrial</b>			
Fuel Oil Distributors	1	H	Fuel oil: spills, leaks, or improper handling or storage
Machine Shops	3	H	Solvents and metal tailings: spills, leaks, or improper handling
RCRA TSDF Facilities	1	H	Hazardous wastes: spills, leaks, or improper handling or storage

Land Uses	Quantity	Threat	Potential Contaminant Sources*
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cess-pools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal (sewered north of Robins St., Maple St.)
<b>Miscellaneous</b>			
Aboveground Storage Tanks	Numerous	M	Materials stored in tanks: spills, leaks, or improper handling
Aquatic Wildlife	Numerous	L	Microbial contaminants
Fishing/Boating	Numerous	L	Fuel and other chemical spills, microbial contaminants (mainly canoes)
Pipeline: Gas and Sewer	2	M	Natural Gas or Sewage: spills or leaks
Road And Maintenance Depots	1	M	Deicing materials, automotive fluids, fuel storage, and other chemicals: spills, leaks, or improper handling or storage
Schools	2	M	Fuel oil, laboratory, art, photographic, machine shop, and other chemicals: spills, leaks, or improper handling or storage (sewered)
Stormwater Drains/ Retention Basins	Numerous	L	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transmission Line Rights-of-Way - Type: Railroad, Natural Gas	2	L	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors	Numerous	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Underground Storage Tanks	Numerous	H	Stored materials: spills, leaks, or improper handling

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

**4. Hazardous Materials Storage and Use** – Five percent of the land area within the Zone II is commercial or industrial land uses. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet "Businesses Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.
- ✓ Work with local businesses through the Board of Health, to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure "Industrial Floor Drains" for more information.

**5. Presence of Oil or Hazardous Material Contamination Sites** – The Zone II contains several DEP Tier Classified Oil and/or Hazardous Material Release Sites indicated on the map as Release Tracking Numbers 1-0011017, 1-0000487, and 1-0013024. Refer to the attached map and Appendix C for more information.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites. Contact the Department's Bureau of Waste Site Cleanup at 413-784-1100 for further information.

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water is a place people want to live and businesses want to locate.

**6. Agricultural Activities** – Six percent of the land use within the Zone II is agricultural as pasture or cropland. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

**Agricultural Activities Recommendation:**

- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Work with hobby farmers to encourage the use of valuable assistance from soil conservation districts regarding BMPs.

**7. Protection Planning** – Currently, the Town does not have water supply protection controls that meet DEP's Wellhead Protection regulations 310 CMR 22.21(2). Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. There are competitive grant funding resources available to help communities develop a plan for protecting drinking water supply wells. Department staff is also

available to assist communities in developing local wellhead protection controls.

**Protection Planning Recommendations:**

- ✓ Develop a Wellhead Protection Plan. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Coordinate efforts with local officials to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21 (2). If there are no local controls or they do not meet the current regulations, adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ If local controls do not regulate floordrains, be sure to include floordrain controls that meet 310 CMR 22.21(2).

**8. Railroad Right-of-Way** – The railroad runs through the entire Zone II, and transects the Zone I of all wells. Rail corridors that serve passenger and/or freight trains are a potential source of contaminants due to chemicals released during normal use, track maintenance, and accidents. Normal maintenance of a railroad right-of-way can introduce contaminants to a water supply through herbicide application for vegetation control. The over-application or improper handling of herbicides on railroad right-of-way is a potential source of contamination. Leaks or spills of transported chemicals or train/track

**What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

maintenance chemicals are also potential sources of contamination to the water supply.

**Railroad Right of Way Recommendations:**

- ✓ Review the railroad right-of-way Yearly Operating Plan to ensure Best Management Practices are implemented with regard to vegetation control in the Zone II, and that the utility has accurate information regarding the locations of the wells and the Zone I. Review the maps the utility uses and supply them with an accurate map as appropriate.
- ✓ Work with your local fire department to review emergency response plans. Updates to this plan should include the railroad rights-of-way including coordination with the owner/operator of the track and trains using the right-of-way. Request emergency response teams to coordinate Emergency Response Drills and practice containment of potential contaminants from train accidents within the Zone II, which should attempt to include representatives from the owner/operator of the trains utilizing the right-of-way.

Other land uses and activities within the Zone II that are potential sources of contamination are included in Table 2. Refer to Appendix B for more information about these land uses. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II

- ✓ and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Supply information about BMPs for hobby farmers regarding pesticides, manure management.
- ✓ Develop and implement a Wellhead Protection Plan.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

#### **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

#### **Additional Information**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue monitoring non-water supply activities in Zone Is.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>NO</b>	The Town "Aquifer Protection District" bylaw meets DEP's best efforts for wellhead protection. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws and health regulations, and current regulations.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>N/A</b>	
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Develop a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Establish committee; include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>SOME</b>	For guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>NO</b>	Include commercial, industrial and municipal uses within the Zone II. Utilize schools and public access channels.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
SPRINGFIELD SPORTSMANS CLUB INC.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
May 27, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Springfield Sportsmans Club Inc.
<i>PWS Address</i>	Woodhill Rd
<i>City/Town</i>	Monson, Massachusetts
<i>PWS ID Number</i>	1191003

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Club House Well #1	1191003-01G	100	406	High	Moderate
Skeet House Well #2	1191003-02G	100	406	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA EXAMPLE** Source Protection Area for Club House Well #1 (1191003-01G)

Zone 1 = 100 ft.  
IWPA = 406 ft.

### How was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic leach fields within the Zone I / IWPA's. The **moderate** susceptibility to potential non-microbial threats is based on the parking areas and the facility within the Zone I and/or the IWPA's.

This source water assessment report is based on information provided by you on your 1999 Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- 3 inspect the Zone I and IWPA regularly;
- 3 work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- 3 restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- 3 make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- 3 remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- 3 do not use pesticides, fertilizers or road salt within the Zone I;
- 3 address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- 3 water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

## For ASYLUM HEALTH & RACQUET CLUB

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

### What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	Asylum Health & Racquet Club
<b>PWS Address</b>	Boston Rd
<b>City/Town</b>	Monson, Massachusetts
<b>PWS ID Number</b>	1191011

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well #1	1191011-01G	124	432	Moderate	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

### What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

### What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1191011-01G)**

Zone I = 124 ft.  
IWPA = 432 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the IWPA. The **high** susceptibility to potential non-microbial threats is based on the railroad tracks; moderate threat activities within the IWPA include commercial facilities, parking and roads.

This source water assessment report is based on information provided by you on your New Source Approval report, Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Turner's Falls Water Department**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Turner's Falls Water Department
<i>PWS Address</i>	226 Millers Falls Road
<i>City/Town</i>	Montague
<i>PWS ID Number</i>	1192000
<i>Local Contact</i>	Mr. Michael S. Brown
<i>Phone Number</i>	413-863-4542

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

## Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

*System Susceptibility:*

*High*

### *Groundwater Sources*

<i>Zone II # 206</i>	<i>Susceptibility: High</i>
Well #1 and Satellite well	1192000-01G
Well #2	1192000-02G

Turner's Falls is one of several villages within the Town of Montague, an industrial/agricultural and growing, rural residential community in western Massachusetts. Turner's Falls Water Department maintains two groundwater sources for the village's drinking water supply: Well #1 and its satellite well (1192000-01G) and Well #2 (1192000-02G). Source 01G consists of Well #1, a 26x34-inch diameter gravel packed well and an 8-inch diameter gravel developed well that withdraw water from a confined aquifer located in the central part of town. The wells (01G) serve as the main supply, are approximately 115 and 110 feet deep, respectively and have a combined, historical pumping capacity of approximately 765 gallons per minute (gpm). Well #2 (02G) is a 187-foot deep, 18 x 36-inch diameter gravel packed well, installed in 1992. Well #2 has an approved withdrawal rate of 1,500 gpm. The wells are located within a deep, pre-glacial, buried valley sand and gravel aquifer that is confined in the immediate vicinity of the wells but partially confined throughout other portions of the aquifer. Due to the presence of iron and manganese in the water, the well water is chlorinated and filtered through green sand filters that are periodically injected with potassium permanganate. The Zone II for Well #2 was delineated through the new source approval process utilizing hydrogeologic mapping and analytical modeling. Well #1 and the satellite well were incorporated within that Zone II through the SWAP program. The Department also maintains the Lake Pleasant and Green Pond reservoirs as emergency sources. These sources will not be further assessed within this report.

The wells are located within a glacially deepened, bedrock valley that was buried with sand, gravel and in some areas clay during the recession (melting) of the glaciers some 10,000 before present. Meltwater laid down coarse sand and gravel that was overlain with fine silt and clay where glacial lakes were formed. Glacial Lake Hitchcock was formed through much of the Connecticut River valley from southern Vermont to central Connecticut. Sediment laden meltwater deltas such as the Montague Plains, were formed into the lake leaving coarse grained materials at the deltas and along the shoreline. Finer grained deposits were carried to deeper quiescent waters and settled to the lake bottom forming the aquifer's confining clay unit. After the glacial lake drained, more recent deposits were laid down over the clay unit. The wells are located within the confined portion of the aquifer however, boring logs show evidence of unconfined areas along the boundaries of the aquifer. The aquifer is considered to be highly vulnerable to contamination because although the wells are located beneath a protective clay unit, the clay is discontinuous and does not exist throughout the majority of the recharge area of the aquifer to the south and along the edges of the aquifer.

Each well has a 400 feet protective Zone I radius. Aquifer parameters were determined from multiple, extended duration pumping tests and the Zone II for the wells was delineated based on conceptual and analytical modeling in conjunction with geological mapping. Please refer to the attached map to view the boundaries of each Zone II. For current information on water quality monitoring results, please refer questions to the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The land uses within the Zone IIs of the Turner's Falls wells are a mixture of commercial, residential and agricultural areas (refer to attached map for details). Although some areas of Montague are served by the Town municipal sewer system, the entire Zone II area is served by on-site septic disposal. Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Tables of Regulated Facilities attached in Appendix B.

### Key Land Uses and Protection Issues include:

1. Residential land uses
2. Transportation corridors
3. Hazardous materials storage and use
4. Underground Injection Control
5. Protection Planning
6. Agricultural activities
7. Sewer Pipeline and Wastewater Treatment Facility

Although there are many safeguards in place, the overall susceptibility ranking to contamination of the groundwater supplies is high, based on the presence of numerous high ranking threat land uses within the Zone II water

supply protection areas, as seen in Table 2.

Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to control the Zone I through ownership or some other mechanism such as a conservation restriction. Only water supply activities are allowed in the Zone I. The Turner's Falls Water Department owns the entire Zone I for both sources. The MA DEP commends the Water Department for its proactive approach to source protection by installing secondary containment in the well house as a result of this assessment and closing out a floor drain.

✓ Continue your current use of BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals and monitor all chemical deliveries.

### 2. Residential Land Uses – Approximately 11% of the Zone II area

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

Modified from © 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

consists of residential land use. Although some of the community is served by municipal sewer, the entire Zone II utilizes on-site septic disposal. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper maintenance and disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems discharge directly to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include petroleum products for automotive and lawn care, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Continue working with Town planners to manage and control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls. Continue catch basin cleaning routines.

**2. Transportation Corridors** – The Zone II has numerous roads throughout. State Route 63 run along the eastern edge of the Zone II and a portion of Route 47 runs through the southern portion of the Zone II. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes and de-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash into catch basins.

#### **Transportation Corridor Recommendations:**

- ✓ **Emergency response**—Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained and be sure that the Emergency Responders are aware of the recharge area and will notify the Water District in the event of an emergency.
- ✓ **Low Salt Areas** - Submit a formal request to MA Highway Department to establish Low Salt Areas along Route 63 and 47 and consider this same request for local Montague roads. Educate employees and private contractors of the restrictions in designated Low Salt Areas if they are designated.

#### **What are "BMPs?"**

Best Management Practices are structural (i.e. oil & grease trap catch basins), nonstructural (i.e. hazardous waste collection days) or managerial measures that are used to protect and improve surface water and groundwater quality.

- ✓ **Planning and Developing** - Be aware of EPA's Intermodal Surface Transportation Efficiency Act. The Intermodal Surface Transportation Efficiency Act (ISTEA) of 1991 contains provision for the planning and developing of highway systems and transportation enhancement activities, including the mitigation of water pollution due to highway runoff. Through ISTEA, states are able to use a portion of their federal funding allotment for runoff pollution control devices and other BMPs to prevent polluted runoff from reaching their lakes, rivers, and bays. Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets, parking areas and lawns. Common potential contaminants include

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 3: Land Uses and Activities in the Protection Area**

For more information, refer to Appendix 2: Regulated Facilities within the Water Supply Protection Area or immediately adjacent to the area.

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Agricultural</b>			
Fertilizer Storage or Use — Crop land	Numerous	M	Fertilizers: leaks, spills, improper handling, or over-application
Pesticide Storage or Use—Crop land	Numerous	H	Pesticides: leaks, spills, improper handling, or over-application
Livestock Operations	2	M	Manure (microbial contaminants): improper handling
Manure Storage or Spreading	Numerous	H	Manure (microbial contaminants): improper handling
<b>Commercial</b>			
Service Stations/ Auto Repair Shops	2	H	Automotive fluids and solvents: spills, leaks, or improper handling
Furniture Stripping and Refinishing/ Window refurbishing	1	H	Hazardous chemicals: spills, leaks, or improper handling
Bus and Truck Terminals	1	H	Fuels and maintenance chemicals: spills, leaks, or improper handling
Car/Truck/Bus Washes	1	L	Vehicle wash water, soaps, oils, greases, metals, and salts: improper management
Sand And Gravel Mining/Washing	3	M	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Miscellaneous</b>			
Aboveground Storage Tanks	Numerous	M	Materials stored in tanks: spills, leaks, or improper handling
Clandestine Dumping/ junkpiles	1	H	Debris containing hazardous materials or wastes
NPDES Locations	1	L	Various depending on discharge limits
UIC Sites	2	--	Owners are currently conducting closure; contact the regional coordinator for status and information.
Small quantity hazardous waste	Numerous	M	Hazardous materials and waste: spills, leaks, or improper handling or storage
Stormwater Drains/ Retention Basins	Numerous	L	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transportation Corridors	Numerous	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Underground Storage Tanks	Unknown	H	Stored materials: spills, leaks, or improper handling

**Table 2 Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

lawn chemicals, pet waste, leakage from dumpsters, household hazardous waste, and contaminants from leaks, maintenance, washing or accidents.

**Stormwater Catch Basins – Recommendations:**

- ✓ **Mapping** - If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to prioritize and investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ **Inspect, Maintain, and Clean** - Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Additionally, street and parking lot sweeping reduces the amount of potential contaminants in runoff. Note: Catch basin cleanings are classified as solid waste by DEP and must be handled and disposed in accordance with all regulations, policies, and guidance. In the absence of written approval from DEP, catch basin cleanings must be taken to a facility permitted by DEP to accept solid waste. For information on DEP's Nonpoint Competitive Grants Program Upcoming Funding Opportunity see: <http://www.state.ma.us/dep/brp/mf/mfpubs.htm#wpa>.
- ✓ **Best Management Practices** - Work with the Town to develop Best Management Practices that are the most

effective, practical means of preventing or reducing pollution from nonpoint sources. Information is available at <http://www.epa.gov/OWOW/NPS/roads.html>.

- ✓ **Local Controls** - Encourage local officials to develop a local stormwater ordinance. For more information see <http://www.epa.gov/owow/nps/ordinance/stormwater.htm>.
- ✓ **Storm Drain Stenciling Program** - Work with local watershed groups to institute a Storm Drain Stenciling Program. For more information on how to develop a storm drain stenciling program go to <http://www.earthwater-stencils.com>.
- ✓ **Wellhead Protection Grants** – Consider applying for a Wellhead Protection Grant from DEP for the purpose of addressing stormwater drainage in the Zone II, and for working with the Town to address the “Phase II Stormwater Regulations”.

**3. Hazardous Materials Storage, Use and Disposal** – Commercial, industrial and mining land uses make up about 8% of the Zone II. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store quantities of hazardous materials. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system, through a floor drain leading directly to the ground or directly to the ground. Unmanaged junkpiles and illegal disposal sites pose a significant threat to the environment.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Work with the local Board of Health to educate local businesses on Massachusetts’ floordrain requirements. See brochure “Industrial Floor Drains” for more information and in development and implementation of Local floor drain regulations and Hazardous Materials handling regulations.
- ✓ Work with the local Board of Health to develop local by-laws for hazardous materials handling and develop an inspection program for facilities that handle, use, store or dispose of hazardous materials.

**4. Underground Injection Control** – The Zone II contains two open-ended DEP sites related to illegal disposal of waste through a floor drain or dry well. Refer any questions to the UIC Coordinator at the WERO in Springfield or Tony Zaharias 413-755-2122.

**UIC Sites Recommendation:**

- ✓ Monitor progress on any ongoing testing and potential remedial action conducted for the known oil or contamination sites.

**5. Protection Planning** – Although the District is in the process of updating the Emergency Response Plan, there are no current plans for developing a protection plan. These types of protection plans coordinate community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public education and outreach. The development of a successful Wellhead Protection Plan is outlined in five steps in DEP’s “Developing a Local Wellhead Protection Plan” (see Appendix A for the full report) as:

- Establish a protection committee or team
- Define the Wellhead Protection Area
- Identify potential sources of contamination
- Protect and manage the wellhead protection area
- Conduct ongoing public education and outreach

The Town does have an Aquifer Protection District By-law, and has requested that the Planning Board amend the by-law to comply with supply protection control regulations 310 CMR 22.21(2). The Town Planner did participate in the SWAP assessment and was instrumental in data acquisition..

**Protection Planning Recommendations:**

- ✓ Develop a Wellhead Protection Plan. Establish a protection team, and refer them to <http://mass.gov/dep/brp/>

dws/protect.htm for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".

- ✓ Coordinate efforts with local officials to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21(2). If there are no local controls or they do not meet the current regulations, adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ If local controls do not regulate floordrains, be sure to include floordrain controls that meet 310 CMR 22.21(2).

**6. Agricultural Activities** – Crop and pasture lands make up 23% of the Zone II area. In addition there are numerous hobby farmers within the Zone II and Zone III area. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water. Improper management of hazardous materials pose a potential threat to the groundwater. In some instances, farmers have on-site irrigation wells or use town water for animals or crops.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Where appropriate, ensure farmers use back-flow prevention devices for connections to public water supplies but also for on-site wells. Inform farmers of BMPs for sanitary seals and back flow prevention for any on-site wells.

Other land uses and activities within the Zone II that have potential for contamination include utility Right-of-way, railroad tracks. Refer to Table 2 and Appendix 2 for more information about these land uses.

**Top 5 Reasons to  
Develop a Local Wellhead  
Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

**Section 3: Source Water Protection Conclusions and Recommendations**

**Current Land Uses and Source Protection:**

Although the Zone II contains numerous existing and potential sources of contamination, awareness and source protection measures reduces the risk of actual contamination, as illustrated in Figure 2. Identifying additional potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those listed above and below should be used to better protect your water supply.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when install containment for all chemicals stored and used within the Zone I of the wells.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the boundaries of the Zone II, stormwater drainage in your Zone II and

- ✓ Zone III when responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Communicate with owners/operators of the rights-of-way to ensure Best Management Practices are being used
- ✓ Develop and implement a comprehensive Wellhead Protection Plan.

➤ **Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships between businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

➤ **Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to groundwater contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained, it could be a potential source of microbial contamination. Animal waste is also a source of microbial contamination.

➤ **Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents, the municipal services and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located; what types of land uses and activities pose threats; and how their efforts can enhance protection.

➤ **Plan for the Future:**

One of the most effective means of protecting water supplies is planning, local include such as the adoption of local controls to protect land use regulations related to watersheds and ground water., These controls may include health ordinances/regulations, no discharge prohibitions general ordinances, and zoning bylaws that prohibit potential sources of contamination from wellhead protection areas.

Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. These recommendations are only part of your ongoing local drinking water source protection.

➤ **Resources for Drinking Water Source Protection:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water

**For More Information**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier and town boards.

supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

**Conclusions:**

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection

priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

#### **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>YES</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>YES</b>	Continue monitoring non-water supply activities in Zone Is.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>Partially</b>	The Town's "Aquifer Protection District" by law has recently been updated and meets DEP's best efforts for wellhead protection. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model by laws and health regulations, and current regulations for any future updates.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>NO</b>	Work with neighboring municipality of Sunderland to include portions of the Zone II in their wellhead protection controls.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Develop a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> . Include the Montague Center Water District in community planning efforts.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>In progress</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Develop a committee as part of the wellhead protection planning process. Include modification and improvement of existing by laws, regulation and inspection programs as appropriate.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>NO</b>	Aim additional efforts at commercial, industrial and municipal uses within the Zone II.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREA

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
134176	Stone's Equipment Repair	Federal Street	Montague	Generator of Hazardous Waste	Very Small Quantity Generator	Auto – Sales and Service
279722	Red Wing Meadow Trout Farm	North Leverett Road	Montague	Generator of Hazardous Waste	Very Small Quantity Generator NPDES	Fish Hatchery

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

# Source Water Assessment Program (SWAP) Report For Monterey Water Company

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 3, 2001

**Table 1: Public Water System (PWS) Information**

<b>PWS NAME</b>	<b>Monterey Water Company</b>
<b>PWS Address</b>	<b>P.O. Box 17, Sandisfield Road</b>
<b>City/Town</b>	<b>Monterey, Massachusetts</b>
<b>PWS ID Number</b>	<b>1193000</b>
<b>Local Contact</b>	<b>Ken Heath, President</b>
<b>Phone Number</b>	<b>413-528-0722</b>

<b>Well Name</b>	<b>Source ID#</b>	<b>Zone I (in feet)</b>	<b>IWPA (in feet)</b>	<b>Source Susceptibility</b>
Well #1	1193000-01G	274	720	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Monterey Water Company serves 58 homes and small businesses in the rural community of Monterey. The community is served by on-site septic disposal systems. Well #1 is a 364-foot deep rock well. An informal pump test in 1994 established an estimated yield for the source of 10-gallons per minute; the pump is set at a depth of approximately 145 feet. The Zone I and Interim Wellhead Protection Area (IWPA) radii are 274 feet and 720 feet, respectively, based on that estimated yield. The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The bedrock near this well is a fairly complex series of folds and faults, involving laminated gneissic metasandstone, metagraywacke, interbedded schists and predominantly carbonate rocks of the Stockbridge formation: quartzose, dolomite, and marble. Although there is no mapping of the overburden material, it is assumed to be till based on topography. There is no information regarding a confining, protective clay layer in the vicinity of the well. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface. The water from the well serving the facility has chlorine added as a disinfectant. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Nonconforming use in Zone I;**
2. **Low density housing with septic systems; and**
3. **Electrical Transformers.**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of few threatening land uses or activities in the Zone I and IWPA, as seen in Table 2.

**1. Nonconforming use in Zone I** - The Zone I for Well #1 is nonconforming with respect to DEP land use restrictions, that allow only water supply related activities in the Zone I. The public water supplier does not own and/or control all land encompassed by the Zone I of the well. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

#### Recommendations:

- ✓ Do not conduct any additional activities within the Zone I. Contact MA DEP prior to conducting any activities within Zone I.
- ✓ Continue to keep a current emergency response plan for responding to an accidental release.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Roadways	Yes	Yes	Moderate	Prohibit parking along road, monitor activities
Low density housing	Yes	Yes	Moderate	Refer to septic system brochure attached
Electrical Transformers	Yes	Yes	Moderate	Request information regarding PCB in MODF change from your electric company

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**2. Low Density Housing --** The Zone I contains Sandisfield Road and one residence with associated parking and septic systems. The IWPA contains two additional homes. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste. Another potential threat from residential users is mismanagement of household waste.

### Recommendations:

- ✓ Provide residents with information about proper maintenance and disposal practices for septic systems. Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.
- ✓ Monitor roadside for spills and leaks.
- ✓ Encourage residents to utilize local household hazardous waste collection days.
- ✓ Supply residents with information about BMPs for household hazardous waste management and lawn care.

**3. Electrical Transformer –** Electrical transformers contain Mineral Oil Dielectric Fluids (MODF). Although the use of PCBs is banned in new transformers, historically, PCBs were used in some transformers.

### Recommendations:

- ✓ Contact the local utility to determine if the transformers contain PCBs. If PCBs are present, urge the immediate replacement of oil.
- ✓ Keep the area near the transformers free of tree limbs that could endanger the transformer in a storm.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Monterey Water Company should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- V Consider well relocation of Well #1 if Zone I threats cannot be mitigated.

### Zone I:

- V Keep non-water supply activities out of the Zone I.
- V Continue to prohibit public access to the well and pumphouse by maintaining locked facilities.
- V Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism; check any above ground tanks for leaks, etc.
- V If it is not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.
- V Redirect road and parking lot drainage in the Zone I away from well.
- V Do not use or store pesticides, fertilizers or road salt within the Zone I.

### Training and Education:

- V Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers and certified operator. Post labels as appropriate on raw materials and hazardous waste.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba of the Western Regional Office at 413-755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

- V Work with your community to ensure that stormwater runoff is directed away from the well along the roadway.

### Facilities Management:

- V Do not store or use hazardous materials within Zone I.
- V Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.
- V For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### Planning:

- V Work with local officials in Monterey to develop and include the Monterey Water Company IWPA in Aquifer Protection District Bylaws, and to assist you in improving protection.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.
- V Consider obtaining a conservation restriction or "Right of First Refusal" for any land within Zone I that cannot be purchased.

### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response application package for the Grant program (RFR). On or about May 1 the new RFR is available and the application is due back on or about June 31. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Source Water Assessment Program (SWAP) Report For Gould Farm

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
March 27, 2002

**Table 1: Public Water System (PWS) Information**

<b>PWS NAME</b>	<b>Gould Farm</b>
<b>PWS Address</b>	<b>P.O. Box 157, 100 Gould Road</b>
<b>City/Town</b>	<b>Monterey, Massachusetts</b>
<b>PWS ID Number</b>	<b>1193003</b>
<b>Local Contact</b>	<b>Daniel Cryns</b>
<b>Phone Number</b>	<b>413-528-1804</b>

<b>Well Name</b>	<b>Source ID#</b>	<b>Zone I (in feet)</b>	<b>IWPA (in feet)</b>	<b>Source Susceptibility</b>
Well #1	1193003-01G	232	568	Moderate
Retreat Lodge Well	1193003-02G	163	459	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas
5. Appendix

## 1. Description of the Water System

Gould Farm is an agricultural, community living facility for people with special needs, located in Monterey. The community is served by a few on-site septic disposal systems and operates a wastewater lagoon for the majority of wastewater disposal. The lagoons are topographically downgradient of the wells and outside of the IWPA's. Well 01G is a 210-foot deep, 6-inch diameter well. The source has a safe yield of 9 gallons per minute based on historical metered data of the system. The Zone I and Interim Wellhead Protection Area (IWPA) radii are 232 feet and 568 feet, respectively. The Retreat Lodge Well (02G) is a 6-inch diameter, 405-foot deep bedrock well, with 59 feet of casing grouted into bedrock with an approved pumping rate of 1.83 gpm, serves a single

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

retreat house for short-term visitors. The Zone I and IWPA radii for the Retreat Lodge Well are 163 feet and 459 feet, respectively. The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The facility also has an emergency, surface water supply (01S) that has been physically disconnected from the system and is not addressed in this report. It is our understanding that Gould Farm intends to officially abandon that source.

Both wells are bedrock wells, located in an area the USGS has mapped as quartzose schist. Geologic mapping identifies the bedrock as fairly complex structure of folding and faulting; there is a relatively thin layer of till often referred to as "hardpan", overlying the bedrock. There is no evidence of a confining clay layer in the area. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier such as clay to prevent surface contamination from migrating into the bedrock aquifer. The water does not require and is, at the time this report was prepared, is not treated. Ultra-violet light is utilized to disinfect the water prior to distribution. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Nonconforming Activities in Zone Is;**
2. **Confirmed Hazardous Materials/Oil Release Sites;**
3. **Aboveground Storage Tanks (ASTs) With Heating Oil;**
4. **Sump pumps in basement.**

The overall ranking of susceptibility to contamination of both wells is moderate, based on the presence of many moderate threat land uses or activities in the IWPA, as seen in Table 2. Please note that the area within the IWPA that is designated as "Cropland" is actually an organic, children's garden. No pesticides or commercial fertilizers are used.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Confirmed hazardous materials/oil release sites (2)	No	Well #1	**	RTN 1-0013146, Tier 1C sites (RAO submitted); See Appendix A
Fuel Storage - Aboveground	Well #1	Both wells	Moderate	Oil tanks should have 110% containment
Sump pumps in boiler room	Well #1	Both wells	Moderate	Protect sumps from potential release or close out the sumps. Refer to UIC program.
Septic System	No	Both wells	Moderate	See septic systems brochure in the appendix
Electrical Transformers	Well #1	Both wells	Moderate	Request information regarding PCB in MODF change from your electric company
Parking lot, driveways & private access roads	Well #1	Both wells	Moderate	Limit road salt usage and maintain drainage away from wells

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/). \*\* - See Appendix A.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**1. Nonconforming Activities in Zone Is** – Currently, the wells do not meet DEP's restrictions, which allow only water supply related activities in the Zone I. Well #1's Zone I contains several buildings, driveways, fuel oil storage and waste transfer/recycling stations. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ If land uses within the Zone I cannot be managed to mitigate potential threats to the well, or water quality is impacted by existing activities, consider installing a well in a more remote area.
- ✓ Do not use or store pesticides, fertilizers, petroleum products (including equipment that use petroleum) or deicing material within the Zone I.

**2. Confirmed Oil Release Site** - The IWPA contains a DEP Bureau of Waste Site Cleanup, Tier 1C Classified Oil and/or Hazardous Material Release site indicated on the map as Release Tracking Number 1-0013146. There had been two releases that were link together and addressed simultaneously. The first release of oil was discovered after the filling of ASTs in October 1999 and the second was in 2000. Contaminated soil was removed from the sites, and an RAO statement was submitted in August 2000. A screening of the RAO by the BWSC Audits/Site Management group did not find any deficiencies in the RAO. For further information on the site, please contact the DEP-Bureau of Waste Site Cleanup at 413-784-1100. For information regarding the location of the site refer to the attached map. Refer to Appendix A for information regarding the Massachusetts Contingency Plan (MCP) and where additional information is available.

### Recommendation:

- ✓ Comply with the requirements of the MCP process and continue monitoring as prescribed by DEP.

**3. Aboveground Storage Tank (AST)** – There are several ASTs containing heating oil and propane located within the Zone I and throughout the IWPA. All of the underground fuel oil tanks have recently been replaced with these new ASTs. All of the ASTs at Gould Farm have some containment, although it may not be 110% of tank capacity. Aboveground Storage Tanks may still be a potential source of contamination due to leaks, spills or overfills of the chemicals they store and must be monitored and maintained.

### Recommendations:

- ✓ Monitor all deliveries and ensure lines are sleeved and maintained.
- ✓ Increase as is practical, all oil/hazardous material storage containment and maintain safety practices. Any modifications to the AST must be accomplished in a manner consistent with Massachusetts' plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs.

**4. Floor drain sump pumps in boiler rooms** - Floor drains are often installed in boiler rooms to provide drainage in the event of a plumbing failure. If there is a potential for hazardous materials to flow accidentally into the floor drain, preventive measures must be taken. In this case, sump pumps present in the basement may be subject to contamination from boilers within the vicinity. Sump pumps in an area that contains hazardous materials must be sealed, discharged to a sewer or a tight tank. Most sump pumps drain to the septic waste lagoons nearby.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

### Recommendations:

- ✓ Bring the floor drains into compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207).
  - Interim Actions: cease using the floor drains.
- ✓ Protect the sumps from contaminants. Oil lines from the tank to the boiler can be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Install containment around the boiler to protect the sump from contaminants. A policy and plan should be in place during maintenance operations, especially when oil filters are changed. Require your boiler maintenance contractor to use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.
- ✓ If protection measures cannot guarantee that boiler blow down or oil will not enter the floor drain, seal the floor drain or install a tight tank and connect the sump pumps that may be impacted by boilers to the tank.

Other activities noted within the protection areas or in the immediate vicinity are several individual septic systems serving Gould Farm buildings, electrical transformers and farming activities. The sanitary waste from the main facilities discharges to wastewater treatment lagoons located just outside the IWPA. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste. Refer to the attachments for more information regarding septic systems. Electrical transformers contain Mineral Oil Dielectric Fluids (MODF). Although the use of PCBs is banned in new transformers, historically, PCBs were used in some older transformers. Contact the local utility to determine if the transformers contain PCBs. Keep the area near the transformers free of tree limbs that could endanger the transformer in a storm. Refer to attachments for agriculture BMPs.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Gould Farm is commended for removing all Underground Fuel Oil Storage Tanks. Gould Farm should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Provide proper containment for all ASTs.
- ✓ Seal or otherwise address floor drains in boiler room areas.

### Zone I:

- ✓ Keep all new non-water supply activities out of the Zone I.
- ✓ Prohibit public access to the well and pumphouse by locking facilities, gating roads, and posting signs in areas such as along the parking lots and roadway.

- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism. Monitor fuel delivery and check above ground tanks for leaks, etc.
- ✓ If Gould Farm intends to continue utilizing the structures in the Zone I, use BMPs and restrict and control activities that could pose a threat to the water supply.
- ✓ Redirect road and parking lot drainage in the Zone I away from well.
- ✓ Do not use or store petroleum products, pesticides, fertilizers or deicing materials within the Zone I. Use secondary containment for these products stored in the IWPA.
- ✓ Upgrade to propane or natural gas for back-up power sources.

### Training and Education:

- ✓ Continue staff training on proper hazardous material use, disposal, emergency response, and best management practices;

include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.

- ✓ Post drinking water protection area signs at key visibility locations away from the wellhead.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

### **Facilities Management:**

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials.
- ✓ Eliminate any non-sanitary wastewater discharges to on-site septic systems.
- ✓ Bring the floor drains into compliance with DEP Regulations (refer to attachment “Industrial Floor Drain Brochure”).
- ✓ Remove hazardous materials from rooms with floor drains that drain to the ground or septic systems.
- ✓ Floor drains in areas where hazardous materials or wastes might reach them need to drain to a tight tank, be sealed, or be connected to a sanitary sewer.
- ✓ Implement Best Management Practices (BMPs) and an Integrated Pest Management Program for the use of fertilizer and pesticides on facility property.
- ✓ The facility is currently not registered as a generator of hazardous waste or waste oil. Review enclosed document “A Summary of Requirements for Small Quantity Generators of Hazardous Waste” to determine your status and regulatory requirements.

### **Planning:**

- ✓ Work with local officials in Monterey to include Gould Farm’s IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Agriculture:**

- ✓ Follow all applicable UMASS recommendations on Integrated Pest Management.
- ✓ Become certified in UMASS/Natural Resource Conservation Service Nutrient Management Certification program.
- ✓ Obtain and follow a Farm Plan through Natural Resource Conservation Service. Alternatively, complete and follow a plan developed through the publication *On Farm Strategies to Protect Water Quality: An Assessment and Planning Tool for Best Management Practices*.

### **Funding:**

The Department’s Source Water and Wellhead Protection Grant Programs provide funds to assist public water suppliers in addressing protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response (RFR), application request, for the Grant program on or about May 1. The applications are due back to the Department on or about June 30. Other funding opportunities are described in “Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation” at <http://www.state.ma.us/dep/brp/mf/files/glpgrgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

Swan Lodge	1193015-03G	100	401	High	High

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for  
HEADQUARTERS WELL  
(1193015-01G)**

Zone I = 100 ft.  
IWPA = 401 ft.

### How was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I / IWPAs. The **high** susceptibility to potential non-microbial threats is based on storage of hazardous materials such as heating oil within the Zone I and/or the IWPAs. Other moderate threats include the local roads and parking areas within the Zone I and/or the IWPAs.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, Sanitary Survey, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information you submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report For THE SEVEN STONES

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	The Seven Stones
<b>PWS Address</b>	103 Lake Buel Rd
<b>City/Town</b>	Monterey, Massachusetts
<b>PWS ID Number</b>	1193019

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well #1	1193019-01G	250	621	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1193019-01G)**

Zone I = 250 ft.  
IWPA = 621 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and the IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the access roads and parking within the Zone I and the IWPA. Well #2 is designated as an emergency source used only for filling the pool and is not addressed in this report.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dwr/bm/dwr>

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
LSGPO ASSOCIATION

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	LSPGO Association
<b>PWS Address</b>	70 Tyringham Rd
<b>City/Town</b>	Monterey, Massachusetts
<b>PWS ID Number</b>	1193023

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well #1	1193023-01G	182	478	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1193023-01G)**

Zone I = 182 ft.  
IWPA = 478 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and the barn within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Mountain View Health Care Center

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department  
of Environmental Protection,  
Bureau of Resource  
Protection,  
Drinking Water Program

Date Prepared:  
November 19, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	<b>Mountain View Health Care Center</b>
<i>PWS Address</i>	<b>Montgomery Road</b>

Well #2	1194001-02G	263	672	Moderate
Well #3	1194001-03G	273	720	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road de-icing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Montgomery is a small, rural community in the Berkshire foothills of western Massachusetts. The Mountain View Health Care Center, nursing home, is located on Montgomery Road and serves a population of approximately 35 to 40 residents and staff. Montgomery does not have a municipal water system or a municipal wastewater treatment facility. Therefore, the nursing home utilizes two, on-site water supply wells

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

and wastewater is discharged through an on-site septic system. Well #2 is a 6-inch diameter, 500-foot deep, bedrock well and has a reported historical yield of 8.5 gpm. The well is located 75 feet west of the building. Well #3 is a 6-inch diameter, 400-foot deep, bedrock well and has a reported historical yield of 10 gpm. Well #3 is located 150 feet northwest of the building. The nursing home also maintains one emergency supply well (01G) which is located in the front of the building, was severed from the system and is not used due to chronic bacteria contamination in the past. Emergency sources will not be addressed further in this report.

The Zone I is the protection area immediately surrounding the well, while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual recharge area (Zone II) has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii for Well #2, based on a historical pumping rate of 8.5 gpm, are 263 feet and 672 feet, respectively. The Zone I and Interim Wellhead Protection Area (IWPA) radii for Well #3, based on a historical pumping rate of 10 gpm, are 273 feet and 720 feet, respectively. Please refer to the attached map of the Zone I and IWPA.

Both wells withdraw water from the bedrock aquifer. The complex is located on an upland area underlain by till and shallow bedrock. Geologic maps of the area identify the bedrock as schist of the Goshen Formation. There is no evidence of a continuous confining unit in the immediate area. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

The water does not receive treatment but it is disinfected with chlorine prior to distribution due to the wells' proximity to the septic systems. For information on current water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The Zone Is for the wells are not in compliance with the DEP Zone I requirements that

**Table 2: Table of Activities within the Water Supply Protection Areas for Both Sources**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-	-	Contact DEP prior to conducting any work in Zone I or expanding the system.
Transportation corridor/parking	Well #2	Both	Moderate	Limit road deicing materials usage and monitor parking areas.
Nursing home	Well #2	Both	Moderate	Supply BMPs to staff regarding waste disposal.
Fuel storage/Floor drain	Well #2	Both	Moderate	Continue to use best management practices and monitor use and delivery of petroleum products.
Septic system components	Both	Both	Moderate	Continue to maintain septic system and protect it from improper disposal.

\* -For more information, see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website- [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

restrict activities to only those associated with water supply or passive, non-threatening activities. The Zone Is and IWPA's encompass the entire complex including the residential area, the fuel oil storage area (inside the building), and septic system components. The facility chlorinates the water prior to distribution.

### Key issues include:

1. **Non-conforming Zone I,**
2. **Transportation/parking**
3. **Nursing Home/residential septic systems,**
4. **Fuel storage (ASTs), and**
5. **Floor drain in boiler room.**

The overall ranking of susceptibility to contamination for the Nursing Home supply wells is moderate based on the presence of several moderate ranked potentially threatening land uses or activities in the Zone I and IWPA. Please refer any questions about water quality at the facility to the contact person listed in Table 1. Continued monitoring and site management is recommended to prevent accidents and minimize threats within the Zone I and IWPA protection areas of the wells.

**1. Non-conforming Zone I** – The water supplier does not own or control the entire Zone I area and there are non-conforming activities within the Zone Is. Systems not meeting DEP Zone I requirements for ownership or control, or that have non-conforming activities within Zone I, must receive DEP approval and address Zone I issues prior to conducting work in Zone I, increasing water use or modifying systems.

### Zone I Recommendations:

- V Prohibit any additional activities within Zone I and where feasible remove non-conforming activities within the Zone I areas.
- V Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.
- V Monitor all fuel oil deliveries and parking areas.
- V Do not use or store pesticides, fertilizers or road salt within the Zone I.
- V Maintain septic systems and upgrade as appropriate.
- V Replace the wells with a conforming source if activities cannot be mitigated or water quality is impacted by activities in the Zone I.

**2. Transportation corridor/parking** – Montgomery Road and the facility parking areas are located within the Zone I and IWPA.

### Transportation corridor Recommendations:

- V Monitor all parking areas and continue to ensure the drainage flows away from the wells.
- V Prepare an Emergency Response Plan that includes coordination among the DEP, the Town, and the State Police in the event of an accident near the wellhead.

**3. Nursing Home/Residential Land Use** – The nursing home and two residences are located within the Zone Is and IWPA's. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

because septic systems leach to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include cleaning materials, medications, automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used generally in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** - Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

### Residential Land Use Recommendations:

- V Educate staff, particularly maintenance staff on best management practices (BMPs) for protecting water supplies. Focus efforts on management and disposal of cleaning materials and potentially hazardous materials.

**4. Aboveground fuel oil storage** - There are two fuel oil ASTs located within the building within the Zone I of both wells. Both tanks are within containment structures. If managed improperly, fuel oil tanks and their associated fuel lines can be a potential source of contamination due to leaks or spills of the materials they store.

#### Recommendation:

- V Any modifications to the tanks and the lines must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs and USTs.
- V Monitor all activities associated with the fuel oil especially delivery.
- V Have spill containment/absorbent materials available on-site.
- V Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room.

**5. Floor Drain in Boiler Room** - There are floor drains in the boiler room, that are assumed to discharge to the septic system. However, the discharge point is not known. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry wells in areas where hazardous materials or petroleum may enter the floor drain. The floor drain must be protected to prevent boiler blow down, oil or other prohibited discharges through the floor drain.

#### Recommendations:

- V Be sure that the floor drains are in compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207 or Tony Zaharias 413-755-2122).
- V Containment to prevent accidental releases to the floor drain may be an option. Contact the regional DEP contact for the UIC program listed above. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. DEP recommends that you require your boiler maintenance contractor use

containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.

- ✓ Determine the discharge location of the drains. Seal all cracks in the floor and the floor drain if it cannot be adequately protected to prevent a prohibited discharge.

## **4. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. Please review and adopt the key recommendations above and as follows:

### **Priority Recommendations:**

- ✓ Maintain the septic systems and consider options for replacement of system or wells as is appropriate.

### **Zone I:**

- ✓ Prohibit any new non-water supply activities from Zone I.
- ✓ Continue regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### **Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Educate neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal and septic system maintenance.

### **Planning:**

- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Supplement the SWAP assessment with additional local information, and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Funding Sources:**

The DEP's Wellhead Protection Grant Program provides funds to assist public water suppliers and their partners in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under this grant program. If funds are available, in the spring, DEP posts a new Request for Response for the grant program (RFR).

These recommendations are only part of your on-going local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## **4. Attachments**

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
CARRIAGE HOUSE MOTEL

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 27, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	Carriage House Motel
<b>PWS Address</b>	Route 7
<b>City/Town</b>	New Ashford, Massachusetts
<b>PWS ID Number</b>	1200002

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well # 1	1200002-01G	209	519	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
# 1 (1200002-01G)**

Zone I = 209 ft.  
IWPA = 519 ft.

### How Was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and the IWPA. The **high** susceptibility to potential non-microbial threats is based on the storage of hazardous materials in the basement of the motel in the Zone I and other moderate threat activities are local roads and parking areas within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, a Sanitary Survey, water quality data, and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Mill River Water Takers

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public **water** supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Mill River Water Takers is a small community water system located within the village of Mill River in the town of New Marlborough, in southern Berkshire County. The source for Mill River Water Takers is located northeast of Southfield Road near the intersection with Church Road. The system's water is supplied by two spring collection boxes (01G and 02G) that act as a single source; source 01G flows by gravity into 02G. The two spring sources have square Zone I protection areas measuring 376 feet by 376

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

feet on a side based on a total system flow estimated by the USGS. The Zone II for the spring system was delineated by the USGS as part of the SWAP program. Preliminary reports from the USGS indicate the source of the spring water is primarily sand and gravel with some contribution from bedrock. The springs are located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and Zone II.

The springs have no treatment at this time but the water is chlorinated prior to distribution. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available at the website [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html). Envirofacts.

## 2. Discussion of Land Uses in the Protection Areas

There are land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Roads; and,**
3. **Sand and Gravel Mining (inactive).**

The overall ranking of susceptibility to contamination for the springs is moderate, based on the presence of at least one moderate threat land use or activity in the Zone I and/or Zone II, as seen in Table 2.

**1. Non-conforming Zone I** – Currently, the spring system does not meet DEP's restrictions, which only allow water supply related activities or non-threatening activities in Zone I. The facility's Zone I contains local roads. Systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems. There is a drop inlet and stormwater collection system upgradient of the spring on Mill River Road and the water supplier has installed a curtain drain around the spring box to collect shallow surface water runoff and direct it away from the collection box.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	Zone II	Threat	Comments
Non-conforming Zone I	-	-	-	Contact DEP before expanding or modifying the system.
Transportation corridors	Yes	Yes	Moderate	Continue working with the community to manage stormwater and limit road salt usage.
Sand and Gravel Mining (inactive)	No	Yes	Moderate	Continue communication with the property owner regarding future land use. Heavy equipment, fuel storage, clandestine dumping, spills or leaks are associated with active mines.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Recommendations:

- ✓ Continue the current practice of monitoring activities and working with the DPW to manage road and surface water drainage in the Zone I by directing runoff away from the springs. Encourage the DPW to continue to maintain the stormwater system upgradient of the spring.
- ✓ Continue to work with the DPW and assess stormwater runoff along Mill River Road.
- ✓ Maintain the stormwater collection drains on the site of the spring.

**2. Transportation corridors** - Roads are potential sources of contamination due to deicing of roadways and leaks or spills of fuels and other hazardous materials during accidents.

## Recommendation:

- ✓ Contact the local fire department to ensure that the Zone I and Zone II areas are included in Emergency Response Planning.
- ✓ Continue the current practice of monitoring activities and working with the DPW to manage road and surface water drainage in the Zone I by directing runoff away from the springs. Encourage the DPW to continue to maintain the stormwater system upgradient of the spring and refer to recommendations for Zone I.

**3. Sand and Gravel Mining** – A formerly active sand and gravel mining operation is located within the Zone II. Sand and gravel mining is a potential source of contamination due to the possibility of spills or leaks from heavy equipment, fuel storage, and clandestine dumping. Although small quantities of fill are removed from the site, the facility is presently not operating commercially.

## Recommendations:

- ✓ Consider negotiating the purchase or entering into an agreement to protect the property in the future.
- ✓ Continue communicating with the landowners regarding proposed future land use.
- ✓ Encourage Best Management Practices for storage, use, and disposal of hazardous materials such as fuel if the facility becomes active in the future.
- ✓ Inspect the Zone II for signs of clandestine dumping on a regular basis.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the spring's susceptibility to contamination. Mill River Water Takers is commended for sealing a floor drain in the pump house and installing a curtain drain and road drainage to direct stormwater runoff away from the springs. Mill River Water Takers should review and adopt the key recommendations above and the following:

## Facilities Management:

- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

### Planning:

- ✓ Work with your community to ensure that stormwater runoff is directed away from the springs and is treated according to DEP guidance.
- ✓ Work with local officials in town to include the facility Zone II in Aquifer Protection District bylaws if the town adopts such bylaws in the future.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Consider long term planning for the system that includes maintenance of the system.

### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Each program year, if funds are available, the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at the DEP website: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Massachusetts Department of Environmental Protection

## Source Water Assessment and Protection (SWAP) Report

### for

## Southfield Water Trust

#### What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

#### SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 24, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Southfield Water Trust
<i>PWS Address</i>	Norfolk Road - Southfield
<i>City/Town</i>	New Marlborough, Massachusetts
<i>PWS ID Number</i>	1203002
<i>Local Contact</i>	Mr. John Stevens
<i>Phone Number</i>	(413) 229-2726

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA</i>	<i>Source Susceptibility</i>
Well #2	1203002-01G	226	554	High

#### Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

### 1. Description of the Water System

The Southfield Water Trust is a small community water system located in Southfield, a village in the town of New Marlborough, southern Berkshire County. The system serves 33 residences, two municipal buildings and a commercial facility. The system's water is supplied by a single 6-inch diameter bedrock well that is located approximately 500 feet east of Norfolk Road behind the former whip shop and a residence. New Marlborough does not have a municipal sewer system and therefore, all wastewater is discharged to on-site septic systems.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The Zone I is the protected area immediately surrounding the well, while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual (Zone II) recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii for this facility's well are 226 feet and 554 feet, respectively, based on metered water use from the system.

The overburden in the area is comprised of glacially derived till of varying thickness over the bedrock; limited stratified drift and alluvium are deposited along river and stream valleys. However, in the vicinity of the well, the surficial geology is mapped as till. The bedrock in the area is mapped as the metamorphic rocks of the Berkshire Highlands, primarily granite, biotite gneiss. Although there is some evidence of a protective barrier of till, the confining unit is highly variable and there is no evidence of a significant and continuous protective barrier in the immediate vicinity of the well. Therefore, the Department has determined this well to have a high vulnerability to contamination due to the absence of a continuous hydrogeologic barrier throughout the recharge area that can prevent contaminant migration from land uses on the ground surface. Please refer to the attached map of the Zone I and IWPA.

Water from the well is not treated at this time prior to distribution. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available at the website [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html). Envirofacts.

## 2. Discussion of Land Uses in the Protection Areas

There are land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

**Key issues include:**

1. **Non-conforming Zone I;**
2. **Residential uses;**
3. **Transportation corridors;**
4. **Confirmed hazardous materials release sites;**
5. **Underground Storage Tanks (USTs); and**
6. **Hazardous materials storage.**

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Confirmed hazardous materials release sites	No	Yes	-	Contact DEP Bureau of Waste Site Cleanup for additional information.
Residential uses (high density)	Yes	Yes	Moderate	Use BMPs for household hazardous waste, heating fuel, septic system management, and lawn care and stormwater runoff.
Hazardous materials	Yes	Yes	High	Conduct inspections of facilities, encourage the use of BMPs and regulatory compliance. Coordination with emergency responders.
Transportation corridors	Yes	Yes	Moderate	Limit road salt usage and provide drainage downgradient from the well.
USTs/ASTs	No	Yes	High	Remove USTs or upgrade older tanks as is feasible. Monitor all deliveries.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

The overall ranking of susceptibility to contamination for the source is high, based on the presence of at least one high threatening land use or activity in the Zone I and/or IWPA, as seen in Table 2.

**1. Non-conforming Zone I** – Currently, the well does not meet DEP's restrictions, which only allow water supply related activities or non-threatening activities in Zone I. The facility's Zone I contains residential activities. Systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems. The ground immediately around the well casing has in the past been subject to slumping that would allow ponding of water around the casing. The Water Trust has corrected this problem but should be diligent in monitoring the area and maintaining adequate drainage.

### Recommendations:

- ✓ Continue the current practice of monitoring activities in the Zone I and prohibiting, as is feasible, the use of pesticide, fertilizers and household hazardous materials.
- ✓ Continue to regularly physically inspect the casing and drainage around the well.

**2. Residential Land Uses** – The IWPA for Well #1 has high-density residential land and commercial use. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store and accidents during delivery.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**3. Transportation corridors** - Roads are potential sources of contamination due to deicing of roadways and leaks or spills of fuels and other hazardous materials during accidents.

### Recommendation:

- ✓ Contact the local fire department to ensure that the Zone I and IWPA areas are included in Emergency Response Planning.

**4. Underground and Aboveground Storage Tanks (UST/AST)** – There are several USTs located within the IWPA and within close proximity to the IWPA of the well. Although in recent years some tanks have been removed or replaced, there are still both fuel oil and gasoline tanks. It is assumed that numerous homes have ASTs.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

### Recommendations:

- ✓ USTs and ASTs in close proximity to the water supply should be closely monitored, especially during deliveries. Review stormwater flow direction and anticipate control of a potential spill during delivery.
- ✓ Work with the fire department to encourage removal and upgrade of tanks and fuel lines as appropriate.
- ✓ Continue to evaluate and consider a replacement well location, as is feasible.
- ✓ Any upgrades and modification to fuel storage facilities must meet current construction standards and be done consistent with Massachusetts plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.

**5. Confirmed Hazardous Materials Release Site** – There are confirmed hazardous materials release sites in the vicinity of the wellhead protection areas. Refer to Appendix C to review the site and refer all questions to the DEP Bureau of Waste Site Cleanup.

### Recommendations:

- ✓ Monitor activities at these sites. Contact the Bureau of Waste Site Cleanup at 413-784-1100.

**6. Hazardous Materials Storage and Use** – Although there are no registered generators of hazardous waste, facilities within the IWPA such as the fire station and commercial facilities may store small quantities of hazardous materials. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a floor drain leading directly to the ground or be discharged directly to the ground. Please refer to the Attachment for a list of registered USTs. Vehicle washing is an activity that should be monitored and there are guidelines for facilities that wash vehicles.

### Hazardous Materials Storage and Use Recommendations:

- ✓ Aboveground storage tanks for hazardous products should be located on an impermeable surface and within containment in an area large enough to hold 110% of the liquid volume, should a spill occur.
- ✓ Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices including overfill protection. Any modifications to ASTs must be accomplished in a manner consistent with Massachusetts plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs.
- ✓ Review the vehicle washing guidance as appropriate.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the source's susceptibility to contamination. The Southfield Water Trust is commended for its detailed knowledge of the land uses within the IWPA and efforts to protect the source. The water supplier should review and adopt the key recommendations above and the following:

### Facilities Management:

- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.
- ✓ Inspect the well casing and the integrity of the storage facilities regularly.

**Planning:**

- V Work with your community to ensure further awareness and protection of the water supply.
- V Work with local officials in town to develop Aquifer Protection District(s) and bylaws and include the facility IWPA in Aquifer Protection District bylaws if the town adopts such bylaws in the future.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Consider long term planning for the system that includes maintenance of the system.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. The Department posts a new Request for Response for the Grant program (RFR) for each program year, if funds are available. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at the DEP website: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

**4. Attachments**

- Map of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheet
- List of underground storage tanks and confirm hazardous materials release sites

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREAS

### Underground Storage Tanks in are adjacent to protection areas

Facility Name	Address	Town	Description	Tank Type	Tank Leak Detection	Capacity (gal)	Contents
Southfield Store	Southfield - Norfolk Road	New Marlborough	Gasoline Dispenser	2 Wall	Interstitial Monitoring	1,000	Gasoline

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site:

<http://www.state.ma.us/dfs/ust/ustHome.htm>

Additional information provided by individual owners.

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitelist.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0010911	Southfield – Norfolk Road	New Marlborough	Oil
1-0000777	Southfield – Norfolk Road	New Marlborough	

For more location information, please see the attached map. The map lists the release sites by RTN.

# Massachusetts Department of Environmental Protection Source Water Assessment Program (SWAP) Report for Kolburne School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
November 19, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. School officials, citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your school.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Kolburne School is a year round residential school located in the community of New Marlborough, for children age 8 through 14 with behavior difficulties and learning disabilities. New Marlborough is a small rural community in southern Berkshire County along the Connecticut border. The facility population is approximately 130 staff and students. New Marlborough does not have municipal water or wastewater disposal, therefore the facility is served by on-site water supply and on-site septic disposal. The

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

school maintains three active, independent bedrock well sources that serve different parts of the systems: Burrirt Hall well (1203003-01G); Intake Office well (1203003-02G); and Main Office well (1203003-03G). Burrirt Hall well is a 6-inch diameter, 260 feet deep bedrock well that is located in a pit, behind the dorm and serves two dorms, a dining room and classroom building. The Intake Office well is a 6-inch diameter, 69 feet deep bedrock well that is located in a pit, behind Stanley Hall and serves six buildings. The Main Administration Office well is a 6-inch diameter, 205 feet deep bedrock well that is in a manhole located in a field behind the maintenance facility; the well serves the main office, the maintenance facility and the director's residence, Pine Edge. The wells and distribution systems are not interconnected.

The Zone I for a well is the protected area immediately surrounding the wellhead while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual recharge area (Zone II) has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and IWPA for the Burrirt Hall well are 238 feet and 585 feet, respectively; the Zone I and IWPA radii for Intake Well are 160 feet and 456 feet, respectively; and the Zone I and IWPA radii for Main Administration Well are 160 feet and 456 feet, respectively. The protective radii are based on metered water use from the wells.

The school is located in the Massachusetts Berkshire highlands; the bedrock is mapped as the gneiss of the Taconic-Berkshire Zone, an area of highly complex folds and faults. The overburden is a relatively thin layer of till (ground moraine) with bedrock commonly exposed. There is no record of a confining, protective clay layer or thick till in the vicinity of the wells. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Residential School	01G & 02G	01G & 02G	Moderate	Use BMPs for all activities near the wells.
Transformers	All	All	Low	MODF (oil) – potential leaks. Confirm that all transformers use non-PCB MODF.
Maintenance facilities/mini-bike shop	03G/02G	03G	High	Use BMPs for handling, storage and use of hazardous materials.
Parking lots, internal transportation corridors	02G	All	Moderate	Request limited use of road salt and provide drainage away from well.
Septic system components	01G & 02G	All	Moderate	Use BMPs to maintain systems and prohibit disposal of non-sanitary waste to systems. School utilizes a dry well for gray water at one dorm.
UST/AST	01G & 02G	All	High/Moderate	Continue to upgrade and maintain storage tanks as appropriate and monitor all use and deliveries
Hazardous materials use and storage (VSQG)	All	--	Moderate	Household hazardous materials and VSQG

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

Water from the wells serving the facility is not treated at this time. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone Is and IWPA's and Table 1 for additional information regarding the location of the wells and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are several activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I,**
2. **Institutional use - residential school,**
3. **Underground and above ground storage tanks**
4. **Transportation corridors,**
5. **Hazardous materials management.**

The overall ranking of susceptibility to contamination for the system is high, based on the presence of one or more high ranking land uses or activities in the Zone I and IWPA of at least one of the sources, as seen in Table 2.

**1. Non-conforming Zone I**– The Burritt and Intake wells are non-conforming to current DEP regulation that limits activities within Zone I to water supply related or other non-threatening activities. The Zone I for the Main Administration Well 03G, is conforming, however the maintenance garage is on the edge of the Zone I. Many sources were developed prior to DEP Zone I restrictions and are grandfathered sources. DEP approval is required prior to increasing water use or modifying systems for sources that are not in conformance with Zone I requirements.

### Recommendations:

- V Continue to monitor activities within the Zone I and prohibit any new non-water supply activities in Zone I.
- V Use Best Management Practices for handling all household hazardous materials, stormwater runoff, and septic system maintenance.
- V Consider relocation of wells if potential threats cannot be mitigated and water quality is impacted.

**2. Institutional use – Residential school** - The facility is a residential school with all associated activities including dormitories, infirmary, recreational facilities, classrooms, maintenance facilities, parking, etc. Maintenance and services provided to the facility include all household hazardous materials including petroleum products for maintenance vehicles (lawn mowers, tractors, etc) paints and cleaning materials.

### Recommendations:

- V Use BMPs for activities within close proximity to the wells.
- V Continue monitoring and managing stormwater runoff, directing it away from the wellhead.
- V Do not use pesticides or fertilizers within the Zone I of the wells. Utilize Integrated Pest Management (as practical) on campus to minimize the use of pesticides and nutrients in fertilizers.

### Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (I WPA).

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and local town boards.

**3. Underground and above ground storage tank (UST/AST)** – The school has two 500-gallon USTs with fuel oil and several ASTs with gasoline and fuel oil. If managed improperly, USTs and ASTs and their associated fuel lines can be a potential source of contamination due to leaks or spills of the chemicals they store.

#### Recommendation:

- ✓ Any modifications to the USTs and ASTs must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding storage tanks. Monitor all activities associated with the products especially during delivery.

**4. Transportation corridors** – There are internal walkways/access roads within the Zone Is and/or IWPA's of the wells. Roadway construction, maintenance, and typical use, even on low use roads can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals such as fuel oil. De-icing materials, automotive chemicals and other debris on roads and in parking areas, are picked up by stormwater and wash into catchbasins or to swales. Stormwater management issues on town roads should be addressed in cooperation with the Town.

#### Transportation Corridor Recommendations:

- ✓ Identify stormwater drains and the drainage system along transportation corridors.
- ✓ Work with local emergency response teams to ensure that any spills within the protection areas can be effectively contained.
- ✓ Use minimal road deicers within the protective areas, and monitor the parking lot and roadside for spills and leaks.

**5. Hazardous Materials Storage and Use** – The school has small amounts of hazardous materials associated with maintenance at the school. The facility is registered as a Very Small Quantity Generator of hazardous waste and maintains a locked storage facility near the Main Office. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to discharge into a floor drain leading to the ground or directly to the ground. This includes floor drains in boiler rooms. The facility uses propane as a fuel source. However, floor drains in areas that hazardous materials make be discharged to, including boiler rooms, may not discharge to the septic system and should be connected to a tight tank. Contact the DEP Underground Injection Control Program (Rick Larson at 413-755-2207) if you require additional information.

#### Hazardous Materials Storage and Use Recommendations:

- ✓ Educate staff on best management practices for storage, use and handling of hazardous materials for protecting water supplies.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Kolburne School is commended for improving management of hazardous materials and is encouraged to continue reviewing and evaluating storage, use and disposal of hazardous materials on campus. Continue monitoring activities in the protection areas and review and adopt the key recommendations above and as follows:

#### Priority Recommendations:

- ✓ Review activities and practices at the maintenance facility. Continue use of BMPs for use and handling of hazardous materials.
- ✓ Maintain septic systems and prohibit inappropriate disposal into the systems.

**Zone I:**

- ✓ Prohibit any new non-water supply activities from the Zone Is.
- ✓ Conduct regular inspections of the Zone Is. Look for evidence of leaks or spills and regularly inspect the integrity of the well caps and seals around the wells.
- ✓ Do not use or store pesticides, fertilizers or hazardous materials within the Zone I.

**Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices, including custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs away from the immediate area of the wells and at locations where BMPs should be used.

**Facilities Management:**

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property. Do not use pesticide in Zone I. Incorporate an Integrated Pest Management (IPM) approach into your pest management programs. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Ensure that stormwater runoff is directed away from the water supplies.

**Planning:**

- ✓ Request that the town develop a Wellhead Protection District and associated bylaws and request that the IWPA for your and other water systems be include in the protection area.
- ✓ Work with local officials in New Marlborough to include the School Zone Is and the IWPA's in their emergency planning and to assist you in improving protection.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
YMCA CAMP WA WA SEGOWEAU

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 27, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	YMCA Camp Wa Wa Segoweau
<i>PWS Address</i>	Foley Hill Rd
<i>City/Town</i>	New Marlborough, Massachusetts
<i>PWS ID Number</i>	1203009

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1203009-01G	182	478	High	Moderate
Well #2	1203009-02G	182	478	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
# 1 (1203009-01G)**

Zone I = 182 ft.  
IWPA = 478 ft.

### How was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and/or the IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and parking areas within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, a Sanitary Survey, water quality data, and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report for New Marlborough Central School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
June 15, 2001

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	New Marlborough Central School
<i>PWS Address</i>	44 Harstville - Hill Road
<i>City/Town</i>	New Marlborough, Massachusetts
<i>PWS ID Number</i>	1203011
<i>Local Contact</i>	Mr. William Cooper, Superintendent

Well 1	1203011-01G	100	421	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

New Marlborough Central School, an elementary school with a total staff and student population of approximately 100 people, is located immediately on the side of the road in a rural, residential setting. Well 1 is the sole source of water for the school and is on the northeast side of the school, within 5 feet of the school wall. The Zone I protective radius for Well 1 is 100 feet and the Interim Wellhead Protection Area (IWPA) radius is 420 feet. The protective radii were based on the average daily water use of 950 gallons per day (gpd) calculated from metered data for the maximum reported month. Please refer to the attached map that shows the Zone I and IWPA.

Well 1 is a 6inch diameter well with the pump set at approximately 180 feet and is reportedly drilled to a final depth of 425 feet. There is no record of final construction of the well or of the materials encountered during drilling. Geologic mapping of the area

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

indicates the overburden material at the school consists of sand and gravel, stream terrace deposits but does not indicate the depth of the deposits. Because of the depth of the well, it is assumed to be a bedrock well. The bedrock is mapped as carbonate (limestone and dolomite) rocks of the Stockbridge Group. Bedrock wells drilled in these conditions are considered to be highly vulnerable to potential contamination from the ground surface because there is no significant barrier to prevent surface contamination from migrating into the bedrock aquifer.

### Water Quality

The New Marlborough Central School well water does not require and does not have treatment at this time. For current information on monitoring results, please refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Activities in Zone I**
2. **An Underground Fuel Oil Storage Tank in IWPA**
3. **Parking, roadways and storm water catch basins**
4. **Floor Drain**

The overall ranking of susceptibility to contamination for the well is high, based on the presence of at least one high and several moderately ranked land use or activities in the IWPA, as seen in Table 2.

1. **Non-conforming Activities in Zone I** – Currently, the well does not meet DEP's restrictions that allow only water supply related activities in Zone I. The facility's Zone I contains school buildings, roads, parking areas, and septic system components. The public water supplier does not own all land encompassed by the Zone I and therefore has no control over some of the activities. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Fuel Storage Below Ground (UST)	No	Yes	High	Underground heating oil tank
Parking lot, storm drains, driveways & roads	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells. Maintain drains.
Athletic Field	No	Yes	Moderate	Continue policy of no fertilizer or pesticide usage. Passive recreation.
Septic System	No	Yes	Moderate	See septic systems brochure in the attachments
Low density residential w/septic systems	No	Yes	Moderate	See septic system/pesticide brochures in the attachments
Floor drain – Boiler Room and Gymnasium	Yes	No	Moderate	No hazardous materials stored in either room No additives to boiler.
Structures	Yes	Yes	-	Non-water supply activities in Zone I

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Recommendations:

- ✓ Do not conduct any new activities within Zone I.
- ✓ Do not use or store pesticides, fertilizers or deicing materials within the Zone I.
- ✓ If the existing threats cannot be mitigated, and pose increased threat, consider investigating an alternative site for a new well.

2. **Underground Fuel Oil Storage Tank (UST)** – The fuel oil storage tank was replaced in 1994 outside of the Zone I and was constructed in compliance with current requirements for double wall construction and leak detection. An UST in the IWPA containing petroleum products is a concern due to the potential threat posed by a release of large quantities of fuel.

## Recommendations:

- ✓ Closely monitor activities associated with the fuel tank refilling and usage.
- ✓ Any further modifications to the UST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.

3. **Parking, roadways and storm water catch basins** – Catch basins transport storm water from the roadway and adjacent properties to the ground. As flowing storm water travels, it picks up debris and contaminants from streets, parking areas and lawns. Common potential contaminants include lawn chemicals, pet waste, leakage from dumpsters, household hazardous waste, and contaminants from vehicle leaks, maintenance, washing or accidents.

## Recommendations:

- ✓ Direct stormwater drain outflows away from the Zone I and IWPA.
- ✓ Work with the Town to have the catch basins inspected, maintained, and cleaned on a regular schedule. Additionally, street and parking lot sweeping reduces the amount of potential contaminants in storm runoff.

4. **Floor Drain** - The floor drain in the boiler room is required to protect the school from accidental plumbing failure. There are no hazardous materials stored in the boiler room and an outside contractor maintains the boiler. The janitor's room is adjacent to the boiler room. Although there are no hazardous materials stored there, the cleaning materials are kept in the room. Floor drains in the gymnasium and in

the stairwell immediately outside of the boiler room are believed to be connected to the same drain. It is the understanding of the school personnel that the drain leads to a surface outlet but collapsed some time ago.

## Recommendations:

- ✓ Install a shallow berm across the threshold between the janitor's room and the boiler room to prevent any accidental spills through the floor drain. Oil lines from the tank to the boiler can be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the bermed boiler. A policy and plan should be in place during maintenance operations, especially when oil filters are changed. Request that your boiler maintenance contractor use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The staffs of the Southern Berkshire Regional School District and the New Marlborough Central School are commended for current protection measures. The New Marlborough Central School in conjunction with the district and local officials should review and adopt the key recommendations above and the following:

#### Priority Recommendations:

- ✓ Install a shallow berm between the janitor's room and the boiler room to prevent an accidental spill through the floor drain.

#### Zone I and IWPA:

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Monitor all non-compliant activities in the Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Prohibit public access to the well by locking facilities and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check area for accidental spills and leaks, etc.
- ✓ Maintain road and parking lot drainage and catch basins.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

#### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous materials.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies or other references).
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

#### Facilities Management:

- ✓ Prohibit non-sanitary wastewater discharges to on-site septic systems. Post sinks as appropriate.
- ✓ Remove hazardous materials from rooms with floor drains that drain to the ground or septic systems; install a berm between the janitor's room and the boiler room.
- ✓ Implement Best Management Practices (BMPs) for the use of pesticides on facility property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ Concrete wellhead protective pads should slope away from well and well casing should extend above ground.
- ✓ For utility transformers, including pole mounted transformers that may contain

PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Contact the utility if the area near the transformer has tree limbs that could endanger the transformer in a storm.

#### Planning:

- ✓ Work with local officials in New Marlborough to encourage the development of and implementation of Aquifer Protection Bylaws that would include the school's IWPA and to assist you in improving protection of your water supply. The Department can assist your community in developing wellhead protection bylaws.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.

- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers address Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Wellhead Protection Grant or the Source Water Protection Technical Assistance/Land Management Grant Program. For additional information, please refer to the attached program fact sheet. Please note that each program year, the Department posts a new Request for Response (RFR – grant application form) for the Grant programs on the internet on or about May 1. Responses are due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
THE MANOR

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 27, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	The Manor
<i>PWS Address</i>	Rte 57
<i>City/Town</i>	New Marlborough, Massachusetts
<i>PWS ID Number</i>	1203012

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1203012-01G	240	592	Moderate	Moderate
Well #2	1203012-01G	240	592	Moderate	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for NEW  
WELL #1 (1203012-01G)**

Zone I = 240 ft.  
IWPA = 592 ft.

### How was my Well's Susceptibility Determined?

Your wells' **moderate** susceptibility to potential microbial threats is based on the construction of the wells and the potential for flooding around the casing. The **moderate** susceptibility to potential non-microbial threats is based on the local roads within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report for Swift River Elementary School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
June 15, 2001

**Table 1: Public Water System (PWS) Information**

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

### The Well

Swift River Elementary School is a rural, elementary school located on the south side of Wendell Road in New Salem. The school student and staff population is approximately 200 people per day and is served by a single potable supply well (Well #1) located in the boiler room of the school.

The well has a Zone I protective radius of 161 feet and an Interim Wellhead Protection Area (IWPA) radius of 457 feet based on reported metered, maximum water usage. Although there is no record of well yield from the well installation, the pump has a rated

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

capacity of approximately 20 gpm. Well #1 is a 6-inch diameter well drilled to a depth of approximately 210 feet below ground. There is no known driller's log describing the construction of the well or materials encountered during drilling. However, it is known that the well pump is set at approximately 190 feet below ground. Bedrock outcrops are observed on-site indicating little or no overburden. The bedrock in the area is mapped as the Fourmile Gneiss, a layered massive, biotite-feldspar gneiss. Wells constructed in bedrock aquifers under these conditions are considered to have high vulnerability due to the lack of a barrier to prevent surface contaminants from migrating into the bedrock aquifer. Currently, the only treatment of the water is the addition of potassium carbonate to raise the pH preventing the leaching of copper and lead from the distribution pipes in the school. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the attached maps of the Zone Is and IWPAs and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, it was noted the few land uses and activities within the drinking water supply protection areas are potential sources of contamination.

### Key issues include:

1. **Non-conforming activities within Zone I**
2. **Septic System components in the IWPA**
3. **Floor drain in boiler room**

The well is located in an aquifer with a high vulnerability to contamination due to the absence of a significant hydrogeologic barrier to prevent contaminant migration. The overall ranking of susceptibility to contamination for the well is high, based on the presence of the presence of several moderate threat land use or activity in the IWPA, as seen in Table 2.

### 1. Non-conforming activities within Zone I

Currently, the well does not meet DEP's restrictions that allow only water supply related activities in Zone I. The facility's Zone I contains school buildings, roads, parking areas, and septic system components. The public water supplier does not own all land encompassed by the Zone I and therefore has no control over some of the activities. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Above Ground oil tank	Yes	No	Moderate	Secondary containment and line protection in place.
Septic System components (leachfield)	No	Yes	Moderate	Refer to attached septic system fact sheet.
Floor Drain in the boiler room to septic system	No	Yes	Moderate	Develop a policy and plan for protecting the floor drain during maintenance
Parking, storm water and road way	Yes	Yes	Moderate	Manage, monitor and maintain system.
Passive Recreation	No	Yes	Low	Athletic Fields

- -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

modifying systems.

### Recommendations:

- ✓ Do not conduct any new activities within Zone I.
- ✓ Do not use or store pesticides, fertilizers or deicing materials within the Zone I.
- ✓ If the existing threats cannot be mitigated, and pose increased threat, consider investigating an alternative site for a new well.

2. **Septic systems** - The septic system leach field is located within the IWPA of the wells. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Improper disposal of household hazardous chemicals to septic systems or discharge from the boiler room are also potential sources of contamination to the water supply.

### Recommendations:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator.
- ✓ Refer to the appendices for more information regarding septic systems. The school is currently not registered as a generator of hazardous waste or waste oil. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" to determine regulatory requirements.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.

3. **Floor drain in the boiler room** – Floor drains may be required in boiler rooms to provide drainage in the event of a plumbing failure. If there is a potential for hazardous materials to flow accidentally into the floor drain, however, preventive measures should be taken. Floor drains in an area that contains hazardous materials must be discharged to a sewer or a tight tank. The boiler room at the Swift River Elementary School has a floor drain that discharges to the septic system. Oil lines from the tank to the boiler are sleeved and have a negative pressure so that so that any drop in pressure would cause the oil to drain back to the tank therefore minimal oil could leak to the boiler room in the event of an accident.

### Recommendations:

- ✓ A written policy and plan should be in place during maintenance operations, especially when oil filters are changed. Request that your boiler maintenance contractor use containment, protect the drain and have absorbent materials onhand to prevent accidental leaks while conducting routine maintenance. Please note that boiler blow down generated during routine maintenance cannot be discharged through the floor drain and must be disposed of off site.

Other activities that were noted during the assessment were stormwater from the parking area and the road and some agricultural activities. As flowing storm water travels, it picks up debris and contaminants from parking areas and lawns. Common potential contaminants include lawn chemicals, pet waste, leakage from dumpsters, household hazardous waste, and contaminants from vehicle leaks, or accidents.

Pollutants are actually not removed from most catch basins until they are cleaned out. Regular maintenance is required to reduce the risk of resuspension of sediments and contaminants during

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

large storm events. Maintenance is essential for the proper operation of catch basins and the sediment/water quality basin. Due to the shallow bedrock contaminant discharged through the basin may impact the bedrock aquifer. If you do not have a storm water maintenance plan, work with the Town to develop one. Maintenance plans should include an inspection and maintenance schedule for inlets and outlets. Look for color, turbidity, odor, oil sheen etc. at the outlet. All observations should be recorded and action taken if evidence of a release of hazardous materials such as petroleum products has been observed. Inspect parking areas periodically for evidence of leaks or accidental spills.

Encourage local farmers to contact the Department of Food and Agriculture or National Soil Conservation Service to obtain and follow a Farm Plan through Natural Resource Conservation Service. Alternatively, farmers may complete and follow their own plan developed through the publication *On Farm Strategies to Protect Water Quality: An Assessment and Planning Tool for Best Management Practice*. Information on funding and resources is available through the Massachusetts Department of Food and Agriculture.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The Swift River Elementary School staff is commended for current protection measures.

Please review and adopt the key recommendations listed above and as follows:

### Zone I and IWPA:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I. Look for evidence of unauthorized access.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider gating the wellhead.
- ✓ Post drinking water supply signs key location such along the access road and in the parking area.
- ✓ Provide information to staff about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Do not use fertilizers and pesticides in Zone I.
- ✓ Use Best Management Practices (BMPs) for the use of fertilizer lawn care, pesticides and household hazardous waste.

### Training and Education:

- ✓ Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies).
- ✓ Inform all staff regarding proper use and disposal of household hazardous materials.

### Facilities Management:

- ✓ Concrete or earthen collars around the wellhead should slope away from well.
- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator.
- ✓ Refer to the appendices for more information regarding septic systems. The school is currently not registered as a

generator of hazardous waste or waste oil. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" to determine regulatory requirements.

**Planning:**

- ✓ Work with local officials in Warwick to include the school well's IWPA in an Aquifer Protection District Bylaws and to assist you in securing protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the 2001 "Wellhead Protection Grant Program". For additional information please refer to the attached program fact sheet. Please note that each program year, on or about May 1 the Department posts a new Request for Response (RFR), grant application form. Generally, the applications are due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at

<http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
HAMILTON ORCHARDS

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 3, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Hamilton Orchards
<i>PWS Address</i>	25 West St
<i>City/Town</i>	New Salem, Massachusetts
<i>PWS ID Number</i>	1204002

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1204002-01G	115	428	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1204002-01G)**

Zone I = 115 ft.  
IWPA = 428 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic leach fields within the Zone I / IWPA. The **high** susceptibility to potential non-microbial threats is based on the storage of hazardous materials, agricultural activities, and floor drains within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your 1999 Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- inspect the Zone I and IWPA regularly;
- work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- do not use pesticides, fertilizers or road salt within the Zone I;
- address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**North Adams Water Department**

### What is SWAP?

The Source Water Assessment and Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including stormwater runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate Best Management Practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Section 1: Description of the Water System

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

### Groundwater Sources

MA GIS Zone II ID #: 471

Susceptibility: High

Well Name	Source ID#
Greylock Well #1	1209000-01G

### Surface Water Sources

Source Name	Susceptibility: High
Notch Reservoir	1209000-01S
Broad Brook Intake	1209000-02S
Williams Reservoir	1209000-04S

North Adams is a mid-sized city located in the northwest corner of Massachusetts, in the heart of the Berkshires. The city developed primarily as an industrial and commercial center along the Hoosic River valley. Outside of the valley area, the more mountainous areas are primarily forest and residential land use. The Hoosic River flows primarily north from Cheshire to the center of North Adams, where the river valley narrows significantly and flows west then northwest before it discharges into the Hudson River. The portion of the river that flows west and northwest is the aquifer utilized by the Williamstown and North Adams wells. The North Adams Water Department maintains and operates one groundwater source (Greylock Well 01G) and three reservoirs (Notch Reservoir 01S, Broad Brook Intake 02S and Mt. Williams Reservoir 04S); one additional surface water source (James Brook 03S) is registered as an emergency source. The emergency reservoir will not be assessed in this report.

The Greylock Well (01G) is located within the center of the same confined, buried valley, sand and gravel aquifer in the Hoosic River valley as the Williamstown groundwater sources. Data from the well development indicates the aquifer is under artesian pressure during static conditions. The aquifer is within a glacially deepened bedrock valley that was filled with sand and gravel during the glacial recession (melting) some 12,000 years ago. Glacial Lake Bascom was formed throughout much of the westerly trending Hoosic River valley leaving some areas with an extensive clay confining unit overlying a productive sand and gravel aquifer; other areas of the valley do not have a protective clay layer and are sand and gravel throughout. The clay layer pinches

out toward the northerly and southerly edges of the aquifer valley and to the east toward the center of North Adams. The protective confining clay unit pinches out approximately 4,500 feet east of North Adams' Greylock well. The bedrock underlying the aquifer is fractured dolomite, a calcium/magnesium carbonate, that can potentially contribute significant amounts of water to the sand and gravel aquifer.

Although some portions of the aquifer are protected from activities and land use on the ground surface by the clay layer, the aquifer is considered to be highly vulnerable to contamination because the hydrogeologic barrier (i.e. clay) is not continuous throughout the developed recharge area. The Zone II for the Greylock well was delineated as part of the SWAP program utilizing empirical data, analytical modeling and geologic mapping. Although the area is densely developed, the entire Zone II area is served by municipal sewers. Please refer to the attached map to view the boundaries of the Zone II.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

The Mt. Williams Reservoir is the primary water source for the City and is supplemented by the Notch Reservoir. The Williams and Notch Reservoirs are located in the uplands adjacent to the Mt. Greylock State Forest. The City owns approximately 80% to 90% of the watershed area with the state forest encompassing a small percentage of land. The watersheds are located in an area of steep slopes, in the till covered uplands in the southwestern part of the City. The bedrock is composed primarily of the metamorphic rock types of schist and gneiss. Water is pumped from the Notch Reservoir through a main into the watershed of the Mt. Williams Reservoir. The water is discharged into a brook that flows into the Mt. Williams Reservoir. Water from the Mt. Williams Reservoir (which includes the flow from the Notch Reservoir) is filtered through the Mt. Williams Treatment Facility, an alternative flocculation system with rapid sand filtration, iron and manganese removal, pH adjustment for corrosion control and chlorine disinfection prior to distribution.

The Broad Brook Intake is located in Pownal, Vermont and is presently an inactive source of water. The source is not filtered but, when used is chlorinated prior to distribution. The watershed is sparsely populated and primarily forest. The Broad Brook watershed is also located within a till covered upland. Bedrock in this area is also primarily schist and gneiss. There are numerous camps along

the Broad Brook within the Zone A along with few roads throughout the watershed. Some of the camps are on private land and some appear to be on City-owned land.

The Greylock Well is utilized to supplement the surface water supplies. Water from the Greylock Well does not require treatment and is not treated prior to distribution. There are confirmed hazardous waste release sites located upgradient of the Greylock Well within the Zone II contribution area. Monitoring wells are located upgradient of the Greylock Well associated with the ongoing investigation of one release site and groundwater from those wells is regularly monitored to evaluate the impact on the aquifer. Although there is no currently reported impact to the water quality from the Greylock Well, there is continued long term monitoring of the water quality in the aquifer. At this time water from the Greylock Well does not require treatment and is not treated prior to distribution. The DEP Bureau

of Waste Site Cleanup (BWSC) is overseeing the activities and investigation related to that site and may be contacted for additional information about confirmed release sites at 413-784-1100.

For current information on drinking water quality monitoring results and treatment, please request a copy of the most recent Consumer Confidence Report from the Public Water System "Local Contact" listed in Table 1. Drinking water monitoring reporting data is also available on the web at <http://www.epa.gov/safewater/ccr1.html>.

## Section 2: Land Uses in the Protection Areas

The Zone II area includes a mix of residential, industrial and commercial land use activities. The watershed areas for the North Adams surface water supplies are primarily forest lands; greater than 90% of the watershed lands is protected through City of State ownership. Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Activities in Zone I
2. Activities in Zone A
3. Residential Land Uses
4. Transportation Corridors
5. Hazardous Materials Storage and Use

### What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

6. Oil or Hazardous Material Contamination Sites
7. Comprehensive Wellhead Protection Planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2. The susceptibility of the surface water sources is moderate based on the activities within their protective areas.

**1. Activities in Zone I** – The Zone I for the well is a 400 foot radius around the wellhead. Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. The Greylock Well is located within a developed residential/industrial area of the City. Only water supply activities are allowed within the Zone I. However, many public water supplies were developed prior to promulgation of the Department's regulation and contain

### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

non-water supply activities such as homes and public roads. The following non-water supply activities occur in the Zone I of the system well:

**Well 01G** - Thirteen homes, local roads, a school, and athletic fields. The entire area is served by municipal sewer.

#### Zone I Recommendations:

- ✓ To the extent feasible, remove all non water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Prohibit new non-water supply activities in the Zone I.

**2. Activities in Zone A** - The Zone A for a reservoir includes all areas within 400 feet of the reservoir shore line and within 200 feet of either side of all streams and feeder ponds that flow into the reservoir. Because the Zone A is the area closest to the reservoir and its tributaries, land uses within the Zone A are of particular concern. Therefore, certain activities that could potentially threaten water quality if improperly managed are restricted by 310 CMR 22.20B. Activities that store, use, or dispose of hazardous materials can be potential sources of contamination if improperly managed. Wild animals and domestic pets can be carriers of waterborne diseases such as Giardia, Cryptosporidium, Salmonella, etc. The following activities occur in the Zone As of the system's reservoirs:

Figure 1: Sample watershed with examples of potential sources of contamination

**Broad Brook (02S)** - There are few local roads in the watershed but numerous camps and residences, in the Zone A of the Broad Brook source, all of which are primitive sites or utilize private septic systems. There is also evidence of extensive access by off road vehicles on both legal and illegal trails throughout the watershed.

**Williams and Notch Reservoirs (01S and 04S)** - There are few roads through these watersheds and the runoff from the road immediately adjacent to the Williams Reservoir is reportedly directed out of the watershed and not toward the reservoir.

#### Zone A Recommendations:

- ✓ Purchase land within the Zone A or protect through conservation restrictions.
- ✓ Enforce no trespassing on Water Department land, particularly in areas along the brooks and closest to the intake. Include signs, patrols and fines for violators as appropriate.
- ✓ To the extent possible, remove all prohibited activities from the Zone A to comply with

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Water Supply Protection Areas**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Zone II	Watershed Source ID	Potential Contaminant Sources*
<b>Commercial</b>					
Auto Repair/Body Shops	10	H	Yes	-	Spills, leaks, or improper handling of automotive fluids, and solvents
Railroad Tracks	1	H	Yes	-	Over-application or improper handling of herbicides, leaks or spills of transported chemicals, maintenance chemicals; fuel storage
Funeral Homes	Few	L	Yes	-	Hazardous chemicals: spills, leaks, or improper handling
Laundromats	1	L	Yes	-	Wash water: improper management
Beauty Salons	3	L	Yes	-	Hazardous chemicals
Car/Truck/Bus Washes	1	L	Yes	-	Vehicle wash water, soaps, oils, greases, metals, and salts: improper management
Gas Stations	3	H	Yes	-	Automotive fluids and fuels: spills, leaks, or improper handling or storage
Bus and Truck Terminals	2	H	Yes	-	Fuels and maintenance chemicals: spills, leaks, or improper handling
Cemeteries	2	M	Yes	-	Over-application of pesticides: leaks, spills, improper handling; historic embalming fluids
<b>Industrial</b>					
Chemical Manufacture Or Storage	1	H	Yes	-	Chemicals and process wastes: spills, leaks, or improper handling or storage
<b>Miscellaneous</b>					
Schools	3	M	Yes	-	Laboratories, cleaning materials, fertilizers
Electroplaters	1	H	Yes	-	Solvents and other chemicals: spills, leaks, or improper handling or storage
Aquatic Wildlife	Occasional	H	No	All	Microbial contaminants
Clandestine Dumping	Few	H	Yes	-	Improper use or storage of fuels and other chemicals

Land Uses	Quantity	Threat*	Zone II	Watershed Source ID	Potential Contaminant Sources*
<b>Miscellaneous</b>					
Oil or Hazardous Material Release Sites (MCP-21E)	12	-	Yes	-	Tier Classified Oil or Hazardous Materials Sites are not ranked due to their site-specific character. Individual sites are identified in Appendix B.
Transmission Line Rights-of-Way : <u>Natural gas</u>	1	H/L	Yes	-	Construction and corridor maintenance, over-application or improper handling of herbicides
Transportation Corridors	Numerous	H/M	Yes	-	Accidental leaks or spills of fuels and other hazardous materials, over-application or improper handling of pesticides
Underground Storage Tanks	Numerous	H	Yes	-	Spills, leaks, or improper handling or storage of hazardous materials and waste
Large Quantity Hazardous Waste Generators	1	H	Yes	-	Hazardous materials and waste: spills, leaks, or improper handling or storage
Small Quantity Hazardous Waste Generators	6	M	Yes	-	Hazardous materials and waste: spills, leaks, or improper handling or storage
Very Small Quantity Hazardous Waste Generator	Numerous	L	Yes	-	Hazardous materials and waste: spills, leaks, or improper handling or storage
Aboveground Storage Tanks	Numerous	M	Yes	-	Spills, leaks, or improper handling or storage of hazardous materials and waste
<b>Residential</b>					
Fuel Oil Storage (at residences)	Numerous	M	Yes	Few—02S	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Yes	Few -02S	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Few	M	No	02S	Hazardous chemicals: microbial contaminants, and improper disposal

**Notes:**

- When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
- For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
- For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - Where there are two rankings, the first is for surface water, the second for groundwater sources. The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

DEP's Zone A requirements.

- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Storage of pesticides, fertilizers or road salt within the Zone A should be covered and contained.
- ✓ Keep any new prohibited activities out of the Zone A.

**3. Residential Land Uses** – The watersheds have very small percentages of residential land use and they are predominantly forested. However, approximately 48% of the Zone II consists of residential land use. The entire Zone II area is served by municipal sewers. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Residential Land Use Recommendations:**

**Top 5 Reasons to Develop a Local Wellhead and Surface Water Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**4. Transportation Corridors** - There are numerous roads located throughout the Zone II and few within the watersheds. Catch basins and natural drainage, transport stormwater from roadways and adjacent properties to the ground, recharge areas, streams, rivers or reservoirs. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include contaminants from automotive leaks, maintenance, car washing, pet waste, de-icing materials, pesticides and fertilizers or accidental spills. Additionally, roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. There reportedly some illegal dumping evident in the protection areas. Clandestine dumping is identified as a significant threat to water supplies.

Railroad tracks run directly through the Zone II along the edge of the aquifer. Rail corridors serving passenger or freight trains are potential sources of

contamination due to chemicals released during normal use, track maintenance, and accidents. Accidents can release spills of train engine fluids and commercially transported chemicals.

**Transportation Corridor Recommendations:**

- ✓ Continue routine inspections of the watershed area and the Zone II for illegal access, dumping and spills. Increase patrols in areas of high access.
- ✓ Post “No Trespassing” signs in high access areas and impose fines for trespassers and identified illegal dumpers.
- ✓ Work with local emergency response teams to ensure that any spills within the protection areas can be effectively contained.
- ✓ Coordinate with the City DPW and the State to have catch basins inspected, maintained, and cleaned on a regular schedule. Regular street sweeping reduces the amount of potential contaminants in runoff. For information on DEP’s S. 319 Nonpoint Source Competitive Grants Program and upcoming funding opportunity refer to: <http://www.state.ma.us/dep/brp/mf/mfpubs.htm#wpa>.
- ✓ Storm Drain Stenciling Program - Work with local watershed groups to institute a Storm Drain Stenciling Program. For more information on how to develop a storm drain stenciling program go to <http://www.earthwater-stencils.com>.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren’t yet available, work with town officials to investigate mapping options such as the upcoming NPDES Phase II Stormwater Rule requiring some communities to complete stormwater mapping. For additional information, refer to the Stormwater Management Information at <http://www.state.ma.us/dep/brp/ww/wwpubs.htm#storm>.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Work with local officials during their review of the railroad right of way Yearly Operating Plans to ensure that water supplies are protected during vegetation control.
- ✓ Review potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP).

The USDA web site is [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Bruce Philbrick, at the local office in Pittsfield office at 413-443-6867 (his e-mail address is [bruce.philbrick@mapittsfield.fsc.usda.gov](mailto:bruce.philbrick@mapittsfield.fsc.usda.gov)). Review the fact sheet available on line and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf>.

- ✓ Visit DEP’s Nonpoint Source Pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**5. Hazardous Materials Storage and Use** – Approximately 13% of the Zone II of the North Adams well includes commercial and/or industrial land uses; the entire area is served by municipal sewers. Many businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Work with local Boards of Health and businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Request that the Board of Health adopt a floor drain regulation in the City. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floor drain requirements. See brochure “Industrial Floor Drains” for more information.

**What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II.
2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

- ✓ The USDA has various funding sources for government, non-government organizations and agricultural facilities in small communities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. Additional information is available on the web site [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Bruce Philbrick, at the local office in Pittsfield office at 413-443-6867 (his e-mail address is [bruce.philbrick@mapittsfi.fsc.usda.gov](mailto:bruce.philbrick@mapittsfi.fsc.usda.gov)).

**6. Presence of Oil or Hazardous Material Contamination Sites** – The Zone II contains DEP Tier Classified Oil and/or Hazardous Material Release Sites indicated on the map as Release Tracking Numbers 1-0000122, 1-0000126, 1-0000342, 1-0000437, 1-0000460, 1-0000475, 1-0000584, 1-0000881, 1-0001061, 1-0010694, 1-0010727, and 1-0013902. Refer to the attached map and Appendix C for more information.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites. Contact the Bureau of Waste Site Cleanup for more information on these sites.

**7. Protection Planning** – Protection planning protects drinking water by managing the land area that supplies water to a well or reservoir. Currently, North Adams does not have water supply protection controls that meet DEP's Wellhead Protection regulation 310 CMR 22.21(2). Wellhead Protection and Surface Water Supply Protection Plans coordinate community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public participation. North Adams in-town reservoirs are well protected by City and state land ownership. The City owns some land around the Broad Brook source. The watershed for Broad Brook is primarily rural but there are no land use controls for the Zone A. The City, does however have an approved Surface Water Supply Protection Plan for that source.

**Protection Planning Recommendations:**

- ✓ Develop a Wellhead Protection Plan. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan."
- ✓ Coordinate efforts with local officials to compare local wellhead protection controls with current MA Wellhead Protection Regulation 310 CMR 22.21(2). If there are no local controls or they do not meet the current regulations, adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ If local controls do not regulate floor drains, be sure to include floor drain controls that meet 310 CMR 22.21(2).

Other land uses and activities within the Zone II and watersheds that are potential sources of contamination are included in Table 2. Refer to Appendix B for more information about these land uses. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

## Section 3: Source Water Protection Conclusions and Recommendations

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone II and watersheds contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- preparing a Water Supply Protection Plan for and efforts to upgrade the Broad Brook source infrastructure that is

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

**For More Information**

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier and the town boards.

- located in Vermont,
- conducting routine inspections of the watersheds, and
- maintaining detailed knowledge of the activities within the watershed and Zone II.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I and Zone As, regularly; when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Develop and implement a Wellhead Protection Plan.
- ✓ Visit DEP's Nonpoint Source Pollution web site for additional information and assistance on NPS pollution at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

#### ➤ **Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships among businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

#### ➤ **Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to groundwater contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained, it could be a potential source of microbial contamination. Animal waste is also a source of microbial contamination.

#### ➤ **Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located, what types of land uses and activities pose threats, and how their efforts can enhance protection.

#### ➤ **Plan for the Future:**

One of the most effective means of protecting water supplies is local planning, including adoption of local controls to protect land use and regulations related to watersheds and groundwater protection. These controls may include health regulations, discharge prohibitions, general ordinances, and zoning by-laws/ordinances that prohibit or control potential sources of contamination within the protection areas.

#### ➤ **Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available on line and call the local office (Amherst 413-253-4350) of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

The Massachusetts Department of Food and Agriculture's Agricultural Environmental Enhancement Program (AEEP) provides funding to farmers to install a variety of water quality protection practices. For more information on the program contact the coordinator, Susan Phinney, at (617) 626-1772, Susan.Phinney@state.ma.us.

The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: if funding is available, each spring DEP posts a new Request for Response for the grant program (RFR) on the website <http://www.comm-pass.com/>.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II and watershed areas. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I and Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I and/or Zone A?	<b>YES</b> 01S, 03S  <b>NO</b> 01G, 02S	Follow Best Management Practices (BMPs) that focus on good house-keeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.  To the extent possible, remove prohibited activities in Zone As to comply with DEP's Zone A requirements. City owns 82% of the watershed.
Are the Zone I and Zone A posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Are the Zone I and Zone A regularly inspected?	<b>YES</b>	Continue inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b> 01G, 02S	Monitor non-water supply activities in Zone I and prohibited activities in Zone As, and investigate options for removing these activities.
<b>Municipal Controls</b> (Zoning Bylaws/Ordinances, Health Regulations, and General Bylaws/Ordinances)		
Does the municipality have Surface Water Protection Controls that meet 310 CMR 22.20C and Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>NO</b>	Working with the Planning Board to review land use controls to see that they meet current requirements of 310 CMR 22.21(2) and 310 CMR 22.20C. Refer to <a href="http://mass.gov/dep/brp/dws/">mass.gov/dep/brp/dws/</a> for model bylaws and health regulations, and current regulations.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>NO</b>	Contact Town officials in Pownal, VT and provide them with information about the boundaries of the watershed. Assist and encourage those representatives in the active protection of the watershed lands.
<b>Planning</b>		
Does the PWS have a local surface water and wellhead protection plan?	<b>YES</b> - Surface <b>NO</b> -Wellhead	Develop a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a watershed and wellhead protection committee?	<b>NO</b>	Develop a committee to include representatives from citizens' groups, neighboring communities, and the business community.
Do the Boards of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	Request adoption of floor drain and hazardous materials handling regulations. For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> .
Does the PWS provide watershed protection education?	<b>YES</b>	Currently, the only outreach is through the annual Consumer Confidence Report. Increase residential outreach through bill stuffers, school programs, Drinking Water Week activities, and coordination with local groups. Aim additional efforts at commercial, industrial and municipal uses within the Zone II.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREA

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Activity Class	Permitted Activity	Facility Description
	Allied Auto Parts/Napa	432 State Road	North Adams	VSQG	HANDLR	Auto Repair
34605	Bator R B	Lime St	North Adams	VSQG	HANDLR	
131418	Berkmatics Inc	59 Demond Ave	North Adams	SQG	HANDLR	
	Braytonville Garage Inc.	10 State Road	North Adams	VSQG	HANDLR	Auto Repair
35642	Collision Shop	5r River St	North Adams	VSQG	HANDLR	Auto Repair

## Underground Storage Tanks

Facility Name	Address	Town	Description	Tank Type	Tank Leak Detection	Capacity (gal)	Contents
Gibbs Oil	303 State Street	North Adams	Gas Station	1 Wall		10,000	Gasoline
				1 Wall		10,000	Gasoline
				1 Wall		10,000	Gasoline
				1 Wall		550	Fuel Oil
Getty Station	326 State Street	North Adams	Gas Station	1 Wall		10,000	Gasoline
				1 Wall		8,000	Gasoline

				1 Wall		8,000	Gasoline
O'Connell Oil Associates, Inc,	1 State Street	North Adams	Gas Station	2 Walls	Interstitial Monitoring	10,000	Gasoline
				2 Walls	Interstitial Monitoring	10,000	Gasoline
				2 Walls	Interstitial Monitoring	10,000	Gasoline
				2 Walls	Interstitial Monitoring	10,000.00	Gasoline

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitellst.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0000122	Ashton Ave.	North Adams	Oil
1-0000126	Brown St	North Adams	
1-0000342	180 River St	North Adams	
1-0000437	Cole St	North Adams	
1-0000460	87 Marshall St	North Adams	
1-0000475	1 State Road	North Adams	Oil
1-0000584	Rt. 2	North Adams	
1-0000881	51 Waldon Street	North Adams	
1-0001061	78 State Rd.	North Adams	Oil

1-0010694	74 Brown St	North Adams	Oil
1-0010727	74 Brown St	North Adams	Hazardous Material
1-0013902	506 State Rd.	North Adams	Hazardous Material

For more location information, please see the attached map. The map lists the release sites by RTN.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Northampton Water Department**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i><b>PWS Name</b></i>	Northampton Water Department
<i><b>PWS Address</b></i>	237 Prospect Street
<i><b>City/Town</b></i>	Northampton, Massachusetts 01060
<i><b>PWS ID Number</b></i>	1214000
<i><b>Local Contact</b></i>	Mr. Charles Borowski
<i><b>Phone Number</b></i>	(413) 587-1098 x301

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Section 1: Description of the Water System

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

### Groundwater Sources

Zone II - MA DEP GIS # 109

Source ID#

Well Name	Susceptibility: High
GP Well #1	1214000-01G
GP Well #2	1214000-02G

### Surface Water Sources

Source Name	Susceptibility: High
Mountain Street Reservoir	1214000-01S
Ryan Reservoir	1214000-03S
West Whately Reservoir	1214000-04S

Northampton is a medium sized community in central western Massachusetts with a diverse economic base of education, retail, commercial and industry. The Northampton Water Department maintains and operates two wells and three reservoirs. The two wells for the Northampton Water Department are located within the same unconfined, sand and gravel aquifer, in the central area of Northampton. Both wells are located within the same Zone II protection area and each well has a Zone I radius of 400 feet. The wells are located in an aquifer with a high vulnerability to contamination due to the absence of a hydrogeologic barrier (i.e. confining clay layer) that can prevent contaminant migration from the ground surface. Please refer to the attached map of the Zone II area.

The Mountain Street Reservoir and its watershed are located on the border of Williamsburg, Whately and Hatfield. The Ryan and West Whately Reservoirs are located in the northwest corner of Whately. The watershed areas for the Ryan Reservoir extend into Williamsburg, Conway and Whately, and the watershed areas for West Whately Reservoir extend into Williamsburg. Water from the Ryan and West Whately Reservoirs can be directed into the Mountain Street Reservoir or directly into the distribution main.

Water from the wells is not treated prior to distribution; water from the reservoirs is disinfected with chlorine and the pH is adjusted with sodium hydroxide and zinc orthophosphate is added for corrosion control prior to distribution. For

current information on monitoring results and treatment, please call the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The Zone II and watersheds for Northampton are primarily forested, with smaller portions consisting of agriculture, residential, and commercial/industrial land uses (refer to the attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

## What is an Aquifer Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

## Key Land Uses and Protection Issues include:

1. Activities in Zone I - 400 foot radius around wells
2. Activities in Zone A - 400 feet from reservoir's edge and 200 feet along either side of the reservoir feeder brooks.
3. Residential Land Uses
4. Transportation Corridors
5. Hazardous Materials Storage and Use
6. Comprehensive Wellhead Protection Planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Activities in Zone I Wellhead Protection Area-** The Zone I for each of the wells is a 400 foot radius around each of the wellheads. Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Northampton does not own the entire Zone I, however, local zoning ordinances limit activities within the Zone I. Many public water supplies were developed prior to the Department's regulations and contain non-water supply activities such as homes and public roads. The following non-water supply

activities occur in the Zone Is of the system wells:

**Well 01G** - There is a local road and one home within the Zone I.

**Well 02G** - There are two homes and an electrical transformer station on the edge of the Zone I.

### Zone I Recommendations:

- ✓ To the extent possible, remove all non-water supply activities from each Zone I to comply with regulatory requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as household hazardous chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non-water supply activities out of the Zone I.

**2. Activities in Zone A of the reservoirs** - The Zone A for the reservoirs includes all areas within 400 feet around each of the reservoirs and within 200 feet of either side of all streams that flow into the reservoirs. Land use activities within a Zone A may have an impact on surface water sources. Wild animals, farm animals and domestic pets can be carriers of waterborne diseases such as Giardia, Cryptosporidium, Salmonella, etc. while road run off can carry other contaminants. There are local roads and small parking areas in the Zone As of the system's reservoirs.

### Zone A Recommendations:

- ✓ Continue to monitor and protect the Zone As and keep any new prohibited activities out of the Zone A.

**3. Residential Land Uses** – Approximately 50% of the Zone II land area and approximately 2% of the total watershed lands consist of residential areas. Although most of the Zone II area is served by municipal sewer, some areas are not and the reservoir watersheds are not served by sewer. All areas not served by sewers, rely on septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not

## What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

## For More Information

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier and town and City boards.

properly maintained they can be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing or accidents.

#### Residential Land Use Recommendations:

- ✓ Make available for distribution the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners in the city and in all host communities to managed development in the water supply protection areas.
- ✓ Continue current efforts to purchase land, conservation restrictions and pursue Right of First Refusal as necessary to further protect the water supplies.

**4. Transportation Corridors** - Local roads run through the protection areas for all of the sources. Roadway construction, maintenance, and typical use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways may be sites for illegal dumping of hazardous or other potentially harmful wastes. Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include contaminants from automotive leaks, maintenance, washing, or accidents.

There are numerous unpaved, ways as well as legal (authorized) and illegal (unauthorized) trails throughout the watersheds and Zone II. Most of these ways and trails through the watershed are not maintained at all or are minimally maintained. The resulting erosion poses a significant threat to water quality in areas that are proximal to feeder streams and the reservoirs, potentially resulting in additional water treatment costs if they continue unchecked and pose a potential threat to public health and safety. Uncontrolled erosion contributes sediment, various contaminants and pathogens into the contributing waters and reservoirs. Evidence of access to the watershed was observed and anecdotal

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

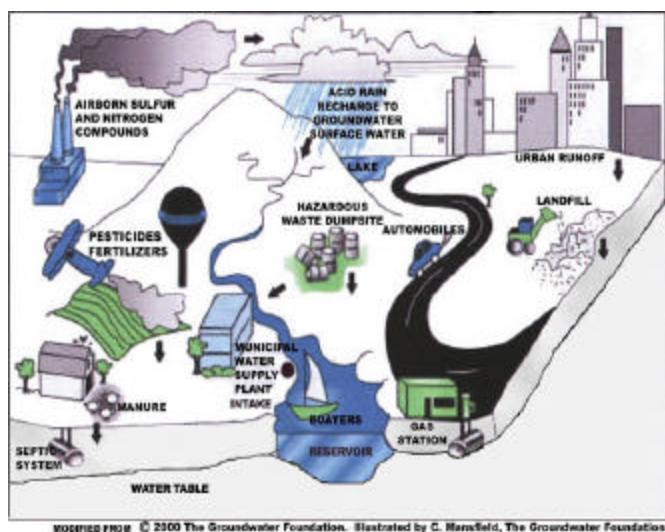

Figure 1: Sample watershed with examples of potential sources of contamination

information indicates access throughout the watersheds. Unmanaged access may also result in vandalism, illegal dumping and access to the reservoir resulting in water quality impairment.

Northampton continues to negotiate with private land owners, recreation groups and the Department of Environmental Management regarding public access and maintenance of trails and ways. They continue to assess the relationship of erosion along trails and turbidity in the reservoir and feeder streams. The City is investigating the disposition of trails and old roads that access the Conway State Forest and other remote areas within the watershed in an effort to manage access and control erosion on trails through the watershed.

#### Transportation Corridor Recommendations:

- ✓ Continue investigating disposition of all roads, ways and “trails” as required. The Department may be of

(Continued on page 6)

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Aquifer Zone II	Watershed Source ID	Potential Contaminant Sources*
<b>Agricultural</b>					
Forestry Operation	Throughout	L	-	All	Have approved forestry plans. Leaks, spills, or improper handling of petroleum products, erosion.
<b>Industrial</b>					
Manufacturer (Proposed)	1	H	Yes	-	Solvents, inks and process waste: spills, leaks, or improper handling or storage of hazardous materials. Area is served by sewer.
<b>Residential</b>					
Fuel Oil Storage (at residences)	> 100 in ZII Few in Watersheds	M	Yes	01S, 03S	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	> 100 in ZII Few in Watersheds	M	Yes	01S, 03S	Over application or improper storage and disposal, of pesticides improper use and handling of petroleum products
Septic Systems / Cesspools	> 100 in ZII Few in Watersheds	M	Yes	01S, 03S	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>					
Aquatic Wildlife	(Actively managed)	H	-	All	Microbial contaminants
Elementary School	1	M	Yes	-	Spills, leaks, or improper handling or storage of household type hazardous materials; large parking area
Stormwater Drains/ Retention Basins	Many in ZII Few in Watersheds	L/H	Yes	All	Erosion, debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transmission Line Rights-of-Way	1	H	-	01S	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors—Legal and illegal access	Several	M/H	Yes	All	Fuels and other hazardous materials: accidental leaks or spills; pesticides—vegetation control: over-application or improper handling. Illegal access to watershed, potential of illegal dumping.
Utility Substation Transformers	1	L	Yes	-	MODF (oils): spills, leaks, or improper handling. The utility has stated that the transformer MODF does not contain PCBs

See Table notes on Page 6.

**Table 2 Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - Where there are two rankings, the first is for surface water, the second for groundwater sources. The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

assistance with discussions regarding the control of access.

- ✓ Continue current patrols of watershed land and active management including enforcement of no trespassing in designated areas.
- ✓ Continue to evaluate options for management of access to ways. Include evaluation of continuing current practice of full access, closing roads to all traffic, closing road to all commercial traffic and limiting access only to residents with a locked gate and key for residents only. Request abandonment of former county roads as appropriate from MA DCAM or the MA Legislature. Continue proactive management of activities.
- ✓ Continue to regularly inspect watershed and Zone II for illegal activities and spills.
- ✓ Work with local emergency response teams to ensure that any spills within the protection areas can be effectively contained.
- ✓ Work with the Towns and the City to have catch basins or other storm water management structures inspected, maintained, and cleaned on a regular schedule. Regular street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with City and town officials to prioritize the mapping of storm drains in the Zone II and the watersheds for the Phase II Stormwater Rule.
- ✓ Promote BMPs for stormwater management and pollution controls. Consider a storm drain stenciling program.
- ✓ Commercial agricultural facilities and rural municipalities may be eligible for funding BMPs through the NRCS. Contact the NRCS about the Environmental Quality Incentives Program (EQIP).

**5. Hazardous Materials Storage and Use** – There are no industrial activities within the watersheds of the reservoirs. However, it is proposed that the water treatment facility be located immediately adjacent to one of the reservoirs. There is no municipal sewer and therefore the facility is proposed to utilize lagoons. Less than 1% of the Zone IIs for Northampton's wells is commercial and industrial land uses. There is only one large facility within the Zone II area. Presently, that facility is idle, however, a business associated with printing manufacturing, presently located within Northampton is reportedly planning to move or expand into the facility. Many businesses and industries use hazardous materials, produce hazardous waste products, and/or store quantities of hazardous materials as part of their operations. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to floor drains leading directly to the ground. The facilities located within the Zone II area are connected to the municipal sewer system.

**What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II.
2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

### Hazardous Materials Storage and Use Recommendations:

- ✓ Work with Board of Health and Planning Department in assisting local businesses with best management practices for protecting water supplies as appropriate. Make available the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Consult with the Board of Health to ensure local businesses register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Consult with the Board of Health regarding local businesses and Massachusetts floordrain requirements. See brochure “Industrial Floor Drains” for more information.
- ✓ Ensure compliance with regulations for management of treatment chemicals including proper containment, emergency response plan for delivery and handling, and stormwater management.
- ✓ Provide the Planning Board and Board of Health with information from the DEP BWP and Office of Technical Assistance regarding existing regulations and assistance available to printing facilities <http://www.state.ma.us/dep/erp/erpforms.htm> and <http://www.state.ma.us/ota/#links>.
- ✓ The USDA has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>.

**6. Protection Planning** – Protection planning protects drinking water by managing the land area that supplies water to a well or reservoir. Currently, Northampton and Williamsburg do have water supply protection controls. The controls should be compared with DEP’s Wellhead Protection regulations 310 CMR 22.21(2) or Surface Water Protection regulations 310 CMR 22.20 (b) and

### Top 5 Reasons to Develop a Local Wellhead and Surface Water Protection Plan

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

(c) to ensure that they are up to date. Wellhead Protection and Surface Water Supply Protection Plans coordinate community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public participation. Northampton has a Surface Water Supply Protection Plan and actively manages

the watershed lands. There are resources available to help communities develop and implement plans for protecting drinking water supply sources. Northampton received a Source Water Protection grant from the Department to assist in further protection of their surface water supplies.

### Protection Planning Recommendations:

- ✓ Develop a Wellhead Protection Plan. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP’s guidance, “Developing a Local Wellhead Protection Plan”.
- ✓ Coordinate efforts with local officials in Williamsburg, Whately, and Conway to compare local surface water supply protection controls with current MA Surface Water Protection regulations 310 CMR 22.20 (b) and (c) . If they do not meet the current regulations, update the controls. For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.

Other land uses and activities within the Zone II and watersheds that are potential sources of contamination are

included in Table 2. Refer to Appendix B for more information about these land uses.

One land use that is not included in the matrix is a sportsmen's shooting range that is located within the Zone II. The facility was visited by representatives of the Department as part of the Massachusetts Lead Shot Initiative who toured shooting range facilities, requested actions as appropriate and provided information on management practices for shooting ranges including how to prepare and implement an Environmental Stewardship Plan. For further information about this or other facilities, please contact Mr. Thomas Keefe, the Department representative for the Lead Shot Initiative in the Springfield Regional Office at 413-784-1100.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone II and watersheds contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Removal of all Underground Storage Tanks (UST) within the Zone II through a town grant program.
- Working cooperatively with landowners within the water supply protection areas to protect the water supplies.
- Working with the town council to allow mandatory water use restriction for water conservation.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Continue to inspect the Zone Is and As regularly.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams in all host communities and the City to ensure that they are aware of the stormwater drainage in your protection areas and to cooperate by contacting the water supplier when responding to spills or accidents within the protection areas.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Develop and implement a Wellhead Protection Plan.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A. DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community.

The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring, on or about May 1, DEP posts a new Request for Response (RFR) application for the grant programs. The applications are usually due on or about July 1.

➤ **Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available on line and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II or watershed. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I and Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I ?	<b>No</b>	Zone Is are controlled through a Zoning Ordinance and oversight by the Water Department. Consider Right of First refusal and when possible purchase Zone I lands.
Are the Zone I and Zone A posted with signs to limit access?	<b>Yes Zone II and Watershed</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988. No trespassing signs are acceptable.
Are the Zone I and Zone A regularly inspected?	<b>Yes</b>	Continue regular inspections of drinking water protection areas.
Are water supply -related activities the only activities within the Zone I and Zone A?	<b>No</b>	Monitor non-water supply activities and continue investigating and implementing options for best management practices within these areas.
<b>Municipal Controls</b> (Zoning, Health Regulations, and General Ordinances)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21 (2) ?	<b>Wellhead Yes</b>	Protections are in place for wells and Zone II. Periodically review for compliance with the most recent regulations. Work with the Planning Board and the Board of Health.
Do neighboring communities have Surface Water Protection Controls that meet 310 CMR 22.20C and protect the water supply protection areas extending into their communities?	<b>Partially (Williamsburg at the Mountain Street Res.)</b>	Work with the communities of Whately, Williamsburg, Hatfield and Conway to encourage them to compare their current protections for the watershed lands with the most recent regulations listed above. Refer to <a href="http://mass.gov/dep/brp/dws/">mass.gov/dep/brp/dws/</a> for model bylaws, ordinances and health regulations, and current regulations 310 CMR 22.21(2) and 310 CMR 22.20C. MA DEP can be of assistance to communities.
<b>Planning</b>		
Does the PWS have a local surface water and wellhead protection plan?	<b>Yes - Surface No - Well</b>	A Surface Water Supply Protection Plan has been approved. Develop a wellhead protection plan. Follow “Developing a Local Wellhead Protection Plan” available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	<b>Yes</b>	Augment plan by developing a joint emergency response plan with fire departments, Board of Health, DPWs, and local and state emergency officials. Coordinate emergency response drills with local teams in all watershed towns.
Does the municipality have a watershed and wellhead protection committee?	<b>No</b>	Develop committees, include representatives from citizens’ groups, neighboring host communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities in the protection areas?	<b>N/A - Surface No - Wells</b>	There are no commercial or industrial activities in the watersheds. There is an industrial facility within the Zone II. For more guidance see “Hazardous Materials Management: A Community’s Guide” at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> . Be sure the Planning Board and Board of Health are aware of the protection area.
Does the PWS provide watershed protection education?	<b>Yes</b>	Currently outreach is to school groups, university groups, and consumers. Increase residential outreach through bill stuffers, Drinking Water Week activities, and coordination with local groups. Aim additional efforts at activities within the protection areas.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Linda Manor Nursing Home

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
November 19, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Linda Manor Nursing Home
<i>PWS Address</i>	349 Haydenville Road
<i>City/Town</i>	Northampton, Massachusetts
<i>PWS ID Number</i>	1214001
<i>Local Contact</i>	Mr. David LaPlante
<i>Phone Number</i>	1-413-238-5344

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1214001-01G	276	733	Moderate
Well #2	1214001-02G	267	688	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road de-icing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Northampton is a medium sized city in western Massachusetts. The Linda Manor Nursing Home is located on the north end of Northampton on Haydenville Road and serves a population of approximately 200 residents and staff. Although Northampton does have a municipal water system and a municipal wastewater treatment facility, the hydraulics in the water system were not conducive to serving the facility. Therefore, the nursing home utilizes two, on-site water supply wells however, wastewater is discharged to the municipal sewer system. The facility uses natural gas as a fuel source and has removed the underground storage tank that formerly stored fuel oil. The facility

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

maintains an emergency generator with a diesel fuel storage tank within a containment structure.

Well #1 is a 6-inch diameter, 300-feet deep, bedrock well and has an approved withdrawal rate of 10.4 gpm. The wells are located approximately 276 feet east of the building. Well #2 is a 6-inch diameter, 280-feet deep, bedrock well and has an approved withdrawal rate of 9.0 gpm. Well #2 is located approximately 25 feet from Well #1. Wells #1 and #2 were developed and approved through the New Source Approval Process. Although each well could pump independently, the wells currently operate simultaneously. Both wells are located with pits that have on occasion had standing water in the pit. The facility also maintains a third well for fire protection that is located in the front of the facility; that well is not connected to the potable water supply system. At the time of the assessment, there was no cap on the third well. Subsequently, the maintenance operator had a temporary cap installed on the casing.

The Zone I is the protection area immediately surrounding the well while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual recharge area (Zone II) has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii for Well #1, based on an approved withdrawal rate, are 276 feet and 733 feet, respectively. The Zone I and Interim Wellhead Protection Area (IWPA) radii for Well #2, based on an approved withdrawal rate, are 267 feet and 688 feet, respectively. Please refer to the attached map of the Zone I and IWPA.

Both wells withdraw water from the bedrock aquifer. The complex is located on an upland area underlain by apparently a thick layer of till. Driller's logs refer to 155 feet of hardpan over bedrock. Geologic maps of the area identify the bedrock as phyllite and schist of the Gile Mountain Formation. Although there is a thick till layer, there is no clear evidence that the till acts as a continuous confining unit in the immediate area. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

The water does not receive treatment. For information on current water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 2

**Table 2: Table of Activities within the Water Supply Protection Areas for Both Sources**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Zone I	-	-	-	Contact DEP prior to conducting any work in Zone I or expanding the system.
Internal transportation/parking	Both	Both	Moderate	Limit road deicing materials usage and monitor parking areas.
Nursing home	No	Both	Moderate	Supply BMPs to staff regarding waste disposal
Septic system components	Both	Both	Moderate	Continue to maintain septic system and protect it from improper disposal

\* -For more information, see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website- [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The Zone Is for the wells are in compliance with the DEP Zone I requirements that restrict activities to only those associated with water supply or passive, non-threatening activities. The IWPA's encompass the entire complex including the residential area, the generator fuel oil storage area (inside containment), and septic system components. The facility chlorinates the water prior to distribution.

**Key issues include:**

1. **Zone I,**
2. **Transportation/parking,**
3. **Nursing Home/Institutional, and**
4. **Above ground fuel storage.**

### Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

The overall ranking of susceptibility to contamination for the Nursing Home supply wells is moderate based on the presence of several moderate ranked potentially threatening land uses or activities in the IWPA.

Please refer any questions about water quality at the facility to the contact person listed in Table 1. Continued monitoring and site management is recommended to prevent accidents and minimize threats within the Zone I and IWPA protection areas of the wells.

**1. Zone I** – The water supplier owns the entire Zone I area and there are only a few parking spaces located within the paved area on the edge of the approved Zone Is. At the time the facility was built, the DEP approved these Zone Is as being in compliance. Systems not meeting DEP Zone I requirements for ownership or control, or that have non-conforming activities within Zone I, must receive DEP approval and address Zone I issues prior to conducting work in Zone I, increasing water use or modifying systems. Systems with conforming Zone Is may not allow threatening activities within the Zone I to occur.

#### **Zone I Recommendations:**

- ✓ Prohibit any additional activities within Zone I and where feasible remove non-conforming activities within the Zone I areas. Do not allow storage or additional parking in the Zone I area.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Monitor and inspect the wells and pits on a regular basis to ensure the integrity of the caps and seals. Review alternatives for preventing standing water in the well pits and sampling taps for the wells.

**2. Transportation corridor/parking** – An internal roadway and a few parking spaces are located in the Zone Is. The remainder of the facility and the parking areas are within the IWPA. Storm drains discharge to the city storm system.

#### **Transportation corridor Recommendations:**

- ✓ Monitor all parking areas and continue to ensure the drainage flows away from the wells.
- ✓ Prepare an Emergency Response Plan that includes coordination among the DEP, the Town, and the State Police in the event of an accident near the

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

wellhead.

**3. Nursing Home/Institutional Land Use** – The nursing home is located within the IWPA's. If managed improperly, activities associated with residential/institutional areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include cleaning materials, medications, automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used generally in homes are potential sources of contamination.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site, <http://www.state.ma.us/dep/brp/wm/nonpoint.htm> for additional information.

### Residential Land Use Recommendations:

- V Educate staff, particularly maintenance staff on best management practices (BMPs) for protecting water supplies. Focus efforts on management and disposal of cleaning materials and potentially hazardous materials.

**4. Aboveground fuel oil storage** – There is one diesel AST located adjacent to the building within the IWPA of both wells. A small quantity of petroleum products for maintenance equipment is also stored within the containment structure. If managed improperly, fuel oil tanks and associated fuel lines can be a potential source of contamination due to leaks or spills of the materials they store.

### Recommendation:

- V Any modifications to the tanks must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs and USTs.
- V Continue to monitor all activities associated with the fuel oil especially delivery.
- V Have spill containment/absorbent materials available on-site.
- V Sleeve all fuel lines that have the potential to leak outside of the containment structure.

## 4. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. Please review and adopt the key recommendations above and as follows as is feasible:

### Priority Recommendations:

- V Inspect the wells regularly and ensure there is no standing water in the pits. Consider alternatives to resolve the issue and ensure the integrity of the seals on well caps and sampling taps.

### Zone I:

- V Prohibit any new non-water supply activities from Zone I.
- V Continue regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- V Do not use or store pesticides, fertilizers or road salt within the Zone I.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Educate neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal and septic system maintenance.

#### **Planning:**

- ✓ Request that the City include the IWPA for your and other water systems in the water supply protection district.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Supplement the SWAP assessment with additional local information, and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

#### **Funding Sources:**

The DEP's Wellhead Protection Grant Program provides funds to assist public water suppliers and their partners in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under this grant program. If funds are available, in the spring, DEP posts a new Request for Response for the grant program (RFR).

These recommendations are only part of your on-going local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## **4. Attachments**

- Map of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheet

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Northfield Water District**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

**Zone II #:** 449

**Susceptibility:** High

Well Names	Source IDs
Well #1	1217000-01G

The Town of Northfield is a primarily agricultural and rural community in Western Massachusetts along the Vermont border. The Connecticut River bisects the northern half of the town and forms the western border of the southern half of Northfield. The Connecticut River valley is relatively narrow through this area and the remainder of the town is hilly terrain. There is one well serving the Northfield Water District, located along the Mill River off of Stowbridge Road. The well is a gravel developed well located in an unconfined narrow bedrock valley buried within glacially deposited sand and gravel. There is no evidence of a confining (protective) clay layer in the vicinity of the well. Wells located in an unconfined aquifer are considered to have a high vulnerability to potential contamination due to the absence of hydrogeologic barriers (i.e. clay) that can prevent contaminant migration into the aquifer from the surface. The well has a Zone I protective radius of 400 feet based on an approved withdrawal rate. The Zone II, recharge area for the well was delineated as part of the SWAP program utilizing empirical data developed during an extended duration pumping test, analytical modeling and hydrogeological mapping. The District does not own the entire Zone I. Please refer to the attached map to view the boundaries of the Zone I and Zone II.

The surficial deposits at the site are mapped as alluvial fan sand and gravel deposits. Surficial features surrounding the site are mapped as glacial outwash deposits of sand, gravel and silt. There is little information about the construction of the well but it is believed to be an 8 inch diameter gravel developed well, approximately 57 feet deep. The bedrock geology at the well site is mapped as a fine-grained amphibolite with interbeds of light-green epidote of the Crag Mountain Formation. The area to the northeast of the well is mapped as thick-bedded greywacke or quartz schist. There are two major faults mapped in the area, the eastern Connecticut border fault and the Mill Brook Fault to the south.

Sodium hydroxide is added to the water prior to distribution to adjust the pH of the water for corrosion control. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The Zone II for Northfield is a mixture of residential, agricultural, and light commercial land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Non-conforming Zone I
2. Residential land uses
3. Transportation corridors
4. Hazardous Materials Storage and Use

5. Comprehensive wellhead protection planning
6. Agricultural Activities

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Non-conforming Zone I** – The Zone I for the well is a 400-foot radius around the wellhead. Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Only water supply activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and contain non-water supply activities such as homes and public roads. The District does not own the entire Zone I radius; there are activities such as pasture lands, residences and roads within the Zone I.

**Zone I Recommendations:**

- ✓ To the extent possible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non water supply activities out of the Zone I.
- ✓ Consider entering into an agreement of right-of first refusal for the potential future purchase of the Zone I land or a conservation restriction to control any future activities within the Zone I land.

**2. Residential Land Uses** – Approximately 29% of the Zone II consists of residential areas. Northfield does not have a public sewer; therefore, all residences are assumed to use septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to

the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

© 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

#### **What are “BMPs?”**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**3. Transportation Corridors** - Local roads are common throughout the Zone II. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash into catchbasins. Much of the area is not served by stormdrains. However, road runoff should be monitored especially along the Warwick Road that runs alongside the Mill Brook and in the immediate vicinity of the well. It is possible that the Mill Brook contributes water to the aquifer under stressed conditions. Emergency response teams should especially be aware of the well and Zone II location.

#### **Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Work with the Town to consider the drainage patterns in the vicinity of the Zone II and the well.
- ✓ Work with the Town to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II and along the Mill Brook can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren’t yet

available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

**4. Hazardous Materials Storage and Use** – Approximately one percent of the land area within the Zone II is designated as commercial land use. An Auction Barn is located in this area. As an auction facility, it is unknown if hazardous materials are brought in and stored before auction. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

#### **Hazardous Materials Storage and Use Recommendations:**

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Potential Contaminant Sources*
<b>Agricultural</b>			
Livestock Operations	1	M	Manure (microbial contaminants): improper handling
Pesticide Storage or Use	1	H	Pesticides: leaks, spills, improper handling, or over-application
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cess-pools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Aboveground Storage Tanks	Numerous	M	Materials stored in tanks: spills, leaks, or improper handling (residential)
Transportation Corridors	Numerous	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Utility Substation Transformers	1	L	Chemicals and other materials including PCBs: spills, leaks, or improper handling
<b>Notes:</b> <ol style="list-style-type: none"> <li>When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.</li> <li>For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.</li> <li>For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.</li> </ol> <p>* <b>THREAT RANKING</b> - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environ-</p>			

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure “Industrial Floor Drains” for more information.

**5. Protection Planning** – Currently, the Town does not have water supply protection controls that meet DEP’s Wellhead Protection regulations 310 CMR 22.21(2). Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. Northfield has a protection plan in place, but it needs updates to fully comply with DEP’s regulations. There are resources available to help communities develop a plan for protecting drinking water supply wells.

**Protection Planning Recommendations:**

- ✓ Refer to the recommendations included in the Zone II report. Encourage the Planning Board to adopt these recommendations and contact the Department for any assistance they may require.
- ✓ Update current Wellhead Protection Plan. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP’s guidance, “Developing a Local Wellhead Protection Plan”.
- ✓ Coordinate efforts with local officials to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21 (2). If there are no local controls or they do not meet the current regulations, adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ If local controls do not regulate floordrains, be sure to include floordrain controls that meet 310 CMR 22.21(2).

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ➊ Reduces Risk to Human Health
- ➋ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ➌ Supports municipal bylaws, making them less likely to be challenged
- ➍ Ensures clean drinking water supplies for future generations
- ➎ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

**6. Agricultural Activities** – Croplands and pasture lands make up 38% of the land uses in the Zone II. There are corn and hayfields in the Zone II, in close proximity to the Zone I. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

**Agricultural Activities Recommendation:**

- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Be sure all farmers are aware that they are within your Zone II. The DFA, Pesticide Bureau regulates the use of pesticides within sensitive areas.

Other land uses and activities within the Zone II that are potential sources of contamination are included in Table 2. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of

contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Work with commercial farmers in your protection areas to make them aware

of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.

- ✓ Supply BMPS to land owners that are hobby farmers to control, fertilizer, pesticide and manure management.
- ✓ Prepare a Wellhead Protection Plan to evaluate existing threats and address future planning for the Water District and the community.

#### **➤ Partner with Local Businesses:**

Since many businesses and industries, including small businesses, use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships between businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

#### **➤ Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located; what types of land uses and activities pose threats; and how their efforts can enhance protection.

#### **➤ Plan for the Future:**

One of the most effective means of protecting water supplies is planning, such as the adoption of local controls to protect watersheds and ground water. These controls may include health regulations, general ordinances, and zoning bylaws that prohibit potential sources of contamination from wellhead protection areas.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## Section 4: Appendices

- A. Protection Recommendations
- B. Additional Documents on Source Protection

### Additional Information

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Consider obtaining conservation restrictions or right of first refusal on land within the Zone I not owned or controlled by the PWS.
Is the Zone I posted with “Public Drinking Water Supply” Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>YES</b>	Continue monitoring non-water supply activities in Zone Is. Request use of BMPs on pasture land in Zone I.
<b>Municipal Controls</b> (Zoning By laws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>NO</b>	Update the Town’s “Aquifer Protection District” bylaw to meet DEP’s best efforts for wellhead protection. Refer to recommendations in Zone II report.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>N/A</b>	
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Develop a wellhead protection plan. Follow “Developing a Local Wellhead Protection Plan” available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Work to establish a committee; include representatives from other water suppliers, citizens’ groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For more guidance see “Hazardous Materials Management: A Community’s Guide” at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>NO</b>	Aim efforts at commercial, industrial and municipal uses within the Zone II.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitellst.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0012353	54 Warwick Avenue	Northfield	Oil

For more location information, please see the attached map. The map lists the release sites by RTN.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**East Northfield Water Company**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i><b>PWS Name</b></i>	East Northfield Water Company
<i><b>PWS Address</b></i>	Northfield Mount Hermon School 206 Main Street
<i><b>City/Town</b></i>	Northfield
<i><b>PWS ID Number</b></i>	1217001
<i><b>Local Contact</b></i>	George Santucci
<i><b>Phone Number</b></i>	413-498-3455

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Section 1: Description of the Water System

### What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

<i>Source Name</i>	<i>Source ID</i>	<i>Susceptibility</i>
Grandin Reservoir	1217001-01S	Moderate

The East Northfield Water Company maintains and operates the Grandin Reservoir, serving a portion of the Northfield Mount Hermon School and several private residences in the vicinity of the school. Northfield is a small, predominantly rural, residential community in western Massachusetts along the Vermont border. The Grandin Reservoir is approximately 7.1 acres in size (surface area) with an estimated safe yield of approximately 0.2 million gallons per day (MGD). The reservoir and approximately 95% of the watershed is

owned by the Northfield Mount Hermon School, which leases the property to the East Northfield Water Company. The entire property is designated in the Northfield Mount Hermon operating plan as water supply protection area. The East Northfield Water Company has prepared and is implementing a watershed protection plan to manage the watershed. Water from the reservoir is chlorinated for disinfection prior to distribution. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

The watershed is located in a forested upland area of moderate to steep terrain with shallow bedrock primarily covered by thin till. The USGS mapped the bedrock geology of the Grandin Reservoir and its watershed area as an area of amphibolite lens within in the Monson gneiss, a light-gray, medium-grained gneiss, with quartz, and biotite.

## Section 2: Land Uses in the Protection Areas

The watershed for the Grandin Reservoir is 98% forested land. Over 95% of the land is owned by Northfield Mount Hermon School, which holds a 99-year lease with the East Northfield Water Company. Surface water supplies by their nature are highly vulnerable to potential contamination. The East Northfield Water Company

Reservoir has a MA DEP approved watershed protection plan, prohibits vehicular traffic to the watershed, actively conducts drinking water supply education, watershed management, and regularly inspects the watershed to maintain a waiver from filtration. There are few anthropomorphic threats within the watershed. Land uses and activities that are potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include

1. Access road
2. Potential for presence of aquatic mammals
3. Forest operations

The overall ranking of susceptibility to contamination for the system is moderate. Although the potential sources of contamination are ranked low, the vulnerability of the surface water supply increases its potential susceptibility. Please refer to Table 2 for the summary of potential sources of contamination.

**1. Access Road** -- The gravel access road through the watershed crosses one tributary stream and follows along the major tributary to the reservoir. At the time of the assessment, active logging was being conducted and erosion along the road was evident although actively being managed. During and following the completion of the logging activities the road was graded to prevent direct

### Glossary Protection Zones

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

runoff to the reservoir. In addition, the bridge across the tributary was significantly deteriorated and was reinforced to allow access with the logging equipment.

#### Access Road Recommendations:

- ✓ Continue to inspect and maintain the road to manage erosion and runoff; re-grade the road as necessary.
- ✓ Continue pursuing alternatives to repair or replace the bridge to maintain access and prevent the bridge from collapsing into the tributary.

**2. Potential for Impact from Wildlife and Aquatic Mammals** – As a surface water supply, there is potential for aquatic mammals (beavers and muskrats) to live in and near the surface water supplies. Aquatic mammals pose a potential threat of microbial contamination of the source from *Giardia* *Lambia* and *Cryptosporidium*, pathogens that are identified in the Surface Water Treatment Rule and Enhanced Surface Water Treatment Rule as posing an unacceptable risk to drinking water. There is no evidence of current aquatic mammal populations in the watershed. The steep topography of the watershed may provide limited habitat for aquatic mammals.

#### Wildlife Recommendations:

- ✓ Continue to monitor the watershed and reservoirs for the presence of aquatic mammals and their proximity to the intake.
- ✓ Monitor raw water quality and assess potential impacts.

**3. Forest Operations** – Approximately 98% of the watershed consists of densely forested areas. Much of the watershed, including portions of Zone A, were part of a recently completed cutting plan. Every 10-30 years, a forest harvest project is performed in the watershed. No new cutting is scheduled at this time. Forestry operations can allow for runoff-induced erosion of soils, which can create a problem with turbidity and increased particulates in the water. There was no evidence of water quality impacts from the logging operations noted during the assessment.

#### Forest Operation Recommendations:

- ✓ Continue current strict adherence to a forest management and cutting plans.
  - ✓ Maintain current diligence and effort to prevent runoff of roads and cut areas.
- 
- ✓ Update watershed management plan and forest management plans as appropriate and necessary.

Additional land uses identified in the watershed are high voltage lines located in the southeast corner of the Zone C, operated by Western Massachusetts Electric. Contact the utility and supply them with a current map of the watershed to ensure the accuracy of the information the utility utilizes to prepare their management plan for the Right-of-way within the water supply watershed.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

MODIFIED FROM © 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

Figure 1: Sample watershed with examples of potential sources of contamination

land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### Section 3: Source Water Protection Conclusions and Recommendations

#### Current Land Uses and Source Protection:

As with many water supply protection areas, the protection areas contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The East Northfield Water Company watershed contains few threats due to forethought in development of the source and purchase of nearly the entire watershed. The supplier is commended for their continued proactive water supply protection through:

- Preparing and actively pursuing a drinking water supply, watershed management plan,
- Actively controlling access and,
- Endorsing public education about the water supply.

#### Additional Source Protection Recommendations:

To maintain protection of the source for the future:

- ✓ Continue regular watershed inspections.
- ✓ Continue to assist in educating residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the watershed boundaries and to cooperate on responding to spills or accidents.
- ✓ In addition to the designation of the watershed in the school operational plan, consider obtaining a conservation restriction on the watershed parcels' deed to ensure protect the source beyond the 99-year lease.
- ✓ Maintain communication with Western Massachusetts Electric to protect your watershed. Provide them with current maps to keep them informed of

the Right-of-Way areas within the Zone C.

#### Conclusions:

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Potential Contaminant Sources*
<b>Agricultural</b>			
Forestry Operation	54 acres	L	Equipment maintenance materials: leaks, spills, or improper handling; road building, erosion (Approximately 10-year cutting cycle recently completed)
<b>Miscellaneous</b>			
Aquatic Wildlife	Potential	L	Microbial contaminants
Transmission Line Rights-of-Way Type: <u>Electric (High Voltage Lines)</u>	1.3 acres	L	Corridor maintenance pesticides: over-application or improper handling; construction. Request manual cutting only.
<b>Notes:</b> <ol style="list-style-type: none"> <li>When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.</li> <li>For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.</li> <li>For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.</li> </ol> <p>* <b>THREAT RANKING</b> - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.</p>			

Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the watershed. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## Section 4: Appendices

- A. Protection Recommendations
- B. Additional Documents on Source Protection

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

- 1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
- 2. MA DEP SWAP Strategy
- 3. Land Use Pollution Potential Matrix
- 4. Draft Land/Associated Contaminants Matrix

### Top 5 Reasons to Develop a Local Surface Water Protection Plan

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone A?	<b>YES</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone A posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone A regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone A?	<b>YES</b>	Continue monitoring activities in Zone A.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Surface Water Protection Controls that meet 310 CMR 22.20C?	<b>N/A</b>	East Northfield Water Company has controls through ownership
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>N/A</b>	East Northfield Water Company has controls through ownership
<b>Planning</b>		
Does the PWS have a local surface water supply protection plan?	<b>YES</b>	Maintain and follow the surface water supply protection plan.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a watershed protection committee?	<b>N/A</b>	
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>N/A</b>	
Does the PWS provide watershed protection education?	<b>YES</b>	Continue educational efforts through the school.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Pioneer Valley Regional School District

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared  
December 4, 2003

Well #1	1217002-01G	279	744	Moderate/High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Pioneer Valley Regional School (the school) is located in the west central section of Northfield. Northfield is a small rural town in northwestern Massachusetts along the Vermont and New Hampshire border. The facility consists of two major school wings located adjacent to each other serving seventh through twelfth grade; the wings are attached to each other. The total school student and staff population is approximately 625 people per day. Although there are two municipal water systems and a wastewater treatment facility in Northfield, they do not serve the area where the school is located.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

Therefore, the school and surrounding facilities are served by on-site water supplies and septic disposal.

The school is served by one potable supply well (Well #1 – 01G), 6-inch diameter, 350-feet deep, bedrock well that is located approximately 700 feet west of the school. The original shallow gravel developed wells for the school are located approximately 300 feet west of the currently active well. The gravel wells were abandoned as potable supplies in 1986 when Well #1 was installed under the DEP New Source Approval Process. The original gravel wells were not physically decommissioned and remain intact. The motor control building also still exists, however, during the recent renovation and school expansion project, the motor controls for the well were relocated from the old building into the school. In the most recent Sanitary Survey of the system conducted in August 2003, the DEP also recommended that capital planning include funds for decommissioning the original wells because the wells are adjacent to a wetland that is subject to flooding.

The school is located on the western edge of the Connecticut River valley at the base of the Berkshire foothills. Geologic mapping indicates overburden deposits of approximately 50 feet of sand and gravel with some amount of till over bedrock at the school. The school is located immediately west of an area mapped as potential, medium yield, sand and gravel aquifer. This valley area is a bedrock valley that was filled with stratified drift (sand and gravel) during the recession of the glaciers some 18,000 years ago. The bedrock in the immediate area of Well #1 is mapped as feldsicc gneiss of the Partridge Formation.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water or other non-threatening activities are allowed to occur. The

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Fuel Oil Storage	-	-	-	UST w/leak detection at school just outside of the IWPA
Floor Drains in Boiler Rooms to septic	No	Yes	Moderate	Presently working with DEP UIC and wastewater programs regarding compliance
Agriculture/Athletic fields	No	Yes	Moderate	Continue prohibiting the use of pesticides/fertilizers on school fields. Refer farmers to DAR and NRCS regarding IPM
School (Middle and High Schools)	No	Yes	Moderate	Limit road deicing usage, use BMPs for household hazardous materials and monitor parking areas and control stormwater
Low density residential housing	No	Yes	Moderate	Septic systems, household hazardous materials, home heating fuel
Septic systems components	No	Yes	Moderate	Residential and part of the school's wastewater components are in the IWPA; the school leachfield is not in the IWPA
Hazardous materials	No	Yes	Moderate/High	Maintenance hazardous materials and laboratory waste
Transformers	No	Both	Low	Monitor transformers for potential leaks
Aquatic wildlife (beavers)	Yes	Yes	Moderate/High	Protect the wells from being inundated

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The well has a Zone I protective radius of 279 feet and an IWPA protective radius of 744 feet. These protective radii were approved at the time the well was installed based on the capacity of the well and Zone I ownership restrictions. Please refer to the attached map that shows the Zone I and IWPA.

There is no evidence of a continuous, protective confining layer such in the vicinity of the well. Wells drilled in these conditions are considered highly vulnerable to potential contamination from activities on the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer. Although there have been periodic detections of dichloromethane and chloromethane in the water, the concentrations have never exceeded any regulatory thresholds. The source of these constituents is not known. Therefore, the water is not treated prior to distribution. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas and in close proximity to the protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Underground storage tanks (outside of protection area);**
3. **Floor drains in boiler rooms;**
4. **School facilities and athletic fields;**
5. **Transportation corridors/parking; and**
6. **Hazardous materials.**

There are several activities within the Zone I and IWPA that pose a potential threat to the water supply. The overall ranking of susceptibility to contamination for the well is moderate/high based on at least one high threat activity within the protection areas. Please refer to Table 2.

**1. Non-conforming Zone I** – The water supplier does not own or control the entire Zone I area for the well, however, the only activities in the Zone I are passive recreation and a periodic beaver population in the nearby wetland. Systems not meeting DEP Zone I requirements for ownership or control or non-conforming activities within Zone I must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Zone I Recommendations:

- ✓ Prohibit any non-water supply activities within Zone I and, where feasible, remove non-conforming activities within the Zone I areas.
- ✓ Do not use or store pesticides or fertilizers in Zone I.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

- ✓ Control beaver activity near the well to protect it from inundation.
- ✓ Inspect the well regularly to ensure the cap is secure and there is no standing water near the well.

**2. Underground fuel oil storage** – There is a fuel oil UST just outside of the IWPA. Since the actual recharge area of the well has not been delineated, this report includes activities that may pose a threat even though they are just outside of the protection areas. If managed improperly, fuel oil tanks and their associated piping can be a potential source of contamination due to leaks or spills of the materials they store.

#### Recommendation:

- ✓ Any modifications to the tank must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs and USTs.
- ✓ Monitor all activities associated with the fuel oil, especially delivery.
- ✓ Have spill containment/absorbent materials available on-site

**3. Floor Drains in Boiler Room** – There are floor drains in the boiler room, that discharge to the septic system. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry wells in areas where hazardous materials or petroleum may enter the floor drain. The floor drain must be protected to prevent boiler blow down, oil or other prohibited discharges through the floor drain. The school is presently required to address the floor drain by the DEP and is working with the Department to resolve the issue.

#### Recommendations:

- ✓ Continue to work with the Department UIC and wastewater program staff.
- ✓ Consider containment to prevent accidental releases to the floor drain. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. DEP recommends that you require your boiler maintenance contractor use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.
- ✓ Seal any cracks in the floor and the floor drain if it cannot be adequately protected to prevent a prohibited discharge.

**4. School facilities and athletic fields** – Elementary and middle schools generally use only household type hazardous materials. However, high school laboratory and photo labs can use potentially harmful materials and the school does not have a tight tank for the laboratory waste. Title 5 prohibits the disposal of any wastewater other than sanitary waste to the septic system. There are state and federal regulations controlling some of the activities and products used at schools to promote "healthy schools". All of the school's facilities are located within the IWPA of the well. Potential exists for contamination of the well by onsite use of fertilizers or pesticides, which can be of concern. Storm drains in the parking areas at the school drain directly into the ground. The high school does use micro-pipeting techniques to minimize laboratory waste.

#### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields across the street. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- ✓ Investigate Integrated Pest Management and Best Management Practices within the IWPA as necessary.
- ✓ Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides or fertilizers within Zone I.

- V Review your emergency response plan regarding to accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- V For additional information, refer to the Massachusetts Public Health Associations Healthy Schools website online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html).

**5. Transportation corridor/parking** – The school’s internal transportation corridors and parking are located within the IWPA. A railroad line is also located on the extreme edge of the IWPA. Accidents and normal use and maintenance of corridors and parking areas may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as, waste from wildlife and pets.

**Recommendations:**

- V Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they area aware of the location of your well.

**6. Hazardous Materials Storage and Use** – The school utilizes hazardous materials for maintenance and in the laboratories. Hazardous materials such as paint, thinners, petroleum products, etc. should be kept in containment and used with caution. Cleaning and disposal should not be through the septic system. Spill kits and signs designating areas of storage should be available. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground. Review the attached fact sheet for additional information regarding the thresholds for triggering a very small quantity hazardous waste generator. The school does have a tight tank for the laboratory wastes.

**Hazardous Materials Storage and Use Recommendations:**

- V Continue current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.
- V Continue to use BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.
- V Maintain the tight tanks as appropriate.

### **3. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will further reduce the well’s susceptibility to contamination. The DEP commends the effort shown in current protection practices of not using pesticides and fertilizers in the Zone I. The school district should comment to the various town boards regarding developments that may impact the school’s well.

Please review and adopt the key recommendations listed above and as follows:

**Priority Recommendations:**

- V Communication with the Town boards and emergency responders regarding the location of the well and the protection areas.

**Zone I and IWPA:**

- V Prohibit any new non-water supply activities from Zone I.
- V Conduct regular inspections of the Zone I and IWPA.
- V Post drinking water supply signs in key location such as along the access road and in the parking areas but away from the well.
- V Provide information to staff and pertinent school organizations about the potential hazards of household chemicals, lab chemicals, lawn care chemicals and fertilizers.
- V Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, lab chemicals, pesticides and household hazardous waste.

**Training and Education:**

- V Incorporate groundwater education into school curriculum (7-12 curricula available; contact DEP for copies).
- V Staff should be instructed on the proper disposal of spent chemicals. Include custodial staff, teachers, groundskeepers, and the certified operator.

**Facilities Management:**

- V Staff should be instructed on the proper disposal of spent household chemicals and or lab chemicals. Include custodial staff, groundskeepers, and the certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator. The school is currently not registered as a generator of hazardous waste or waste oil. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" and register to participate, if necessary.
- V Continue to work with the Department regarding compliance of the floor drains in the boiler room.

**Planning:**

- V Work with local officials to develop an Aquifer Protection District Bylaw that includes the school well's IWPA and to assist you in continued protection of the water supply.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- V Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Source Water Assessment Program (SWAP) Report For Northfield Mountain Station and Visitor's Center

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
April 27, 2001

**Table 1: Public Water System (PWS) Information**

<i>PWS NAME</i>	<b>Northfield Mountain Station &amp; Visitors Center</b>
<i>PWS Address</i>	<b>99 Millers Falls Road</b>
<i>City/Town</i>	<b>Northfield, Massachusetts</b>
<i>PWS ID Number</i>	<b>1217003</b>
<i>Local Contact</i>	<b>Mr. Robert Perry</b>
<i>Phone Number</i>	<b>413-659-4468</b>

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well A	01G	100	420	Moderate
Well B	02G	191	490	Low

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## INTRODUCTION

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. DESCRIPTION OF THE WATER SYSTEM

Northfield Mountain Station & Visitor's Center is a pumped storage, hydroelectric generating station and outdoor recreation facility owned by Northeast Generation Company and operated by Northeast Generation Services Company. The power generating facility is located approximately eight hundred feet below ground and was constructed in the 1960's. The station generally pumps water from the Connecticut River to a storage reservoir at night, releasing the water during the day to generate power during high demand periods. The recreational facility includes a Visitor's Center that offers educational displays, coordinates tours and maintains picnic areas and trails for hiking, mountain biking and cross-country skiing.

The facility maintains two public water supply wells, Well A (01G - the back-up well) and Well B (02G - the main well). Well A has an 8-inch casing set within a 14-inch

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are may not be identified in this report.

casing located in an underground vault approximately 200 feet from the Visitor's Center. Well A is utilized only under high water demand conditions to maintain pressure in the storage tank. Well B is the main supply well and is located approximately 500 feet from the transmission switchyard and provides 85% to 95% of the total annual system demand. Well B has an 8-inch casing terminating 16-inches above the ground. The depth and construction details of the wells are not known, however, pump information indicates Well A is greater than 193 feet in depth. Based on that information and the location of Well B, on the side of a hill, both wells are assumed to extend into bedrock. The bedrock geology map shows the Poplar Mountain Formation gneiss underlies the area. The gneiss is a medium to fine-grained, gray to greenish gray foliated, micaceous gneiss.

Well A is approximately 110 feet from the rotary in the Visitor's Center parking area. Only passive recreational activities occur within the Zone I of Well A. Within the IWPA of Well A are the access road, parking, sewer lines and a septic tank. There are no fertilizers or pesticides utilized on the lawns at the facility. Well B is located south of the substation switchyard facility at a slightly lower elevation; a small drainage feature (swale) lies between the well and the switchyard. Well B is located on a natural bedrock feature while the switchyard is located upon an artificial highland constructed from rubble excavated during construction of the hydroelectric generating facility. There is passive recreation and a high-tension transmission main within the Zone I and IWPA of Well B. However, the IWPA for Well B terminates at the edge of the switchyard. The IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. Therefore due to the proximity of the switchyard to the well, activities in the switchyard were also reviewed.

As noted above, both wells are located in a bedrock aquifer. Bedrock aquifers are considered to have a high vulnerability to potential contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Table 2 - Table of Land Uses Specific to Each Protection Area describes the activities identified during the assessment. Please refer to this table and the attached map of the Zone Is and IWPAs for more information.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### The Water Quality

At this time, water from both wells does not require and is not treated. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1.

**Table 2: Table of Activities Specific to Each Protection Area**

#### Water Supply Protection Area for Well A

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Visitor's Center	Sewer lines and septic components	No	Yes	Moderate	Sewer lines and septic tank in IWPA. See septic systems brochure in the appendix. Continue annual tank pumping.
	Access road and parking	No	Yes	Moderate	Continue minimal salt use and monitor area.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Water Supply Protection Area for Well B

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Power Station	Power Transmission Lines	Yes	Yes	Low	Use only mechanical clearing or chemicals approved for IWPA's.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## 2. DISCUSSION OF LAND USES IN THE PROTECTION AREAS

There are a very few land uses and activities within the drinking water supply protection areas for Northfield Mountain & Visitor's Center wells that are potential sources of contamination. The overall ranking of susceptibility to contamination for the wells is moderate for Well A and low for Well B based on the presence of at least one moderate threat land use or activity in the IWPA for Well A, as seen in Table 2.

Key Land Use Issues for the Wells include:

1. **Ownership of Zone I, Well B**
2. **Access Road and Parking**
3. **Power Transmission Lines**

1. **Ownership of Zone I** – Although the Zone I is primarily forested with passive recreational activity and the transmission main through the area, Northeast Gen. Co. does not own the entire Zone I.

- **Recommendation** – Investigate the potential for additional land purchase, entering into a Conservation Restriction or an agreement for Right of First Refusal upon sale of the land.

2. **Access Road and Parking** - The parking along the access road at the Visitor's Center within the IWPA of Well A constitutes a moderate threat due to the potential for accidental release of petroleum products. The parking in the rear of the facility has storm drains that discharge outside of the IWPA, away from the well, and is not included in the assessment.

- **Recommendation** – Monitor vehicle parking area along the Visitor's Center access road and discourage parking in the turnaround proximal to the Zone I at Well A.

3. **Power Transmission Mains** – Vegetation control and maintenance activities pose a low threat to Well B.

- **Recommendation** – Continue use of only mechanical methods or approved chemicals for vegetation control in IWPA and use caution when utilizing vehicles along transmission main.

In addition to being a public water system, Northeast Generation Company is registered with the MA DEP or EPA for the following: small quantity generator of waste oil/PCBs, very small generator of hazardous waste (other than oil), and minor surface water discharge. The surface water discharge is located well outside of the IWPA however, storage of petroleum products and hazardous waste generation are conducted within the switchyard. As previously noted, although the switchyard and its associated buildings are located outside of the IWPA for Well B, all activities were reviewed due to the close proximity of the IWPA. Petroleum products and hazardous materials stored near or proximal to the IWPA pose a potential threat of a release of large

Figure 1: Example of how a well could become contaminated by different land uses and activities.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

quantities of fuel and other materials. Proper handling and containment minimizes the potential threat from these products.

The hazardous waste observed during the site visit was labeled and within secondary containment. One Aboveground Storage Tank (AST) for diesel fuel is located immediately adjacent to the IWPA and within a secondary containment structure. There is a 2,000-gallon diesel Underground Storage Tank (UST) for the emergency generator. The tank is a cathodically protected steel, double-walled tank with leak detection and overfill protection. During the assessment, several areas with floor drains were observed that were not connected to a tight tank or sewer. One area, the maintenance garage, contains hazardous materials. Following the site visit, the floor drains were investigated, assessed and have all been sealed in accordance with the MA DEP policy and regulations.

It should also be noted that the attached map inaccurately shows an underground storage tank near the access road to the Visitor's Center. Some time ago there was a garage with a UST in that vicinity. However, the garage and UST were dismantled and removed in 1983.

Implementing the recommendations below will reduce the system's susceptibility to contamination.

## 3. PROTECTION RECOMMENDATIONS

Northfield Mountain Station and Visitor's Center has fairly well protected wells. The MA DEP encourages limiting the activities near the wells and continued diligence in updating your protection measures. Northeast Generation Co. should review and adopt the following recommendations at the facilities:

### Zone I:

- Keep non-water supply activities out of the Zone I.
- Erect water supply protection signs along the perimeter of the protection areas
- Consider additional land purchase, Conservation Restriction or Right of First refusal agreement for Zone I for Well B.
- Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any above ground tanks for leaks, etc.
- Direct road and parking lot drainage away from well, as feasible.
- Continue the current practice of not using pesticides, fertilizers or road salt within the Zone I.

### Facilities Management:

- Continue standard operating procedures regarding proper storage, use and disposal of hazardous materials and emergency response.
- Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices.
- Continue use of Best Management Practices (BMPs) for hazardous materials.
- Continue current practice of annual septic system inspection and maintenance. Refer to the appendices for more information regarding septic systems.

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the water supplier and town boards and will be made available on the DEP's web site.

### **Planning:**

- Work with local officials in town to include the facility IWPA in Aquifer Protection District Bylaws.
- Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## **4. ATTACHMENTS**

- Map of the Public Water Supply (PWS) Protection Area
- Recommended Source Protection Measures Factsheet
- Your Septic System Brochure

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Linden Hill School

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 18, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Linden Hill School is located on South Mountain Road in the town of Northfield in northwestern Massachusetts on the Vermont and New Hampshire border. The facility is a residential school for boys, ages 9 to 15 with special educational needs; the summer program includes boys and girls ages 7 to 16. Northfield is a small rural residential community that has public water and sewer, however those services are not available in the area where the school is located. The facility is therefore served by a single on-site water supply well and wastewater is discharge to a common septic system.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The school population fluctuates but has the capacity for approximately 100 staff and students. The school grounds include approximately six buildings including a gymnasium, dorms and classrooms. The school recently added a new dormitory.

Water is supplied by a single source, Well #4 that is located on the side of the hill east of the Headmaster's house. Well #4 was approved in November 2003 to replace Wells #1, #2 and #3 which are non-conforming with respect to DEP Zone I restrictions and are located in the center of the campus adjacent to buildings. Wells #1, #2 and #3 have currently been designated as emergency sources and will not be further addressed in this report. Well #4 is a 6-inch diameter, 520 feet deep well drilled into the bedrock aquifer. The well has 50 feet of casing grouted 31 feet into the rock.

The Zone I is the area immediately around the wellhead while the Interim Wellhead Protection Area (IWPA) is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wells may be smaller or much larger than the IWPA. The Zone I and IWPA radii for Well #4 are 250 feet and 622 feet, respectively, based on a withdrawal rate approved as a result of the New Source Approval Process. Please refer to the attached map that shows the Zone I and IWPA radii.

The complex is located in an area where the geologic mapping indicates thin till overburden covering the bedrock. The well logs confirm approximately 19 feet of overburden at the well site. The bedrock at the site is mapped as gneiss associated with the Bronson Hill Zone. There is no evidence of an extensive protective till or clay layer in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

The facility's well water is not treated. Public water suppliers are required to monitor water quality at the facility. For current information on monitoring results, please review the Consumer Confidence report (CCR) that is issued annually by the water supplier or refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridors/parking	No	Yes	Moderate	Manage stormwater and limit road salt usage.
Above ground storage tank (fuel oil)	No	Yes	Moderate	Use BMPs for fuel oil storage and delivery
High density/low density residential	No	Yes	Moderate	Provide BMPs for household hazardous waste management. Use IPM for lawn maintenance.
Septic system components	No	Yes	Moderate	Leachfield is located outside of the protection areas. Some components are within the Zone I and IWPA.
School	No	Yes	Moderate	Use BMPs for household hazardous materials

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

There are land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Institution use (residential school);**
2. **Transportation corridors/parking.**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of several moderate threat land use or activity in the IWPA, as seen in Table 2. However, the well is located topographically upgradient of the school and the well is fairly remote from activities at the school. A few moderate threat activities are located on the downgradient portion of the IWPA. The system is in compliance with the Zone I restrictions that allow only water supply related or non-threatening activities in the Zone I for the Well 04G.

**1. Institutional use** – The school consists of land uses that are common to residential uses. The facility utilizes a single on-site septic disposal system; the leachfield is outside of the IWPA although some components are within the IWPA. One private home is located within the IWPA. The school utilizes fuel oil for heating and the storage tanks are located in the buildings. Only the headmaster's house is within the IWPA. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. The septic system is predominantly outside of the protection areas although some components are within the downgradient edge of the IPWA. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their piping can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent

Figure 1: Example of how a well could become contaminated by different land uses and activities.

properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" attached to this report and at the DEP website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls. Provide containment for the tanks and sleeve the fuel lines.
- ✓ The facility utilizes fuel oil for a heating source. Containment of the fuel system to prevent accidental releases to the basements and ground should be reviewed in the buildings. Fuel tanks should be within containment

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

to protect floor drains, cracked floors or walls that could act as conduits if fuel oil leaks or is spilled from the storage tanks. Contact the regional DEP staff from the UIC program (Tony Zaharias 413-755-2122 or Rick Larson 413-2207) for advice regarding protecting tanks. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. DEP recommends that you require your boiler maintenance contractor use containment, protect any drains and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.

- ✓ Seal all cracks in the floor and any floor drains if they cannot be adequately protected to prevent a prohibited discharge.

**2. Transportation corridor/parking** – The school's internal corridors and South Mountain Road are within the IWPA. Accidents and normal use and maintenance of corridors and parking areas may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills, as well as, waste from wildlife and pets.

#### Recommendations:

- ✓ Prepare an Emergency Response Plan that includes coordination among town emergency responders to be sure they are aware of the location of your well and the protection areas.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Linden Hill is commended for replacement of the threatened wells. Review and adopt the key recommendations above and the following:

#### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I.

#### Facilities Management:

- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.
- ✓ Continue to educate the staff and control the use of household hazardous materials

in the Zone I.

- ✓ Continue to minimize the use of fertilizers and pesticides on campus.
- ✓ Monitor fuel oil delivery and use to prevent releases.

#### Planning:

- ✓ Work with your community to include your IWPA in the District along with other public water supplies in town.

- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Continue long term planning for the system that includes maintenance of the water and wastewater systems.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Each program year, if funds are available, the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

**4. Attachments**

- Recommended Source Protection Measures Fact Sheet

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Orange Water Department**

### What is SWAP?

The Source Water Assessment Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

### Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

## Section 1: Description of the Water System

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

### System Susceptibility

### High

#### Zone II #: 234

**Susceptibility:** High

Well Names	Source IDs
Well #1	1223000-01G
Well #2	1223000-02G

#### Zone II # 233

**Susceptibility:** High

Well Names	Source IDs
Well #3	1223000-04G

The town of Orange is a medium sized community in north west-central, Massachusetts. Orange, settled in the 1700's, was established as a town in the early 1800's, and initially developed as an industrial community along the Millers River. The Orange Water Department maintains three active water supply wells Well #1 (01G), Well #2 (02G) and Well #3 (04G). The Department also lists three surface water supplies: Lake Mattawa, Crystal Spring and Coolage Brook Reservoirs as emergency sources of water. The emergency sources will not be addressed further in this report.

Wells #1 and #2 are located approximately 4,000 feet apart, within the same, relatively narrow, unconfined, sand and gravel aquifer that lies between Lake Mattawa and the Millers River along the North Pond Brook valley. Well #1 is rarely used and is a 10-inch diameter well, 54 feet deep installed in the 1940s. Well #2 is used as the main supply, in conjunction with Well #3, and is an 18-inch diameter, gravel developed well, approximately 85 feet deep. Wells #1 and #2 are located within the same hydrogeologic regime, and share the same Zone II contribution area. However, Well #2 is located downgradient of Well #1 and is proximal to (within 850 feet of) the Millers River. The Zone II (#234) is entirely within Orange. Well #3 (04G) is located in the southeast section of the town within a separate, semi-confined, (leaky-confined) sand and gravel aquifer and has a different Zone II contribution area. Well #3 is a 24 x 32-inch diameter gravel packed well that was installed in the 1990s. The majority of the Zone II #233 is in Orange with approximately 25% of the area within New Salem.

Both aquifers are glacially deepened, bedrock valleys that were filled in with sand and gravel deposited during the recession (melting) of the glaciers some 12-18,000 years ago. Streams and rivers have reworked and eroded the glacial deposits and recent streams have deposited additional alluvial material. Boring logs and maps in the North Pond Brook valley indicate medium to coarse sand and gravel deposits up to 85 feet in depth. Although some boring logs indicate silt and clay, there is no evidence of a continuous confining clay layer in the North Pond Brook aquifer in the vicinity of Wells #1 and #2. Due to the proximity of Well #2 to the Millers River (approximately 850 feet), under extreme drought and extended duration pumping conditions, according to the Zone II analysis report, the Millers River could contribute water to the aquifer supplying Well #2. Well #1 is immediately north of Crystal Spring an emergency, surface water source for Orange. Well #3 is located on the western edge of the aquifer, that flows primarily east, northeast toward Lake Rohunta

and ultimately to the Millers River. It appears that Well #3 lies near a surface water drainage divide between Cold Brook and Shingle Swamp Brook. Well log data indicates a confining clay unit in the immediate vicinity of well #3, however, the confining unit pinches out to the east and north. Therefore the aquifer responds as a confined aquifer initially, but over time, the area of contribution, expands to the unconfined portion of the recharge area. The clay layer was deposited during the glacial recession when a dam was formed blocking the melt water flow and causing the formation of a temporary lake; the clay layer represents the lake bottom sediments. Eventually the dam was breeched and the lake drained. The effect of this hydrogeologic regime is that although the aquifer may be protected from some land uses immediately adjacent to the confining clay layer, the aquifer is vulnerable to contamination from activities conducted in the unconfined portions of the recharge area. The extent and protectiveness of the confining layer is not known with certainty.

The bedrock in the area is a complex series of folded and faulted metamorphic rocks. In the vicinity of Zone II for Wells #1 and #2, the bedrock is mapped as bands of the Littleton Formation, a mica and quartzose schist and aluminous phyllite, the Partridge Formation, a mica biotite schist, and the Clough Quartzite. The bedrock within the Zone II of Well #3 is the Monson Gneiss, a massive, layered biotite, plagioclase gneiss.

Each well has a Zone I protective radius of 400 feet immediately around the wellhead. The Zone IIs were delineated by consultants for the Water Department utilizing geologic mapping, and analytical and/or numerical modeling. Data for the analysis was gathered from extended duration pumping tests and boring logs. Both aquifers, the North Pond Brook aquifer and the Cold Brook/ Shingle Swamp aquifer are considered to be highly vulnerable to contamination due to the absence or discontinuous nature of the hydrogeologic barriers (i.e. clay) that can prevent contaminant migration from activities on the land surface. In fact, low levels of volatile organic compounds (VOCs) have been reported in the water from Well #3. VOCs

were reported in water from Well #1 during one sample round in 1990 but were not detected subsequently. The concentrations reported in Well #3 are below the action levels and therefore treatment is not required at this time. Please refer to the attached map to view the boundaries of the Zone II and consult the Consumer Confidence report for current water quality data.

Potassium hydroxide is added to the water from all wells to raise the pH for corrosion control. For current information on water quality monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

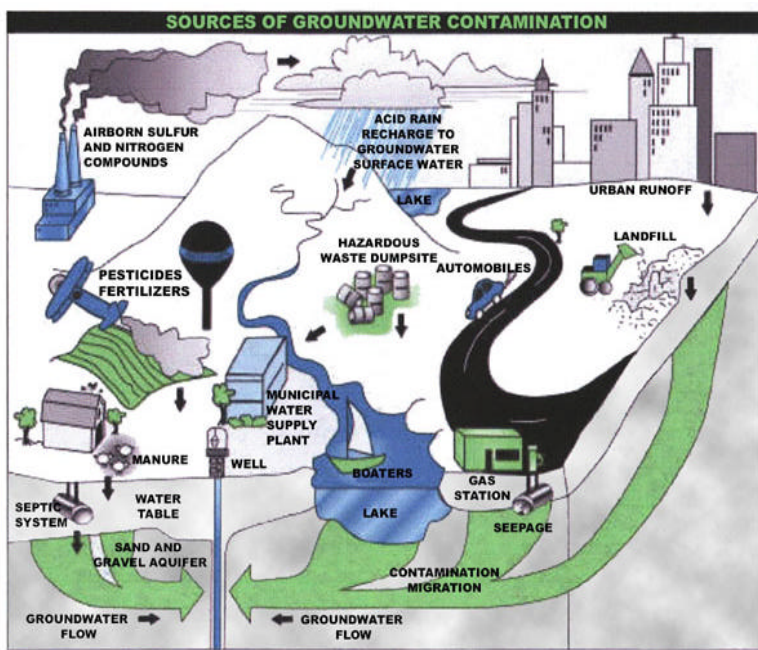

## Section 2: Land Uses in the Protection Areas

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

The land use within the Zone IIs for the Orange Water Department wells is a mixture of forest, cropland, and residential, with a small portion of commercial/light industrial land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

**Key Land Uses and Protection Issues include:**

1. Non-conforming Zone I
2. Residential land uses
3. Transportation corridors
4. Agricultural activities
5. Comprehensive wellhead protection planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of one high threat land use within the water supply protection areas of Well #3, as seen in Table 2.

**1. Non-conforming Zone Is** – The Zone I for each of the wells is a 400 foot radius around the wellhead. Currently, Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) require public water suppliers to own the Zone I, or control the Zone I through a conservation restriction, Memorandum of Understanding or other legal mechanism as approved by the DEP. The public water supplier does not own or control the entire Zone I for any of the wells. Only activities directly related to the water supply, or other no-threatening activities, as determined by the DEP, are allowed in the Zone I. Route 2 and other transportation corridors, and a portion of a farm are within the Zone Is. Well #2 is the most remote from non-conforming activities within the Zone I. Numerous water sources were developed prior to the 400-foot Zone I requirement and are therefore grandfathered. The Department encourages grandfathered systems to acquire ownership or control of the Zone I. The Orange Water Department has actively pursued methods of protecting and/or acquiring the Zone I land.

**Zone I Recommendations:**

- ✓ Prohibit any new non-water supply activities from the Zone I.
- ✓ Continue your current efforts to purchase land and/or negotiate a conservation restriction for land within the Zone I.
- ✓ Agreement Options - Until land is available for acquisition or restriction, attempt to obtain a Memorandum of Understanding and Right of First Refusal.
  - A Memorandum of Understanding (MOU) is an agreement between the landowner and public water supplier in which the landowner agrees not to engage in specific threatening activities. The MOU should be specific to the land use or activity. For example, if the land is residential with a septic system, the owner could agree to not place chemicals, petroleum products, or other hazardous or toxic substances, including septic system

(Continued on page 6)

**What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**For More Information**

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Areas

Activities	Quantity	Threat*	Zone II #	Potential Source of Contamination
<b>Agriculture</b>				
Dairy Farms	1	M	233	Manure (microbial contaminants): improper handling
Fertilizer/Pesticide Storage or Use—Crops	2	H	Both	Fertilizers: leaks, spills, improper handling, or over-application
Livestock Operations	1	M	233	Manure (microbial contaminants): improper handling
Nurseries	2	M	233	Fertilizers, pesticides, and other chemicals: leaks, spills, improper handling, or over-application
<b>Residential</b>				
Fuel Oil Storage (at residences)	Numerous	M	Both	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Both	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Both	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>				
Aboveground Storage Tanks	1	M	Both	Materials stored in tanks: spills, leaks, or improper handling
Stormwater Drains/ Retention Basins	1	L	Both	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Railroad Right-of-Way	1	M	234	Very small area within Zone II. Corridor maintenance and accidental spills in Zone III.
Sand and Gravel Mining/ Washing	1	M	234	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
Golf Courses/Driving Range	2	M	233	Fertilizers or pesticides: over-application or improper handling. Hazardous materials handling
Medical facility	1	M	234	Biological, chemical, and radioactive wastes: spills, leaks, or improper handling or storage

Activities	Quantity	Threat*	Zone II #	Potential Source of Contamination
<b>Miscellaneous</b>				
Transportation Corridors	Several	M	Both	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Underground Storage Tanks	1	H	Zone III of #234	Stored materials: spills, leaks, or improper handling
Transformers	Several	L	Both	MODF and possibly PCBs: spills, leaks, or improper handling. Contact the electric company to ensure no PCBs are within the transformers.

**Table 2 Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

cleaners, into the septic system, and agree that the system will be pumped at a specific frequency. As another example, the portions of fields within the Zone I would not have manure, fertilizers or pesticides spread on them. Understanding how an activity threatens drinking water quality is an important component of developing an effective MOU.

- A Right of First Refusal is a legal document that gives the water supplier the first chance to purchase land when it becomes available. Please refer to the example of the Right of First Refusal documents attached in the Appendices.

The Department commends the Orange Water Department for its proactive efforts to acquire property and recommends continued efforts in establishing a program for planning to acquire ownership or control of property within the areas critical to protecting water quality. If there is no other reasonable method to secure rights and protect these sources, the Department may consider taking necessary water supply land by eminent domain to protect the sources. This recommendation is not only for the existing sources but also should be considered for future development of sources if they are needed.

**2. Residential Land Uses** – Approximately 16% and 4% of the Zone IIs for Wells #1 and 2 and Well #3 respectively, consist of residential areas. The Zone II areas are not connected to municipal sewer and therefore utilize on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not

properly maintained they can be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** - Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

**3. Transportation Corridors** - State highways (Rt. 2, 202 and 122) and local roads run throughout the Zone II protection areas. Roadway construction, stormwater runoff, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are also frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catch basins. The stormwater drainage along Rt. 2 within the Zone II #234 is anticipated to be addressed during the Rt. 2 reconstruction.

The Water Department coordinates with the Fire Department to plan and train for emergency response actions related to releases that may impact the water supplies. This planning is especially effective because of the highways and the proximity of the Orange Airport. Although the airport is not within the Zone II, it is within close proximity to the recharge areas.

#### **Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II. If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping. This information could be very important in the event of an accident and release of hazardous materials that could wash into stormwater drains.
- ✓ Contact the Town and State to ensure catch basins are inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.

#### **Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ➊ Reduces Risk to Human Health
- ➋ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ➌ Supports municipal bylaws, making them less likely to be challenged
- ➍ Ensures clean drinking water supplies for future generations
- ➎ Enhances real estate values - clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

- ✓ Continue current efforts of working and planning with local emergency response teams to ensure that any spills within the Zone II can be effectively contained and the water Department is notified.

**4. Agricultural Activities** – There are several farms (dairy, crop, and nurseries) and agricultural activities (haying and non-commercial animals) throughout both Zone IIs. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water supplies. In addition, farms and large commercial facilities often conduct their own maintenance on their equipment and have storage of hazardous materials and waste.

#### **Agricultural Activities Recommendation:**

- ✓ If appropriate, work with the DEP to negotiate Conservation Restrictions for these land areas.
  - ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Review the fact sheet available online and call the local office of the NRCS in Hadley at 413-585-1000 for assistance or online at <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf>.
- ✓ Encourage farmers and property managers to incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
  - ✓ Promote the use of BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning. Request that farms, golf courses and other large commercial facilities evaluate their status as hazardous waste generators and register as appropriate.
  - ✓ Continue your current work with farmers, and include nurseries and the golf course to ensure that pesticides and fertilizers are being stored within a structure designed to prevent runoff.
  - ✓ The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf>, and call the local office of the NRCS for assistance. This is also appropriate for New Salem.
  - ✓ Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

**5. Protection Planning** – Currently, the Town of Orange has water supply protection controls that do meet the requirements of the Department's Wellhead Protection regulation 310 CMR 22.21(2). However, the Town of New Salem does not have regulations for the protection area for Well #3. Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan can coordinate community and inter-community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells.

It should also be noted that activities within the Zone III may pose a potential threat to the water supply. Specifically, under rare conditions when the river may contribute water to the aquifer an accidental release to the river may pose a threat to water quality at Well #2. This report does not include facilities located along the Millers River or in the Zone III of the wells. Land uses that should be considered in protection and emergency response planning are the WWTP, auto repair facilities, USTs, and railroad tracks. Railroad tracks run through a very small portion of the Zone II # 233

and along the river. Rail corridors serving passenger or freight trains can be potential sources of contamination due to chemicals released during normal use, track maintenance, and accidents. Accidents can release spills of train engine fluids and commercially transported chemicals. In the event of a release to the river, the railroad company should notify the Water Department. As noted previously, under extreme drought conditions, there is a potential for the river to contribute water to the aquifer near well #2. It should be noted that Utility Yearly Operating Plans (YOPs) do take into consideration sensitive environments when conducting vegetation control and track maintenance.

**Protection Planning Recommendations:**

- ✓ Consider inventorying facilities upstream along the Millers River and incorporate any potentially high threat facilities into your Emergency Response Action Plan such as the wastewater treatment plant and other facilities that may be just outside of the Zone II or within the Zone III.
- ✓ Consider preparing a Wellhead Protection Plan. Establish a protection team that includes participants from the Town of New Salem, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Request that the New Salem Board of Health adopt floor drain controls and hazardous materials handling regulations and that the Planning Board propose wellhead protection bylaws for the Zone II.
- ✓ Request that the Board of Health review the maps used by the railroad in their YOP for accuracy. This should only have to be done one time.

Other land uses and activities within the Zone II are listed in Table 2. Refer to Table 2 and Appendix 2 for more information about these land uses.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system's Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Proactively pursuing land acquisition and protection options in the Zone I and II,
- Maintaining detailed knowledge of activities within the protection areas,
- Establishing and maintaining a working relationship with the emergency responders in town to develop response actions to various emergencies,
- Operating an award winning water department.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Consider inventorying USTs within the Zone IIs.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Develop and implement a Wellhead Protection Plan and continue efforts to include New Salem in source protection efforts.

**Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Each spring, if funds are available, DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the protection area. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Continue working with land owners to negotiate a Conservation Restriction and other forms of protection.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue to keep other land uses out of the Zone Is. Continue working with land owners to negotiate a CR, MOU and other forms of protection.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>YES</b>	Modify protection measures as appropriate if regulations are modified for additional protection.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>NO</b>	New Salem does not have wellhead protection measures in place that meet 310 CMR 22.21(2). Continue efforts to encourage New Salem to adopt bylaws and regulations to protect resources.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	However, Orange is proactive with respect to wellhead protection. Consider formalizing current and past protection efforts into a plan; include strategies for future source development and protection. Refer to "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Orange is commended for proactively coordinating with the emergency responders. Continue to work with the fire department, Board of Health, DPW, and local and state emergency officials. Include industries and the WWTP.
Does the municipality have a wellhead protection committee?	<b>YES</b>	Include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>PARTIAL</b>	Orange does have protective bylaws and regulations, however New Salem does not. For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> . Work with neighboring communities to adopt floor drain regulations.
Does the PWS provide wellhead protection education?	<b>YES</b>	Aim additional efforts at commercial, industrial and municipal uses within the Zone II and as appropriate Zone III.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Gale Brook School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared  
December 22, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	<b>Gale Brook School</b>
<i>PWS Address</i>	<b>Athol Road</b>
<i>City/Town</i>	<b>Orange, Massachusetts</b>
<i>PWS ID Number</i>	<b>1223010</b>
<i>Local Contact</i>	<b>Mr. James Majewski</b>
<i>Phone Number</i>	<b>1-888-377-7678</b>

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1223010-01G	100	401	Moderate/High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Gale Brook School (the school) is located on the corner of Athol Road and Royalston Road in North Orange. Orange is a medium to large size town in northwestern Massachusetts, north of Quabbin reservoir. The school well serves the school and the library that is located on the same parcel. The school is home to the Head Start Program preschool. The total school student and staff population is less than 50 people per day. Although there is a municipal water system and a wastewater treatment facility in Orange, they do not serve the area where the school is located. Therefore, the school and surrounding facilities are served by on-site water supplies and septic disposal.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

The school is served by one potable supply well. Well #1-01G is a 6-inch diameter, 400-foot deep, bedrock well that is located beneath a bulkhead that can be accessed through the basement of the school. There are 2275 gallon fuel oil tanks within containment in the basement along with the boiler; the floor drain in the basement was redirected to a surface discharge. The library has an underground fuel oil storage tank that the Town intends to remove when funding is available. There are two roads and several private homes within the IWPA.

The school is located on the southeast flank of Temple Hill, southeast of Whites Pond in the central Massachusetts highlands. The Tully River valley, east of the school is a bedrock valley that was filled with stratified drift (sand and gravel) during the recession of the glaciers some 18,000 years ago. However, observations and geologic mapping indicates thin overburden deposits of till over bedrock on the hill where the school is located. The bedrock in the area is of the Bronson Hill Zone and mapped in the immediate area of Well #1 as garnetiferous schist of the Littleton Formation.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water or other non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The well has a Zone I protective radius of 100 feet and an IWPA protective radius of 401 feet. These protective radii were based on the capacity of the well and Zone I ownership restrictions. Please refer to the attached map that shows the Zone I and IWPA.

There is no evidence of a continuous, protective confining layer such in the vicinity of the well. Wells drilled in these conditions are considered highly vulnerable to potential contamination from activities on the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer. The water is not treated prior to distribution. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Fuel Oil Storage	Yes	Yes	Moderate/High	AST in containment in basement/UST at the library in the IWPA.
School	Yes	Yes	Moderate	Limit road deicing usage, use BMPs for household hazardous materials and monitor parking areas and control stormwater
Residential housing	No	Yes	Moderate	Septic systems, household hazardous materials, home heating fuel.
Septic systems components	No	Yes	Moderate	Residential and the school's wastewater components are in the IWPA.
Transportation and parking	Yes	Yes	Moderate	Monitor stormwater runoff and redirect as necessary to protect the well.

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas and in close proximity to the protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Underground/Above ground storage tanks;**
3. **School facilities;**
4. **Transportation corridors/parking; and**

There are several activities within the Zone I and IWPA that pose a potential threat to the water supply. The overall ranking of susceptibility to contamination for the well is moderate/high based on at least one high threat activity within the protection areas. Please refer to Table 2.

**1. Non-conforming Zone I** – The water supplier owns nearly the entire Zone I except for a small portion of North Road. However, the activities in the Zone I are non-conforming since the well is located beneath a bulkhead adjacent to school and the school and all associated activities are within the Zone I. Systems not meeting DEP Zone I requirements for ownership or control or non-conforming activities within Zone I must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Zone I Recommendations:

- ✓ Prohibit any additional non-water supply activities within Zone I and, where feasible, remove non-conforming activities within the Zone I areas.
- ✓ Do not use or store pesticides, fertilizers or hazardous materials near the well.
- ✓ Inspect the well regularly to ensure the cap is secure and there is no standing water near the well.

**2. Underground/Above ground fuel oil storage** – There is a fuel oil UST in the IWPA and there are ASTs within containment in the IWPA. If managed improperly, fuel oil tanks and their associated piping can be a potential source of contamination due to leaks or spills of the materials they store.

### Recommendation:

- ✓ Any modifications to the tank must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs and USTs.
- ✓ Monitor all activities associated with the fuel oil, especially delivery.
- ✓ Have spill containment/absorbent materials available on-site

**3. School facilities** – Elementary and preschools generally

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier and town boards.

use only household type hazardous materials.

### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school.
- ✓ Review your emergency response plan regarding to accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- ✓ For additional information, refer to the Massachusetts Public Health Associations Healthy Schools website online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html).

**4. Transportation corridor/parking** – Transportation corridors and parking are located within the Zone I and IWPA. Accidents and normal use and maintenance of corridors and parking areas may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as, waste from wildlife and pets.

### Recommendations:

- ✓ Prepare an Emergency Response Plan that includes coordination among the emergency responders to be sure they are aware of the location of your well.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the well's susceptibility to contamination. The DEP commends the school and the Town on their efforts to remove hazards from the protection area such as redirecting the floor drains and removal of potential hazardous materials from the basement, as well as efforts to acquire funds to remove the UST.

Please review and adopt the key recommendations listed above and as follows:

### Priority Recommendations :

- ✓ Communication with the Town boards and emergency responders regarding the location of the well and the protection areas and continue efforts to remove the UST.

### Zone I and IWPA:

- ✓ Prohibit any new non-water supply activities from Zone I.
- ✓ Conduct regular inspections of the Zone I and IWPA.
- ✓ Post drinking water supply signs in key location such as along the access road and in the parking areas but away from the well.
- ✓ Provide information to staff and pertinent school organizations about the potential hazards of household chemicals.
- ✓ Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, cleaning products and household hazardous waste.

### Training and Education:

- ✓ Staff should be instructed on the proper disposal of spent chemicals. Include custodial staff, teachers, groundskeepers, and the certified operator.

### Planning:

- ✓ Request that local officials include the IWPA in the Aquifer Protection District and to continue assisting you in protection of the water supply.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.

- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- V Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

## For THE FARM SCHOOL

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 11, 2004

### What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	The Farm School
<i>PWS Address</i>	Sentinel Elm Rd
<i>City/Town</i>	Orange, Massachusetts
<i>PWS ID Number</i>	1223012

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1223012-01G	100	422	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

### What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

### What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1223012-01G)**

Zone I = 100 ft.  
IWPA = 422 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on septic system components and farm animals being located within the Zone I and the IWPA. The **high** susceptibility to potential non-microbial threats is based on the local roads and other farm related activities located within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Reports, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information you submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ continue to manage manure storage and spreading as well as stormwater on site;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

February 10, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Otis Ridge Ski Area
<i>PWS Address</i>	159 Monterey Rd
<i>City/Town</i>	Otis, Massachusetts
<i>PWS ID Number</i>	1225013

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1225013-01G	198	500	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
# 1 (1225013-01G)**

Zone I = 198 ft.  
IWPA = 500 ft.

### How Was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and parking areas within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your 2000 Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Otis Ridge Ski Camp
<i>PWS Address</i>	159 Monterey Rd
<i>City/Town</i>	Otis, Massachusetts
<i>PWS ID Number</i>	1225019

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1225019-01G	113	427	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
# 1 (1225019-01G)**

Zone I = 113 ft.  
IWPA = 427 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the IWPA. The system disinfects the water prior to distribution. The **moderate** susceptibility to potential non-microbial threats is based on buildings and parking areas within the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.

# Source Water Assessment Program (SWAP) Report for Farmington River Regional Elementary School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

November 26, 2001

**Table 1: Public Water System (PWS) Information**

Well #1	1225040-01G	200	503	Low

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Farmington River Regional Elementary School (the school) is a rural, elementary school located on the west side of North Main Road in Otis. The school student and staff population is approximately 235 people per day and is served by a single potable supply well (Well #1) located southeast of the school. The school is served by the Town's municipal sewer system; all sewer components are located outside of the Zone I.

The well has a Zone I protective radius of 200 feet and an Interim Wellhead Protection Area (IWPA) radius of 503 feet based on a pumping rate that was approved by the DEP in 1995. Please refer to the attached map that shows the Zone I and IWPA. The Zone I

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wellhead may be larger or smaller.

The 6-inch diameter bedrock well is 405 feet deep. It is located approximately 425 feet southeast of the school. Geological mapping in the area identifies the bedrock as the Taconic-Berkshire Zone, consisting of granite, diorite and granitic gneiss. There is no evidence of a confining unit such as clay in the area. In fact, bedrock outcrops of granite were noted throughout the area during the site visit. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer. The water does not require and is, at the time this report was prepared, not treated. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone Is and IWPAs and Table 2 for additional assessment information. Please note that the land use descriptions are limited and the school area is described as Urban Open space for lack of a better descriptor.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, very few land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. School facilities
2. Town facilities

The Farmington River School well is fairly well protected. There were no activities within the Zone I that pose a significant threat to the water supply. Although there are a few activities of concern within the IWPA, based on the topography, it appears those activities are primarily downgradient of the well. The overall ranking of susceptibility to contamination for the well is low. Please refer to Table 2.

**1. School Facilities** – Elementary schools generally use only household type hazardous materials for cleaning, pest control and lawn care. Part of the recreation field is within

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Town salt shed	No	Yes	Moderate	Salt shed on the edge of IWPA, is covered and downgradient
School building and athletic fields	No	Yes	Moderate	Use BMPs for household type hazardous materials; do not use pesticide/fertilizers on fields
Transportation corridor	No	Yes	Moderate	Route 8
Residential development	No	Yes	Low	100% municipal sewer
Town garage	No	No	--	Currently not registered as a VSQG

- -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/den/hrn/dws/](http://www.state.ma.us/den/hrn/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

the IWPA of the well. Potential exists for contamination of the well by fertilizers, herbicides, and pesticides, all of which can be of concern.

### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields. Consider drought resistant grasses and/or low release nutrient fertilizers as required.
- ✓ Investigate Integrated Pest Management and Best Management Practices for field maintenance within the IWPA as necessary.
- ✓ Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.

**2. Town facilities** – A section of roadway (Route 8) is within the IWPA of the well. However, drainage discharges away from the well. In addition, the Town salt shed and the Town garage are partially in or just outside of the IWPA. All of these appear to be topographically down gradient of the well. The Town highway garage is not registered as a very small quantity generator. To enhance protection of the public and private water supplies in the area, BMPs should be utilized at all facilities.

### Recommendations:

- ✓ Monitor the parking lot and roadside for spills and leaks. Be sure the highway and police departments are aware of the well locations and notify you in the event of an accident on the roadway that results in a release that may impact the well.
- ✓ Use BMPS for handling of all hazardous materials.
- ✓ A copy of "A Summary of Requirements for Small Quantity Generators of Hazardous Waste" and a fact sheet for Very Small Quantity Generators have been sent to the Board of Selectmen. Although the Town's Transfer station is registered, it is recommended that the Town Highway Department review it's status and register as required.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the well's susceptibility to contamination. Farmington River Regional Elementary School and the Town of Otis are commended for the effort shown in siting the well connecting to the municipal sewer and current protection efforts.

Please review and adopt the key recommendations listed above and as follows:

### Zone I and IWPA:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider gating the wellhead.
- ✓ Post drinking water supply signs in key location such as along the access road and in the parking area.
- ✓ Provide information to staff and pertinent school organizations about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, pesticides and household hazardous waste.

### Training and Education:

- ✓ Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies).

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

### Facilities Management:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator. The school is currently not registered as a generator of hazardous waste or waste oil. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" and register to participate, if necessary.

### Planning:

- ✓ Work with local officials to develop an Aquifer Protection District Bylaw that includes the school well's IWPA and to assist you in continued protection of the water supply.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Funding:

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the 2001 "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note that each program year, on or about May 1 the Department posts a new Request for Response (RFR), grant application form. Generally, the applications are due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
KATIES COUNTRY STORE

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 24, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Katies Country Store
<i>PWS Address</i>	Rte 23
<i>City/Town</i>	Otis, Massachusetts
<i>PWS ID Number</i>	1225041

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1225041-01G	100	410	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#1 (1225041-01G)**

Zone I = 100 ft.  
IWPA = 410 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **high** susceptibility to potential non-microbial threats is based on the local roads, underground storage tanks, and hazardous materials storage within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Palmer Water District #1**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

## Section 1: Description of the Water System

**System Susceptibility:**

**High**

### Groundwater Sources

**Zone II # 237**

Source Name	Susceptibility: High
Galaxy Wellfield	1227000-01G
GP Well #2	1227000-02G

### Surface Water Sources

Source Name	Susceptibility: Moderate
Upper Reservoir, Graves Brook	1227000-01S
Lower Reservoir, Graves Brook	1227000-02S

Palmer is a medium sized, industrial community in west, central Massachusetts. Palmer, established in the early 1700's, initially developed as an industrial community along the numerous brooks and rivers that flow through the area. Palmer consists of four villages: Bondsville, Three Rivers, Thorndike and Depot Village. The Swift River flows into the Ware River and the Ware and Quaboag Rivers join to form the Chicopee River. The area east of the confluence is known as Three Rivers. The Quaboag River forms part of the Eastern and southern boundaries of the Town.

There are four community public water supply systems in Palmer: Thorndike, Palmer, Bondsville and Three Rivers Fire Districts. The Bondsville District currently supplies water to the Thorndike system with the Three Rivers District supplying a portion due to previous water quality problems with the Thorndike Fire District's source. Palmer Water District #1 maintains four active water supplies: two surface water sources, Upper (1227000-01S) and Lower (1227000-02S) Graves Brook Reservoirs and two groundwater sources, Galaxy Wellfield (1227000-01G) and the Gravel Packed well (1227000-02G). The surface water supplies are located in the south, central section of town off of Reservoir Street. Water from the surface water supplies is treated through the Graves Brook Water Treatment Plant, a Trident microfloc filtration system using alum nonionic polymer as a flocculent, sodium hydroxide and trimetaphosphate for corrosion control and finally sodium hypochlorite for disinfection prior to distribution. The

surficial geology is mixed, consisting locally of sand and gravel associated with glacial outwash and in some areas, thin till over bedrock. The watersheds are underlain primarily by gneiss, as can be seen at the outcrops surrounding and gravel pit near the reservoir.

The groundwater supplies are located in the deep sand and gravel, glacial outwash and alluvial deposits along the Quaboag River valley south of an industrial area along Route 20. The Galaxy wellfield consists of 19, 2½-inch diameter, shallow (20-25 feet deep), closely located wellpoints. The Zone I for the wellfield is delineated as an oval approximately 250 feet radial distance from the outer wellpoints. The Gravel Packed well, installed in 1970, is a 65-foot deep, 18 by 48-inch diameter, gravel packed well located southeast of the Galaxy wellfield and has a Zone I radius of 400 feet. Water from both sources is treated through a granular activated carbon to remove volatile organic compounds, has trimetaphosphate and sodium hydroxide added for corrosion control and is disinfected with sodium hypochlorite prior to distribution. The Department has identified several responsible parties for the release of

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

hazardous materials. Additional information regarding the current water quality and status of confirmed release sites may be obtained from the Department's Bureau of Waste Site Cleanup and Drinking Water Program at the Springfield Regional Office.

The Quaboag River valley, where the groundwater supplies are located, is a glacially deepened, buried bedrock valley. The valley was filled with stratified, sand and gravel deposits during the recession (melting) of the glaciers some 10,000 to 12,000 years before present. The Quaboag valley trends primarily east west and is joined by the Chicopee Brook valley trending south to north, just south of the well sites. The bedrock geology of the area of the area is mapped as layers of gneiss, amphibolite, and augen gneiss.

Aquifer parameters were determined from multiple, extended duration pumping tests and the Zone II for the wells was delineated based on conceptual and analytical modeling in conjunction with geological mapping. Under various pumping scenarios, groundwater may be contributed from the Chicopee Brook valley and induced from the Quaboag River. Please refer to the attached map to view the boundaries of the Zone II. For current information on water quality

monitoring results and treatment processes, please refer questions to the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The Zone II for Palmer Water District's wells is a mixture of industrial, light commercial, residential and agricultural areas (refer to attached map for details). The land uses in the watersheds are forested water supply land and low density residential. The Palmer Water District owns almost the entire watershed for the reservoirs. The most significant threat to the surface water supplies is from natural, microbial threats, potentially from forestry and from beavers. Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Tables of Regulated Facilities attached in Appendix B.

### Key Land Uses and Protection Issues include:

1. Nonconforming Zone I
2. Residential land uses
3. Transportation corridors
4. Hazardous materials storage and use
5. Oil or hazardous waste contamination sites
6. Protection Planning
7. Agricultural activities
8. Railroad/Pipeline Right of Way
9. Potential presence of Beavers in Surface Water Sources
10. Water Treatment Facility

The overall ranking of susceptibility to contamination for the system is high. The susceptibility to contamination of the surface water supplies is moderate while the groundwater supplies is high, based on the presence of numerous high ranking threat land uses within the Zone II. Please refer to Table 2.

**1. Non-conforming Zone I** – Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to control the Zone I through ownership or some other mechanism such as a conservation restriction. Only water supply activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and contain non-water supply activities such as homes and public roads. Palmer Fire District does not own the entire Zone I for either groundwater source. Within the Zone Is are a gas/oil pipeline right-of-way,

### What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

transportation corridors, and some residences.

#### Zone I Recommendations:

- ✓ Obtain a Right-of-First Refusal for acquiring additional land within the Zone I currently not owned by the District.
- ✓ Consider purchasing the land or acquiring a conservation restriction on the land to minimize potential threats.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Contact the property owners to be sure they are aware they are within the Zone I and Zone II of the wells. Provide information about BMPs.

**2. Residential Land Uses** – Approximately 25% of the Zone II consists of residential areas. The reservoir watershed has less than 1% of the land use as

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

residential. From this perspective, residential land uses are more of a potential threat within the Zone II than in the watershed areas. However, nearly the entire Zone II area is served by municipal sewer. There are a few residents in the watershed and Zone II that utilize on site septic disposal. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. There are some residential uses within the Zone A of the reservoirs as well. Common potential sources of contamination include:

- **Septic Systems** – Improper maintenance and disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems discharge directly to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include petroleum products for automotive and lawn care, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

Figure 1: Sample watershed with examples of potential sources of contamination

- ✓ Work with planners to manage and control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls. Continue catch basin cleaning routines.

**3. Transportation Corridors** - Route 20 and Route 32 run through part of the Zone II, and local roads are common throughout the Zone II and watershed. The transportation corridors are more heavily traveled in the Zone II than in the watershed, and are therefore a greater threat in the Zone II; however, it is equally important to use best management practices in both areas. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Zone II or Watershed	Potential Contaminant Sources*
<b>Agricultural</b>				
Fertilizer Storage or Use	2	M	Zone II	Fertilizers: leaks, spills, improper handling, or over-application
Forestry Operation	Selectively	L	Watershed	Herbicides or pesticides, equipment maintenance materials: leaks, spills, or improper handling; road building
Nurseries	1	M	Zone II	Fertilizers, pesticides, and other chemicals: leaks, spills, improper handling, or over-application
Pesticide Storage or	1	H	Zone II	Pesticides: leaks, spills, improper handling, or over-application
<b>Commercial</b>				
Car/Truck/Bus Washes	1	L	Zone II	Vehicle wash water, soaps, oils, greases, metals, and salts: improper management
Gas Stations	1	H	Zone II	Automotive fluids and fuels: spills, leaks, or improper handling or storage
Service Stations/Auto Repair Shops	1	H	Zone II	Automotive fluids and solvents: spills, leaks, or improper handling
Bus and Truck Termi-	1	H	Zone II	Fuels and maintenance chemicals: spills, leaks, or improper handling
Golf Courses	1	M	Zone II	Fertilizers or pesticides: over-application or improper handling
Junk Yards	2	H	Zone II	Automotive chemicals, wastes, and batteries: spills, leaks, or improper handling
Medical Facilities	1	M	Zone II	Biological, chemical, and radioactive wastes: spills, leaks, or improper handling or storage
Paint Shops	1	H	Zone II	Paints, solvents, other chemicals: spills, leaks, or improper handling or storage
Photo Processors	1	H	Zone II	Photographic chemicals: spills, leaks, or improper handling or storage

Land Uses	Quantity	Threat	Zone II or Watershed	Potential Contaminant Sources*
<b>Commercial (continued)</b>				
Railroad Tracks And Yards	Numerous	H	Zone II	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills
Repair Shops (Engine, Appliances, Etc.)	1	H	Zone II	Engine fluids, lubricants, and solvents: spills, leaks, or improper handling or storage
Sand And Gravel Mining/Washing	2	M	Both	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
<b>Industrial</b>				
Asphalt Plants	1	M	Zone II	Hazardous chemicals and wastes: spills, leaks, or improper handling or storage
Chemical Manufacture Or Storage	Numerous	H	Zone II	Chemicals and process wastes: spills, leaks, or improper handling or storage
Foundries or Metal Fabricators	1	H	Zone II	Solvents and other chemicals: spills, leaks, or improper handling or storage
Hazardous Materials Storage	2	H	Both	Hazardous materials: spills, leaks, or improper handling or storage (Water Treatment facility located in Zone A)
Hazardous Waste Storage, Treatment and Recycling	1	H	Zone II	Hazardous materials: spills, leaks, or improper handling or storage
Industrial Lagoons and Pits	1	H	Zone II	Liquid wastes: improper seepage or overflows
Industry/Industrial Parks	1	H	Zone II	Industrial chemicals and metals: spills, leaks, or improper handling or storage
Metal Plating	1	H	Zone II	Solvents, other chemicals, and process wastes: spills, leaks, or improper handling or storage
Machine/ Metalworking Shops	1	H	Zone II	Solvents and metal tailings: spills, leaks, or improper handling
Petroleum Storage Facilities	1	H	Zone II	Petroleum products and equipment maintenance chemicals: spills, leaks, or improper handling or storage
<b>Residential</b>				
Fuel Oil Storage	Numerous	M	Both	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Both	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Both	Hazardous chemicals: microbial contaminants, and improper disposal

Land Uses	Quantity	Threat	Zone I or Watershed	Potential Contaminant Sources*
<b>Miscellaneous</b>				
Aboveground Storage Tanks	Numerous	M	Both	Materials stored in tanks: spills, leaks, or improper handling
Aquatic Wildlife	Periodic	L	Watershed	Microbial contaminants
Combined Sewer Overflows	1	L	Zone II	Microbial and non-microbial contaminants including industrial wastewater; improper disposal of hazardous wastes
Large Quantity Hazardous Waste Generators	3	H	Zone II	Hazardous materials and waste: spills, leaks, or improper handling or storage
Oil or Hazardous Material Sites	7	--	Zone II	Tier Classified Oil or Hazardous Materials Sites are not ranked due to their site-specific character. Individual sites are identified in Appendix B. Contact DEP BWSC for additional information.
Pipeline (Oil and sewer)	1	M	Zone II	Oil or sewage: spills or leaks
Road and Maintenance Depots	1	M	Zone II	Deicing materials, automotive fluids, fuel storage, and other chemicals: spills, leaks, or improper handling or storage
Small Quantity Hazardous Waste Generators	1	M	Zone II	Hazardous materials and waste: spills, leaks, or improper handling or storage
Stormwater Drains/ Retention Basins	Numerous	L	Zone II	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Tire Dumps	1	M	Zone II	Tires: improper handling or management
Transmission Line Rights-of-Way (Oil/Electric)	2	L	Zone II	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors	Numerous	M	Zone II	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Utility Substation Transformers	1	L	Zone II	Chemicals and other materials including PCBs: spills, leaks, or improper handling
Very Small Quantity Hazardous Waste	12	L	Zone II	Hazardous materials and waste: spills, leaks, or improper handling or storage

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash into catch basins.

**Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

**4. Hazardous Materials Storage and Use**— About 11% of the land area within the Zone II is commercial or industrial land uses. Many businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. As Palmer is well aware, if hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ **Hazardous Materials Program Best Management Practices** - Support the development and implementation of a hazardous materials program that includes a By law or Health Regulation. Such a program educates businesses on hazardous material management requirements, explicitly informs the business community what is expected of them, and decreases the potential future liability businesses may be unknowingly creating for themselves. A local program lets the town serve as a consultant, helping businesses protect themselves. See DEP's website for additional information on developing a program for hazardous materials management at <http://www.state.ma.us/dep/brp/dws/files/hazmat.doc>. Distribute the fact sheet "Businesses Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.
- ✓ **Register Hazardous Waste Generators** - Work with local businesses and the Board of Health to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ **Floor Drains** - Work with the local Board of Health to educate local businesses on Massachusetts' floordrain requirements. See brochure "Industrial Floor Drains" for more information.
- ✓ **Storage Tanks** - Support your local fire department in upgrading all above and below ground oil/hazardous material storage tanks in order to meet current construction standards. Funding for replacing of non-residential underground storage tanks is available through the MA Department of Revenue. For more information, refer to [http://www.dor.state.ma.us/ust/ust\\_home.htm](http://www.dor.state.ma.us/ust/ust_home.htm)
- ✓ **Inspection Program** - Coordinate efforts with local officials and the other water districts in Palmer to develop and implement an Inspection Program that is usually conducted by the local Board of Health to prevent hazardous substances from entering water supplies. Inspections target facilities that generate, use, store, or disposal of hazardous/toxic materials. Programs can also include floor drain inspections and underground storage tanks. Local inspection programs often provide educational material and technical assistance on Best Management Practices.

- Building Inspectors are often involved in local inspection programs.
- ✓ **Lawn care and Landscaping** - Encourage local businesses to incorporate Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides. For more information, refer to [http://www.massdfa.org/pesticides/publications/IPM\\_kit\\_for\\_bldg\\_mgrs.pdf](http://www.massdfa.org/pesticides/publications/IPM_kit_for_bldg_mgrs.pdf)
  - ✓ **Office of Technical Assistance** - For additional help regarding environmental requirements and toxic use reduction approaches to compliance contact the Office of Technical Assistance (OTA) for Toxic Use Reduction. The OTA is a non-regulatory agency within the Commonwealth's Executive Office of Environmental Affairs. OTA provides free, confidential assistance on toxic use reduction opportunities. <http://www.state.ma.us/ota/>

**5. Presence of Oil or Hazardous Material Contamination Sites** – The Zone II contains DEP Tier Classified Oil and/or Hazardous Material Release Sites indicated on the map as Release Tracking Numbers 1-0000593, 1-0000827, 1-0010792, 1-0000681, 1-0000716, 1-0000140 and 1-0000139. Refer to the attached map and Appendix C for more information.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Continue your current practice of monitoring progress of ongoing remedial action conducted for the known oil or contamination sites.

**6. Protection Planning** – Currently, Palmer does not have a Wellhead Protection Plan, but the Town does have a Watershed Protection Districts and a zoning By law. The by law has not been approved by DEP for compliance with water supply protection control regulations 310 CMR 22.21(2). A Watershed Protection Plan has been submitted and approved by the Department's Boston office for content and procedures. These types of protection plans coordinate community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public education and outreach. The

**Top 5 Reasons to Develop a Local Wellhead and Surface Water Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

development of a successful Wellhead Protection Plan is outlined in five steps in DEP's "Developing a Local Wellhead Protection Plan" (see Appendix A for the full report) as:

- Establish a protection committee or team
- Define the Wellhead Protection Area
- Identify potential sources of contamination
- Protect and manage the wellhead protection area
- Conduct ongoing public education and outreach

A Watershed Protection Plan was recently developed for the reservoirs. During the assessment it was determined that the watershed is incorrectly delineated along the northern border of the watershed. It appears that the watershed area identified in the plan is larger than the actual watershed area. The Department will coordinate and work with Palmer Fire District to rectify any inaccuracies and encourages you to correct any inaccuracies prior to implementing any activities within the area in question.

**Protection Planning Recommendations:**

- ✓ Develop a Wellhead Protection Plan. Work with the other Palmer water suppliers in a coordinated effort with the town of Palmer to protect all of Palmer's water supplies. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Coordinate efforts with local officials and other town water suppliers to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21(2). If the local controls do not meet the current regulations, or the overlay District does not cover the entire recharge area, adopt controls that meet 310 CMR 22.21(2) and request modification of the District outlines. For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ If local Board of Health controls do not regulate floor drains, be sure to include floor drain controls that meet 310 CMR 22.21(2).

**7. Agricultural Activities** – Crop and pasture lands make up about 8% of the land use in Zone II. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.

**8. Railroad/Pipeline Right-of-Way** – The railroad runs through the entire Zone II. The pipeline runs through the Zone II and part of the Zone I. Rail corridors that serve passenger and/or freight trains are a potential source of contaminant due to chemicals released during normal use, track maintenance, and accidents. The pipeline carries refined petroleum products and therefore the risk is from a rupture in the line. Normal maintenance of a right-of-way can introduce contaminants to a water supply through herbicide application for vegetation control. The over-application or improper handling of herbicides on railroad right-of-way is a potential source of contamination. Leaks or spills of transported chemicals or train/track maintenance chemicals are also potential sources of contamination to the water supply.

**Right of Way Recommendations:**

- ✓ Review the right-of-way Yearly Operating Plan from both the railroad and the oil company to ensure Best Management Practices are implemented with regard to vegetation control in the Zone II, and that the utility has accurate information regarding the locations of the wells and the Zone I. Review the maps the utility uses.
- ✓ Work with your local fire department to review emergency response plans. Updates to this plan should include the rights-of-way including coordination with the owner/operator of the track and pipeline using the right-of-way. Request emergency response teams to coordinate Emergency Response Drills and practice containment of potential contaminants from accidents within the Zone I and Zone II, which should attempt to include representatives from the owner/operator of the rights-of-way.

**9. Presence of Aquatic mammals in Surface Water Watershed** – There is the potential for aquatic mammals (beavers and muskrats) living in and near the surface water supplies. Aquatic mammals pose a potential threat of microbial

**What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II.
2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

Land uses within the Zone III were not assessed for this report.

**For More Information**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, town boards, and the local media.

contamination of the source from *Giardia Lamblia* and *Cryptosporidium*, pathogens that are identified in the Surface Water Treatment Rule and Enhanced Surface Water Treatment Rule as posing an unacceptable risk to drinking water.

**Presence of Beavers in Surface Water Sources**

**Recommendations:**

- ✓ Monitor the watershed and reservoirs for the presence of aquatic mammals and their proximity to the intake. Monitor raw water quality and assess potential impacts.

**10. Water Treatment Facility** - The Palmer water treatment facility is located within the Zone A of the upper reservoir. The facility is served by municipal sewer but has a lagoon in the event they need it. They have never used the lagoons. Activities associated with water treatment involve

storage and use of hazardous materials such as chlorine, sodium hydroxide and fuel oil for the generator. All chemicals are stored above ground in secondary containment. The facility also has a garage for vehicle storage. According to the watershed protection plan, storm water from the facility discharges outside of the watershed. Spills or leaks of hazardous materials during handling and delivery and storm water are a potential source of contamination.

**Water Treatment Facility Recommendations:**

- ✓ Ensure water treatment facility is operated and maintained according to DEP requirements.
- ✓ Ensure stormwater drains and the drainage system around the treatment plant do drain outside of the watershed. Maintain catchbasins as necessary.
- ✓ Continue current use of best management practices for proper handling of materials and in containing spills and leaks.
- ✓ Update emergency plans as necessary.

Other land uses and activities within or immediately adjacent to the Zone II that have potential for contamination include repair shops, large equipment storage, a greenhouse, a former oil business and a large agricultural supply facility. Additionally, there are facilities that may not be registered as hazardous materials handlers or are presently vacant. Future use of these sites should be monitored.

Refer to Table 2 and Appendix 2 for more information about these land uses.

### **Section 3: Source Water Protection Conclusions and Recommendations**

**Current Land Uses and Source Protection:**

Although the Zone II contains numerous existing and potential sources of contamination, awareness and source protection measures reduces the risk of actual contamination, as illustrated in Figure 2. Identifying additional potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those listed above and below should be used to better protect your water supply. Palmer's surface water supply is well protected through ownership of the nearly the entire watershed. Palmer is commended for the efforts taken to protect the reservoir and identifying additional threats to the groundwater supply. Palmer Fire District has been proactive in monitoring progress of remedial actions at the confirmed release sites.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and watersheds when responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Communicate with owners/operators of the rights-of-way to be sure
- ✓ Develop and implement a Wellhead Protection Plan.
- ✓ Correct any inaccuracies in the Watershed Protection Plan and implement the plan. The Department can assist you in correcting the mapping.

➤ **Partner with Local Businesses:**

Since many businesses and industries, including small businesses, use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships between businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

➤ **Provide Outreach to the Community:**

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located; what types of land uses and activities pose threats; and how their efforts can enhance protection.

➤ **Plan for the Future:**

One of the most effective means of protecting water supplies is planning, such as the adoption of local controls to protect watersheds and ground water. These controls may include health regulations, general ordinances, and zoning bylaws that prohibit potential sources of contamination from wellhead protection areas.

➤ **Plan as a community:**

Palmer currently has four different water districts. Review the consolidation feasibility studies, updating them as necessary and proceed in a manner that is beneficial to public health and safety and is fiscally responsive. The Department strongly encourages consolidation of systems when it assists in system compliance, is economically advantageous and enhances redundancy and water supply protection. This effort will require community leadership.

**Resources for Drinking Water Source Protection:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A. DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR). Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

**Conclusions:**

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II and watershed. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

**Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I and/or Zone A?	<b>No</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. To the extent possible, remove non-water supply activities from each Zone I and prohibited activities in Zone A to comply with DEP's Zone I and Zone A requirements. Investigate options for gaining ownership or control of the Zone I for groundwater sources.
Are the Zone 1 and Zone A posted with "Public Drinking Water Supply" Signs?	<b>Yes</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Are the Zone 1 and Zone A regularly inspected?	<b>Yes</b>	Continue daily inspections of drinking water protection areas.
Are water supply -related activities the only activities within the Zone 1 and Zone A?	<b>No</b>	Monitor non-water supply activities in Zone I and prohibited activities in Zone A, and investigate options for removing these activities.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Surface Water Protection Controls that meet 310 CMR 22.20C and Wellhead Protection Controls that meet 310 CMR 22.21(2)	<b>No</b>	While the town has bylaws, they have not been reviewed by DEP. Continue working with the Planning Board and the Board of Selectmen to adopt land use controls that meet 310 CMR 22.21(2) and 310 CMR 22.20C. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws and health regulations, and current regulations.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>No</b>	Palmer Water District should request that Monson expand their Wellhead Protection to the Zone II that extends into Monson.
<b>Planning</b>		
Does the PWS have a local surface water and wellhead protection plan?	<b>Yes/No</b>	Work with the Department to correct the surface water supply protection plan. Develop a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>No</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams and other water suppliers.
Does the municipality have a watershed and wellhead protection committee?	<b>No</b>	Reconvene committee; include representatives from citizens' groups, other water/fire districts, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>Unknown</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> . Work with Town and other water suppliers.
Does the PWS provide watershed protection education?	<b>Some</b>	Currently, the only outreach is through the annual Consumer Confidence Report. Increase residential outreach through bill stuffers, school programs, Drinking Water Week activities, and coordination with local groups. Aim additional efforts at commercial, industrial and municipal uses within the Zone II and watershed.

# APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREA

## DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
131172	Rathbone Precision Metals, Inc.	1241 Park Street	PALMER	Toxic User	Large Quantity	Industrial
				Hazardous Waste Generator	Large Quantity	
				Oil Waste Generator	Small Quantity	
				Air Handler	Minor (BM150)	
32847	Massachusetts Electric Company	#503 Substation, Blanchard Street	PALMER	Hazardous Waste Generator	Very Small Quantity	Utility
				Oil Waste Generator	Large Quantity	
134293	Palmer Trailer Sales Company, Inc.	158 Park Street	PALMER	Hazardous Waste Generator	Very Small Quantity	Commercial
36726	Baker's Auto Body	702 Park Street	PALMER	Hazardous Waste Generator	Very Small Quantity	Auto Repair
37852	Buddy's Citgo	1150 Park Street	PALMER	Hazardous Waste Generator	Very Small Quantity	Service Station
131175	Palmer Paving Corporation	25 Blanchard Street	PALMER	Plant	RES Application Approved	Paving Company
				Plant	Emission Stack Tester	

				Recycler	Class A Permit	
				Fuel Dispenser	Fuel Dispenser	
				Hazardous Waste Generator	Very Small Quantity	
				Oil Waste Generator	Very Small Quantity	
318144	Massachusetts Highway, Palmer	Blanchard St	PALMER	Fuel Dispenser	Fuel Dispenser	Maintenance Depot
118209	Jarvis and Jarvis	127 S. Main Street	PALMER	Toxic User		
				Hazardous Waste Generator	Very Small Quantity	
				Oil Waste Generator	Large Quantity	
223072	2000 Food & Fuel	1239 Park Street	PALMER	Fuel Dispenser	Fuel Dispenser	Service Station
2807	Palmer Santucci	1239 Park Street	PALMER	Hazardous Waste Generator	Very Small Quantity	
283651	Jackson's Auto Sales and Service	1307 Park Street	PALMER	Hazardous Waste Generator	Very Small Quantity	Auto Repair
132190	Contech Construction Products	Fenton Street	PALMER	Oil Waste Generator	Very Small Quantity	Construction Company
	Northern Tree Service	290 Park Street	PALMER	Hazardous Waste Generator	Very Small Quantity	Tree Service

## Underground Storage Tanks:

Facility Name	Address	Town	Description	Tank Type	Tank Leak Detection	Capacity (gal)	Contents
2000 Food & Fuel	1239 Park St	Palmer	Convenience, Gas Station	1 Wall	Approved In Tank Monitor	10,000	Gasoline
				1 Wall	Approved In Tank Monitor	8,000	Gasoline
				1 Wall	Approved In Tank Monitor	8,000	Gasoline
Massachusetts Highway Palmer	Blanchard St	Palmer	Fuel Dispenser	?			
Palmer Paving Corporation	25 Blanchard Street	Palmer	Fuel Dispenser	?			

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitellst.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0000593	150 Park Street	Palmer	Hazardous Material
1-0000681	127 South Main Street	Palmer	Oil
1-0000140	Riverview Parkway	Palmer	Oil
1-0000716	239 Park Street	Palmer	Oil
1-0010792	184 Park Street	Palmer	Oil
1-0011079	241 Park Street	Palmer	Hazardous Materials
1-0010903	158 Park Street	Palmer	Oil

For more location information, please see the attached map. The map lists the release sites by RTN.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Bondsville Fire & Water District**

### What is SWAP?

The Source Water Assessment Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i><b>PWS Name</b></i>	Bondsville Fire & Water District
<i><b>PWS Address</b></i>	P.O. Box 179
<i><b>City/Town</b></i>	Palmer
<i><b>PWS ID Number</b></i>	1227002
<i><b>Local Contact</b></i>	Mr. Robert Flagg
<i><b>Phone Number</b></i>	(413) 283-9922

### Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

**System Susceptibility**

**High**

**Zone II #: 103**

**Susceptibility: High**

Well Names	Source IDs
Well #1	1227002-01G
Well #2	1227002-02G
Well #4	1227002-04G
Well #5 (Proposed)	

Bondsville is a village within the town of Palmer Massachusetts, a medium sized community in south central, Massachusetts. Palmer, established in the early 1700's, initially developed as an industrial community along the numerous brooks and rivers that flow through the area. Palmer consists of the villages of Bondsville, Three Rivers, Whipples, Thorndike and Palmer. The Swift River flows into the Ware River and the Ware and Quabaug Rivers join to form the Chicopee River. The Swift River forms the northwestern boundary of Palmer between Palmer and Belchertown. Bondsville is located along that portion of the Swift River.

There are four community public water supply systems in Palmer: Thorndike, Palmer, Bondsville and Three Rivers Fire Districts. The Bondsville District currently supplies water to the Thorndike system with the Three Rivers District supplying a portion of Thorndike's water. Thorndike purchases water from Bondsville and Three Rivers because of previous water quality problems with the Thorndike Fire District's source. Bondsville Fire & Water District maintains three active water supply Wells #1 (1G), #2 (02G) and #4 (04G); Well #4 was installed adjacent to Well #3, to replace the Well #3 due to decreased capacity. Well #3 has been maintained as an emergency source. Bondsville Fire & Water District is presently completing the final stages of the New Source Approval Process for Well #5. Once proposed well #5 is put into service, Well #3 will be abandoned as a public water supply.

All of the wells are located within the same unconfined sand and gravel aquifer, immediately adjacent to the Jabish Brook in the town of Belchertown. Well #1 is approximately 200 feet east of Well #2 and Well #4 is approximately 200 feet northeast of Well #1. Wells #1 and #2 are on the west side of Jabish Brook and Well #4 is on the east side. All of the wells are located approximately 80 feet from the brook channel. Well #1 is a gravel packed well, while Wells #2 and #4 are gravel developed wells. All of the wells are between 54 and 57 feet deep. Since the wells are all located within close proximity to each other and within the same hydrogeologic regime, they share the same Zone II contribution area. The wells and the entire Zone II are located within the Town of Belchertown.

The wells are located in sand and gravel deposited during the recession (melting) of the glaciers some 12-18,000 years before the present. Streams and rivers have reworked the deposits and recent streams have deposited additional alluvial material. Boring logs and maps in the vicinity of the wells indicate

medium to coarse sand deposits approximately 45 to 85 feet in depth. There is no evidence of a confining clay layer. Groundwater modeling conducted to delineate the Zone II, indicates that under extended duration pumping conditions, Jabish Brook contributes water to the aquifer. Geologic mapping of the area shows the bedrock in the area mapped as the Belchertown Complex, an igneous, quartz monzodiorite.

Each well has a Zone I radius of 400 feet and the Zone II was delineated as part of the New Source Approval process utilizing geological mapping and analytical modeling. The Zone II for Well #5 was delineated through a numerical model and for the most part mimics but slightly modifies the existing Zone II. Data for the analysis was gathered from extended duration pumping tests. The wells are located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers (i.e. clay) that can prevent contaminant migration. Please refer to the attached map to view the boundaries of the Zone II and consult the Consumer Confidence report for current water quality data. Belchertown's overlay Aquifer District includes all stratified drift (sand and gravel aquifer) areas within town and there are protective bylaws associated with that overlay district. In addition, the Board of Health has adopted groundwater supply protection regulations for the Aquifer District. The Board of Health intends to modify language in the regulations and adopt a floor drain regulation to be in compliance with 310 CMR 22.000.

Water is chlorinated for disinfection prior to distribution. For current information on water quality monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The land use within the Zone II for the Water District wells is a mixture of forest, cropland, grazing and residential (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Zone I
2. Residential land uses
3. Transportation corridor, railroad and right-of-way
4. Agricultural activities
5. Comprehensive protection planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Zone Is** – The Zone I for all of the wells is a 400 foot radius around the well casing. Currently, Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction, Memorandum of Understanding or other legal mechanism as approved by the DEP. The public water supplier does not own the entire Zone I for wells #1 through #4. The District does own the Zone I for Well #5. Only activities directly related to the water supply, or other no-threatening activities, as determined by the DEP, are allowed in the Zone I.

© 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

The wells are located within the floodplain of Jabish Brook. The Water District has recently acquired additional land within the Zone II to protect the water supply area. The Vermont Central Railroad and a portion of Bardwell Road are within the Zone I area. The District has received a verbal agreement from the railroad company that they will not use chemical pesticides within the Zone I. The motor control building is located within the Zone I and has a tight tank installed for the facility's floor drain.

#### Zone I Recommendations:

- ✓ Prohibit any new non-water supply activities from the Zone I.
- ✓ Where it is feasible, consider for future expansion, options for purchasing land and/or negotiate a conservation restriction for land adjacent to the existing Zone I.
- ✓ Agreement Options - Until land is available for acquisition or restriction, attempt to obtain a Memorandum of Understanding and Right of First Refusal.
  - A Memorandum of Understanding (MOU) is an agreement between the landowner and public water supplier in which the landowner agrees not to engage in specific threatening activities. The MOU should be specific to the land use or activity. For example, if the land is residential with a septic system, the owner could agree to not place chemicals, petroleum products, or other hazardous or toxic substances, including septic system cleaners, into the septic system, and agree that the system will be pumped at a specific frequency. As another example, the portions of fields within the Zone I would not have manure, fertilizers or pesticides spread on them. Understanding how an activity threatens drinking water quality is an important component of developing an effective MOU.
  - A Right of First Refusal is a legal document that gives the water supplier the first chance to purchase land when it becomes available. Please refer to the example of the Right of First Refusal documents attached in the Appendices.

The Department commends the Bondsville Fire & Water District for its proactive efforts to acquire property and control activities within the Zone I and recommends continued efforts in establishing a program for planning to acquire ownership or control of additional property within the areas critical to protecting water quality. If there is no other reasonable method to secure rights and protect these sources, the Water District may wish to consider taking necessary water supply land by eminent domain to protect the sources. This recommendation is not only for the existing sources but also should be considered for future development of sources, if they are needed. We recommend consulting your Solicitor regarding land takings in another community.

**2. Residential Land Uses** – Portions of the Zone II consist of residential areas. The Zone II areas are not connected to municipal sewer and therefore utilize on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### For More Information

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

#### Source Protection Decreases Risk

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Areas

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Agriculture</b>			
Fertilizer / Pesticide Storage or Use—Crops	1	H	Fertilizers: leaks, spills, improper handling, or over-application
Farm animal—non-commercial (horses)	1	M	Manure (microbial contaminants): improper handling
Manure Storage	1	H	Microbial and nutrient contamination to surface and groundwater
Hazardous materials—farm equipment	Few	M	Fuel storage, petroleum products for equipment
<b>Residential</b>			
Fuel Oil Storage (at residences—ASTs/USTs)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Transportation corridors	1	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Pole mounted electrical transformers	Several	L	MODF and possibly PCBs: spills, leaks, or improper handling. Most transformers have been converted to non-PCB. Contact the electric company to ensure no PCBs are within the transformers especially in Zone I.
Right-of-way (water)	1	L	Corridor maintenance, over-application or improper handling of pesticides.
Railroad tracks	1	H	Over-application or improper handling of herbicides, leaks or spills of transported chemicals and maintenance chemicals. Verbal agreement to use mechanical methods.
Cemetery	1	M	Leaks, spills, improper handling, or over-application of pesticides; historic embalming fluids (such as arsenic)

**Table 2 Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Consider working with the Fire Chief to inventory fuel sources and storage methods in the Zone II. Provide BMPs to homeowners for fuel oil storage.

**3. Transportation corridors, railroad and right-of-way** - A portion of Bardwell Road runs through the Zone I and several other local roads run throughout the Zone II area. Roadway construction, stormwater runoff, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are also frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing materials, automotive chemicals and other debris on roads are picked up by stormwater and wash into catchbasins or directly into streams and brooks.

Railroad tracks run through the Zone II. Rail corridors serving passenger or freight trains are potential sources of contamination due to chemicals released during normal use, track maintenance, and accidents. Accidents can release spills of train engine fluids and commercially transported chemicals.

**Recommendations:**

- ✓ Identify stormwater drains and the drainage along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II. Where it is practical recommend water quality swales to slow stormwater flow and settle out sediments before they discharge to surface water.

- ✓ Contact the Town to ensure stormwater systems are inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Continue current efforts of working and planning with local emergency response teams to ensure that any spills within the Zone II can be effectively contained and the Water District is notified.

**4. Agricultural Activities** – There are a few farms (commercial/non-commercial—crop, hay and pasture) throughout the Zone II. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure piles and field application are potential sources of contamination to ground and surface water supplies. In addition, farms and large commercial facilities often conduct their own maintenance on their equipment and have storage of hazardous materials and waste.

**Agricultural Activities Recommendation:**

- ✓ If appropriate, work with the DEP to negotiate Conservation Restrictions for these land areas.
- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS in Hadley at 413-585-1000 for assistance.

**What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

- ✓ Encourage farmers and property managers to incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Promote the use of BMPs for on-site storage of fuel oil, handling, storage, and disposal of hazardous materials, and emergency response planning. Request that farmers evaluate their status as hazardous waste generators and register, as appropriate.
- ✓ Encourage farmers to manage pesticides, fertilizers and manure and store them within a structure designed to prevent runoff.
- ✓ The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>, and call the local office of the NRCS for assistance.
- ✓ Work with hobby farmers by supplying them with information regarding protecting their own wells and the public water supply by encouraging the

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

**5. Comprehensive Protection Planning** – Currently, the Town of Belchertown does have water supply protection controls that meet the requirements of the Department's Wellhead Protection regulation 310 CMR 22.21(2). The Board of Health has adopted protection regulations that encompass the Aquifer Protection District in town that includes the Zone II areas. The Board of Health reportedly will be considering a floor drain regulation and some language modifications to existing regulations to comply with 310 CMR 22.000. The District does not have a protection plan although they have many of the components in place, such as a plan for land acquisition which it has executed to protect land critical to the recharge areas. Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan can coordinate community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells.

It should be noted that activities within the Zone III may also pose a potential threat to the water supply. Specifically, the Jabish Brook contributes water to the aquifer and wells and when the brook contributes water to the aquifer, an accidental release to the brook may pose a threat to water quality. This report

does not include facilities located upgradient of the wells along the Jabish Brook.

#### **Protection Planning Recommendations:**

- ✓ Consider preparing a Wellhead Protection Plan. Establish a protection team that includes participants from the Town of Belchertown and the Belchertown Water District, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Work with and encourage the Board of Health to investigate land uses that may pose a potential threat to the water quality within the aquifer and along Jabish Brook.
- ✓? Work with emergency responders to be sure the District is notified of a release to Jabish Brook within the Zone II or Zone III.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply. Other land uses and activities within the Zone II are listed in Table 2.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system's Zone II contains potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Proactively pursuing land acquisition and protection options in the Zone I,
- Maintaining detailed knowledge of activities within the protection areas,
- Efforts to work with land owners to control activities in the Zone II.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I areas regularly and when feasible remove activities not related to the water supply.
- ✓ Educate residents on ways they can help you to protect drinking water sources.

- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage, (particularly along Bardwell Road and Barrett Road) in your Zone II and to contact the District when responding to spills or accidents within the Zone II.
- ✓ Consider inventorying USTs within the Zone II.
- ✓ Continue working with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies. Encourage the use of BMPs on hobby farms.
- ✓ Develop and implement a Wellhead Protection Plan and include Belchertown in source protection efforts.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. When funds are available, the Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Each spring, if funds are available, DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the protection area. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

### **A. Protection Recommendations and Additional Documents on Source Protection**

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Continue working with land owners to negotiate a Conservation Restriction or ownership to acquire additional land for protection.
Is the Zone I posted with "Public Drinking Water Supply" signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue to keep other land uses out of the Zone Is. Continue working with land owners to negotiate a CR, MOU and other forms of protection as is practical.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>NO</b>	Although the Town of Belchertown has bylaws and health regulations protecting the aquifers in town, they are not fully in compliance with 310 CMR 22.000. The Department has been in contact with the Belchertown Health Agent who has indicate that the Board will be considering the changes to the regulation sometime this fall or winter. Keep up contact with the Board to offer assistance in this matter.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>N/A</b>	
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Consider developing a plan and include strategies for future source development and protection. Refer to "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> . Include Belchertown officials in the plan development and implementation.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Continue to work with the Fire Department, Board of Health, DPW, and local and state emergency officials.
Does the municipality have a wellhead protection committee?	<b>YES</b>	Include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>N/A</b>	
Does the PWS provide wellhead protection education?	<b>YES</b>	Aim additional efforts at residential and agricultural uses within the Zone II and as appropriate Zone III.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Three Rivers Fire District**

### What is SWAP?

The Source Water Assessment Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Three Rivers Fire District
<i>PWS Address</i>	2031 Main Street, P.O. Box 182
<i>City/Town</i>	Palmer
<i>PWS ID Number</i>	1227003
<i>Local Contact</i>	John Sasur
<i>Phone Number</i>	(413) 283-9284

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

**Zone II #: 465**

**Susceptibility: High**

Well Names	Source IDs
Well #1	1227003-01G
Well #3	1227003-03G

Three Rivers is a village within the town of Palmer Massachusetts, a medium sized community in south central, Massachusetts. Palmer, established in the early 1700's, initially developed as an industrial community along the numerous brooks and rivers that flow through the area. Palmer consists of the villages of Bondsville, Three Rivers, Whipples, Thorndike and Palmer. The Swift River flows into the Ware River and the Ware and Quabaug Rivers join to form the Chicopee River. The area east of the confluence is known as Three Rivers.

There are four community public water supply systems in Palmer: Thorndike, Palmer, Bondsville and Three Rivers Fire Districts. The Bondsville District currently supplies water to the Thorndike system with the Three Rivers District supplying a portion due to previous water quality problems with the Thorndike Fire District's source. Three Rivers Fire District maintains two active water supply wells 01G and 03G. The wells are located approximately 1,200 feet apart, immediately south of the Ware River. Both are gravel packed wells constructed in an unconfined sand and gravel aquifer. The wells for Three Rivers Water District are located within the same hydrogeologic regime and are within the same Zone II contribution area.

The wells are located in sand and gravel deposited during the recession (melting) of the glaciers some 12-18,000 before present. Streams and rivers have reworked the deposits and recent stream have deposited additional alluvial material. Boring logs and maps in the vicinity of the wells indicate medium to coarse sand, deposits approximately 45 to 85 feet in depth. There is no evidence of a confining clay layer. Under long duration pumping conditions, the river likely contributes water to the aquifer. The bedrock in the area is mapped as the Belchertown Complex, an igneous, quartz monzodiorite.

Each well has a Zone I radius of 400 feet and the Zone II was delineated as part of the SWAP program utilizing geological mapping and analytical modelling. Data for the analysis was gathered from extended duration pumping tests. The wells are located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers (i.e. clay) that can prevent contaminant migration. Please refer to the attached map to view the boundaries of the Zone II.

Sodium hydroxide is added to the water from both wells to raise the pH for corrosion control. The District has the capability of adding sodium hypochlorite as a disinfectant in the event of an emergency, however, it is not regularly added to the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The Zone II for Three Rivers is a mixture of forest, cropland, and residential, with a small portion commercial/light industrial land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

**Key Land Uses and Protection Issues include:**

1. Zone I Protection
2. Residential land uses
3. Transportation corridors
4. Agricultural activities
5. Comprehensive wellhead protection planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Non-conforming Zone Is** – The Zone I for each of the wells is a 400 foot radius around the wellhead. Currently, Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) require public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. The public water supplier does not own or control the entire Zone I for either of the wells. Only water supply activities are allowed in the Zone I. The river and a portion of a farm are within the Zone I, however, there is no active crop cultivation within the Zone I. Numerous water sources were developed prior to the 400-foot Zone I requirement and are therefore grandfathered. The Department encourages grandfathered systems to acquire ownership or control of the Zone I. The Three Rivers District has actively pursued methods of protecting and/or acquiring the Zone I land.

**Zone I Recommendations:**

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Continue your current efforts to purchase land and/or negotiate a conservation restriction for land within the Zone I.

**2. Residential Land Uses** – Approximately 25% of the Zone II consists of residential areas. Much of the area south of the river is served by public

sewers, however, some residential/rural areas use septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

disposal of chemical products used in homes are potential sources of contamination.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Transportation Corridors** - Local roads are common throughout the Zone II. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catch basins.

Railroad tracks run through the Zone II. Rail corridors serving passenger or freight trains are potential sources of contamination due to chemicals released during normal use, track maintenance, and accidents. Accidents can release spills of train engine fluids and commercially transported chemicals.

#### **Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.
- ✓ Work with local officials during their review of the railroad right of way Yearly Operating Plans to ensure that water supplies are protected during vegetation control.

(Continued on page 6)

#### **What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### **For More Information**

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Commercial</b>			
Cemeteries	2	M	Over-application of pesticides: leaks, spills, improper handling; historic embalming fluids
Railroad Tracks And Yards	1	H	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills
Sand And Gravel Mining/Washing	1	M	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Aboveground Storage Tanks	1	M	Materials stored in tanks: spills, leaks, or improper handling
Combined Sewer Overflows	3	L	Microbial and non-microbial contaminants including industrial wastewater; improper disposal of hazardous wastes
Schools	3	M	Fuel oil, laboratory, art, photographic, machine shop, and other chemicals: spills, leaks, or improper handling or storage
Stormwater Drains/ Retention Basins	1	L	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transmission Line Rights-of-Way	1	L	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors	Several	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Underground Storage Tanks	2	H	Stored materials: spills, leaks, or improper handling
Utility Substation Transformers	1	L	Chemicals and other materials including PCBs: spills, leaks, or improper handling

**Table 2 Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.
- 4.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

**4. Agricultural Activities** – There are several farms throughout the Zone II. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resource Conservation Service farm plan to protect water supplies.
- ✓ Work with the Department to negotiate Conservation Restrictions as appropriate.

**5. Protection Planning** – Currently, the Town has water supply protection controls, but they do not meet the minimum requirements of the Department's Wellhead Protection regulations 310 CMR 22.21(2). Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells. The Department recognizes the difficulty for one of four water supply districts to work independently to achieve comprehensive source protection.

It should be noted that activities within the Zone III may pose a potential threat to the water supply. Specifically, under conditions when the river contributes water to the aquifer an accidental release to the river may pose a threat to water quality. This report does not include facilities located upgradient of the wells along the Ware River.

**Protection Planning Recommendations:**

- ✓ Consider the fiscal and practical aspects of consolidating the Districts. It is our understanding that a feasibility study has been conducted to consider combining Districts. The Department endorses and encourages consolidation of systems when it will result in improved compliance and customer service, lower costs, and broaden rate options. The Department will assist the Districts if all or some of the Districts wish to consolidate.
- ✓ Inventory facilities upstream within, the Zone III, and incorporate any potentially high threat facilities into your Emergency Response Action Plan.
- ✓ Keep your Wellhead Protection Plan up to date. Meet with your protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

- ✓ of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Coordinate efforts with local officials to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21(2). If they do not meet the current regulations, adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ Local controls do not regulate floordrains; work with the Board of Health to adopt floordrain controls that meet 310 CMR 22.21(2).

Other land uses and activities within the Zone II are listed in Table 2. Refer to Table 2 and Appendix 2 for more information about these land uses.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### Section 3: Source Water Protection Conclusions and Recommendations

#### What is a Zone III?

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

#### Current Land Uses and Source Protection:

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Requiring residential UST owners to register their UST in order to fill it.
- Pursuing funds to aid homeowners in replacing or upgrading older USTs.
- Successfully acquiring grant funds to study upstream land uses and prepare emergency response plan for addressing potential upstream impacts.

#### Source Protection Recommendations:

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Work with the Department to acquire a Conservation Restriction for the Zone I area not currently owned by the District.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials. Since the wells can induce recharge from the river, include those businesses in the Zone III along the river.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.

#### Top 5 Reasons to Develop a Local Wellhead Protection Plan

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

- ✓ Develop and implement a Wellhead Protection Plan. Work with the other water suppliers in Palmer to present a joint effort within Town.

**Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

**Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Continue working with land owners to negotiate a Conservation Restriction and other forms of protection.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue to keep other land uses out of the Zone Is. Continue working with land owners to negotiate a Conservation Restriction and other forms of protection.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>Partial</b>	Palmer does have controls in place, however the Zone II area must be modified and some language in the by law should be revised to meet DEP's requirements for wellhead protection. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> and Zone II report.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>NA</b>	Zone II is completely within the Town of Palmer. However, under stressed conditions, the river can contribute water to the aquifer, therefore activities within the Zone III should be monitored and Emergency Response Plans should include upstream land uses .
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>YES</b>	When updating plan, follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> . The four water departments/districts in the community should work together in water supply protection efforts. Plans should include consolidation and redundancy options.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>NO</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>YES</b>	Include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>PARTIAL</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> Work with neighboring communities to adopt floor drain regulations and work with industries to protect water supplies.
Does the PWS provide wellhead protection education?	<b>YES</b>	Aim additional efforts at commercial, industrial and municipal uses within the Zone II and as appropriate Zone III.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREA

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
331161	Pathfinder Regional High School	240 Sykes St.	Palmer	Generator of Hazardous Waste	Very Small Quantity Generator of Hazardous Waste, Waste Oil, or PCBs	Educational
363363	Public Petroleum	2394 Main St.	Palmer	Fuel Dispenser	Fuel Dispenser	Petroleum Distribution
				Generator of Hazardous Waste	Very Small Quantity Generator of Waste Oil or PCBs	Petroleum Distribution

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitelist.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0000247	RTE 181 MAIN ST	Palmer	Oil or Hazardous Material

For more location information, please see the attached map. The map lists the release sites by RTN.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
PERU ROADSIDE SPRING

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Peru Roadside Spring
<i>PWS Address</i>	East Main Rd
<i>City/Town</i>	Peru, Massachusetts
<i>PWS ID Number</i>	1233003

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>Zone II</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1 Spring	1233003-01G	136	Refer to the map	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and a Contribution Area or Zone II. The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The Contribution Area is the larger area that is likely to contribute water to the spring. Refer to **Figure 1** on page 2 for an example of a Zone I and Contribution Area.

The Contribution Area of Zone II is the primary recharge area for the aquifer and the spring source. This area was defined by a hydrogeologic study conducted for the MA DEP SWAP program by the USGS. The Zone II was approved by DEP. Refer to the attached map to determine the land within your Zone II.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Contribution Area (Zone II). Please see the enclosed map for your well's Zone I and Zone II areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source Protection  
Area for WELL #1 SPRING  
(1233003-01G)**

Zone I = 136 ft.  
Refer to map for the  
Contribution Area

## What is a Protection Area?

A spring's water supply protection area is the land around the spring where protection activities should be focused. Each spring has a Zone I protective area and a contribution area (Zone II).

## How Was My Well's Susceptibility Determined?

Your spring's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and the contribution area. The **moderate** susceptibility to potential non-microbial threats is based on the local roads within the Zone I and the contribution area.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

## Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

## Source Water Assessment Program (SWAP) Report For Harvard School of Forestry

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

### SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
January 26, 2003

**Table 1: Public Water System (PWS) Information**

<b>PWS NAME</b>	Harvard School of Forestry
<b>PWS Address</b>	324 North Main Street
<b>City/Town</b>	Petersham, Massachusetts
<b>PWS ID Number</b>	2234001
<b>Local Contact</b>	Edith Ellen
<b>Phone Number</b>	(978) 724-3302

<b>Well Name</b>	<b>Source ID#</b>	<b>Zone I (in feet)</b>	<b>IWPA (in feet)</b>	<b>Source Susceptibility</b>
Well #1	2234001-01G	168	464	Moderate
Well #2	2234001-02G	168	464	Moderate

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

### 1. Description of the Water System

The facility gets its water supply from two wells. The primary source, Well #1, is a 750 foot deep rock well, and the backup well, Well #2, is a dug well. Well #1 is located indoors. Each well has a Zone I of 168 feet and an Interim Wellhead Protection Area (IWPA) of 464 feet. The IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The wells serving the facility have no treatment at this time. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website [www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Inappropriate Activities in Zone Is;**
2. **An Aboveground Storage Tank (AST) with Heating Oil;**
3. **Septic systems;**
4. **Vehicle maintenance; and**
5. **Stormwater Catchbasin.**

The overall ranking of susceptibility to contamination for the well is Moderate, based on the presence of only low and moderate threat land use or activity in the IWPA's, as seen in Table 2.

1. **Zone Is** – Currently, the well does not meet DEP's restrictions, which only allow water supply related activities in Zone Is. The facility's Zone Is contain buildings, roads, and parking areas. The public water system owns and controls all land encompassed by the Zone Is. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

#### Recommendations:

- ✓ Remove all non-water supply activities from the Zone Is to comply with DEP's Zone I requirements.
  - ✓ Do not use or store road salt within the Zone I.
2. **Aboveground Storage Tank (AST)** – In 1990, all the underground storage tanks were removed and replaced with four 275 gallon ASTs. The tanks are in secondary containment, equipped with monitoring devices, and have an emergency plan in place. If managed improperly, Aboveground Storage Tanks can be a potential source contamination due to leaks or spills of the chemicals they store.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Parking lot, driveways & roads	Both wells	Both wells	Moderate	Limit road salt usage and provide drainage away from wells
Fuel Storage Above Ground	No	Both wells	Moderate	Tanks in secondary containment
Septic System	No	Both wells	Moderate	See septic systems brochure in the appendix
Vehicle maintenance area	Both wells	Both wells	Moderate	Use of oils and degreaser
Dairy operation	No	Both wells	Moderate	Three cows
Stormwater drains	Both wells	Both wells	Low	
Structures	Both wells	Both wells	-	Non-water supply structures in Zone I

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

### Recommendation:

- ✓ Any modifications to the AST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs.

- 3. Septic system** – Septic systems belonging to the facility and some belonging to neighbors lie within the IWPA of both wells. If a septic system fails or is not properly maintained it could be a potential source of microbial and nitrate contamination. Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the water supply.

### Recommendations:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ The neighbor should be made aware of the location of the source of drinking water.

- 4. Vehicle maintenance/Storage of hazardous chemicals** – The ground floor of the resource center building is used for vehicle maintenance. The floor is cemented and is in good shape, and there are no floor drains. Five to ten gallon containers for chainsaw oils, gas, diesel are stored in a locked yellow safety cabinet. A sign is posted. Used oil is collected and disposed of at the town recycling fuel unit. Hazardous fluids are collected in 55 gallon drums and hauled away by a licensed hauler.

### Recommendation:

- ✓ Continue routine maintenance, and documentation of this responsibility to ensure its continuation in case of staff turnover.

- 5. Storm Water Catch Basin** – Catch basins transport storm water from the roadway and adjacent properties to the ground. As flowing storm water travels, it picks up debris and contaminants from streets, parking areas and lawns. Common potential sources of contamination include lawn chemicals, pet waste, leakage from dumpsters, household hazardous waste, and contaminants from vehicle leaks,

### Recommendation:

- ✓ Work with the Town to have the catch basins inspected, maintained, and cleaned on a regular schedule. Additionally, street and parking lot sweeping reduces the amount of potential contaminants in storm runoff.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Harvard School of Forestry should review and adopt the key recommendations above and the following:

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact **Josephine Yemoh-Ndi** in DEP's **Worcester Office** at **(508) 792-7650 x 4030** for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier and town boards.

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ If Harvard School of Forestry intends to continue utilizing the structures in the Zone Is, use BMPs and restrict activities that could pose a threat to the water supply.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/bwp/dhm/dhmpubs.html](http://www.state.ma.us/dep/bwp/dhm/dhmpubs.html).
- ✓ Eliminate any non-sanitary wastewater discharges to on-site septic systems. Instead, in areas using hazardous materials, discharge drains to a tight tank or sanitary sewer.

### Planning:

- ✓ Work with local officials in Petersham to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## 4. Attachments

- Map of the Public Water Supply (PWS) Protection Area.
- Recommended Source Protection Measures Factsheet
- Your Septic System Brochure

## Source Water Assessment Program (SWAP) Report For Petersham Sisters of the Assumption

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

### SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,

**Table 1: Public Water System (PWS) Information**

<b>PWS NAME</b>	Petersham Sisters of the Assumption
<b>PWS Address</b>	211 North Main Street
<b>City/Town</b>	Petersham, Massachusetts
<b>PWS ID Number</b>	2234003
<b>Local Contact</b>	Robert Goodfellow
<b>Phone Number</b>	(978) 724-3468

<b>Well Name</b>	<b>Source ID#</b>	<b>Zone I (in feet)</b>	<b>IWPA (in feet)</b>	<b>Source Susceptibility</b>
Well #1	2234003-01G	227	556	Moderate

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

### 1. Description of the Water System

The well for the facility is located near the rear of the building, protected within a pit and covered. The well has a Zone I of 227 feet and an Interim Wellhead Protection Area (IWPA) of 556 feet. The IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA. The well serving the facility has no treatment at this time. For current information on monitoring results and treatment and a copy of the most recent Consumer Confidence Report, please contact the Public Water System contact person listed above

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

in Table 1. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Inappropriate Activities in Zone Is;**
2. **An Aboveground Storage Tank (AST) With Heating Oil;**
3. **Agricultural land use; and**
4. **Septic system.**

The overall ranking of susceptibility to contamination for the well is Moderate, based on the presence of all moderate threat land use or activity in the IWPA, as seen in Table 2.

1. **Zone I**– Currently, the well does not meet DEP's restrictions, which only allow water supply related activities in Zone Is. The facility's Zone I contains the on-site buildings and access road onto the property. The public water supplier owns and controls all land encompassed by the Zone I. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
  - ✓ Do not use or store road salt within the Zone I.
2. **Aboveground Storage Tank (AST)** – There are four AST located on cement pads and walled, in the cellar. The ASTs are piped from the top to prevent leakage. The modifications were made a few years ago to incorporate proper containment and safety practices. If managed improperly, Aboveground Storage Tanks can be a potential source contamination due to leaks or spills of the chemicals they store.

### Recommendations:

- ✓ Any modifications to the AST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Driveway	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Fuel Storage Above Ground	Yes	Yes	Moderate	Tanks are contained
Agricultural land use	No	Yes	Moderate	Fertilizer & Pesticide use
Septic System	No	Yes	Moderate	See septic systems brochure in the appendix
Structures	Yes	Yes	-	Non-water supply structures in Zone I

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

local fire department for any additional local code requirements regarding ASTs.

- 3. Agricultural land use** - A farm is located within the IWPA of the well. If improperly stored or applied, the contaminants of concern are pesticides and fertilizers that are applied on the cropland.

**Recommendations:**

- ✓ Consider obtaining a conservation restriction for any agricultural land. Another option is to negotiate a "Memorandum of Understanding" (MOU) with the farmer to refrain from using pesticides and fertilizers and eliminate manure storage within the IWPA.
- ✓ Encourage farmers in the IWPA to seek assistance from the Natural Resource Conservation Service (NRCS) in addressing manure management issues.

- 4. Septic system** – The septic system is located within the IWPA. The on-site sewage treatment is composed of two 15,000 gallon concrete tanks, and is pumped annually. If improperly used or maintained, septic systems are a potential source of contamination in groundwater and the water supply.

**Recommendations:**

- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ Residents and maintenance staff should be trained on proper disposal of spent household chemicals and encouraged to participate in local Household Hazardous waste collections.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Sisters of the Assumption should review and adopt the key recommendations above and the following:

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Since the on-site building, which is in use, lies within the Zone I, use BMPs and restrict activities that could pose a threat to the water supply.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste the well and is treated according to DEP guidance.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Josephine Yemoh-Ndi in DEP's Worcester Office at (508) 792-7650 x 5030 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, and the local media.

### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/bwp/dhm/dhmpubs.html](http://www.state.ma.us/dep/bwp/dhm/dhmpubs.html).
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.

### Planning:

- ✓ Work with local officials in town to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Source Water Assessment Program (SWAP) Report For Petersham Center School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The well for the facility is located in a covered pit behind the school building. The well has a Zone I of 100 feet and an Interim Wellhead Protection Area (IWPA) of 409 feet. The IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA. The well serving the facility has no treatment at this time.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Inappropriate Activities in Zone I; and**
2. **An Aboveground Storage Tanks (AST) with Heating Oil; and**
3. **Septic system**

The overall ranking of susceptibility to contamination for the well is Moderate, based on the presence of moderate threat land use or activity in the IWPA, as seen in Table 2.

1. **Zone I** – Currently the well does not meet DEP's restrictions, which only allow water supply related activities in Zone Is. The facility's Zone I contains the school building, playing field, access road to the school, and parking areas. The playing field is mowed, no fertilizer application is allowed. The public water supplier does not own and/or control all land encompassed by the Zone I. The Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- V Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
  - V Do not use road salt within the Zone I.
2. **Aboveground Storage Tank (AST)** – Four 275 gallon AST are located in the basement of the school building. If managed improperly, Aboveground Storage Tanks can be a potential source of contamination due to leaks or spills of the chemicals they store.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Parking lot and access road	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Septic System	No	Yes	Moderate	See septic systems brochure in the appendix
Fuel Storage Above Ground	Yes	Yes	Moderate	Should be on an impervious surface
Structures	Yes	Yes	-	Non-water supply structures in Zone I

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Recommendations:

- ✓ Aboveground storage tanks in your Zone I and IWPA should be located on an impermeable surface, and also contained in an area large enough to hold 110% of the complete liquid volume, should a spill occur.
- ✓ Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices. Any modifications to the AST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs.

3. **Septic system** - The septic system is located within the IWPA of the well. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the water supply.

## Recommendations:

- ✓ Staff should be instructed on the proper disposal of spent chemicals. Include custodial staff, groundskeepers, and certified operator.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Petersham Center School should review and adopt the key recommendations above and the following:

Figure 1: Example of how a well could become contaminated by different land uses and activities.

## Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ If the school intends to continue utilizing the structures, parking areas, and playing field in the Zone I, use BMPs and restrict activities that could pose a threat to the water supply.
- ✓ Do not use road salt within the Zone I.

## Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.

### For More Information:

Contact **Josephine Yemoh-Ndi** in DEP's **Worcester Office** at (508) 792-7650 x 5030 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, and the local media.

- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Incorporate groundwater education into school curriculum (K-6 and 7-12 curricula available; contact DEP for copies).
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/bwp/dhm/dhmpubs.htm](http://www.state.ma.us/dep/bwp/dhm/dhmpubs.htm).

### Planning:

- ✓ Work with local officials in Petersham to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

### **Introduction**

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### **Purpose of this report:**

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### **This report includes the following sections:**

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

## Glossary Protection Zones

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

## Section 1: Description of the Water System

**System Susceptibility:**

**High**

**Source Name:**

**Source ID**

**Susceptibility:**

Cleveland Reservoir	1236000-06S	High
---------------------	-------------	------

### Ashley Reservoir System

Ashley Lake Reservoir	1236000-01S	High
Farnham Reservoir	1236000-02S	High
Sackett Brook Reservoir	1236000-04S	High
Sandwash Reservoir	1236000-07S	High
Ashley Reservoir Plant	1236000-03S	High

Pittsfield Department of Public Utilities, Water Department maintains and operates six surface water sources and two water treatment facilities for their drinking water supply. The Cleveland Reservoir (1236000-06S) supplies the majority of the City's demand yielding approximately 7.5 million gallons per day. Flow from the Windsor and Cady Brooks are also diverted into the Cleveland Reservoir watershed. Water from the Cleveland Reservoir is filtered, pH adjusted for corrosion control and disinfected at the Cleveland Water Treatment Plant. The Ashley Reservoir System includes five reservoirs. Ashley Lake Reservoir (01S) flows through Ashley Brook to the Ashley Intake Reservoir (03S). Water from the Sandwash Reservoir (07S) flows through an aerator, an open canal and then through a semi-closed aqueduct to the Farnham Reservoir (02S). Water from the Farnham Reservoir flows to the Ashley Intake structure then to the Ashley Water Treatment Plant. Water from the Sackett Brook Reservoir (04S), also flows via an aqueduct to the Ashley Intake structure then to the Ashley Treatment Plant. The Ashley Water Treatment Plant is exactly the same as the Cleveland Treatment Plant; water is filtered, pH adjusted for corrosion control and disinfected prior to distribution.

The watersheds for Pittsfield's reservoirs are located in the towns of Hinsdale, Windsor, Peru and Washington. The watersheds for the Ashley Reservoir System consist of approximately >90% protected open space. Approximately 60% of the watershed for the Cleveland Reservoir is designated as "protected open space" however, the City owns only 8% of the watershed. The protected open space designation on the SWAP map includes land owned by Pittsfield but also includes state forest land as well as other land held under various types of conservation restrictions. So although the land appears on the map as "protected", these lands are not under the control of the Water Department. Please refer to the attached map to view the boundaries of the protective zones.

As noted, all water from the reservoirs is treated through one or the other water treatment plants where the processes consist of chemical addition, flocculation, dissolved air flotation, and filtration. The water is pH adjusted and chlorinated for disinfection prior to distribution. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

There are few activities that pose significant anthropogenic threats to the reservoirs. However, due to the nature of surface water supplies, the sources are considered highly vulnerable to potential contamination. Land uses and activities that are considered potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Residential land use in Zone A and watershed
2. Transportation corridors (legal and illegal)
3. Forestry/Watershed Management
4. Protection Planning
5. Utility Line Right of Way

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Residential Land Uses** – Approximately 9.1 acres of the Zone A and watershed consists of residential areas in the Farnham and Sandwash Reservoirs, 19.5 acres in the Cleveland Reservoir watershed with addition acreage in the Windsor and Cady Brook watersheds in the Town of Windsor. None of the areas have public sewers, therefore on-site septic systems are used. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they may be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of

chemical products used in homes are potential sources of contamination.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

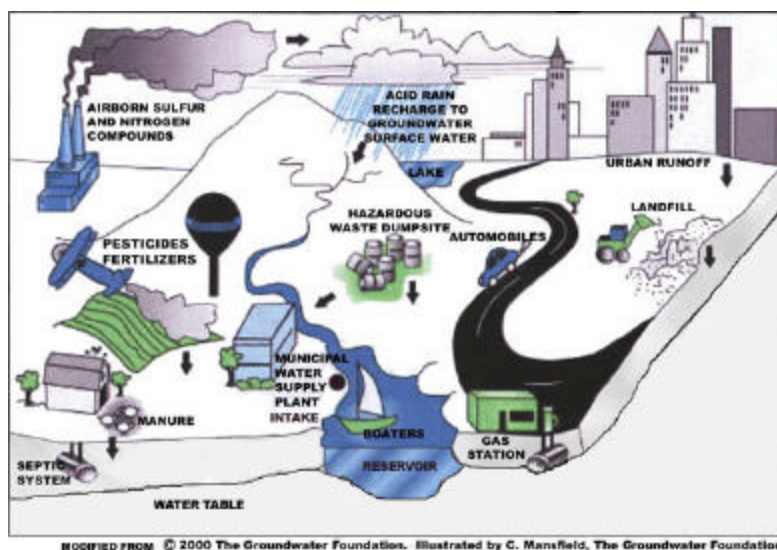

Figure 1: Sample watershed with examples of potential sources of contamination

leaks, maintenance, washing, or accidents.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Contact the Boards of Health and Selectmen in Washington, Windsor and Hinsdale to supply them with technical assistance
- ✓ Consider negotiating a Right of First Refusal agreement or conservation restrictions for land not currently owned by the Pittsfield.

**2. Transportation Corridors** – There are many local roads located throughout the watersheds of the reservoirs, including many that are dirt roads. A section of State Route 9 in Windsor runs through the Zone A along Windsor Brook. Though most roadways are low-use, due to the close proximity of some of the roads to the reservoirs, even typical roadway maintenance and use pose a potentially significant source of contamination from accidents and washouts along the dirt road. De-icing materials, petroleum chemicals and other debris on roads are picked up by stormwater washed and discharge into the reservoirs. Uncontrolled erosion contributes sediment, various contaminants and pathogens into the reservoirs. Additionally, illegal dumping is evident along some of the roads accessible by street vehicles. Clandestine dumping is identified as a significant threat to the water supplies.

There are numerous unpaved, ways as well as legal (authorized) and illegal (unauthorized) trails throughout the watersheds. Most of these roads and trails are not maintained at all or are minimally maintained. The resulting erosion poses a significant threat to water quality in areas that are proximal to feeder streams and the reservoirs, potentially resulting in additional water treatment costs if they continue unchecked. Uncontrolled erosion contributes sediment, various contaminants and pathogens into the contributing waters and reservoirs. Access to the reservoirs was observed and anecdotal information indicates

evidence of camping near the reservoirs and throughout the watersheds. Unmanaged access may result in vandalism, illegal dumping and access to the reservoir resulting in water quality impairment.

The Berkshire Regional Planning Commission prepared a watershed management plan to address stormwater management and erosion control on City property and throughout the watershed. The BRPC prepared an inventory of the existing conditions within the watershed and determined numerous areas of uncontrolled access and erosion problems.

#### **Transportation Corridor Recommendations:**

- ✓ Investigate disposition of all roads, ways and “trails”.
- ✓ Increase patrols of watershed land and enforce no trespassing.
- ✓ Evaluate all options for management of access to ways. Include evaluation of continuing current practice of full access, closing roads to all traffic, closing road to all commercial traffic and limiting access only to residents

#### **What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Source	Potential Contaminant Sources*
<b>Residential</b>				
Fuel Oil Storage (at residences)	Numerous	M	06S, 07S	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	06S, 07S	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	06S, 07S	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>				
Aquatic Wildlife	Actively managed	M	All	Microbial and organic contaminants
Clandestine Dumping	Historical	H	All	Debris containing hazardous materials or wastes
Stormwater Drains/ Retention Basins	Numerous	L	07S, 02S	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transmission Line Rights-of-Way - Type: <u>Electric</u>	1	L	06S	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors including trails (legal and illegal)	Numerous	M	All	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling. Erosion and illegal access to water.
<b>Notes:</b> <ol style="list-style-type: none"> <li>When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.</li> <li>For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.</li> <li>For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.</li> </ol> <p>* <b>THREAT RANKING</b> - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.</p>				

with a locked gate and key for residents only. The Towns of Washington, Becket, Hinsdale and Windsor must be partners in these strategies once the disposition of the roads is determined. Communicate with Selectmen or the State (for old county roads) regarding abandonment, control and other access issues for town roads.

- ✓ Evaluate stormwater drainage along the many local roads in the watershed. Specifically, Frank Schnopps, Stonehouse and Main Dalton Roads in the Cleveland reservoir watershed; and the Kirchner/Pittsfield Road along Sackett Reservoir; and the Lenox/Whitney Road at the Farnham Reservoir. Consider various strategies to detain/slow the flow, redirect runoff out of the watershed or retain/detain sediments from roads within the watershed. Since these roads are in neighboring communities, the City should foster a relationship to work with the communities to evaluate and mediate stormwater threats identified within the watershed. Coordinate efforts for work and cost sharing with the Dalton Fire District and the Town of Windsor on issues within the Windsor/Cady Brook watersheds.
- ✓ Inspect, maintain, and clean catch basins or BMPs on a regular schedule.
- ✓ Evaluate existing conditions throughout the watershed with respect to current illegal use of watershed land. Determine where access is being gained and what are the destination points. Develop a strategy, management plan, to eliminate or control access. Coordinate with the host communities for management strategies.
- ✓ Work with local emergency response teams to ensure effective management of potential spills.
- ✓ Contact MA DEM regarding uncontrolled and advertised access to abutting DEM land to develop an effective strategy to eliminate, control and/or manage access as appropriate through the watershed especially in areas proximal to the Zone As. Request an access and management plan for all lands within the Pittsfield watershed. Request an access and management plan for all lands within the Pittsfield watershed and require BMPs.

**3. Forestry/Watershed Management** – The majority of the watershed is not currently managed, but there is a potential for this practice to occur in the future. There is no watershed/forest management plan at this time. Logging in a forest

#### Top 5 Reasons to Develop a Local Surface Water Protection Plan

- ➊ Reduces Risk to Human Health
- ➋ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ➌ Supports municipal bylaws, making them less likely to be challenged
- ➍ Ensures clean drinking water supplies for future generations
- ➎ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

without a well-designed plan may result in poor water quality and an unhealthy forest. However, with the use of a properly designed watershed, forest management plan and the enforced use of BMPs, forest management may enhance the water production and quality of the raw water. Higher quality raw water results in reduced treatment cost. Unmanaged forests may result in an even aged forest that is susceptible to fires and disease. Aquatic wildlife such as beavers or muskrats, are currently being managed in the watershed on an as needed basis.

#### Forestry/Watershed Management Recommendations:

- ✓ Prepare a water supply, watershed management plan and include in the plan, an evaluation of the need for a forest inventory and forest management plan specifically designed for water supply management. Consider management strategy of forest roads that may exacerbate public access issues.
- ✓ Evaluate whether there are impacts associated with access and determine what if any, management strategies are required for public access to the watershed.
- ✓ Continue to inspect the watershed regularly.

**4. Protection Planning** – A Watershed Protection Plan has not been prepared and submitted for approval by the Department's Boston office for content and procedures. These types of protection plans coordinate community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public education and outreach. The development of a successful Watershed Protection Plan is outlined in DEP's "Developing a Local Watershed

Protection Plan” (see Appendix A for the full report). Currently, the host communities of Windsor, Hinsdale and Washington do not have Watershed Protection Districts or Bylaws although the majority of the watersheds are currently “protected” land.

**Protection Planning Recommendations:**

- ✓ Develop a Watershed Protection Plan. Watershed access, forest management and roads and dirt roads maintenance should be addressed, especially at brook crossing and proximal to the reservoirs. Establish a protection team, and utilize <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP’s guidance, “Developing a Local Watershed Protection Plan”. Include the MA DEM and official from the Dalton fire District, Windsor, Hinsdale, Washington and Becket in your strategy for access and stormwater management.
- ✓ Coordinate efforts with local officials to compare local watershed protection controls with current MA Watershed Protection Regulations 310 CMR 22.21(2). If there are no local controls or they do not meet the current regulations, adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.

**5. Utility Line Right-of-Way** – Electric utility lines run through the entire watershed of Cleveland Reservoir and directly over the reservoir. Normal maintenance of a right-of-way can introduce contaminants to a water supply through herbicide application for vegetation control. The over-application or improper handling of herbicides on railroad right-of-way is a potential source of contamination. Leaks or spills of chemicals used for maintenance of the line are also potential sources of contamination to the water supply.

**Right of Way Recommendations:**

- ✓ Review the right-of-way Yearly Operating Plan from both the electric company to ensure Best Management Practices are implemented with regard to vegetation control in the Zone A, and that the utility has accurate information regarding the locations of the Zone A. Review the maps the utility uses or supply them with accurate maps from your records.
- ✓ Work with the local fire department to review emergency response plans. Updates to this plan should include coordination with the owner/operator using the right-of-way. Request emergency response teams to coordinate Emergency Response Drills and practice containment of potential contaminants from accidents within the Zone A and watershed, which should attempt to include representatives from the owner/operator of the rights-of-way.

Land uses and activities within the watershed that are potential sources of contamination are included in Table 2. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources.

Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

## **Section 3: Source Water Protection Conclusions and Recommendations**

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system’s watershed contains potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply

**For More Information**

Contact Catherine V. Skiba in DEP’s Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, town boards, and the local media.

Protection Areas through:

- Actively pursuing watershed protection through stormwater management. The City received a water supply protection grant to address runoff issues throughout the watershed.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the protection areas regularly, and when feasible, remove any non-water supply activities.
- ✓ Control access to the watersheds, through patrols, public education and controlling watershed access points.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the

- ✓ stormwater drainage in your watershed and to cooperate on responding to spills or accidents.
- ✓ Work with landowners in your protection areas to make them aware of your water supply and to encourage the use of a best management practices for residential and recreational uses.
- ✓ Consider supplementing the household hazardous waste collection efforts in the communities of Washington, Hinsdale, Windsor and Becket for residents living within the watershed.
- ✓ Develop and implement an access control strategy as part of the watershed management plan.
- ✓ Develop and implement Forest Management Plan for water supply protection.
- ✓ At a minimum, investigate disposition of roads and actively pursue stormwater management and access management on ways closest to the reservoirs and feeder streams.
- ✓ Request that the utility supply you directly with their maintenance plan. Provide the electric company an accurate map of the watershed and meet with their representative to ensure they are working with an accurate map.
- ✓ Actively pursue an agreement with DEM regarding uncontrolled access to the watershed.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Source Protection Grant Program provides funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring, about May 1, the Department posts a new Request for Response (RFR- the grant application form) for the grant program.

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone C. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

#### **Section 4: Appendices**

- A. Protection Recommendations
- B. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone A?	YES	Follow Best Management Practices (BMPs) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone A posted with “Public Drinking Water Supply” Signs?	NO	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone A regularly inspected?	YES	Continue inspections of drinking water protection areas. Increase frequency when possible. Investigate access controls.
Are water supply related activities the only activities within the Zone A?	YES	Continue monitoring non-water supply activities in Zone A and throughout watershed.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Surface Water Protection Controls that meet 310 CMR 22.20 C?	NO	The Towns do not have watershed protection bylaws. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws, health regulations, and current regulations.
Do neighboring communities protect the water supply protection areas extending into their communities?	N/A	Pittsfield or other agencies own most of watersheds in the other communities.
<b>Planning</b>		
Does the PWS have a local Surface Water Protection Plan?	NO	Develop a surface water protection plan. Include forest management, erosion controls and access control. Follow “Developing a Local Surface Water Protection Plan” available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws.</a>
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	Partial	Create a plan by developing a joint emergency response plan with fire department, Board of Health, DPW, DEM and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a watershed protection committee?	NO	Establish committee; include representatives from citizens’ groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	N/A	
Does the PWS provide watershed protection education?	NO	Aim education at schools, residential and municipal uses within the watershed.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREAS

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
208618	Friendly Fred's Package Store	1173 Rte 9	Windsor	Fuel Distributors		Distribution
208656	Estes' General Store	1895 Rte 9	Windsor	Fuel Distributors		Distribution

\* Massachusetts Identification Number

\*\* EPA Identification Number

\*\*\* Scheduled to be cleaned up

### Underground Storage Tanks

Facility Name	Address	Town	Description	Tank Type	Tank Leak Detection	Capacity (gal)	Contents
Estes General Store	1895 Route 9	Windsor	Convenience, Gas Station	1 Wall	Approved In Tank Monitor	4,000	Gasoline
				1 Wall	Approved In Tank Monitor	4,000	Gasoline
				1 Wall	Approved In Tank Monitor	4,000	Gasoline
Tyler Brook Inc. Friendly Fred's	Route 9	Windsor		1 Wall	Approved In-Tank Monitor	4,000	Gasoline
				1 Wall	Approved In-Tank Monitor	4,000	Diesel
				1 Wall	Approved In-Tank Monitor	2,000	Diesel
				2 Walls	Interstitial Monitoring	6,000	Gasoline

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

# Source Water Assessment Program (SWAP) Report For DEM Berkshire Regional Headquarters

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 27, 2001

**Table 1: Public Water System (PWS) Information**

<b>PWS NAME</b>	<b>DEM Berkshire Regional Headquarters</b>
<b>PWS Address</b>	<b>740 South St., P.O. Box 1433</b>
<b>City/Town</b>	<b>Pittsfield, Massachusetts</b>
<b>PWS ID Number</b>	<b>1236016</b>
<b>Local Contact</b>	<b>Paul Adams</b>
<b>Phone Number</b>	<b>413-442-8928</b>

<b>Well Name</b>	<b>Source ID#</b>	<b>Zone I (in feet)</b>	<b>IWPA (in feet)</b>	<b>Source Susceptibility</b>
Well #1	1236016-01G	100	414	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The DEM Berkshire Regional Headquarters, located in Pittsfield, serves approximately 30 employees year round. The system is served by on-site septic disposal located 200 feet from the well. The Zone I and Interim Wellhead Protection Area (IWPA) radii are 100 feet and 414 feet, respectively based on estimated water use. The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA.

The well is reportedly drilled to a 400-foot depth with the pump set at 248-feet below grade. The facility is located within an area of bedrock that is mapped by USGS as the

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- The IWPA is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Wallomsac Formation comprised primarily of dark-grey phyllite, schist and intrusive limestone. There is no surficial geology map available; however, based on the observed bedrock outcrops and topography at the site, it is assumed the surficial geology is a thin layer of till. There is no evidence of a confining, protective layer such as clay in the vicinity of the well. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The well water serving the facility is exposed to ultra-violet light for disinfection. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Nonconforming activities in the Zone I;**
2. **Septic System; and**
3. **Floor drain in boiler room.**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of at least one moderate threat land use or activity in the Zone I or IWPA, as seen in Table 2.

**1. Nonconforming activities in the Zone I** – Currently, the water supplier does not own or control the entire Zone I area for the well. Please note that systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. A portion of the Zone I is owned by the South Mountain Associates (SMA). In addition, the SMA owners have an easement that allows parking on the DEM land during the concert season that runs 5 or 6 Saturdays in the fall. There is also an interior transportation corridor located within the Zone I.

#### Recommendations:

- ✓ Continue to work with South Mountain Associates in an attempt to find alternative parking solutions.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or road salt within the Zone I.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Internal Transportation Corridors and Seasonal Parking	Well # 1	Well #1	Moderate	Monitor area for accidental leaks or spills
Septic System	No	Well #1	Moderate	See Septic System brochure
Floor drain in boiler room	No	Well #1	Moderate	Bring the floor drains into compliance with Department Regulations
Underground Storage Tank (UST) – Fuel oil	No	Well #1	High	New double-walled, 1000-gallon heating oil tank

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

- ✓ Prepare an emergency response plan for responding to an accidental release.
- ✓ Do not conduct any additional activities within the Zone I. Contact MA DEP prior to conducting any activities within Zone I.

**2. Septic Tank** – Although the septic system and leach field for the facility are located outside of the Zone I and are topographically down gradient from the well, they are within the IWPA of the well. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste.

**Recommendations:**

- ✓ Provide staff and area residents with information about proper maintenance and disposal practices for septic systems. Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Upgrade and maintain the facility's system as required.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.

**3. Floor drain in boiler room** – A floor drain is located in the boiler room, which discharges into the septic system. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system. The floor drain must be sealed, connected to a tight tank or as a last resort, protected to guarantee that boiler blow down, oil or other prohibited discharges cannot enter the floor drain.

**Recommendations:**

- ✓ Bring the floor drains into compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207).
  - Interim Actions: cease using the floor drains.
- ✓ If you wish to retain the drain, install a tight tank and connect the boiler room floor drains to the tank.

Additionally, there is a 1000-gallon capacity, #2 fuel oil UST within the IWPA, located in the front yard, downhill from the facility and well. The tank is double-steel wall, installed two years ago. USTs in close proximity to the water supply should be closely monitored especially during deliveries. Any upgrades and modification must meet current construction standards and be done consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the DEM Berkshire Regional Headquarters' well susceptibility to contamination. DEM Berkshire Regional Headquarters is commended for bringing the wellhead above grade, for upgrading the UST. DEM Berkshire Regional Headquarters should review and adopt the key recommendations above and the following:

**Priority Recommendations:**

- ✓ Keep non-water supply activities out of the Zone I as much as possible. Attempt to work out a compromise agreement for seasonal parking use.
- ✓ Address floor drains in boiler room.

**Zone I:**

- ✓ Prohibit public access to the well by locking facilities and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, etc.

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

- ✓ If water quality cannot be protected continue investigating other options for connecting to City water.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, and certified operator. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, refer to <http://www.state.ma.us/dep/bwp/dhm/files/sqgsum.pdf> for the Requirements for Small Quantity Generators.
- ✓ Eliminate non-sanitary wastewater discharges to on-site septic systems. Instead, in areas using hazardous materials, seal the floor drain or discharge drains to a tight tank or sanitary sewer. (refer to attachment "Industrial Floor Drain Brochure").
- ✓ Remove hazardous materials from rooms with floor drains that drain to the ground or septic systems.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ Concrete or earthen collars around wellheads should slope away from well casing.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Work with local officials in Pittsfield to include DEM Berkshire Regional Headquarters' IWPA in an Aquifer Protection District overlay and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## 4. Attachments

- Map of the Public Water Supply (PWS) Protection Area.
- Recommended Source Protection Measures Fact Sheet
- Your Septic System Brochure
- Pesticide Use Fact Sheet
- Industrial Floor Drains Brochure
- Source Protection Sign Order Form

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report For EARTHDANCE

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 24, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Earthdance
<i>PWS Address</i>	252 Prospect St
<i>City/Town</i>	Plainfield, Massachusetts
<i>PWS ID Number</i>	1237003

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1237003-01G	136	438	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1237003-01G)**

Zone I = 136 ft.  
IWPA = 438 ft.

### How Was My Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and/or the IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads, parking and facility buildings within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report for Richmond Consolidated School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
June 15, 2001

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Richmond Consolidated School
<i>PWS Address</i>	State Road
<i>City/Town</i>	Richmond, Massachusetts
<i>PWS ID Number</i>	1249004

Well #1	1249004-02G	250	622	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

### The Well

Richmond Consolidated School is a rural, kindergarten through eighth grade school located on the east side of State Road, Route 41 in Richmond. The total school student and staff population is approximately 250 people per day and is served by a single potable supply well (Well #1 –02G) located northeast of the school. The school was expanded and renovated in 1999 and the school's old (01G) was abandoned as a water supply and decommissioned, by filling in and sealing the well in accordance with the DEP's requirements

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Well #1 has a Zone I protective radius of 250 feet and an Interim Wellhead Protection Area (IWPA) radius of 622 feet based on pumping test data and Zone I restrictions. The well was tested at a rate of 18 gallons per minute (gpm) under the New Source Approval Process and was granted an approved withdrawal rate of 10,000 gallons per day (7 gpm) due to a limited Zone I area of a 250-foot radius.

Well #1 is a 6-inch diameter well drilled to a depth of approximately 440 feet below ground. The driller's log states that topsoil was encountered from ground level to 3 feet below ground, where bedrock was encountered. The driller logged the bedrock as limestone from 3 feet to the final well depth; the geologic map of the area states that the bedrock is dolomite and marble of the Stockbridge Formation. Forty feet of casing was grouted into place with approximately 24-inches of casing above ground. At the time this report was prepared, the water does not require and is not treated. You may request additional, current information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the attached maps of the Zone Is and IWPAs and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Parking and Stormwater Retention Basin**
2. **Passive Recreation in IWPA**

The well is located in an aquifer with a high vulnerability to contamination due to the absence of a significant hydrogeologic barrier to prevent contaminant migration. The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of at least one moderate threat land use or activity in the IWPA, as seen in Table 2.

1. **Parking and Stormwater Retention Basin in the IWPA** – The stormwater from the parking areas is discharged to a retention basin immediately adjacent to the Zone I. The discharge line was mounded, rather than buried, due to shallow bedrock and the retention basin is located on bedrock, with riprap. Storm water from the parking lot is routed through catch basins prior to discharge to the sediment trap/water quality basin. There are eight (8) catch basins and the building footing drain that discharge to the basin. Four (4) of those basins are located in the parking lot.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Parking and Storm water retention	No	Yes	Moderate	Manage, monitor and maintain system.
Passive Recreation	Yes	Yes	Low	Evidence of low frequency passive activity.

- -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

As flowing storm water travels, it picks up debris and contaminants from parking areas and lawns. Common potential contaminants include lawn chemicals, pet waste, leakage from dumpsters, household hazardous waste, and contaminants from vehicle leaks, or accidents.

Pollutants are actually not removed from most catch basins until they are cleaned out. Regular maintenance is required to reduce the risk of resuspension of sediments and contaminants during large storm events. Maintenance is essential for the proper operation of catch basins and the sediment/water quality basin. Due to the shallow bedrock contaminant discharged through the basin may impact the bedrock aquifer.

### Recommendations:

- ✓ If you do not have a storm water maintenance plan, develop one. Maintenance plans should include an inspection and maintenance schedule. Inlets should be cleaned out a minimum one time per year and inspected quarterly. The outfall should be inspected annually for structural integrity and determine if it needs to be cleaned. Look for color, turbidity, odor, oil sheen etc. All observations should be recorded and action taken if evidence of a release of hazardous materials such as petroleum products has been observed.
- ✓ Inspect parking areas periodically for evidence of leaks or accidental spills.
- ✓ Post Drinking Water supply signs in the parking areas.
- ✓ Sweeping parking lots reduces the amount of potential contaminants in stormwater runoff.
- ✓ All sediments and hydrocarbons should be properly handled and disposed in accordance with local, state and federal guidelines and regulations. Catch basin cleanings are classified as a solid waste and must be handled and disposed of in accordance with all DEP regulations, policies and guidance.

2. **Passive Recreation in IWPA** – Passive recreation occurs in the IWPA at a tennis court. Passive recreation poses minimal threat provided access to the wellhead is prevented.

### Recommendations:

- ✓ Conduct routine inspections of the wellhead and monitor for activities near the wellhead.
- ✓ If there is evidence of unauthorized access to the wellhead, consider fencing off the wellhead area. Fencing for the wellhead is an eligible project under the Wellhead Protection grant program. (See Funding below).

Other activities that were noted during the assessment were the open fields adjacent to the school. It is our understanding that these fields are hayed. Provided that no soil enhancements, manure or pesticides are applied, haying poses minimal threat to the aquifer. Any soil enhancements should be applied following a nutrient management plan prepared with assistance from the There is one residence in the northern section of the IWPA and low-density residential development west of Route 41. Normal residential activities pose minimal threat to the water quality of the public water supply as well as their own private supply provided homeowners are aware of the potential hazards of household waste, lawn care chemicals, animal waste and septic systems and they utilize best management practices.

Provide information to residents about the potential hazards of household chemicals, lawn care chemicals and fertilizers.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

Include information on Best Management Practices (BMPs) for the use of fertilizer lawn care, pesticides, household hazardous waste and septic system maintenance and disposal practices.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The Richmond Consolidated School is commended for current protection measures specifically those designed into the school renovations.

Please review and adopt the key recommendations listed above and as follows:

#### Priority Recommendation:

- ✓ If you do not have a storm water maintenance plan, work with the Town to develop one. Maintenance plans should include an inspection and maintenance schedule. Inlets should be cleaned out a minimum one time per year and inspected quarterly. The outfall should be inspected annually for structural integrity and determine if it needs to be cleaned. Catch basin cleanings are classified as a solid waste and must be handled and disposed of in accordance with all DEP regulations, policies and guidance. Look for color, turbidity, odor, oil sheen etc. All observations should be recorded and action taken if evidence of a release of hazardous materials such as petroleum products has been observed.

#### Zone I and IWPA:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I. Look for evidence of unauthorized access.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider fencing and gating the wellhead area. This is an eligible project for a Wellhead Protection grant.
- ✓ Post drinking water supply sign in the parking lots at the front and rear of the building.
- ✓ Provide information to residents about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Provide information on Best Management Practices (BMPs) for the use of fertilizer lawn care, pesticides and household hazardous waste.
- ✓ Provide educational outreach to residents regarding septic system maintenance and disposal practices.

#### Training and Education:

- ✓ Post drinking water protection area signs at key visibility locations such as in the parking areas.
- ✓ Incorporate groundwater education into school curriculum (K-6 and 7-12 curricula available; contact DEP for copies).

#### Facilities Management:

- ✓ Work with the town or develop a storm water maintenance plan that includes an inspection and maintenance schedule. Inlets should be cleaned out a minimum one time per year and inspected quarterly. The outfall should be inspected annually for structural integrity and determine if it needs to be cleaned. Look for color, turbidity, odor, oil sheen etc. All observations should be recorded.
- ✓ Inspect parking areas periodically for evidence of leaks or accidental spills.
- ✓ Sweeping parking lots reduces the amount of potential contaminants in stormwater runoff.
- ✓ All sediments and hydrocarbons should be properly handled and disposed in accordance with local, state and federal guidelines and regulations. Catch basin cleanings are classified as a solid waste and must be handled and disposed of in

accordance with all DEP regulations, policies and guidance.

- ✓ Septic system components should be inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ Concrete protective collars on the wellhead (earthen or concrete) should slope away from well and the well casing should extend above ground.

#### **Planning:**

- ✓ Encourage local officials in Richmond to develop protective bylaws and include the school well's IWPA in an Aquifer Protection District Bylaws and to assist you in securing protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

#### **Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the 2001 "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note that each program year, on or about May 1 the Department posts a new Request for Response (RFR), grant application form. Generally, the applications are due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## **4. Attachments**

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for View Drive Community

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection,  
Drinking Water Program

Date Prepared:  
November 19, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road de-icing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

View Drive Community is a residential development located in Richmond, a small rural, hilltown in western Berkshire County on the New York state border. The community consists of 20 homes on the western slope of Lenox Mountain. Richmond does not have municipal water and sewer systems, therefore, the community is served by one, on-site water supply well and wastewater is discharged through individual on-site septic systems.

Well #1 is a 6-inch diameter, 230-feet deep, bedrock well located on the side of Lenox

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Mountain, fairly remote from the homes adjacent to a trail. Water from the well is pumped to a storage tank lower on the hill. The geologic mapping of the area indicates thin overburden material of till with numerous exposures of bedrock. Geologic mapping also shows the well near the contact between the carbonate rocks of the valley and the metamorphic equivalents of the sedimentary and volcanic rocks of the Taconic Allochthon, predominantly a chloritoid-rich schist of the Everett Formation. It seems apparent that the well does not intersect the carbonate rocks, as the system must treat the water for corrosion control. The system has been conducting pilot studies to control the pH and has not established a treatment system yet.

The Zone I is the protection area immediately surrounding the wellhead, while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii, based on an estimated volume from the well are 223 feet and 547 feet, respectively. The system does not have a master meter; therefore Title 5 flow estimates were used to determine the protection areas. Please refer to the attached map of the Zone I and IWPA.

There is no record or evidence of a continuous, confining and protective layer such as thick till or clay, in the vicinity of the well. Wells located in this type of geologic setting are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

For information on current water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 2 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The well is fairly remote and the protection areas include a hiking trail, forest and two residences on the edge of the IWPA.

#### Key issues include:

1. **Passive recreation**
2. **Residential land use**

The overall ranking of susceptibility to contamination for the View Drive Community

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Recreation	Yes	Yes	Low	Inspect the well regularly to ensure against tampering. Inspect the integrity of the cap and the drainage around the well.
Residential	No	Yes	Moderate	Supply BMPs to residents. Monitor activities within the entire IWPA area for potentially hazardous activities near your wells.

\* -For more information, see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

supply well is low/moderate based on the presence of only one low and one moderate ranked potentially threatening land use or activity in the Zone I and IWPA. Please refer any questions about water quality at the facility to the contact person listed in Table 1.

**1. Passive recreation within Zone I** – The Zone I is the area immediately surrounding the wellhead where only activities associated with supplying water or other non-threatening activities are allowed. The Zone I is fairly remote, however there is a hiking trail that traverses the Zone I.

**Zone I Recommendations:**

- ✓ Control access to the wellhead areas with sanitary seals and secure facilities.
- ✓ Inspect the well regularly to ensure the integrity of the cap and the drainage around the well.

**2. Residential Land Use** – There are two residences within the IWPA protection area. If managed improperly,

activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Do not allow the accumulation of refuse within the protection areas.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. The Department commends the Community for previous efforts to protect the source but there is still work needed to fully protect the sources. The water supplier should review and adopt the key recommendations above and the following:

**Priority Recommendations:**

- ✓ Monitor and control activities in the Zone I and IWPA areas.
- ✓ Consider ways to protect the well if activities cannot be controlled.

**Zone I:**

- ✓ Prohibit any new, non-water supply activities from the Zone I.
- ✓ Continue regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ Redirect drainage in the Zone I, downgradient and away from the well area.

**Training and Education:**

- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Educate residents, neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal.
- ✓ Keep areas near transformers free of tree limbs that could endanger the transformer in a storm.

### Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-feet to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Planning:

- ✓ Request that the town develop a Wellhead Protection District and associated bylaws and request that the IWPA for your and other water systems be included in the protection area.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Be sure that the local emergency responders know where your sources are located and notify you in the event of an accident in the vicinity of your well.
- ✓ Supplement the SWAP assessment with additional local information, and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Other Funding Sources:

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>

The DEP's Wellhead Protection Grant Program provides funds to assist public water suppliers and their partners in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under this grant program. If funds are available, in the spring, DEP posts a new Request for Response for the grant program (RFR).

These recommendations are only part of your on-going local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures. Copies of this report have been forwarded to the water supplier and Town officials.

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

- Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
- MA DEP SWAP Strategy

## Source Water Assessment and Protection (SWAP) Report

### for Yankee Atomic Electric Company

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- Inventory land uses within the recharge areas of all public water supply sources;
- Assess the susceptibility of drinking water sources to contamination from these land uses; and
- Publicize the results to provide support for improved protection.

#### SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department  
of Environmental  
Protection, Bureau of  
Resource Protection,  
Drinking Water Program

Date Prepared:  
October 24, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Yankee Atomic Electric Company's (Yankee Atomic) former nuclear power station is located in Rowe, a small, rural community in northwestern, Massachusetts along the Vermont border. The facility was a small nuclear power generation station, the third built in the country and the first in New England. The facility stopped generation in 1992 and is in the final stages of being decommissioned and dismantled; the anticipated date of completion is 2005. The current staff is approximately 200 people per day and the facility is served by a single potable supply well (02G) located at the facility. The

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

original well #1 (01G) was abandoned and decommissioned as part of the facility decommissioning process. Rowe does not have public water or municipal wastewater sewers available and therefore, the facility is served by an on-site water supply and septic disposal. Numerous local, state and federal programs regulate activities at the facility. Some of those regulatory programs are: the Massachusetts Department of Public Health radiation control program, and MA DEP air quality, solid waste, industrial wastewater, hazardous waste, water supply, wastewater, and waste site cleanup programs. In addition, the federal regulatory programs include, but are not limited to the National Pollution Discharge Elimination System (NPDES), the Nuclear Regulatory Commission (NRC), the Resource Conservation and Recovery Act (RCRA), and the Toxic Substance Control Act (TSCA).

The Zone I is the protected area immediately surrounding the well, while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual (Zone II) recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii for this facility's well are 200 feet and 504 feet, respectively, based on an approved withdrawal rate as determined through the New Source Approval Process.

The overburden in the area is comprised of glacially derived stratified drift and till of varying thickness (0 to 246 feet) over the bedrock; limited stratified drift and alluvium are deposited along the adjacent Deerfield River. The bedrock in the area is mapped as the Hoosac formation, a lower Cambrian age gneiss. Well 02G is approximately 280 feet deep, set into sound bedrock beneath 246 feet of glacial till. Although there is some evidence of a protective barrier of thick till, the confining unit is highly variable in the vicinity of the well, as bedrock exposure is noted at various locations on site. Therefore, the Department has determined this well to have a high vulnerability to contamination due to the absence of a continuous, hydrogeologic barrier throughout the recharge area that can prevent contaminant migration from the surface. Please refer to the attached map of the Zone I and IWPA.

The water from the well is presently not treated prior to distribution. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1. Refer to Table 2 for additional information regarding the location of the well and activities within the protection areas.

**Table 2: Table of Activities within the Water Supply Protection Areas for Both Sources**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Nuclear Power Plant (former, partially dismantled)	No	Yes	High	Radiological activities are controlled and regulated by NRC and DPH.
Hazardous materials storage and use	No	Yes	High	Continue the use of BMPs and coordinate with emergency responders.
LQG	No	Yes	High	Hazardous materials handling
Fuel storage (ASTs)	No	Yes	Moderate	Continue the use of BMPs and coordinate with emergency responders.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridor and parking	No	Yes	Moderate	Ensure stormwater from the site is directed downgradient and away from the well.
Transmission lines	Yes	Yes	Low	Use only mechanical means of vegetation control.
Confirmed hazardous waste release site	No	Yes	--	Refer to MA DEP BWSC files for progress on remediation and Appendix C.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## 2. Discussion of Land Uses in the Protection Areas

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

The Zone I protection area for Well #2 is in compliance with the DEP restrictions that allow only water supply related activities or other non-threatening activities to be conducted within the Zone I. However, the IWPA includes parts of the facility including hazardous materials storage and use, fuel storage (ASTs only), internal roads and parking, and radiological control and storage area. All site activities are immediately adjacent to the protection areas including solid waste (non-radiological) disposal areas, wastewater disposal, etc.

#### Key issues include:

##### 1. Hazardous materials storage and use.

The overall ranking of susceptibility to contamination for the Yankee Atomic water system is high, based on the presence of several moderate and high threat ranked land use or activity in the IWPA and immediately adjacent to the IWPA. Please refer to Table 2 for more details.

**1. Hazardous Materials Storage and Use** – Yankee Atomic utilizes and stores hazardous materials and generates hazardous waste. The Site Closure Project Plan, (Rev. 1, Oct. 20, 2003) addressed issues of compliance with local, state and federal requirements. Information regarding the observations and subsequent actions related to various closure issues are addressed in the recent update. At the time of the assessment, hazardous materials appeared to be handled appropriately. There is detailed documentation of procedures for handling of hazardous materials, both radiological and non-radiological. Spill kits and signs designating areas of storage were noted during the visit. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground. For details regarding compliance with the various MA DEP programs refer to the closure plan and the individual MA DEP program in the Springfield Regional office at (413) 784-1100.

#### Hazardous Materials Storage and Use Recommendations:

- V Continue current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.
- V Continue to comply with all local, state, and federal regulatory requirements for restoration of the site.
- V Contact Rick Larson 413-2207 or Tony Zaharias 413-755-2122 with questions regarding the UIC program.
- V Refer to the following Yankee Atomic Electric Company web sites for additional information and for updated reports <http://www.yankee.com/siteclosure/index.htm> <http://www.yankee.com/> regarding the progress of the decommissioning.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

#### Training and Education:

- ✓ Continue staff training on proper hazardous material use, disposal, emergency response, and best management practices.
- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.

#### Planning:

- ✓ Update the assessment as the dismantling and decommissioning progresses.
- ✓ Work with local officials in Rowe to develop an Aquifer Protection District and Bylaws for compliance with 310 CMR 22.000 to include your and other IWPAs in that district.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at: [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. Review and consider adopting the key recommendations above and the following:

#### Priority Recommendations:

- ✓ Comply with all local, state and federal regulations for closure and site remediation.

#### Zone I:

- ✓ Prohibit any non-water supply activities from the Zone I.
- ✓ Continue to conduct regular inspections of the Zone I. Inspect the well cap to ensure it is secure and the seal is intact.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### 4. Attachments

- Map of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheets
- List of Regulated facilities in the protection areas

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREAS

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
	Yankee Electric	Yankee Road	Rowe	Hazardous Waste Generator (Waste oil)	LQG	Power plant
				Hazardous Waste Generator (Hazardous waste)	LQG	Power plant
				Recycling	BUD	Solid Waste
				Air Quality	BLW-AQ	Air Emissions
				Solid Waste	LF	Solid waste
				Surface Water Discharges	SW	Stormwater and Process Water

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitelist.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0013411	Yankee Atomic Electric	Rowe	Hazardous materials

For more location information, please see the attached map. The map lists the release sites by RTN.

Well #1	1130002-01G	100	421	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Rowe Elementary School is a rural elementary school located on the west side of Pond Road. The school student and staff population is approximately 75 people per day and is served by a single potable supply well (Well #1) located northeast of the school. The well is located within a vault in the parking lot of the school. The pit is bermed and has a locking bilco type hatchway.

The well has a Zone I protective radius of 100 feet and an Interim Wellhead Protection Area (IWPA) radius of 421 feet based on an average maximum daily withdrawal rate from metered usage data. The protective radii were based on the average daily-metered

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

water use for the two highest months on record. Please refer to the attached map that shows the Zone I and IWPA. The Zone I is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wellhead may be larger or smaller.

The 6-inch diameter well is drilled to a depth of approximately 300 feet below ground. There is no record of the materials encountered during drilling of the well. Bedrock outcrops were observed in the vicinity of the school during the site visit indicating relatively shallow depth of bedrock. The geologic mapping of the area indicates till underlying the school with the bedrock identified as grey to green medium grained schist of the Moretown Formation dating from the Ordovician. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer. The water does not require and is, at the time this report was prepared, not treated. You may request additional information regarding the quality of the water from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone Is and IWPAs and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, very few land uses and activities within the drinking water supply protection areas were identified as potential sources of contamination.

### Key issues include:

1. **Underground fuel oil storage tank (UST)**
2. **Septic System**
3. **Floor drain in boiler room**
4. **Parking and roadway**

Although the Town owns the entire Zone I area, there are activities within Zone I that are not related to water supply. The well is located in an aquifer with a high vulnerability to contamination due to the absence of a significant hydrogeologic barrier to prevent contaminant migration from the surface. The overall ranking of susceptibility to contamination for the well is high, based on the presence of at least one high threat land use or activity in the IWPA, as seen in Table 2.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Underground Storage Tank (UST, fuel oil)	No	Yes	High	Double walled tank with monitoring 135 feet from well
Septic System components	No	Yes	Moderate	Refer to the attached septic system fact sheet.
Floor Drain in the boiler room to septic system	Yes	Yes	Moderate	Floor drain must be protected from accidental spills or connected to tight tank.
Parking area and roadway	Yes	Yes	Moderate	Grassy drainage swales in Zone I

- **-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).**

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**1. Underground fuel oil storage tank** – The school's underground fuel oil tank and propane tank are located within the IWPA of the school well. The oil tank is located 135 feet from the well and is double walled with a monitoring system. The propane tank, also located within the IWPA, poses a minimal threat to water quality due to the gaseous nature of propane if released.

### Recommendations:

- ✓ Diligently monitor the status of the tanks and the delivery of oil.
- ✓ Consider long term planning of replacing the UST after its useful life with an above ground tank with containment.

**2. Septic system components in the IWPA** - The septic tank, grease trap, pipeline and distribution box are all within the IWPA of the well. A very small portion of the leach field is also on the perimeter of the IWPA. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Improper disposal of household hazardous chemicals to septic systems or discharge from the boiler room are also potential sources of contamination to the water supply.

### Recommendations:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator.
- ✓ Refer to the appendices for more information regarding septic systems. The school is currently not registered as a generator of hazardous waste or waste oil. If you wish to participate in the Town household hazardous waste pick-up day, review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" to determine regulatory requirements.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.

**2. Floor drain in the boiler room** – Floor drains may be required in boiler rooms to provide drainage in the event of a plumbing failure. If there is a potential for hazardous materials to flow accidentally into the floor drain, however, preventive measures should be taken. Floor drains in an area that contains hazardous materials must be discharged to a sewer or a tight tank. The boiler room at the Rowe Elementary School has a floor drain that is assumed to discharge to the septic system.

### Recommendations:

- ✓ Oil lines from the tank to the boiler can be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. A written policy and plan should be in place during maintenance operations, especially when oil filters are changed. Require your boiler maintenance contractor to use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. Please note that boiler blow down generated during routine maintenance cannot be discharged through the floor drain and must be disposed of off site.
- ✓ If protection of the floor drain cannot be assured, a tight tank must be installed for the floor drain.

**3. Parking and roadway** - The well is located within the school parking lot and the roadway is within the IWPA of the well. Parking lot and schoolyard drainage consists of an earthen swale. Drainage the school is discharged

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, and the local media.

approximately 200 feet from the well to an area that topographically drains away from the wellhead.

#### Recommendations:

- ✓ Use minimal road salt and deicers.
- ✓ Monitor the parking lot for spills and leaks.
- ✓ Maintain a buffer from parking near the well.

Other land uses observed were the storage shed just outside the Zone I and the pole mounted power transformer approximately 75 feet from the well. Be sure to store all petroleum products in secondary containment and contact the power utility to ensure that the fluid in the transformer does not contain PCBs. Implementing the previously noted and following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The Rowe Elementary School is commended for current protection measures.

Please review and adopt the key recommendations listed above and as follows:

#### Zone I and IWPA:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Monitor oil delivery and storage.
- ✓ Continue to prohibit parking immediately adjacent to the well vault and monitor the parking area for spills and leaks.
- ✓ Consider replacement of the well if Zone I threats cannot be mitigated.
- ✓ Post drinking water supply signs key location such along the access road to the school.
- ✓ Provide information to staff about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Do not use fertilizer or pesticides.
- ✓ Use Best Management Practices (BMPs) for household hazardous products.

#### Training and Education:

- ✓ Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies).

#### Facilities Management:

- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.

#### Planning:

- ✓ Work with local officials to include the school well's IWPA in an Aquifer Protection District Bylaws and to assist you in securing protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands.

Keep the phone number of a bottled water company readily available.

- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the 2001 "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note that each program year, on or about May 1 the Department posts a new Request for Response (RFR), grant application form. Generally, the applications are due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

<b>Local Contact</b>	Vickie Paine
<b>Phone Number</b>	(978) 249-8443

<b>Well Name</b>	<b>Source ID#</b>	<b>Zone I (in feet)</b>	<b>IWPA (in feet)</b>	<b>Source Susceptibility</b>
Well #1	2255000-01G	323	1085	High

**Introduction**

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

**Purpose of this report:**

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

**This report includes:**

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas
5. Appendix

**1. Description of the Water System**

The well for South Royalston Improvement Corporation is located adjacent to Blossom Street. The well is an eight-inch diameter bedrock that was drilled to a depth of 290 feet. The well has a Zone I of 323 feet and an Interim Wellhead Protection Area (IWPA) of 1085 feet. The IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA. The well serving the facility has no treatment at this time. The DEP requires public water

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Inappropriate Activities in Zone Is;**
2. **Transportation Corridor**
3. **Railroad Tracks; and**
4. **Aquatic wildlife / Fishing and Boating.**

The overall ranking of susceptibility to contamination for the well is high, based on the presence of at least one high threat land use or activity in the IWPA, as seen in Table 2.

1. **Zone Is** – Currently, the well does not meet DEP's restrictions, which only allow water supply related activities in Zone Is. The facility's Zone I contains buildings, a home, roads, cemetery and parking areas. The public water supplier does not own and/or control all land encompassed by the Zone I. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

#### Recommendations:

- ✓ Remove non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
  - ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
  - ✓ Use BMPs and restrict activities that could pose a threat to the water supply.
2. **Transportation Corridor** – Route 68 lies within the protection for the well. Highways are potential sources of contamination due to salting of roadways and leaks or spills of fuels and other hazardous materials during accidents.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Parking lot, driveways & roads	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Railroads Tracks	No	Yes	High	Spills of hazardous chemicals; pesticide use for vegetation control.
Transportation Corridor	Yes	Yes	Moderate	Spills, leaks and road salt
Utility Transformer	No	Yes	Low	Check for PCBs
Aquatic Wildlife/Fishing & Boating	Yes	Yes	Low	Millers River
Structures	Yes	Yes	-	Non-water supply structures in Zone I

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

### Recommendation:

- ✓ Contact the local fire department to ensure that the IWPA is included in Emergency Response Planning

- 3. Railroad Tracks** – Gilford railroad lies within the IWPA of the well. Railroad corridors serving passenger and/or freight trains are potential contaminant sources due to chemicals released during normal use, track maintenance, and accidents. Normal maintenance of railroad rights of way can introduce contaminants to a water supply through improper herbicide application for vegetation control. Accidents can release spills or engine fluids and commercially transported chemical.

### Recommendations:

- ✓ Contact your local Board of Health to ensure that the IWPA is included in right of way pesticide management planning.
- ✓ Contact local fire department to ensure that the IWPA is included in Emergency Response Planning

- 4. Aquatic Wildlife/Fishing & Boating** - The Millers River is located within the IWPA. Ducks and other wildlife within and around the river are potential sources of microbial contamination to the water supply.

### Recommendation:

- ✓ Discourage wildlife by prohibiting the feeding of ducks and wildlife.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. South Royalston Improvement Corp. should review and adopt the key recommendations above and the following:

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Prohibit public access to the well and pumphouse by locking facilities, gating roads, and posting signs.

- ✓ Conduct regular inspections of the Zone I.
- ✓ Since owners intend to continue utilizing the structures in the Zone I, use BMPs and restrict activities that could pose a threat to the water supply.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.
- ✓ Do not use road salt within the Zone I.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include residents, groundskeepers, and certified operator.
- ✓ Post drinking water protection area signs at key visibility locations.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Josephine Yemoh-Ndi in DEP's Worcester Office at (508) 849-4030 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

### Facilities Management:

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Work with local officials in Royalston to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Source Water Assessment Program (SWAP) Report For Village School/Raymond School

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
April 13, 2002

**Table 1: Public Water System (PWS) Information**

<i>PWS NAME</i>	VILLAGE SCHOOL/ RAYMOND SCHOOL
<i>PWS Address</i>	ON THE COMMON
<i>City/Town</i>	ROYALSTON
<i>PWS ID Number</i>	2255001
<i>Local Contact</i>	Reise Richardson, School Director
<i>Phone Number</i>	(978) 249-3505

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	2255001-01G	100	420	High

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? inventory land uses within the recharge areas of all public water supply sources;
- ? assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? publicize the results to provide support for improved protection.

## Maintaining Your Good Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The well for the facility is located about 30 feet to the right of the building as you face the front of the building. The well is a deep rock well, and has a Zone I of 100 feet and an Interim Wellhead Protection Area (IWPA) of 420 feet. The IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA. The well serving the facility has no treatment at this time. Please refer to the attached map of the Zone I and IWPA.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

For current information on monitoring results and treatment, please contact the Public Water System contact person listed above.

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

Key issues include:

1. **Inappropriate activities in Zone I; and**
2. **Aboveground Storage Tank (AST) with fuel oil.**

The overall ranking of susceptibility to contamination for the well is Moderate, based on the presence of only moderate threat land use or activities in the IWPA.

1. **Zone I** - Currently, the well does not meet DEP's restrictions, which only allow water supply related activities in Zone I. The school's Zone I contains a portion of the school building, a portion of the school's driveway, the playground and some parking spaces. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

#### Recommendations:

- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Do not use road salt within the Zone I.
- ✓ If the school intends to continue utilizing the structures, athletic fields, and parking areas in the Zone I, use BMPs and restrict activities that could pose a threat to the water supply.

2. **Aboveground Storage Tank** - A 250 gallon AST with fuel oil is located in the building on cement floor, without secondary containment. If managed improperly, Aboveground Storage Tanks can be a potential source of contamination due to leaks or spills of the chemicals they store.

#### Recommendations:

- ✓ The Department recommends that you provide 110% secondary containment for the AST located in the school building. Aboveground storage tanks in your IWPA should be located on an impermeable surface.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
School	Parking lot & driveways	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
	Aboveground Storage Tank	Yes	Yes	Moderate	AST on cement floor in building
	Structure	Yes	Yes	Moderate	Non-water supply structures in Zone I

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

- ✓ Comply with all provisions of the regulations regarding AST. Any modifications to the AST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. The Department recommends that you consult with the local fire department for any additional local code requirements regarding AST.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Village /Raymond School should review and adopt the following recommendations at the school:

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated. Please note that DEP Permit Approvals must be obtained prior to the installation of a new well.

### Training and Education:

- ✓ Instruct staff on emergency response, and best management practices; include custodial staff, groundskeepers and certified operator.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Incorporate groundwater education into school curriculum.

### Planning:

- ✓ Work with local officials in Royalston to include the school's IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? inventory land uses within the recharge areas of all public water supply sources;
- ? assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? publicize the results to provide support for improved protection.

## Maintaining Your Good Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The well for the facility is a 6 inch diameter bedrock well drilled to a depth of 180 feet. The well site is within the wetland buffer zone. The well has a Zone I of 200 feet, and an Interim Wellhead Protection Area (IWPA) of 507 feet. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers such as clay that can prevent contaminant migration. Please refer to the attached map of the Zone I and IWPA. Please refer to the attached map of the Zone I and IWPA.

The well serving the facility has no treatment at this time. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

**Key issues include:**

1. **Inappropriate activities in Zone I;**
2. **Underground Storage Tank; and**
3. **Local road.**

The overall ranking of susceptibility to contamination for the well is High, based on the presence of at least one high threat land use or activity in the IWPA.

1. **Zone I-** Currently, the well does not meet DEP's restrictions, which only allow water supply related activities in Zone Is. The facility's Zone I contains an athletic field. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

#### **Recommendations:**

- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ If the school intends to continue utilizing the athletic field in the Zone I, use BMPs and restrict activities that could pose a threat to the water supply.

2. **Underground Storage Tank** – A UST with heating oil is within the IWPA. The tank was installed in 1995, and is equipped with a leak detector and alarm. If not properly monitored UST can leak and its contents can potentially contaminate groundwater.

#### **Recommendations:**

- ✓ Any modifications to the UST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.
- ✓ The Department recommends that you inspect, maintain and replace or upgrade components of your heating system regularly. Inspect oil lines (i.e. furnace to tank) for corrosion or pitting and replace copper lines with lines encased in a protective sleeve or install UL listed oil safety valve to prevent leaks (refer to attachments).
- ✓ During refilling of UST, ensure that the operator of the oil transport tanker does not leave the vehicle area while the UST is being filled.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
School	Fuel Storage Below Ground	No	Yes	High	Heating oil tank, tank is up to date with leak detection and alarm
	Stormwater drain	No	Yes	Low	Drains away from well and outside of IWPA
	Local road	No	Yes	Moderate	Rural road- encourage limited use of road salt

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

3. **Local road** – A local road is located within the IWPA. Roads are potential sources of contamination due to salting of roadways and leaks or spills of fuels and other hazardous materials during accidents.

### Recommendation:

- ✓ Contact local fire department to ensure that the IWPA is included in Emergency Response Planning.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Royalston Elementary School should review and adopt the following recommendations at the facility:

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements. Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying their system.
- ✓ Consider well relocation if Zone I threats cannot be mitigated. Please note that DEP Permit Approvals must be obtained prior to the installation of a new well.

### Training and Education:

- ✓ Train staff on proper hazardous material transport, use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Incorporate groundwater education into school curriculum

### Facilities Management:

Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/brp/dws/dwspubs.html](http://www.state.ma.us/dep/brp/dws/dwspubs.html).

### Planning:

- ✓ Work with local officials in Royalston to include the school's IWPA in **Aquifer Protection District Bylaws** and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

**For More Information:**

Contact Josephine Yemoh-Ndi in DEP's Worcester Office at (508) 792-7650 x 4030 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

Copies of this assessment have been provided to the water department and town boards.

# Source Water Assessment Program (SWAP) Report For New Boston Nursing Home

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The New Boston Nursing Home, located in the rural town of Sandisfield, is home to approximately 55 men with about 40 staff. The facility is served by an on-site septic disposal system. Well 01G is reportedly, a 174-foot deep, 6inch diameter gravel developed well, constructed in 1968. However, based on the depth of the well, it is believed that the well actually utilizes the bedrock aquifer. The safe yield was not determined at the time of construction, but the average daily water consumption at the facility is 6,500 gallons per day. The Zone I and Interim Wellhead Protection Area (IWPA) radii are 218 feet and 536 feet, respectively. The Zone I is the protected area

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. These protective radii have been calculated based on the available metered data; however, the actual recharge area to the well may be significantly larger or smaller than the IWPA.

The well is located just north of the confluence of two rivers in an area mapped as a shallow, unconfined sand and gravel deposit that parallels both the Clam River and the west branch of the Farmington River. There is no record of a confining, protective clay layer in the vicinity of the well. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The well serving the facility has chlorine (sodium hypochlorite) added as a disinfectant. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Nonconforming activities in the Zone I;**
2. **Septic System;**
3. **Low-density Housing;**
4. **Transportation Corridors; and**
5. **Improper storage of hazardous household materials.**

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Parking lots, and Transportation Corridors	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Septic System	Yes	Yes	Moderate	See septic systems brochure attached
Low density Housing	Yes	Yes	Moderate	Supply residents with BMP guidance; refer to septic system brochure
Floor Drain in boiler room	Yes	Yes	Moderate	Bring floor drains into compliance with Department regulations. Consult UIC coordinator.
Storage of household hazardous materials	Yes	Yes	Moderate	Provide secondary containment
Electrical Transformers	Yes	Yes	Moderate	Request information regarding PCB in MODF from your electric company
Nursing Home	Yes	Yes	Low	Nonconforming Zone I

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

The overall ranking of susceptibility to contamination for the well is moderate based on the presence of moderate threat land uses or activities in the Zone I and IWPA, as seen in Table 2.

**1. Nonconforming Zone I** – Currently, the water supplier does not own or control the entire Zone I area. Please note that systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. The Zone I area includes the New Boston Nursing Home, septic system leach field, a private residence, State Route 57, and parking lots for the nursing home and New Boston Inn. It was noted during the site visit that the wellhead is below grade and the cap was not a sanitary well cap.

**Recommendations:**

- ✓ Control access to the wellhead area and make every effort to acquire Zone I control or ownership.
- ✓ Replace split well cap with a watertight, sanitary seal cap and raise wellhead above grade.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or road salt within the Zone I.

**2. Septic System** -The Zone I contains components of the nursing home's septic system. The IWPA contains the septic system leach field for the entire nursing home, residences and other small businesses. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste.

**Recommendations:**

- ✓ Provide staff and area residents with information about proper maintenance and disposal practices for septic systems. Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Upgrade and maintain the facility's system as required.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.

**3. Low-density Housing** - The Zone I contains a residence with associated parking and septic tank. Potential threats from residential users are mismanagement of household waste, improper disposal of non-sanitary waste, and lack of septic system maintenance.

**Recommendations:**

- ✓ See septic system recommendations.
- ✓ Monitor roadside for spills and leaks.
- ✓ Supply residents with information about BMPs for household hazardous waste management and lawn care.

**4. Transportation Corridors** - State Routes 57 is located within the Zone I and both Routes 57 and 8 are within the IWPA. Accidental leaks, spills, and road salt are some of the possible threats associated with transportation corridors. At the time of the site visit, New Boston Nursing Home expressed concern about the most recently reported sodium level in the well water.

**Recommendations:**

- ✓ Inspect facility drainage and direct, as is feasible, road runoff away from the wellhead.
- ✓ Raise the wellhead above grade to protect against flooding.
- ✓ Continue monitoring the sodium levels in the water.
- ✓ Contact the Massachusetts Highway Department regarding

**Glossary**

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

your concerns, if the sodium concentrations in the well water increase. Request reduced winter road salting near the Zone I.

- ✓ Do not use salt deicers within the Zone I.

**5. Improper storage of hazardous household materials** – Paints, grout, deicers (calcium chloride), and other hazardous household wastes are stored within the basement of the nursing home.

#### Recommendations:

- ✓ Store in stable, enclosed cabinets with secondary containment. Items no longer used should be properly discarded during the town's hazardous waste day.
- ✓ Provide secondary containment for storage of potentially hazardous items.

Other issues noted during the site visit were the presence of electrical transformers and floor drains in the boiler room. Electrical transformers contain Mineral Oil Dielectric Fluids (MODF). Although the use of PCBs is banned in new transformers, historically, PCBs were used in some transformers. Contact the local utility to determine if the transformers contain PCBs. If PCBs are present, urge their immediate replacement. Keep the area near the transformers free of tree limbs that could endanger the transformer in a storm.

Floor drains in boiler rooms provide drainage in the event of a plumbing failure. Floor drains in areas that contain hazardous materials must be sealed or discharged to a sanitary sewer or tight tank. The discharge point of the floor drain is unknown but assumed to be the septic system. The floor drain must therefore either be sealed or protected to prevent hazardous materials from discharging through the floor drain. Do not store hazardous materials within the boiler room. The system utilizes propane for fuel. Require your boiler maintenance contractor to protect the floor drain from lubricants and spills especially during maintenance. Boiler blowdown must be disposed of off-site. Please consult the regional UIC coordinator Rick Larson at 413-755-2207. Refer to attached brochures and UIC forms.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the New Boston Nursing Home's well susceptibility to contamination. New Boston Nursing Home is commended for using propane as the fuel source. New Boston Nursing Home should review and adopt the key recommendations above and the following:

#### Priority Recommendations:

- ✓ Raise the wellhead and replace current spilt well cap with a sanitary, watertight well cap.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Remove as is feasible all non-water supply activities within the Zone I, or use BMPS.

#### Zone I:

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Prohibit public access to the well by locking facilities, and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism; check any above ground tanks for leaks, etc.
- ✓ If the facility and residents intend to continue utilizing the structures in the Zone I, use BMPs and restrict activities that could pose a threat to the water supply.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.
- ✓ Redirect road and parking lot drainage in the Zone I away from well.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

**Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations, such as at the entrance to the facility.
- ✓ Inspect drainage and ensure that stormwater runoff is directed away from the well and treated according to DEP guidance if required.

**Facilities Management:**

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, refer to <http://www.state.ma.us/dep/bwp/dhm/files/sqgsum.pdf> for the Requirements for Small Quantity Generators.
- ✓ Eliminate non-sanitary wastewater discharges to on-site septic systems. Remove hazardous materials from rooms with floor drains that drain to the ground or septic systems.
- ✓ Floor drains in areas where hazardous materials or wastes might reach them need to drain to a tight tank, be sealed, or be connected to a sanitary sewer.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.
- ✓ Septic system components should be located, inspected, maintained on a regular basis and upgraded as required.
- ✓ Wellheads should terminate above grade and have a surface sanitary seal. Concrete or earthen collars should slope away from wellhead.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

**Planning:**

- ✓ Work with local officials in Sandisfield to include the facility IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response for the Grant program (RFR). On or about May 1 the new RFR is available and the application is due back on or about June 31. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
SILVER BROOK CAFE

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

February 27, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Silver Brook Café
<i>PWS Address</i>	Route 57
<i>City/Town</i>	Sandisfield, Massachusetts
<i>PWS ID Number</i>	1260003

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1260003-01G	100	422	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1260003-01G)**

Zone I = 100 ft.  
IWPA = 422 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the IWPA. The source is considered to be under the influence of surface water and the system is required to address this issue through specific actions as detailed by the Department. The **high** susceptibility to potential non-microbial threats is based on the storage of hazardous materials such as oil within the IWPA. Other moderate threats include local roads, parking, and storage of road salt within the IWPA.

This source water assessment report is based on information provided by you on your Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Savoy Elementary School

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses in the Protection Areas
3. Protection Recommendations
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Savoy Elementary School is a small, rural school with a total student and staff population of approximately 75 people per day, located on the corner of Chapel Road and Hawley Road in the town of Savoy, Massachusetts. Savoy is a residential, recreational community situated in the Berkshire Hills in northern Berkshire County. The Town of Savoy does not have municipal water or sewer; therefore, the school operates a single public water supply well and disposes of wastewater through an on-site septic system. The school uses propane as a heating fuel and has a single aboveground

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The Zone II** The primary recharge area defined by a hydrogeologic study.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

storage tank adjacent to the school. The school well is a 6-inch diameter, 80-feet deep bedrock well that is located approximately 75 feet from the closest school building, but within 20 feet of the school parking area and 64 feet from Hawley Road. The well is located within a 3-foot diameter pit that is approximately 3-feet deep with a cement cover.

The Zone I is the protective area immediately surrounding the source and is assumed to contribute recharge to the source. The Zone I for individual wells is a circle centered on the well with a radius ranging from 100 to 400 feet based on the approved withdrawal rate from the well. An Interim Wellhead Protection Area (IWPA) is a primary recharge area designated for a groundwater source when the Zone II has not yet been delineated. The actual recharge area for a well may be significantly larger or smaller than the IWPA. The Zone I and IWPA protective radii for Well #1 are 100 feet and 407 feet, respectively and was originally based on the estimated daily water use from Title 5 flow estimates. Current metered water use data confirms that the average daily water use is approximately 380 gallons per day. The school was recently expanded and replaced the septic system leachfield; the addition and the leachfield are within the IWPA but outside of the Zone I.

Geologic mapping and field observations indicate the school is located in the Berkshire uplands with thin till overburden covering the bedrock. The bedrock is mapped as schist of the Rowe-Hawley Zone. The bedrock is a complex series of folds and faults with bedrock mapped as various metamorphic rock types. There is no evidence of a continuous confining, clay layer or a thick till layer in the immediate vicinity of the well. Wells located in these conditions are considered to be located in aquifers with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from activities on the ground surface. Please refer to the attached map of the Zone I and IWPA.

The water from the well is treated through a limestone contactor to raise the pH for corrosion control prior to distribution. In addition, a review of water quality data shows sodium levels increasing from 22 mg/L in 1995 to 74 mg/L in 2001. There is no drinking water standard for sodium, however, the DEP does have a guideline of 20 mg/l for sodium. The DEP requires public water suppliers to regularly monitor the quality of the water. For current information on monitoring results and treatment, please refer questions to the Public Water System contact person listed above in Table 1 for the most recent information. Drinking water monitoring reporting data is also available at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html), the EPA's website for Envirofacts.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-	-	Contact DEP prior to conducting any work in Zone I or expanding the system.
Septic system components	Yes	Yes	Moderate	Maintain septic systems.
Transportation corridors and school parking	Yes	Yes	Moderate	Control the use of deicers and coordinate with emergency response personnel. Monitor for leaks and spills near the well.
School	Yes	Yes	Moderate	Use BMPs for school facilities.
Residential	No	Yes	Moderate	Provide information on BMPs.
Horse farm/hay fields	No	Yes	Moderate	Manure management, fertilizers/pesticides, and petroleum products.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

## 2. Discussion of Land Uses in the Protection Areas

There are some land uses and activities within the drinking water supply protection areas that are potential sources of contamination. Although most of the agricultural activities are outside of the Zone I and IWPA, because the IWPA is not a scientifically determined recharge area, the DEP often identifies activities that are near the source.

### Key issues include:

1. **Non-conforming Zone I;**
2. **School;**
3. **Residential;**
4. **Transportation corridor/parking; and**
5. **Agricultural activities.**

The overall ranking of susceptibility to contamination for the system is moderate, based on the presence of at least one moderate threat land use or activity in the protection areas of the well, as seen in Table 2.

**1. Non-conforming Zone I** – Well #1 has a non-conforming Zone I with respect to ownership and activities within the Zone I. There is a play structure within the Zone I of Well #1, however, the DEP may allow some passive recreation and other non-threatening activities within the Zone I. There are also non-conforming activities in the Zone I such as parking. The school is commended for recently installing a berm around the parking area to prevent runoff from the parking area to flow toward the well.

### Recommendations:

- ✓ Continue to work toward prohibiting/limiting activities in close proximity to the well and using BMPs to protect the water supplies.
- ✓ Do not allow any additional non-conforming activities within Zone I. Inspect the well cap and pit regularly to ensure the security of the pit, and that there is no standing water in the pit. Replace the split cap with a sanitary, watertight cap that is secure.
- ✓ Although historically this has not been a problem, if at any time, water is evident in the pit, consider raising up the well casing to above grade with a sanitary seal sloping away from the casing to prevent the potential for water ponding at the well casing.
- ✓ Monitor the runoff from the parking area and roadways to ensure there is no runoff directed toward the well.

**2. School and residential use** – The school facilities and portions of residential properties are within the Zone I and IWPA of the well. Elementary schools generally use only household hazardous materials and the recommendations for small schools are similar to those for residents. In addition, there are state and federal controls on some activities and products used at schools to promote “healthy schools”. All of the school’s facilities are located within the IWPA of the well. Potential exists for contamination of the well by on-site use of cleaning materials, petroleum from lawn equipment, fertilizers, and pesticides. If managed improperly, activities associated with residences and the school can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, petroleum products for home equipment and lawn maintenance equipment and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they could be a potential source of microbial contamination.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

Copies of this assessment have been made available to the public water supplier and town boards.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** - Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at the following MADEP website <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

#### School and Residential Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and online at [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), the MA DEP website which provides BMPs for common residential issues.
- ✓ Continue the use and maintenance of BMPs for activities within close proximity to the well.
- ✓ Continue to prohibit the use pesticides or fertilizers within the Zone I of the well. Consider the use of Integrated Pest Management to minimize the use of pesticides and nutrients in fertilizers.
- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields across the street. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- ✓ Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Review your emergency response plan regarding accidental releases within the area. Ensuring that emergency responders in town are aware of the locations of your resource areas.
- ✓ Refer to the Massachusetts Public Health Association's Healthy Schools website for additional information at: [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html)
- ✓ Prepare a policy and a plan for maintenance operations regarding the boiler. DEP recommends that you require your boiler maintenance contractor use containment and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.

**6. Transportation corridor and parking** – The parking areas for the school and a portion of Chapel Road and Hawley Road are within the Zone I of the well. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets.

#### Recommendations:

- ✓ Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they are aware of the location of your well.
- ✓ Notify the Town Highway Department of your well and inform them of the elevated sodium levels. Review the stormwater management near the well with the Highway Department and work to ensure runoff is directed away from the well.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the source's susceptibility to contamination. The Savoy Elementary School is commended for utilizing propane as a fuel source, expanding the school away from and outside of the Zone I and for installing a berm around the parking area to prevent runoff from flowing toward the well. The DEP encourages continued diligence in monitoring activities within and near protection areas. The water supplier should review and adopt the key recommendations above. Consider contacting the agricultural property landowner just to make them aware of your water supply and to encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies.

Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Call the local office of the NRCS in Pittsfield at 413-443-6867 ext. 3 for assistance and review the fact sheet available online at the following NRCS website: <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>. This may be appropriate for the Savoy Highway Department. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources regarding hobby farmers' BMPs.

#### **Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the program fact sheet. If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Source Water Assessment Program (SWAP) Report For Berkshire School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
February 11, 2002

**Table 1: Public Water System (PWS) Information**

Well #3	1267001-03G	360	1600	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Berkshire School is a private boarding school for grades 9-12, located in the rural community of Sheffield served by on-site water supply and septic disposal. Sources 01G and 01S are physically disconnected from the system, designated as emergency sources and therefore, not addressed in this report. Well 02G is a 255-foot deep, 6-inch diameter well, with 88 feet of casing. The Department approved well 02G in August 1991, allowing for the asphalt tennis court within the Zone I with the stipulation that no activities would be added or expanded within the Zone I. The approved safe yield of this source is 34.5 gallons per minute with a maximum daily withdrawal of 49,700 gallons. The Zone I and Interim Wellhead Protection Area (IWPA) radii are 352 feet and 1464 feet, respectively. The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA.

The final construction and approval of Well 03G has recently been completed. This 8-inch diameter, 700-foot deep bedrock well was approved by the Department through the New Source Approval Process for a total maximum daily withdrawal rate of 54,000 gallons per day, or 37.5 gallons per minute. This source has a Zone I radius of 360 feet and an IWPA radius of 1600 feet.

USGS maps the bedrock within the area as quartz-mica schist. The overburden is a relatively thin layer of till. There is no record of a confining, protective clay layer in the vicinity of the well. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The well serving the facility has no treatment at this time. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Underground Storage Tanks;**
2. **Above-ground Storage Tanks;**
3. **Floor Drains in Boiler Rooms; and**
4. **Septic System.**

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
School	No	Both wells	Moderate	School facilities with in IWPA
Septic System	No	Both wells	Moderate	See Septic System Brochure
Underground Storage Tanks	No	Both wells	High	Multiple tanks, mostly new with alarm systems; monitor for leaks, overfills
Above-Ground Storage Tanks	No	Both wells	Moderate	Multiple tanks; monitor for leaks, cracks, overfills
Floor Drains in Boiler Rooms	No	Both wells	Moderate	See UIC brochure
Parking lots, Internal Transportation Corridors	No	Both wells	Moderate	Limit road salt usage and provide drainage away from wells
Catch basins	No	Both wells	Low	Non-water supply structures in Zone I
Passive Recreation (Tennis Courts)	Well #2	Both wells	Low	Approved within Zone I at time of well approval; prohibit pesticide/herbicide use

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

The overall ranking of susceptibility to contamination for wells 2 and 3 is high, based on the presence of one or more high ranking land use or activity in the Zone I and IWPA, as seen in Table 2.

**1. Underground Storage Tank (UST)** – There are five USTs located within IWPA, with a capacity of 10,000 gallons of fuel oil each. All tanks except one have been replaced and are now double-walled with alarm monitoring. Well #3 is topographically approximately 800 to 850 feet upgradient from the nearest UST or AST. Well #2 is approximately 450 feet, topographically upgradient of the tanks.

**Recommendation:**

✓ USTs in close proximity to the water supply should be closely monitored especially during deliveries. Any upgrades and modification must meet current construction standards and be done consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.

**2. Above-ground Storage Tanks (ASTs)** -- There are nine ASTs containing heating oil and propane located throughout the IWPA of both wells. If managed improperly, ASTs can be a potential source of contamination due to leaks or spills of the chemicals they store.

**Recommendations:**

✓ Aboveground storage tanks in your IWPA should be located on an impermeable surface and contained in an area large enough to hold 110% of the liquid volume, should a spill occur.

✓ Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices. Any modifications to the AST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs.

**3. Floor Drains in Boiler Rooms** -- A floor drain is located in the boiler room, which discharges into the septic system. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system. The floor drain must be sealed, connected to a tight tank or as a last resort, protected to guarantee that boiler blow down, oil or other prohibited discharges cannot enter the floor drain.

**Recommendations:**

✓ Bring the floor drains into compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached). Contact the UIC program for the Western Region

Office of the Department (Rick Larson 413-755-2207 or Tony Zaharias 413-755-2122) for assistance.

✓ Interim Actions: cease using the floor drains.

✓ If you wish to retain the drain, install a tight tank and connect the boiler room floor drains to the tank.

✓ Require a policy and plan for maintenance operations, especially when oil filters are changed. We recommend that you require your boiler maintenance contractor to use containment and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.

**4. Septic System** – The facility is served by a 40, 000-gallon septic tank and a 30,000-gallon septic tank. Although the septic system and leach field for the facility are located outside of the Zone I and are topographically down gradient from the well, they are within the IWPA of the well. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste. The school is currently evaluating how laboratory wastes are treated and disposed; a tight tank will be installed if required.

**Glossary**

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

### Recommendations:

- ✓ Install a tight tank for science laboratory wastes as soon as possible.
- ✓ Provide staff and area residents with information about proper maintenance and disposal practices for septic systems. Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Upgrade and maintain the facility's system as required.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.
- ✓ Eliminate all non-sanitary waste disposal from the septic system.

Other potential threats to the wells within the IWPA's noted during our visit were parking lots, internal transportation corridors, and catch basins. Vehicles parking within the protective areas pose a risk of release of petroleum products to the aquifer from leaks, accidents or road maintenance. Use minimal road salts and deicers within the protective areas, and monitor the parking lot and roadside for spills and leaks.

Catch basins transport storm water from the roadway and adjacent properties to the ground. As flowing storm water travels, it picks up debris and contaminants from streets, parking areas and lawns. Common potential contaminants include lawn chemicals, pet waste, leakage from dumpsters, household hazardous waste, and contaminants from vehicle leaks, maintenance, washing or accidents. Direct stormwater drain outflows away from the Zone I and IWPA. Work with the Town to have the catch basins inspected, maintained, and cleaned on a regular schedule. Additionally, street and parking lot sweeping reduces the amount of potential contaminants in storm runoff.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Berkshire School is commended for replacing underground fuel oil storage tanks and electrical transformers, and for evaluating the need for a tight tank on the chemistry lab drains. Berkshire School should review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Address floor drain issues.
- ✓ Install a sanitary cap on the emergency wellhead.
- ✓ Comply with the wastewater disposal requirements.

### Zone I:

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Prohibit public access to the well and pumphouse by locking facilities, gating access roads, and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any above ground tanks for leaks, etc.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Upgrade to propane or natural gas for back-up power sources.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Incorporate groundwater education into school curriculum (K-6 and 7-12 curricula available; contact DEP for copies).
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

### **Facilities Management:**

- ✓ Berkshire School is a registered Small Quantity Generator of Hazardous Waste. Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, refer to <http://www.state.ma.us/dep/bwp/dhm/files/sqgsum.pdf> for the Requirements for Small Quantity Generators.
- ✓ Eliminate non-sanitary wastewater discharges to on-site septic systems. Instead, in areas using hazardous materials such as science labs, discharge drains to a tight tank or sanitary sewer.
- ✓ Bring the floor drain into compliance with DEP Regulations (refer to attachment “Industrial Floor Drain Brochure”).
- ✓ Floor drains in areas where hazardous materials or wastes might reach them need to drain to a tight tank, be sealed, or be connected to a sanitary sewer.
- ✓ Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ Concrete pads should slope away from well and well casing should extend above ground.

### **Planning:**

- ✓ Work with local officials in Sheffield to include the Berkshire School’s IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Funding:**

The Department’s Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response for the Grant program (RFR). On or about May 1 the new RFR is available and the application is due back on or about June 31. Other funding opportunities are described in “Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation” at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## **4. Attachments**

- Map of the Public Water Supply (PWS) Protection Area.
- Recommended Source Protection Measures Fact Sheet
- Your Septic System Brochure
- Pesticide Use Fact Sheet
- Industrial Floor Drains Brochure
- Healthy Schools Fact Sheet
- Wellhead Protection Grant Program Fact Sheet
- Source Protection Sign Order Form

# Source Water Assessment Program (SWAP) Report for Mount Everett School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
June 18, 2001

## INTRODUCTION

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. DESCRIPTION OF THE WATER SYSTEM

Mount Everett School has a total staff and student population of approximately 1,085 people and is located in a rural setting surrounded primarily by woodland, wetland, and rural residential land uses. The school is a regional Elementary, Middle and High School and Well #1 is the sole source of water for the school. The well is located within the old, abandoned boiler room. During the reconstruction and expansion of the school in 1991, several attempts were made to drill a new well for the school. Insufficient yield from the wells resulted in utilization of the old well and removal of the boiler and all other peripheral equipment and piping from the room. In addition, the old underground oil storage tanks (UST) were removed and replaced outside of the Zone I protective radius of the well.

The Zone I protective radius for Well #1 is 328 feet and the Interim Wellhead Protection

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are may not be identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Area (IWPA) radius is 1,136 feet. The Zone I and IWPA protective radii are based on an approved pumping rate of 33,120 gallons per day established through a 1991 pumping test and estimated maximum future water demands. Please refer to the attached map that shows the Zone I and IWPA.

Well #1 is a 6-inch diameter well drilled to a depth of 205 feet in the late 1950's. The well has a watertight cap and is finished above grade, in a room with a concrete floor; there is no information regarding a deep sanitary seal around the casing. No drilling records are available for the well other than the steel well casing was driven 35 feet, where bedrock was encountered. There is no description of the overburden material from the driller's log. Borings in the vicinity of the well report the overburden ranges from fine sand and silt to clay with thickness ranging from 17 feet to greater than 35 feet to bedrock. Bedrock mapping of the area and driller's logs from the 1991 drilling efforts indicate the bedrock is a carbonate rock of the Stockbridge Formation consisting primarily of dolomite and marble. Bedrock wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant, continuous hydrologic barrier to contaminant migration.

### Water Quality

At the time this report was prepared, the Mount Everett School well water does not require and does not have treatment. The DEP requires public water suppliers to monitor the quality of the water. For current monitoring results, please refer questions to the local contact identified in Table 1.

## 2. DISCUSSION OF LAND USES IN THE PROTECTION AREAS

The existing well does not meet DEP's Zone I restrictions, which only allow water supply related activities in Zone Is. There are numerous non-conforming activities within the Zone I and IWPA. The overall susceptibility ranking of the well to contamination is high, based on the proximity of the former oil tank site and the presence of numerous moderate threat land uses or activities in the IWPA. The school's current operator is diligent in monitoring activities that may pose a threat to the school's water supply. Please refer to Table 2 for a list of activities within the protection areas.

### Key issues include:

1. **Activities within Zone I**
2. **Confirmed Release of Hazardous Materials Site**
3. **Septic System Components**

**Table 2: Activities within the Water Supply Protection Areas**

Potential Sources of Contamination*	Zone I	IWPA	Threat	Comments
Underground Storage Tank (UST)	No	Yes	High	UST is double lined, tank with interstitial monitoring
Confirmed Oil Release Site (UST)	Yes	No	**	RTN # 1-0001015 - Tier 2 – Oil release
School	Yes	Yes	Moderate	All of the school's facilities are within the Zone I or IWPA
Septic System components	Yes	Yes	Moderate	Septic tank in Zone I, Groundwater Discharge (permitted) in IWPA

\* For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

\*\* For more information on an individual site in the MCP or an updated status, please contact the WERO BWSC - 413-784-1100.

**Table 2: Activities within the Water Supply Protection Areas (continued)**

Potential Sources of Contamination	Zone I	IWPA	Threat	Comments
Parking and storm drains	Yes	Yes	Low	Monitor for spills and maintain catchbasins
Passive Recreation	No	Yes	Low	Athletic fields pose minimal threat provided pesticides are not used on fields. Continue policy of no fertilizer or pesticide usage.
Above Ground storage tank (AST)	No	Yes	Low	Propane storage is a minimal threat to groundwater
Utility Transformer	No	Yes	Low	Although PCBs are not likely present, MODF is present in transformers
Low Density Residential Use Septic systems and lawn care	No	Yes	Moderate	See Fact Sheets for septic and lawn care

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**1. Zone I Activities** - The well's Zone I contains school buildings, parking areas, and school playground.

**Recommendation:**

- ✓ Since it is not feasible to remove all non-water supply activities from Zone I to comply with DEP's Zone I requirements, please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system. Monitor all existing activities, use Best Management Practices for maintenance work and prevent any new activities within Zone I.

**2. Confirmed Oil Release Site** - Presence of Oil Contamination Sites within the Zone I - The Zone I for Well #1 contains a DEP Tier II Classified Oil and/or Hazardous Material Release Site indicated on the map as Release Tracking Number 10001015. The release was discovered during the removal of the old oil tank that had been located near the old boiler room. The drinking water

program at the time required additional monitoring of the water quality. For information regarding the location of the site refer to the attached map. Appendix I includes additional information regarding the Massachusetts Contingency Plan (MCP) and where additional information is available.

**Recommendation:**

- ✓ Comply with the requirements of the MCP process and continue monitoring as appropriate.

**3. Septic System Components** - The holding tank is located within the Zone I of the well. However, boring logs indicate clay, in the immediate vicinity of the tank on the order of 20 to 30 feet in thickness, thereby minimizing the potential for contaminant migration to the aquifer in the event of a leak. The wastewater is treated in a small on-site secondary treatment system and discharged to a system permitted through a Groundwater Discharge Permit. Requests for additional information can be made through the WERO DEP Wastewater Program. The school does not have a tight tank to capture science laboratory and art laboratory wastewater. The science laboratory sinks reportedly are equipped with limestone traps to neutralize acids, however, these would not neutralize bases or remove any other constituents that may impact the RBC or groundwater quality. The wastewater Title 5 system has a groundwater discharge permit with water quality limits. The recharge area is on the perimeter of the IWPA, topographically downgradient from the well.

**Recommendations:**

- ✓ Establish a hazardous material handling/hazardous waste disposal procedure and policy for the teachers and include maintenance staff. The arts and science programs must control the disposal of any constituents that may be considered

Figure 1: Example of how a well could become contaminated by different land uses and activities.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

hazardous. Title 5 regulations prohibit the disposal of any non-sanitary waste to the sanitary waste disposal system. Title 5 regulations prohibit the disposal of non-sanitary waste to the sanitary waste disposal system; a tight tank or municipal sewers are used for disposal of non-sanitary waste. The school does not have a municipal sewer system near enough to connect to. Contact the Western regional office of DEP to speak with Paul Nietupski of the wastewater management program at 413-755-2118 and your local Board of Health to discuss this option.

- ✓ The school is currently not registered as a generator of hazardous waste. Review the enclosed documents "A Summary of Requirements for Small Quantity Generators of Hazardous Waste" and a fact sheet for Very Small Quantity Generators to determine your status and regulatory requirements. Contact the Massachusetts Office of Technical Assistance at 617-626-1061 regarding proper hazardous material use, storage, disposal, emergency response, and best management practices. Arrange to have potentially hazardous materials disposal available for the school staff, including the custodial staff, either through the Town's hazardous waste collection days or through other means. It is likely that the school will have to register as a Very Small Generator of Hazardous Waste to dispose of small quantities of hazardous materials. Include custodial staff, groundskeepers, certified operator, and food preparation staff in the training.

Other land uses and activities noted within the protective areas are an underground heating oil storage tank, parking areas, passive recreation and residential homes. The fuel oil tank was installed in compliance with regulations in place in 1991. Paved parking areas with drainage utilizing BMPs and discharging away from the well, pose minimal threat to water quality. Storm drains and catch basins, must however, be maintained to ensure protectiveness.

Implementing the recommendations below will reduce the system's susceptibility to contamination.

## 3. PROTECTION RECOMMENDATIONS

The MA DEP encourages limiting the activities near the wells and continued diligence in updating your protection measures. The Mount Everett School and District should review and adopt the following recommendations at the facility:

### Zone I:

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Erect water supply protection signs along the perimeter of the protection areas
- ✓ Consider once again investigating an alternative water source if existing threats cannot be mitigated.
- ✓ Comply with the MCP regarding the existing release site.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism; check for leaks and accidental spills, etc.
- ✓ Maintain storm drains that direct road and parking lot drainage away from well, as feasible.
- ✓ Continue the current practice of not using pesticides, fertilizers within the Zone I. Minimize the use of road salt as practical.

### Facilities Management:

- ✓ Establish a written plan for the science and art departments for the management of materials used in class and the proper storage and disposal of potentially harmful materials. These types of materials are primarily used in the senior high school science

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the water supplier, town boards, the town library and the local media.

labs and the arts department. Contact the Massachusetts Office of Technical Assistance at 617-626-1061 regarding proper hazardous material use, storage, disposal, emergency response, and best management practices.

- ✓ Post sinks as appropriate with a reminder to students and staff that only sanitary waste is disposed of in the sinks.
- ✓ Contact the local BOH and the DEP regarding a tight tank to dispose of senior high science and art lab waste.
- ✓ If you do not have a storm water maintenance plan, develop one. Maintenance plans should include an inspection and maintenance schedule. Inlets should be cleaned out a minimum one time per year and inspected quarterly. The outfall should be inspected annually for structural integrity and determine if it needs to be cleaned. Catch basin cleanings are classified as a solid waste and must be handled and disposed of in accordance with all DEP regulations, policies and guidance.

### **Planning:**

- ✓ Work with local officials in town to include the facility IWPA in the Aquifer Protection District Bylaws.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## **4. ATTACHMENTS**

- Map of the Public Water Supply (PWS) Protection Area
- Recommended Source Protection Measures Fact Sheet
- Your Septic System Brochure
- Very Small Quantity Generator of Hazardous Waste Fact Sheet
- Site/Reportable Release Lookup – Table from DEP BWSC Website - Sheffield

## **5. APPENDICES**

- APPENDIX 1 – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas

## **APPENDIX 1 – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas – Bureau of Waste Site Cleanup**

DEP's data layer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitellst.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1: Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)**

<b>RTN</b>	<b>Release Site Address</b>	<b>Classification</b>	<b>Town</b>	<b>Contaminant Type</b>
1-001015	Mount Everett School	Tier II	Sheffield	Oil

For more location information, please see the attached map. The map lists the release sites by RTN.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
SHEAS PINE TREE INN

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 13, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Sheas Pine Tree Inn
<i>PWS Address</i>	1375 North Main St
<i>City/Town</i>	Sheffield, Massachusetts
<i>PWS ID Number</i>	1267006

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1267006-01G	118	429	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1267006-01G)**

Zone I = 118 ft.  
IWPA = 429 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and parking areas within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For The Options Institute & Fellowship

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
February 23, 2004

Well #3	1267008-03G	301	889	Moderate
Well #4	1267008-04G	116	428	Moderate
Well #5	1267008-05G	131	436	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Options Institute & Fellowship (Options) is located on South Undermountain Road in the town of Sheffield in southwestern Massachusetts and Salisbury, Connecticut. The facility is located on approximately 95 acres of land. The main Options facility is a treatment and training center founded in 1983 for adults to develop self-direction and

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

empowerment. The facility also includes the Autism Treatment Center of America for autistic children and adults on an adjacent property east of Route 41. Sheffield is a small rural residential community that has a public water system, however the system does not serve the area where Options is located. There is no municipal wastewater treatment facility in Sheffield. Options is therefore served by on-site water supply wells and wastewater is discharged to a common septic system for the main complex and a small septic system at the Son-Rise building.

The facility's population fluctuates but has the capacity for 50 staff and over 55 clients per day. Visitors and volunteer staff may attend the institute for one week to eight weeks. The facilities include the main house, several residential and teaching facilities, a fitness center, a cafeteria and maintenance facilities.

The facility maintains five wells on site. Water is supplied to the various facilities by three sources: Wells #3 (03G), #4 (04G) and #5 (05G). Wells #1 (01G) and #2 (02G) are located in the front yard adjacent to the Main House but those two wells are severed from the system, designated as emergency wells and are currently used only for irrigation. Emergency wells will not be further addressed in this report. Well #3 was approved in 1991 to replace Wells #1 and #2 as part of an expansion of the facility. Well #3 was permitted by the DEP through the New Source Approval Process and was installed and tested in accordance with current regulations. Well #3 is a 435-foot deep bedrock well located approximately 300 feet from the Mountain House cafeteria and two new residential/classroom buildings. Well #3 provides water for the Main House, the Mountain House, the two new mountainside facilities, the Ice House, the Boat House, and the Options House. Well #4 is a 6-inch diameter well drilled into the bedrock aquifer located at the Son-Rise building on the east side of Route 41. The Son-Rise building houses the staff and clients for the Autism Treatment Center for America. The facility has two units for clients and facilities for day staff and clients. There is no information regarding the depth or construction of the well. Well #5 (05G) is a 6-inch diameter well located south of the Connecticut state line that is located immediately adjacent to (within 20 feet of) the Staff House. Well #5 is newly registered as a public water supply well and there is no information regarding the depth or construction of the well. The well serves the administration building (the Lama Barn) and three residential buildings (the Staff House, the Ravine House and the Woodland House). One underground fuel oil storage tank was observed approximately 100 feet from the well at the Staff House and according to Options staff, each of the resident halls served by Well #5 has a UST for fuel oil.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	04G and 05G	-	-	Contact DEP prior to conducting any work within Zone I or expanding facilities.
Transportation corridors/parking	04G and 05G	All	Moderate	Manage stormwater and limit road salt usage.
Underground storage tank (fuel oil)	05G	05G	High	Use BMPs for fuel oil storage and delivery. Upgrade or convert to propane as is feasible.
Aboveground storage tank (fuel oil)	04G	All	Moderate	Use BMPS for fuel oil storage and delivery.
Institutional uses	05G	All	Moderate	Provide BMPs for household hazardous waste management. Use IPM for lawn maintenance.
Septic system components	05G	All	Moderate	The leachfield and some components are within the protection areas.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

The Zone I is the area immediately around the wellhead while the Interim Wellhead Protection Area (IWPA) is a larger area that likely contributes water to the well. The Zone I area is the most protected area and DEP regulations allow only water supply related activities or other non-threatening activities within the Zone I. The IWPA is only an interim protection area; the actual area of contribution to the wells may be smaller or much larger than the IWPA. The Zone I and IWPA radii for the facility's wells are as follows: Well #3 – Zone I is 301 feet and IWPA is 889 feet based on an approved withdrawal rate of 22,000 gpd; Well #4 – Zone I is 116 feet and IWPA is 428 feet based on Title 5 flow estimates from the building usage. The Zone I and IWPA for the newly registered Well #5 are 131 and 436 feet based on an estimated Title 5 flow of 1,600 gallons per day from the well. These protection areas may be adjusted to be larger or smaller based on actual metered water use once that information becomes available. Please refer to the attached map that shows the Zone I and IWPA radii.

The complex is located in an area where geologic mapping indicates thin till overburden covering the bedrock. However, the well log for Well #3 indicates 161 feet of casing set 74 feet into bedrock. The driller's log indicates 5 feet of "dirt", 86 feet of "hardpan" (till) and 34 feet of "decayed" rock. The geologic mapping of the area indicates a bedrock contact at the site indicating the bedrock at Well #3's location as quartzose argillite of the Mount Everett Formation with the bedrock at the location of Well #4 and #5 mapped as marble of the Stockbridge Formation. Water from wells #3 and #4 is treated through a softener prior to use and water from Well #3 passes through an ultraviolet lamp prior to distribution because of historical detections of bacteria when the well was first installed. There is no evidence of an extensive protective till or clay layer in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

Public water suppliers are required to regularly monitor water quality from all sources at the facility. For current information on monitoring results, please refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

There are land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

Key issues include:

1. Non-conforming Zone I;
2. Institutional use;
3. Transportation corridors/parking;
4. Underground/Aboveground storage tanks; and
5. Hazardous materials storage and use.

The overall ranking of susceptibility to contamination for the well is high based on the presence of high threat land uses or activities in the Zone I of Well #5 as seen in Table 2. However, the main well for the facility (Well #3) is conforming with respect to DEP regulations and has a moderate threat ranking based on moderate threat land uses within the IWPA of the well. There are several moderate threat land uses and activities in the Zone I and IWPA of Well #4.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

**1. Non-conforming Zone I** – The water supplier does not own the entire Zone I area for Well #4 and although it does own the Zone I for Well #5, there are numerous activities within the Zone I that are non-conforming. Facility components include fuel storage, transformers, buildings, sewer lines, and parking are within the Zone I of wells #4 and #5. Systems not meeting DEP Zone I requirements for ownership or control or that have non-conforming activities within Zone I must receive DEP approval and address Zone I issues prior to increasing water use or modifying systems/facilities.

#### Zone I Recommendations:

- ✓ Prohibit any non-water supply activities within Zone I and, where feasible, remove non-conforming activities within the Zone I areas.
- ✓ Do not use or store pesticides or fertilizers in Zone I.
- ✓ Inspect the wells regularly to ensure the cap is secure, there is no standing water near the wells and that runoff cannot infiltrate around the well casings.
- ✓ Relocate the wells if they cannot be secured or if water quality is impaired by activities near the wells.
- ✓ Monitor all activities associated with petroleum products within the Zone Is and replace USTs as feasible or appropriate.

**2. Institutional use** – The Options Institute consists of land uses that are common to high-density residential uses. The facility utilizes on-site septic disposal systems and some components are within the Zone I and/or IWPA of one or more of the sources. The facility utilizes both propane and fuel oil for heating with both ASTs and USTs used. At least one fuel oil UST is within the Zone I of Well #5. Although the facility is not a registered hazardous waste generator, the maintenance staff utilizes and stores small quantities of household hazardous materials, e.g. stains, paints and cleaning materials. If managed improperly, activities associated with institutional uses can contribute to drinking water contamination. Stormwater drainage, roadway drainage and parking areas all pose a potential threat to the water supplies if accidental release of petroleum products occurs. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they could be a potential source of microbial contamination.
- **Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their associated piping can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Institutional Land Use Recommendations:

- ✓ Promote BMPs for stormwater management and pollution controls. Monitor all activities associated with the petroleum products, especially delivery.
- ✓ Have spill containment/absorbent materials available on-site
- ✓ The facility utilizes fuel oil as well as propane for a heating source. Containment of the fuel system to prevent accidental releases to the basements and ground should be reviewed in the buildings. Fuel tanks should be within containment to protect floor drains, cracked floors or walls that could act as conduits if fuel oil leaks or is spilled from the storage tanks. Contact the regional DEP staff from the UIC program (Rick Larson 413-755-2207) for advice regarding protecting any

floor drains or potential conduits to the ground. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. DEP recommends that you require your boiler maintenance contractor use containment, protect any drains and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.

- V Continue the use of Best Management Practices for all activities at the facility. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- V Investigate Integrated Pest Management and Best Management Practices within the Zone I and IWPA.
- V Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- V Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides or fertilizers within Zone I.
- V Review your emergency response plan regarding accidental releases within the protection areas. Ensure that emergency responders in town are aware of the locations of your resource areas.

**3. Transportation corridor/parking** – The facility’s internal corridors and South Undermountain Road are within the protection areas. Accidents and normal use and maintenance of corridors and parking areas may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills, as well as, waste from wildlife and pets.

**Recommendations:**

- V Prepare an Emergency Response Plan that includes coordination among town emergency responders to be sure they area aware of the location of your well and the protection areas.

**4. Underground/Aboveground petroleum storage tanks** – According to Options’ staff, there are at least two underground fuel oil tanks and several aboveground tanks within the protection areas of Wells #4 and #5. If managed improperly, fuel oil tanks and their associated piping can be a potential source of contamination due to leaks or spills of the materials they store.

**Recommendation:**

- V Replace older USTs with propane as is feasible or upgrade tanks in accordance with applicable regulations for storage tanks. Any modifications to the tanks must be accomplished in a manner consistent with Massachusetts’s plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs and USTs. For those tanks that are located within the State of Connecticut contact officials in Connecticut to determine appropriate regulatory requirements.
- V Monitor all activities associated with the petroleum products, especially delivery.
- V Provide containment for the tanks and sleeve the fuel lines.
- V Have spill containment/absorbent materials available on-site.
- V Seal all cracks in the floor and any floor drains if they cannot be adequately protected to prevent a prohibited discharge.

**5. Hazardous Materials storage and use** – The facility utilizes hazardous materials for maintenance. The floor drains in the maintenance building were sealed at the time of the assessment and there is no water to the building and therefore no wastewater disposal. Hazardous materials such as paint, thinners, petroleum products, etc. should be kept in containment and used with caution. Cleaning and disposal should not be through any septic system on the site. Spill kits and signs designating areas of storage should be available. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, or floor drain leading directly to the ground. Review the attached fact sheet for additional information regarding the thresholds for triggering a very small quantity hazardous waste generator.

**Hazardous Materials Storage and Use Recommendations:**

- V Continue current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.
- V Continue to use BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.
- V Ensure that management plans are up to date and staff review BMPs for the handling of hazardous materials.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Review and adopt the key recommendations above and the following:

#### **Zone I:**

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Replace the well cap on Well #5 and prevent runoff from infiltrating around Well #3.
- ✓ Remove or upgrade fuel oil USTs as feasible.

#### **Facilities Management:**

- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.
- ✓ Educate the staff and control the use of hazardous materials in the Zone I.
- ✓ Continue to minimize the use of fertilizers and pesticides.
- ✓ Monitor fuel oil delivery and use to prevent releases.

#### **Planning:**

- ✓ Work with your community to develop and include your IWPAs in an aquifer protection district along with other public water supplies in town.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Continue long term planning for the system that includes maintenance of the water and wastewater systems.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

Well #2	02G	190	487	High

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? inventory land uses within the recharge areas of all public water supply sources;
- ? assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? publicize the results to provide support for improved protection.

#### Maintaining Your Good Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## INTRODUCTION

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Massachusetts Department of Environmental Protection (MA DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. DESCRIPTION OF THE WATER SYSTEM

The Custom Extrusion Inc. (CEI) manufacturing facility, has been in business since 1957, employs approximately 45 people, and produces custom-made rigid thermo-plastic parts and forms. CEI manufactures its own metal dies, can run up to seven extrusion lines and supply specialized product finishing. The facility consists of approximately 50% manufacturing and finishing and 50% storage and warehousing. The two water supply wells, the primary well, Well #1 and the auxiliary well, Well #2, are located approximately 10 feet from the southeast side of the main building and approximately 25 feet from the southwest corner of the main building, respectively. Both wells have a Zone I of 190 feet and an Interim Wellhead Protection Area (IWPA) of 487 feet. The

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Zone I and IWPA protective radii were calculated utilizing historical metered water use data submitted by CEI.

Both wells have their casing extending above grade and are 6inch diameter bedrock wells drilled into a carbonate formation consisting generally of dolomite and marble. The generalized geologic map of the area indicates fairly complex folding and faulting of the bedrock with several geologic contacts in the immediate vicinity of the site. Well #1 was drilled in 1988 and is reportedly 450 feet deep with an estimated yield of 50 gpm; well #2 was drilled in 1957 and is 165 feet deep and does not have a yield estimate. Bedrock is relatively shallow in the immediate vicinity of the facility and therefore the aquifer has a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from surface spills. Although Well #1 is in close proximity to the parking areas and the process buildings, it is utilized as the primary well because it has fewer potential contamination sources proximal (within the Zone I) to the well and supplies adequate yield for the facility's needs. Well #2 reportedly has limited yield and is immediately adjacent to an abandoned dry well, a 10,000 fuel oil underground storage tank and a sanitary waste (septic) system that is scheduled to be abandoned and replaced outside of the Zone I. Please refer to the attached map of the Zone I and IWPA.

The water currently does not require treatment and is not treated. For current information on monitoring results, please contact Mr. Franklin Kellogg from CEI at the number listed above.

### Current Status

The CEI facility is currently in compliance with and proceeding under a mutually agreed upon Administrative Consent Order to bring all wastewater and other water discharges into compliance with appropriate regulations. CEI has made commendable progress in eliminating uncontrolled discharges of water to the environment through floor drains, dry wells and several septic systems. Sampling of the soil and groundwater at those former water disposal sites show no indication of contamination at the facility.

## 2. DISCUSSION OF LAND USES IN THE PROTECTION AREAS

There are a number of land uses and activities within the drinking water supply protection areas for CEI's water supplies that are potential sources of contamination. The overall ranking of susceptibility to contamination for the wells is high, based on the

presence of at least one high threat land use or activity in the Zone Is, as seen in Table 2.

### Key issues include:

1. Nonconforming Zone Is;
2. Storage, Use and Generation of Hazardous Materials in the Zone I and IWPA
3. Underground Storage Tank (UST) for Heating Oil
4. Roadways

**1. Zone Is** - Currently, neither Well 1 nor 2 meet DEP's restrictions, that allow only water supply related activities in Zone I. The Zone Is for Wells 1 and 2 contain the process area, office and storage facility, parking areas and roads. The 10,000 gal. UST is also located within the Zone I of Well #2. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or

Figure 1: Example of how a well could become contaminated by different land uses and activities.

**Table 2: Table of Activities within the Water Supply Protection Areas for Wells #1 and #2**

Facility Type	Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Plastic Extrusion/Manufacture	Fuel Storage Below Ground (UST)	Well #2	Well #1	High	10,000 gallon fiberglass No 2 fuel oil tank
	Hazardous Materials Storage	Both wells	No	Moderate	Storage and use of oils and solvents with containment
	Parking lot & driveways	Both wells	Both wells	Moderate	Limit salt usage and provide drainage away from wells
	Septic System	No	Both wells	Moderate	See septic systems brochure in the appendix
	Very Small Quantity Hazardous Waste Generator (VSQG)	Both wells	Both wells	Low	Generation of waste oils and solvents
Residential Homes	Septic Systems/lawn care	No	Both wells	Moderate	See septic systems brochure in the appendix
	Local roads	Both wells	Both wells	Moderate	Notify local maintenance/emergency response personnel that you are a PWS
Agriculture	Pasture	No	Well #2	Low	Only haying at present. No significant agricultural threat at this time

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at: [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

modifying systems.

### Recommendations:

- Keep all new non-water supply activities out of the Zone I.
- Educate all staff regarding the importance of proper disposal practices and use of Best Management Practices.

**2. Hazardous Materials** - CEI is a registered very small quantity hazardous waste generator. The facility stores raw product and waste materials in the loading dock area and contracts with a hazardous waste disposal firm. Floor drains throughout the facility have been appropriately closed and all non-sanitary discharges to the sanitary waste system have been eliminated. The existing sanitary waste water system has been upgraded.

### Recommendation:

- Use Best Management Practices and comply with regulations regarding the handling, storage, and shipping of the hazardous materials and wastes.

**3. Underground Storage Tank** – A heating oil UST is within the IWPA of Well 1 and the Zone I of Well 2.

### Recommendation:

- All tanks in close proximity to water supply wells should be upgraded to meet current construction standards and closely monitored for integrity. Any

Copies of this assessment have been provided to the water supplier, town boards, the town library and the local media.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

modifications to the UST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.

**4. Roadways** – Local roads run through the Zone Is and IWPAs of both Wells 1 and 2. Accidents can release spills of petroleum products, primarily oils and gasoline and potentially transported chemicals.

Other land uses within the protection areas include residential homes, a registered injection well and agricultural activities. At least two residential homes are located within the IWPA of Wells #1 and #2. The potential threats from residential homes include septic systems, pesticide use, inappropriate management of petroleum and other household hazardous materials. CEI operates a registered injection well that receives non-contact cooling water, the injection well is located within the IWPAs of both drinking water wells. Minor agricultural activities are conducted on the fringes of IWPAs on land owned by CEI. Previously usage was growing corn; the current lease agreement is for growing sod. Agricultural practices, if improperly managed may pose a potential threat to water quality. Be sure that your tenant/contractor is aware that the PWS is in the vicinity and that they contact the Department of Food and Agriculture regarding use of pesticides within and proximal to an IWPA. DFA is also available to provide technical assistance as required. Contact Brad Mitchell of the pesticide bureau at 617-626-1771 or [Brad.Mitchell@state.ma.us](mailto:Brad.Mitchell@state.ma.us).

MA DFA's website is <http://www.massdfa.org/pesticide.htm>

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. PROTECTION RECOMMENDATIONS

Custom Extrusion, Inc. should review and consider adopting the following recommendations at the facility:

### Priority Recommendation:

- 3 Continue controlling water usage to minimize the area of contribution and use diligence in storing and handling hazardous materials on site.

### Zone I:

- Keep all new non-water supply activities out of the Zone I. Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use, conducting activities within the Zone I or modifying their system.
- Continue monitoring water usage. Keep your total water consumption below the monthly average daily use of 3,894 gpd to maintain compliance with the calculated Zone I and IWPA protective radii.
- Consider well relocation if Zone I threats cannot be managed.
- Closely monitor your UST for indications of leakage. Upgrade as necessary.
- Prohibit public access to the wellhead using locking facilities and posting signs.
- Limit parking near well #1.
- Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism.
- Monitor road and parking lot drainage to ensure it flows away from well. Work with your community to ensure that stormwater runoff in the Zone I and IWPA is directed away from the well and is treated according to DEP guidance.
- Use Best Management Practices and comply with regulations regarding the handling, storage, and shipping of the hazardous materials and wastes.

### **Training and Education:**

- Train all staff on proper labeling, hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- Maintain drinking water protection signs in key visibility locations.

### **Facilities Management:**

- Implement standard operating procedures regarding proper storage, labeling, use and disposal of hazardous materials. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/brp/dws/dwspubs.html](http://www.state.ma.us/dep/brp/dws/dwspubs.html).
- Upgrade all oil/hazardous material storage areas to incorporate proper containment, labeling and safety practices.
- Septic system components should be inspected and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- Concrete protective surface pads or collars around wells should slope away from wellhead.
- Pole mounted utility transformers may contain PCBs. Contact the utility to determine if the PCB containing oil has been replaced. If PCBs are present, urge the immediate removal.

### **Planning:**

- Work with local officials in Sheffield to include CEIs IWPA in their Aquifer Protection District Bylaws and to assist you in improving protection.
- Prepare a Wellhead Protection Plan and Emergency Response Plan to address short-term water shortages, and long-term water demands and protection. Keep the phone number of a bottled water company readily available.
- Work with the Sheffield Board of Health to encourage education of residents regarding proper maintenance of septic systems, chemical management and lawn care. See attachments.
- Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.
- Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.
- Encourage farms in the IWPA to seek assistance from the Natural Resource Conservation Service (NRCS) or DFA in addressing management issues as necessary. Be sure that your tenant/contractor is aware that the PWS is in the vicinity and that they contact the Department of Food and Agriculture regarding use of pesticides within an IWPA. DFA is also available to provide technical assistance as required. Contact Brad Mitchell of the pesticide bureau at 617-626-1771 or [Brad.Mitchell@state.ma.us](mailto:Brad.Mitchell@state.ma.us). MA DFA's website is <http://www.massdfa.org/pesticide.htm>

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussions to assist the water supplier in his efforts to protect his water and further review overall local drinking water protection measures.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Shelburne Falls Fire District**

### What is SWAP?

The Source Water Assessment Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

<i><b>Phone Number</b></i>	413-625-6392

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

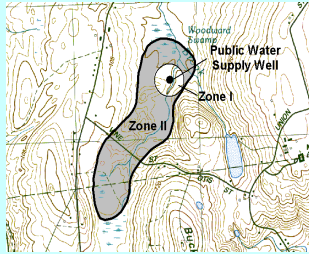

### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

## Section 1: Description of the Water System

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

### System Susceptibility

**High**

**Zone II #: 232**

**Susceptibility: High**

Well Names	Source IDs
New Well #1	1268000-03G
Well #2	1268000-02G

The town of Shelburne is a small community in the Berkshire foothills of northwestern Massachusetts. Shelburne, settled in the early-1700's as part of Deerfield, was established as a town in the mid-1700's, and initially developed as a farming and later, an industrial community along the Deerfield River. The developed section of town is located within the Shelburne Falls section of town on the western border delineated by the Deerfield River. The community is currently primarily a residential agricultural community with an emphasis on artisans, and natural and cultural attractions. The Shelburne Falls Fire District provides water for the Shelburne Falls area of town. The District maintains two groundwater supplies, New Well #1 (03G) and Well #2 (02G); 03G was developed as a replacement well to the original Well #1 that was abandoned as a source of water. The District also maintains the Fox Brook Reservoir as an emergency water source. The emergency and abandoned water sources will not be discussed further in this report.

New Well #1 and Well #2 are located approximately 220 feet apart, within the same, relatively narrow, unconfined, sand and gravel aquifer that lies within the North River valley in Colrain, the Town north of Shelburne. New Well #1 is located approximately 130 feet from the river and Well #2 is located downgradient of Well #1 and approximately 120 feet from the river. The wells are both used as primary wells and function alternately. Both wells are 18 x 24-inch diameter, gravel packed wells, have 10 foot long, 200 slot screens; New Well #1 is 55 feet deep while Well #2 is 45 feet deep. New Well #1 and Well #2 are located within the same hydrogeologic regime, and share the same Zone II contribution area.

The aquifer is a glacially deepened, bedrock valley that was filled in with sand and gravel deposited during the recession (melting) of the glaciers some 12-18,000 years ago. Streams and rivers have reworked and eroded the glacial deposits and recent streams have deposited additional alluvial material. Boring logs and maps in the North River valley indicate medium to coarse sand and gravel deposits up to approximately 82 feet in depth. There is no evidence of a confining, protective clay layer in the North River aquifer in the vicinity of New Well #1 and Well #2. Due to the proximity of wells to the river, under pumping conditions, the wells withdraw water from the aquifer west of the river and water is likely induced to flow from the river into the aquifer.

The bedrock in the area is a complex series of folded metamorphic rocks with igneous intrusions. The bedrock in the Zone II area is associated with the lower Conway formation and the equivalent of Goshen Schist. The bedrock is mapped as a quartz mica schist and marble, equivalent to the Goshen Schist, and a quartzite conspicuous amphibolite.

Each well has a Zone I protective radius of 400 feet immediately around the wellhead. The Zone II was delineated by consultants for the Water Department utilizing geologic mapping, and analytical and numerical modeling. Data for the analysis was gathered from extended duration pumping tests and boring logs. The North River aquifer is considered to be highly vulnerable to contamination due to the absence of a hydrogeologic barrier (i.e. clay) that can prevent contaminant migration from activities on the land surface. Please refer to the attached map to view the boundaries of the Zone II and consult the Consumer Confidence report for current water quality data.

Sodium hydroxide is added to the water from the wells to raise the pH for corrosion control and a chlorinator is available and used as is necessary. For current information on water quality monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The land uses within the Zone II for the Shelburne Falls Fire District wells are a mixture of forest, cropland, residential, industrial and commercial land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Non-conforming Zone I
2. Residential land uses
3. Hazardous materials storage and use
4. Confirmed hazardous waste release sites
5. Wastewater treatment plant
6. Transportation corridors and Utility right-of-way
7. Agricultural activities
8. Comprehensive wellhead protection planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Non-conforming Zone Is** – The Zone I for each of the wells is a 400 foot radius around the wellhead. Currently, the Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction, Memorandum of Understanding or other legal mechanism as approved by the DEP. The public water supplier does not own or control the entire Zone I for either of

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

© 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

the wells. Only activities directly related to the water supply, or other non-threatening activities, as determined by the DEP, are allowed within the Zone I. However, numerous water sources were developed prior to the 400-foot Zone I requirement and are therefore grandfathered. The Department encourages grandfathered systems to acquire ownership or some alternate method of control of the Zone I land use activities. The Shelburne Falls Fire District has actively pursued methods of protecting and/or acquiring the Zone I land and the Department has approved the Zone I for Well #3 with the farm field west of the North River.

#### Zone I Recommendations:

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Continue your current efforts to purchase land and/or negotiate a conservation restriction for land within the Zone I. Continue monitoring activities conducted in Zone I
- ✓ Agreement Options - For any potential future water supply development or additional land acquisition in the Zone I or Zone II, consider a Memorandum of Understanding and Right of First Refusal.

A Memorandum of Understanding (MOU) is an agreement between the landowner and public water supplier in which the landowner agrees not to engage in specific threatening activities. The MOU should be specific to the land use or activity. For example, if the land is residential with a septic system, the owner could agree to not place chemicals, petroleum products, or other hazardous or toxic substances, including septic system cleaners, into the septic system, and agree that the system will be pumped at a specific frequency. As another example, the portions of fields within the Zone I would not have manure, fertilizers or pesticides spread on them. Understanding how an activity threatens drinking water quality is an important component of developing an effective MOU.

A Right of First Refusal is a legal document that gives the water supplier the first chance to purchase land when it becomes available. Please refer to the example of the Right of First Refusal documents attached in the Appendices.

The Department commends the District for its proactive efforts to acquire control of the Zone I property and recommends continued efforts in establishing a program for planning to acquire ownership or control of property within the areas critical to protecting water quality. This recommendation is not only for the existing sources but also should be considered for future development of sources if they are needed. Although a land taking by eminent domain is not appropriate for the current situation, it may be considered for future well development as necessary.

**2. Residential Land Uses** – Approximately 20% of the Zone II land area consists of residential areas. Some areas of the Zone II are connected to municipal sewer, other portions utilize on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### For More Information

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Areas

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Agriculture</b>			
Fertilizer/Pesticide Storage or use - Crops	5	M	Fertilizers, pesticides, manure and land application of sludge: leaks, spills, improper handling, or over-application. Farms also often utilize petroleum products and hazardous materials and waste.
Non-commercial livestock (manure spreading)	2	M	Manure (microbial contaminants): improper handling. Petroleum products for equipment used on site.
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides and fertilizers: over-application or improper storage and disposal
Septic Systems / Cesspools (Some areas are on sewer)	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Aboveground Storage Tanks	1	M	Materials stored in tanks: spills, leaks, or improper handling
Stormwater Drains/ Retention Basins	1	L	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Utility Rights-of-Way	3	M	Corridor maintenance pesticides: over-application or improper handling; construction
NPDES Discharges	2	M	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
Underground Storage tanks	2	H	Materials stored in tanks: spills, leaks, or improper handling
Auto Repair Shop	1	H	Automotive fluids, vehicle paints and solvents: spills, leaks, or improper handling
Cemeteries	1	L	Over-application of pesticides: leaks, spills, improper handling; historic embalming fluids

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Miscellaneous</b>			
Transportation Corridors	Several	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Gas Stations/ Service Stations	1	H	Automotive fluids and fuels: spills, leaks, or improper handling or storage
Transformers	Several	L	MODF and possibly PCBs: spills, leaks, or improper handling. Contact the electric company to ensure no PCBs are within the transformers.
Industrial Lagoons and Pits	1	M	Remediation is currently on-going
RCRA TSDF Facilities	1	H	Hazardous wastes: spills, leaks, or improper handling or storage
Industry/Industrial Facilities	3	H	Industrial chemicals and metals: spills, leaks, or improper handling or storage
Hazardous Materials Storage	3	M/H	Hazardous materials: spills, leaks, or improper handling or storage
Wastewater Treatment Plant	1	L/M	Treatment chemicals or equipment maintenance materials: improper handling or storage; wastewater: improper management
Wood products manufacture (roof trusses)	1	L	Potential petroleum, products from vehicles and equipment

**Table 2 Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the protection areas may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can

be potential sources of contamination due to leaks or spills of the fuel oil they store.

- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with Colrain planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Hazardous Materials Storage and Use** – Six percent of the land area within the Zone II is commercial, industrial or waste disposal land use. An industrial complex is located at the former AF&F facility, the Wastewater Treatment Plant is located on the west side of the North River and a roof truss manufacturer is located at the northern (upgradient end) of the Zone II. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. As you are keenly aware, hazardous materials that are improperly stored, used, or disposed, become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain or allowed to spill directly to the ground.

#### **Hazardous Materials Storage and Use Recommendations:**

- ✓ Continue current efforts to educate and work with local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Work with local businesses to ensure that the District is included in their emergency response plans for notification of any release that may impact the groundwater or surface water of the North River. This should include any releases that may result in a pass-through of the wastewater treatment plant or a direct spill to the river. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate and assist the community on promulgation of a hazardous materials handling and floordrain regulation and inspection program. Refer to the brochures regarding “Industrial Floor Drains” and Hazardous Waste Handling for more information.

**4. Presence of Oil or Hazardous Material Contamination Sites** – The Zone II contains DEP Tier Classified Oil and/or Hazardous Material Release Sites indicated on the map as Release Tracking Numbers 1-0011974 and 1-0013555. Refer to the attached map and Appendix B for more information.

#### **Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Continue to participate in the monitoring of progress of the ongoing

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

#### **Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ➊ Reduces Risk to Human Health
- ➋ Cost Effective! Reduces or Eliminates Costs Associated With:
  - Increased groundwater monitoring and treatment
  - Water supply clean up and remediation
  - Replacing a water supply
  - Purchasing water
- ➌ Supports municipal bylaws, making them less likely to be challenged
- ➍ Ensures clean drinking water supplies for future generations
- ➎ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

remedial action conducted at the confirmed release sites.

**5. Transportation Corridors and Utility Right-of-Way** - State highways and local roads are common throughout the Zone II. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing material, automotive chemicals and other debris on roads are picked up by stormwater and wash into catch basins. The stormwater drainage along Rt. 112 within the Zone II discharges to the North River.

There are numerous unpaved ways as well as legal (authorized) and illegal (unauthorized) trails throughout the Zone II watersheds. Unmanaged access may result in vandalism and illegal dumping.

Power transmissions lines run through the Zone II. Vegetation control measures have the potential to introduce contaminants into resource protection areas. Pesticides or petroleum products used for mechanical methods of vegetation control may pose a threat to water supplies.

#### **Transportation Corridor and Utility Rights-of-Way Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II. If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.
- ✓ Contact the Town and State to ensure catch basins are inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Continue working with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ Work with local officials during their review of the utility right-of-way Yearly Operating Plans to ensure that water supplies are protected during vegetation control. Ensure that the utility is utilizing accurate maps for their YOP.
- ✓ If your on-going work identifies specific trails, roads or ways as venues of trespassing, continue to evaluate all options for access management.

**6. Wastewater Treatment Plant** - The Zone II contains the Colrain Wastewater Treatment Plant that discharges upgradient of the wells into the North River. The former AF&F facility also has industrial lagoons that are in the process of being closed and remediated. Activities associated with wastewater treatment involve storage and use of hazardous materials such as chlorine and fuel oil. Municipal wastewater contains contaminants including bacteria, viruses, metals and volatile chemicals. Industrial wastewater contains a variety of chemicals that are specific to the type of operations conducted at the facility. The discharges from the wastewater treatment plant are regulated by the EPA and include specific limits on the amounts of specific contaminants they are allowed to discharge. Accidental pass-through, spills, leaks or mismanagement of wastewater, hazardous materials and storm water at the plant are potential sources of contamination.

#### **Wastewater Treatment Plant Recommendations:**

- ✓ Communicate with the wastewater treatment facility to be sure it is operated and maintained according to Department requirements.
- ✓ Communicate with the wastewater treatment facility to request stormwater drains and the drainage system around the wastewater treatment plant are mapped in the event of a spill or a release.
- ✓ Communicate with the wastewater treatment facility to be sure that best management practices are used for proper handling of materials and in

- ✓ containing spills and leaks.
- ✓ Communicate with the wastewater treatment facility to be sure emergency planning includes notification of Shelburne Falls Water District in the event a release to the river occurs.
- ✓ Communicate with the wastewater treatment facility to ensure that the plant's underground and/or aboveground storage tanks have secondary containment and are maintained properly.

**6. Agricultural Activities** – There are several agricultural activities within the Zone II area including non-commercial, cropland and hayfields. Pesticides, fertilizers and manure have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water supplies. In addition, farms and large commercial facilities often conduct their own maintenance on their equipment and have storage of hazardous materials and hazardous waste.

**Agricultural Activities Recommendation:**

- ✓ If appropriate, work with the Department to negotiate additional Conservation Restrictions regarding the type of activities conducted in land areas determined to be most critical to source protection.
- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Review the fact sheet available online and call the local office of the NRCS in Hadley at 413-585-1000 for assistance or online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Encourage farmers and property managers to incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Promote the use of BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning. Continue efforts to assist Colrain in promulgation of Hazardous Materials Handling Regulations through the Board of Health.
- ✓ Continue your current work with farmers to ensure that pesticides and fertilizers are being stored within a structure designed to prevent runoff.
- ✓ The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS for assistance.
- ✓ Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

**7. Protection Planning** – The Shelburne Falls Fire District wells and Zone II are located within Colrain. Currently, Colrain does not have water supply protection controls that meet the minimum requirements of the Department's Wellhead Protection regulation 310 CMR 22.21(2). Shelburne Falls Fire District was awarded wellhead protection grants to prepare a wellhead protection plan that included forming a committee with members from Colrain and Shelburne and implementation of the plan. Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation.

It should be noted that activities within the Zone III may pose a potential threat to the water supply. Specifically, under conditions when the river contributes water to the aquifer an accidental release to the river may pose a significant threat to water quality in the wells. This report does not include facilities located within the Zone III either along the river or just outside the Zone II such as USTs/ASTs or other activities that may pose a threat to the sources.

**Protection Planning Recommendations:**

- ✓ Consider inventorying activities in the Zone III, just outside of the Zone II that may pose a potential threat and include them into an Emergency Response Action Plan, this may include USTs or farms that may store or use hazardous materials.
- ✓ Update the Wellhead Protection Plan as appropriate. Continue meeting with the protection committee and

- ✓ coordinating with Colrain to promulgate protection regulations/bylaws in Colrain.
- ✓ Continue to coordinate with local officials to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21(2) to adopt controls that meet requirements of that regulation. For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ Local controls in Colrain do not regulate floor drains; continue efforts through the Aquifer Protection Committee and the Colrain Board of Health to promulgate floor drain controls, hazardous materials handling regulations and an inspection program.
- ✓ Work with town boards to review and provide recommendations on proposed development within your water supply protection areas. To obtain information on build-out analyses for the town, see the Executive Office of Environmental Affairs' community preservation web site, <http://commpres.env.state.ma.us/>.

Other land uses and activities within the Zone II are listed in Table 2. Refer to Table 2 and Appendix 2 for more information about these land uses.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone II contains potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Proactively pursuing land acquisition options in the Zone I.
- Preparing and implementing a Wellhead Protection Plan and Emergency Response Plan.
- Efforts to include and work with the community of Colrain to promote source protection.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Continue working with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents. Ensure that industries and the treatment plant include the District in their emergency response plan list of agencies to notify in the event of a release of hazardous materials.
- ✓ Consider inventorying USTs within the Zone II and Zone III.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies including IPM.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. If funds are available, each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource

Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the protection area. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

#### **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Areas
- C. Confirmed hazardous material release sites
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

<b>Protection Measures</b>	<b>Status</b>	<b>Recommendations</b>
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO (However, DEP has approved 03G)</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Continue working with land owners to negotiate a Conservation Restriction, MOU and other forms of protection.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue to keep other land uses out of the Zone Is. Continue working with land owners to negotiate a Conservation Restriction and other forms of protection.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>N/A</b>	
Do neighboring communities protect the Zone II areas extending into their communities?	<b>NO</b>	The wells and Zone II for Shelburne Falls Fire District are completely within the Town of Colrain. Under stressed conditions, the river contributes water to the aquifer, therefore activities within the Zone III should also be monitored and Emergency Response Plans should include upstream (Zone III) land uses that may pose a significant threat.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>YES</b>	When updating plans, include an update on implementation and review the effectiveness of the plan.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment the plan by reviewing and encouraging a joint emergency response plan with fire department, Board of Health, DPW, industries, wastewater treatment plant, and local and state emergency officials.
Does the municipality have a wellhead protection committee?	<b>YES</b>	Include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> Continue to work with neighboring communities to adopt floor drain regulations and work with industries to protect water supplies.
Does the PWS provide wellhead protection education?	<b>YES</b>	Aim additional efforts at commercial, industrial and municipal uses within the Zone II and as appropriate Zone III.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Anchorage Nursing Home

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection,  
Drinking Water Program

Date Prepared:  
October 29, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Anchorage Nursing Home
<i>PWS Address</i>	Shelburne
<i>City/Town</i>	Shelburne, Massachusetts
<i>PWS ID Number</i>	1268001
<i>Local Contact</i>	Mr. William Barton
<i>Phone Number</i>	800-340-6041

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #3	1268001-03G	253	633	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road de-icing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Shelburne is a small community in northwestern Massachusetts. The Anchorage Nursing Home is located on Route 2 (Mohawk Trail) and serves a population of approximately 33 residents plus staff. Although Shelburne Falls has a municipal water system the service does not extend to this part of town. Therefore, the nursing home utilizes on site water supply and septic system for wastewater disposal. The system operates a single 6-inch diameter, 380-foot deep, flowing artesian bedrock well. Based on the results of a 48-hour extended duration pumping test conducted in 1993 and Zone I restrictions, the well was approved for a daily maximum withdrawal of approximately 10.5 gallons per minute.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The nursing home also maintains two emergency supply wells (01G and 02G). Those wells have been severed from the potable water supply system but maintained in the event of an emergency. Emergency sources will not be addressed further in this report.

The Zone I is the protection area immediately surrounding the well while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual recharge area (Zone II) has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii, based on the approved pumped volume from Well #3, are 253 feet and 633 feet, respectively. Please refer to the attached map of the Zone I and IWPA.

Well #3 withdraws water from the bedrock aquifer. The complex is located on an upland area underlain by till and shallow bedrock. The driller's log indicates till over schist and geologic mapping of the area indicates the Conway Formation of metamorphic quartz-mica schist with marble interbeds. Although the well is a flowing artesian well, there is no evidence of a continuous confining unit in the immediate area and there is some bedrock exposure in the vicinity. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

For information on current water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The Zone I for Well #3 is in compliance with the DEP Zone I requirements that restrict activities to only those associated with water supply or passive, non-threatening activities. The IWPA encompasses the entire complex including the residential area, the fuel oil storage area (inside the building), parking, maintenance facilities and all of the septic system components. All of these facilities are located topographically downhill from Well #3. The remainder of the IWPA, topographically uphill of Well #3, is woodland.

**Table 2: Table of Activities within the Water Supply Protection Areas for Both Sources**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Internal transportation/parking	No	Yes	Moderate	Limit road deicing materials usage and monitor parking areas.
Nursing Home	No	Yes	Moderate	Supply BMPs to staff regarding waste disposal
Fuel storage	No	Yes	Moderate	Continue to use best management practices and monitor use and delivery of petroleum products.
Septic system components	No	Yes	Moderate	Continue to maintain septic system and protect it from improper disposal

\* -For more information, see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

### Key issues include:

1. **Transportation/parking**
2. **Nursing Home**
3. **Fuel storage (ASTs)**

The overall ranking of susceptibility to contamination for the Anchorage Nursing Home supply well (03G) is moderate based on the presence of several moderate ranked potentially threatening land uses or activities in the IWPA. Please refer any questions about water quality at the facility to the contact person listed in Table 1.

The nursing home is commended for installing a more protective well that is conforming with Zone I requirements. Continued monitoring and site management is recommended to prevent accidents and minimize threats within the IWPA protection area of the well.

**1. Transportation/parking** – The facility parking area and maintenance areas are located within the IWPA. These facilities are located topographically downgradient from the well and stormwater runoff is directed away from the well.

#### Transportation corridor Recommendations:

- ✓ Monitor all fuel storage and maintenance equipment.
- ✓ Prepare an Emergency Response Plan that includes coordination among the DEP, the Town, and the State Police in the event of an accident near the wellhead.

**2. Nursing Home/Residential Land Use** – The nursing home facility is located within the IWPA. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include cleaning materials, medications, automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used generally in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automobile leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

#### **For More Information:**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

#### **Residential Land Use Recommendations:**

- V Educate staff, particularly maintenance staff on best management practices (BMPs) for protecting water supplies. Focus efforts on management and disposal of cleaning materials and potentially hazardous materials.

## **4. Protection Recommendations**

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. Please review and adopt the key recommendations above and as follows as is feasible:

#### **Priority Recommendations:**

- V Continue efforts to control activities in the IWPA area and monitor use of hazardous materials.

#### **Zone I:**

- V Prohibit non-water supply activities from Zone I.
- V Continue regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- V Do not use or store pesticides, fertilizers or road salt within the Zone I.

#### **Training and Education:**

- V Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- V Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- V Educate neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal and septic system maintenance.

#### **Planning:**

- V Have a plan to address short-term water shortages and long-term water demands.
- V Keep the phone number of a bottled water company readily available in the event of an emergency.
- V Supplement the SWAP assessment with additional local information, and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

#### **Funding Sources:**

The DEP's Wellhead Protection Grant Program provides funds to assist public water suppliers and their partners in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under this grant program. If funds are available, in the spring, DEP posts a new Request for Response for the grant program (RFR).

These recommendations are only part of your on-going local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## **4. Attachments**

- Map of the Public Water Supply (PWS) Protection Areas.
- Recommended Source Protection Measures Fact Sheet

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Clark's Corvair

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department  
of Environmental  
Protection, Bureau of  
Resource Protection,  
Drinking Water Program

Date Prepared:  
October 29, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Clark's Corvair Parts, Inc. is located in Shelburne, a small, rural community in northwestern, Massachusetts. The facility purchases, sells, refurbishes and fabricates parts and manuals for Corvair automobiles. The total staff is approximately 40 people per day and is served by a single potable supply well (01G) located at the facility. Although the center of Shelburne does have public water and municipal wastewater sewers available, this area of town is served by an on-site water supply and septic disposal.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The Zone I is the protected area immediately surrounding the well while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual (Zone II) recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii for this facility's well are 100 feet and 412 feet, respectively, based on estimated water use of less than 1,000 gallons per day.

The overburden in the area is mapped as a thin covering of glacial till over bedrock. There is no evidence of a protective barrier of either thick till or of a confining, protective clay layer in the vicinity of the well. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface. Please refer to the attached map of the Zone I and IWPA.

For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 2 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The protection areas for Well #1 includes the entire facility, Route 2 as well as a residence and abutting business.

### Key issues include:

1. **Non-conforming activities within Zone I,**
2. **Residential/commercial land uses with on-site septic disposal**
3. **Transportation corridors, and**
4. **Hazardous materials storage and use.**

Clark's Corvair is commended for their diligent management of hazardous materials on-site. The overall ranking of susceptibility to contamination for Clark's Corvair water system is high, based on the presence of several moderate and one high threat ranked land use or activity in the Zone I and IWPA. Please refer to Table 2 for more details.

1. **Non-conforming activities within Zone I** – Currently, the water supplier does own the entire Zone I area however, the activities conducted within the Zone I are non-

**Table 2: Table of Activities within the Water Supply Protection Areas for Both Sources**

Potential Contaminant Sources	Zone I	IWPA/ Zone II	Threat	Comments
Non-conforming Zone I	--	--	--	Non-conforming uses in Zone I
Hazardous materials storage and use	Yes	Yes	High	Continue the use of BMPs and coordinate with emergency responders.
VSQG	Yes	Yes	Moderate	Hazardous materials/VSQG
Septic system	No	Yes	Moderate	Microbial threat and potential improper disposal of hazardous materials

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transportation corridor and parking	No	Yes	Moderate	Limit road deicing materials and monitor drainage upgradient of the well
Transformer (ground mounted)	Yes	Yes	Low	Although most transformers today do not contain PCBs, the oils may pose a threat due to the proximity to the well.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

conforming and pose a threat to the water supply. Systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I activities prior to increasing water use or modifying systems. The well is located between two of the facility's Quonset huts. Clark's is a registered Very Small Quantity Hazardous Waste Generator and heats with fuel oil utilizing two aboveground storage tanks (ASTs) that are located within buildings. The Quonset huts have cement floors with berms except at the entrance; there are no functional floor drains on site. In addition there are some parking spaces in Zone I. The parking area is paved and drainage flows away from the well.

#### Recommendations:

- ✓ Consider relocation of the well if potential threats cannot be mitigated and water quality is impacted by activities.
- ✓ To the extent feasible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements. Prohibit new non-water supply activities in the Zone I.
- ✓ Where it is feasible, remove all hazardous materials from the Zone I. Continue current good housekeeping practices and the use of BMPs for the storage, use, and disposal of hazardous materials.
- ✓ Carefully monitor the delivery, handling and storage of chemicals and products.
- ✓ Inspect the well casing and cap regularly to ensure it is sanitary and watertight.

**2. Residential Land Uses** – The Zone I and IWPA for Well #3 has high-density residential land use. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in

Figure 1: Example of how a well could become contaminated by different land uses and activities.

Appendix A and online at the MA DEP website - [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**3. Transportation corridor** – Route 2 is located within the IWPA and the access and parking areas for the facility are within Zone I as well. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as waste from wildlife and pets. Route 2 is topographically downgradient of the well, however the bedrock recharge area has not been determined for this well.

#### Recommendations:

- ✓ Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they are aware of the location of your well.

**4. Hazardous Materials Storage and Use** – Clark's Corvair utilizes hazardous materials and generates hazardous waste. There were no floor drains observed during the assessment and the hazardous materials appeared to be handled appropriately. Spill kits and signs designating areas of storage were noted during the visit. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground. It should be noted that vehicle washing is a restricted activity under the UIC regulations. Review the attached fact sheet for additional information about vehicle washing activities.

#### Hazardous Materials Storage and Use Recommendations:

- ✓ Continue current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. Review and consider adopting the key recommendations above and the following:

#### Priority Recommendations:

- ✓ Consider relocation of the well if potential threats cannot be mitigated.
- ✓ Inventory activities in the IWPA and catalog any new potential threats identified.

#### Zone I:

- ✓ Prohibit any new non-water supply activities from the Zone I.
- ✓ Prohibit public access to the well and pump house with locking facilities, gating roads, and posting signs as appropriate.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ Redirect road drainage in the Zone I away from well area.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

#### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.
- ✓ Inform neighbors and consumers regarding BMPs with respect to household hazardous materials handling and disposal and septic system maintenance.

### Planning:

- ✓ Work with local officials in Shelburne to review Aquifer Protection District Bylaws for compliance with 310 CMR 22.000 and to include Clark's IWPA in that district.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
VIPASSANA MEDITATION CENTER

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 5, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Vipassana Meditation Center
<i>PWS Address</i>	386 Colrain-Shelburne Rd.
<i>City/Town</i>	Shelburne, Massachusetts
<i>PWS ID Number</i>	1268010

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1268010-01G	162	458	High	High
Well # 2	1268010-02G	214	528	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1268010-01G)**

Zone I = 162 ft.  
IWPA = 458 ft.

### How was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic leach fields within the Zone I / IWPA. The **high** susceptibility to potential non-microbial threats for Well #1 is based on the oil tanks within the Zone I and the IWPA. The **moderate** susceptibility to potential non-microbial threats for Well #1 is based on the local roads and facilities within the IWPA.

This source water assessment report is based on information provided by you on your 1999 Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- inspect the Zone I and IWPA regularly;
- work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- do not use pesticides, fertilizers or road salt within the Zone I;
- address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report for Dragon Hill Condominium

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
February 11, 2002

Well #2	1268011-02G	273	720	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Many potential contaminant sources, including septic systems, road salt and improperly disposed of hazardous materials may threaten the quality of water from drinking water wells. Citizens and local officials can work together to better protect drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Dragon Hill Condominium complex is located south of Route 2 and consists of nine buildings with a total of 18 units. All units have individual, 275-gallon oil tanks located in basements, fueling the forced hot water heating systems. Footing drains and individual unit basement floor drains discharge to the ground surface at different locations throughout the complex. The facilities include internal transportation, parking, lawn and wooded areas. There is no municipal wastewater disposal available and therefore the homes are served by onsite septic disposal. The leachfields are partially within the IWPA but topographically downgradient from the wells.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The complex is served by two active wells, Wells #1 (01G) and #2 (02G) that pump in a lead/lag sequence (well #1 being the lead well) to the storage tank, located in a secure vault. There is an unapproved well #3 (03G) kept as an emergency source. Although this report does not address that well specifically, well #3 is located adjacent to the active wells. The system maintains a propane back-up generator.

The Zone I and Interim Wellhead Protection Area radii for Wells #1 and #2 are 273 feet and 720 feet, respectively. The protective radii were based on an approved pumping rate of 14,400 gallons per day (gpd) determined through a pumping test required by the DEP New Source Approval Process (NSA). Please refer to the attached map that shows the Zone I and IWPA radii. The Zone I is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wells may be larger or smaller. There are two units partially located within the Zone I of well #1.

Wells #1 and #2 are 750-feet deep, 6-inch diameter bedrock wells; both wells are completed approximately 2 feet above grade. The complex is located on an upland area underlain by till and shallow bedrock. The driller's log indicates till over schist. The bedrock is mapped as metamorphic quartz-mica schist with marble interbeds of the Conway Formation. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

The Dragon Hill Condominium well water does not require and does not have treatment at this time. For current information on monitoring results, please review the Consumer Confidence report (CCR) that is issued annually by the water supplier or refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

There are few land uses and activities within the drinking water supply protection areas that are potential sources of contamination. Therefore, the overall ranking of susceptibility to contamination for the wells is moderate, based on the presence of moderate threat land use or activity in the Zone I and IWPA, as seen in Table 2. The Association is commended for current efforts to protect the water supply.

**Table 2: Table of Activities Common to the Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Internal transportation corridors	No	Both Wells	Moderate	Limit road salt usage. Monitor for spills
Ground mounted transformers	No	Both Wells	Moderate	Potential release of MODF
Septic system components	No	Both Wells	Moderate	All components in IWPA
Residential development	Well #1	Both Wells	Moderate	Household hazardous materials and pesticides
Floor drains/Fuel oil storage	Yes	Yes	Moderate	Seal the drains. Contact UIC Coordinator.
Storm drains	No	Both Wells	Low	Road salt, spills and runoff

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

**Key land use issues include:**

1. **Non-conforming activities in the Zone I (Well #1);**
2. **Residential development;**
3. **Septic system; and**
4. **Floor drains.**

**1. Non-conforming activities in the Zone Is** – The Zone I for Well #1 is non-conforming with respect to MA DEP land use restrictions, which allow only water supply related activities in Zone Is. The Zone I for Well #1 contains a portion of two units along with the parking and other activities associated with a residential unit. Please note that systems not meeting DEP Zone I requirements must receive DEP approval and address Zone I issues prior to increasing water use, modifying systems or conducting any activities within Zone I. The Zone I for Well #2 is in compliance with the Zone I restrictions.

**Recommendations:**

- ✓ Do not conduct any additional activities within the Zone

I. Contact MA DEP prior to conducting any activities within Zone I.

- ✓ Prepare an emergency response plan for responding to an accidental release.
- ✓ Encourage residents to utilize Shelburne's household hazardous waste collection days.
- ✓ Monitor parking lots for spills and leaks.
- ✓ Record water meter data regularly to monitor water use and help assess system for potential leaks.

**2. Residential development**– Residential development includes the condominium complex. Normal residential activities pose minimal threat to the water quality of the public water supply provided homeowners are aware of the potential hazards of household waste, lawn care chemicals, animal waste and improper disposal through septic systems and they utilize best management practices. In addition, each unit has a floor drain in the basement.

**Recommendations:**

- ✓ Provide residents with information about protecting the facilities resources. Include information on Best Management Practices (BMPs) for the use of pesticides, household hazardous waste and septic system maintenance and disposal practices.
- ✓ Encourage residents to utilize the Franklin County Solid Waste Management facilities for household hazardous waste and paint exchange.

**3. Septic systems** - Septic systems are located within the IWPA of the wells. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the water supply.

**Recommendations:**

- ✓ Refer to recommendations under item 2.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.

**4. Floor drains** - Floor drains are often installed where boilers are present to provide drainage in the event of a plumbing failure. If there is a potential for hazardous materials such as oil to flow accidentally into the floor drain, however, preventive measures must be taken. Hazardous materials may not be stored without containment in areas where spills could flow into the floor drains. Floor drains in an area with hazardous materials or petroleum products that do not have secondary containment must discharge to a sewer or a tight tank or be sealed.

**Recommendations:**

Consider the three following options:

- ◆ Seal off the floor drains. Without a trap, floor drains may act as conduits for natural radon gas or for stormwater to backup into the basements. Unless the drains are necessary, seal the drains. Please see the attached UIC forms and contact **Rick Larson of the MA DEP Springfield Office at 413-755-2207 for the proper procedures**. If a sump is required in the basement to relieve hydrostatic pressure beneath the floor, it must be entirely set below grade and sealed (e.g. sealed with a watertight cover) to prevent any accidental spills from entering the sump. Water from the sump cannot discharge to the septic system.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

- ◆ Protect the floor drains from contaminants. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak in the event of a leak. Install a small berm around the boiler and a larger containment structure around the ASTs to contain 110% of the tank.
- ◆ If the drain is not sealed and protection measures are not taken, install a tight tank and connect the floor drain to the tank. Contact Rick Larson for guidance.

Other uses and activities identified in the protection areas are stormwater discharges located within the IWPA of the wells and electrical transformers. The condominium should consider BMPs and include periodic cleaning of catch basins and street sweeping. Street sweepings and catch basin cleanings are considered solid waste and should be handled as described in the DEP's policy. All electrical transformers contain oil and if the transformers were to rupture, oil would be released to the soils and could potentially impact water quality. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

Work with the DEP and local officials regarding protecting the water supplies through emergency response coordination.

## 3. Protection Recommendations

To reduce the system's susceptibility to contamination, the Dragon Hills Condominium should review and adopt the following recommendations:

### Zone I and IWPA:

- ✓ Keep all new non-water supply activities out of the Zone I.
- ✓ Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use, modifying their system or conducting any additional non-conforming activities in Zone I.
- ✓ Prohibit public access to the wells by locking facilities and posting signs at the facility entrance. Check the integrity of the well caps regularly and replace as necessary.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any aboveground tanks for leaks, etc.
- ✓ Work with the local fire department, DEP, State highway, and local officials regarding protecting the water supplies through emergency response coordination.
- ✓ Be sure that the town is aware that your facility is a public water supply so that you can be notified of any accidents or threats from accidents. Ask that your facility be included in Town wide water supply protection efforts.

### Training and Education:

- ✓ Continue staff training on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, certified operator, and other appropriate staff.
- ✓ Maintain the drinking water protection area signs at key visibility locations.

### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of any hazardous materials at the facility. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/bwp/dhm/dhmpubs.html](http://www.state.ma.us/dep/bwp/dhm/dhmpubs.html).
- ✓ Continue utilizing Best Management Practices (BMPs) for the use of fertilizers pesticides on facility property.
- ✓ Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Work with local officials in town to include the facility IWPA in an Aquifer Protection District and to assist you in improving protection.

Copies of this assessment have been provided to the public water supplier and town boards.

- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws), including:

- Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.

**4. Attachments**

- Maps of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheet
- Pesticide Use Fact Sheet
- Fertilizer Use Fact Sheet

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
DEM C. A. HOLMES RECREATION AREA

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	DEM C. A. Holmes Recreation Area
<b>PWS Address</b>	94 Lake View Drive
<b>City/Town</b>	Shutesbury, Massachusetts
<b>PWS ID Number</b>	1272001

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well #1	1272001-02G	232	568	Moderate	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1272001-02G)**

Zone I = 232 ft.  
IWPA = 568 ft.

## How was my Well's Susceptibility Determined?

Your well's **moderate** susceptibility to potential microbial threats is based on the septic system components within the IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads within the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, Sanitary Survey, New Source Approval Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report for Shutesbury Elementary School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

January 14, 2002

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Shutesbury Elementary School
<i>PWS Address</i>	West Pelham Road
<i>City/Town</i>	Shutesbury, Massachusetts
<i>PWS ID Number</i>	1272002
<i>Local Contact</i>	Mr. Walter Turati

Well #1	1272002-02G	270	702	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Shutesbury Elementary School (the school) is a rural, elementary school located on the west side of West Pelham Road in Shutesbury. The school student and staff population is approximately 275 people per day and is served by a single potable supply well (Well #2) located southwest of the school. The school is served by on-site septic disposal; all sewer components are located outside of the Zone I.

The well was approved through the Department's New Source Approval Process prior to renovation and expansion of the school in 1994 and has a Zone I protective radius of 270 feet and an Interim Wellhead Protection Area (IWPA) radius of 702 feet. Please

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

refer to the attached map that shows the Zone I and IWPA. The Zone I is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wellhead may be larger or smaller. Well #1 (01G) is an emergency water supply that is physically disconnected from the potable water system and used as an irrigation well. That source is not addressed in this report.

The 200 foot deep, 6-inch diameter is located southwest of the school. Geological mapping in the area identifies the bedrock as the Dry Hill Gneiss, consisting of gneiss and quartzite. Based on topography and site observations, the overburden is assumed to be till; there is no evidence of a confining unit such as clay in the area. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer. The water does not require and is, at the time this report was prepared, not treated. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone Is and IWPAs and Table 2 for additional assessment information. Please note that the land use descriptions are limited and the school area is described as Urban Open space for lack of a better descriptor.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, very few land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

**Key issues include:**

1. **Fuel oil storage;**
2. **Floor drains in boiler rooms;**
3. **School facilities and athletic fields; and**
4. **Residential housing.**

The Shutesbury Elementary School well is fairly well protected. There were no activities within the Zone I that pose a significant threat to the water supply. Although there are a few activities of concern within the IWPA, based on the topography, it

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Underground Fuel Oil Storage	No	Yes	High	New tank w/containment
Floor Drains in Boiler Rooms	No	Yes	Moderate	Leachfield outside Zone I; consult with UIC program regarding compliance
Athletic fields	Yes	Yes	Moderate	Do not use pesticide/fertilizers on fields
School facilities and parking	No	Yes	Moderate	Limit road salt usage use BMPs for household hazardous materials. Monitor parking areas
Medium density residential housing	No	Yes	Moderate	Septic systems and household hazardous materials

**-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).**

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

appears those activities are primarily downgradient of the well. The overall ranking of susceptibility to contamination for the well is moderate. Please refer to Table 2.

**1. Underground fuel oil storage tank (UST)** – A double-walled steel, fuel oil UST is located within the IWPA of the water supply. If managed improperly, Underground Storage Tanks can be a potential source of contamination due to leaks or spills of the chemicals they store.

### Recommendation:

- ✓ Any modifications to the UST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.

**2. Floor Drains in Boiler Room** – There is a day tank with adequate secondary containment in the boiler room. However, there are floor drains in the boiler room, that discharge to an unknown location. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry wells in areas where hazardous materials or petroleum may enter the floor drain. The floor drain must be sealed, connected to a tight tank or sewer or protected to prevent boiler blow down, oil or other prohibited discharges through the floor drain. In the event of a failure of the float in the daytank or a leak in the oil feed lines, oil may enter the floor drains or the crack in the floor next to the small pressure tank for the "irrigation well".

### Recommendations:

- ✓ Be sure that the floor drains are in compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached) or sealed.
  - Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson) at 413-755-2207.
- ✓ Install secondary containment for storage tank. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. We recommend that you establish a policy and plan for conducting maintenance operations on the boiler, especially when oil filters are changed. Require your boiler maintenance contractor to use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.

- ✓ Seal all cracks in the floor and the floor drain if it cannot be adequately protected to prevent a prohibited discharge.

**3. School facilities and athletic fields** - Elementary schools generally use only household type hazardous materials for cleaning, pest control and lawn care. Part of the recreation field is within the IWPA of the well. Potential exists for contamination of the well by fertilizers, herbicides, and pesticides, all of which can be of concern.

### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- ✓ Investigate Integrated Pest Management and Best Management Practices for field maintenance within the IWPA as necessary.
- ✓ Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or road salt within Zone I.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

- ✓ Prepare an emergency response plan for responding to an accidental release.
- ✓ Monitor roadside for spills and leaks.

**4. Residential housing** – Residential development in general, poses minimal threat to public and private water supplies provided there is proper management of household hazardous materials and maintenance of septic systems. Septic systems are located within the IWPA of the wells. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the water supply.

#### Recommendations:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include all teaching staff, custodial staff, groundskeepers, kitchen staff and certified operator.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems and supply this information to the Town to distribute to residents.
- ✓ Work with the town to promote household hazardous waste collection days.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the well's susceptibility to contamination. Shutesbury Elementary School and the Town of Shutesbury are commended for the effort shown in siting the well and current protection efforts.

Please review and adopt the key recommendations listed above and as follows:

#### Zone I and IWPA:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider gating the wellhead.
- ✓ Post drinking water supply signs in key location such as along the access road and in the parking area.
- ✓ Provide information to staff and pertinent school organizations about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, pesticides and household hazardous waste.

#### Training and Education:

- ✓ Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies).
- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator.

#### Facilities Management:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a

Very Small Quantity Generator. The school is currently not registered as a generator of hazardous waste or waste oil. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" and register to participate, if necessary.

#### Planning:

- ✓ Work with local officials to develop an Aquifer Protection District Bylaw that includes the school well's IWPA and to assist you in continued protection of the water supply.

- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note that each program year, on or about May 1 the Department posts a new Request for Response (RFR), grant application form. Generally, the applications are due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

**4. Attachments**

- Map of the Public Water Supply (PWS) Protection Area
- Developing a Wellhead Protection Plan
- Recommended Source Protection Measures Fact Sheet
- Schools Fact Sheet

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report For SIRIUS COMMUNITY CENTER

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Sirius Community Center
<i>PWS Address</i>	72 Baker Rd
<i>City/Town</i>	Shutesbury, Massachusetts
<i>PWS ID Number</i>	1272004

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1272004-01G	103	423	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1272004-01G)**

Zone I = 103 ft.  
IWPA = 423 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the parking, local roads and facilities within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, site visit, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**South Hadley Fire District No. 2**

### What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	South Hadley Fire District No. 2

<i>City/Town</i>	South Hadley
<i>PWS ID Number</i>	1275001
<i>Local Contact</i>	William Selkirk
<i>Phone Number</i>	(413) 532-9210

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate Best Management Practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

## Section 1: Description of the Water System

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

**Zone II #: 615**

**Susceptibility:** High

Well Names	Source IDs
Dry Brook Well	1275001-04G

South Hadley is a medium sized community in western Massachusetts located on the east bank of the Connecticut River. The Town was settled in the late 1600s and incorporated in the late 1700s. South Hadley developed as an agrarian community and later as an industrial community with the influx of the paper industry. Today South Hadley is predominantly a residential community with a prominent college. South Hadley has municipal water and wastewater disposal. However, some areas of town are not served by the municipal sewer system and therefore discharge wastewater through on-site septic systems. Water is supplied by two separate water systems; although the systems are connected and could supply water to the other system in the event of an emergency. South Hadley Fire District No. 1 serves the southern section of town and receives its water from the Massachusetts Water Resources Authority (MWRA), the source being Quabbin Reservoir. South Hadley Fire District No. 2 serves the northern section of Town and receives its water from one groundwater source, Dry Brook Well. Dry Brook Well is located along the Connecticut River near the Hadley town line. The District is proposing to install a well within 50 feet of the existing well as a mechanical backup to Well #1.

The well is an artesian, gravel packed well that is approximately 112 feet deep. The well utilizes water from a confined to semi-confined, sand and gravel aquifer located within a buried, bedrock valley. The bedrock valley, is comprised primarily of sedimentary (sandstone) and volcanic (basalt) rocks of the Hartford Basin, that was somewhat deepened by advancing glaciers and were later filled in with sand and gravel from the receding glaciers and overlain by silt and clay from glacial Lake Hitchcock some 18,000 years before present. Recent alluvial deposits cover the entire valley area. The glacial feature located immediately south of the Dry Brook Well is a delta (sand and gravel) formed when stalled ice melted and discharged meltwater and sediment into Lake Hitchcock. The confining clay layer is primarily contiguous in the immediate vicinity of the well but is known to pinch out south of the well and to the west.

The Zone I is the area immediately surrounding the wellhead, while the Zone II is the land area that contributes water to the pumped well. The Dry Brook Well has a Zone I radius of 400 feet. The Zone II contribution area was delineated by the USGS as part of the SWAP program. The delineation included an analysis of empirical data from an extended duration pumping test and use of the numerical model MODFLOW. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers (i.e. clay) throughout the Zone II that can prevent contaminant migration. A hydrogeologic barrier does exist in the immediate vicinity of the well and in portions of the Zone II. The hydrogeologic barrier that does exist provides some protection relative to impeding the downward migration of contaminants from areas overlying the barrier. Please refer to the attached map to view the boundaries of the Zone II.

Currently the well water does not receive treatment. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data are also available on the web at <http://www.epa.gov/safewater/ccr1.html>.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 2: Land Uses in the Protection Areas

The land uses for the Zone II for South Hadley Fire District No. 2 are predominantly pasture, cropland, mining, and residential. Land uses and activities that are potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Non-conforming Zone I
2. Sand and Gravel Mining
3. Residential land uses
4. Underground Storage Tanks
5. Manure Spreading
6. Comprehensive wellhead protection planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix A.

**1. Non-conforming Zone I** – The Zone I for Dry Brook Well is a 400 foot radius around the wellhead. Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Many public water supplies were developed prior to the Department's regulations and contain non water supply activities such as homes and public roads. The following non- water supply activities occur within the Zone I:

**Zone I Activities:** Although South Hadley Fire District No. 2 owns the entire Zone I area, a dock and storage shed originally belonging to an abutting property owner still exists and is in use within the Zone I.

### Zone I Recommendations:

- ✓ To the extent possible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.

**2. Sand and gravel mining** – A sand and gravel mining operation is located within the Zone II. Sand and gravel mining is a potential source of contamination due to the possibility of spills or leaks from heavy equipment, fuel storage, and clandestine dumping.

### Recommendations:

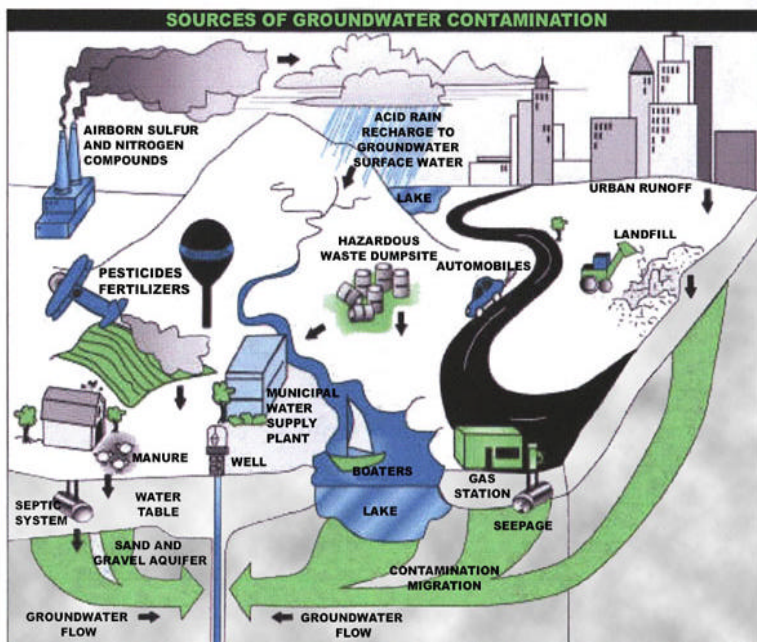

- ✓ Work with the owner to install or allow for the installation of monitoring wells on the northwest side of the mining operations. Annual monitoring for extractable petroleum hydrocarbons (EPH) would potentially allow for the early detection of releases of diesel fuel or gasoline that could impact the well.
- ✓ Encourage Best Management Practices for storage, use, and disposal of oil,

## Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

© 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

- fuel, and hazardous materials.
- ✓ Inspect the Zone II for signs of clandestine dumping on a regular basis.

**3. Residential Land Uses** – The residential areas within the Zone II do not have public sewers and, therefore, use septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) and the associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix C and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls. Visit DEP’s web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**4. Underground Storage Tanks** – At least one UST is located within the Zone II area based upon a UST survey conducted by the water supplier. If managed improperly, underground storage tanks and the associated fuel lines can be potential sources of contamination due to leaks or spills of the chemicals they store.

**Recommendation:**

- ✓ Encourage the UST owner to replace the UST with an above ground tank (AST) located on an impervious surface with proper spill containment. Grant money may be available for the UST removal through Massachusetts Department of Revenue. See the conclusions in Section 3 below for more information regarding grant/loan programs.

**What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**For More Information**

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix A: Regulated Facilities within the Water Supply Protection Areas

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Agricultural</b>			
Livestock Operations	1	Moderate	Manure (microbial contaminants): improper handling
Manure Spreading	some	High	Manure (microbial contaminants): improper handling
<b>Residential</b>			
Fuel Oil Storage (at residences)	numerous	Moderate	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	numerous	Moderate	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	numerous	Moderate	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Fishing/Boating	-	Low	Fuel and other chemical spills, microbial contaminants
Transportation Corridor	1	Moderate	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Underground Storage Tanks	1	High	Stored materials: spills, leaks, or improper handling

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix A: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix B: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

(Continued from page 4)

**5. Manure Spreading** – Manure spreading on crop land occurs within the Zone II. Given the semi-confined nature of the Dry Brook aquifer, microbial contamination is probably not a significant concern. However, nitrate and nitrite contamination from manure spreading applications could potentially impact the water quality at the well.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Work with farmers to investigate grants and loans designed to protect surface and groundwater. See <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> for more information on the USDA Environmental Quality Incentives Program (EQIP). Information on the MA Department Agricultural Resources' Agricultural Environmental Enhancement Program (AEEP) is available on the web at <http://www.state.ma.us/dfa/programs/aEEP/>.

**6. Protection Planning** – Currently, the Town of South Hadley has water supply protection controls that meet DEP's Wellhead Protection regulations 310 CMR 22.21(2). However, the Town's Water Supply Protection District bylaws should clearly define the boundaries of the district as corresponding to the Primary and Secondary Recharge Areas for Existing and Potential Public Water Supply Wells and Watershed Area for Public Water Supply Reservoir as shown on the map titled "South Hadley Water Protection Area". Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. South Hadley currently has a Wellhead Protection Plan.

**Protection Planning Recommendations:**

- ✓ Verify that the newly approved Zone II is covered by the existing Water Supply Protection District.
- ✓ Work with town boards to review and provide recommendations on proposed development within your water supply protection areas. To obtain information on build-out analyses for the town, see the Executive Office of Environmental Affairs' community preservation web site, <http://commpres.env.state.ma.us/>.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### Section 3: Source Water Protection Conclusions and Recommendations

**Current Land Uses and Source Protection:**

As with many water supply protection areas, Dry Brook Well's Zone II contains potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Having a Wellhead Protection Plan;
- Having a formal Emergency Response Plan;
- Having a wellhead protection committee;

#### Top 5 Reasons to Develop a Local Wellhead Protection Plan

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

### What is a Zone III?

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

- Providing wellhead protection education to schools and colleges; and,
- In general being proactive relative to wellhead protection issues.

#### Source Protection Recommendations:

To better protect the sources for the future:

- ✓ Continue working with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Monitor progress on any remedial action conducted for oil or hazardous waste contamination sites that may be identified in the Zone II in the future.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.

#### Conclusions:

These recommendations are only part of your ongoing local drinking water source protection.

Additional source protection recommendations are listed in Table 3 and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. Grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. Grants are also available from the Massachusetts Department of Revenue's (DOR's) Underground Storage Tank (UST) Program for the removal of

underground storage tanks. For more information regarding the DOR UST, program visit their website at: [http://www.dor.state.ma.us/ust/ust\\_home.htm](http://www.dor.state.ma.us/ust/ust_home.htm).

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## Section 4: Appendices

- A. Regulated Facilities within the Water Supply Protection Area
- B. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- C. Additional Documents on Source Protection

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

**Table 3: Current Protection and Recommendations**

<b>Protection Measures</b>	<b>Status</b>	<b>Recommendations</b>
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>YES</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue routine inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue relationship with the owner of the dock and shed to not store chemicals, pesticides, petroleum products or other hazardous materials within the Zone I.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21 (2)?	<b>YES</b>	Verify that the recently approved Zone II falls within the existing Water Supply Protection District. Request a modification of the District boundaries as appropriate.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>YES</b>	Update the plan as appropriate to include any new information from the Zone II delineation.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Continue current efforts in the joint emergency response plan with fire department, Board of Health, DPW, and state emergency response officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>YES</b>	
Does the PWS provide wellhead protection education?	<b>YES</b>	

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Southampton Water Department**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

<i><b>Phone Number</b></i>	413-527-3664

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

### Zone II # 201

*Susceptibility: High*

Source Name:	Source ID
College Highway	1276000-01G

Southampton is a small, agricultural/residential town in the Connecticut River Valley of western Massachusetts. The Southampton Water Department maintains and operates a single groundwater source and supplements the system by drawing raw surface water from the City of Holyoke's 42-inch transmission main (by legislated right), served by the Tighe-Carmody Reservoir. For information regarding that source, please refer to the Source Water Assessment and Protection Report for the City of Holyoke. Southampton is in the process of developing a replacement well for 01G as the well has been experiencing diminished capacity due to deterioration of the screen. The replacement well is located immediately adjacent to (within 50 feet of) the College Highway Well (01G) and the Zone II recharge area will be the same. The well has a Zone I protective radius of 400 feet and approved withdrawal rate of 0.792 MGD. The Zone I includes a small area of College Highway and an undeveloped field. The Zone II was delineated utilizing data developed during an extended duration pumping test, geological mapping and analytical modelling.

The aquifer is part of the Barnes Aquifer, an extensive sand and gravel aquifer that has been designated by the EPA as a "Sole Source Aquifer". The aquifer extends through Holyoke, Westfield, Southampton and Easthampton. The Zone II for the College Highway well is aerially extensive and extends through Southampton and into Westfield to the south. The Barnes Aquifer Protection Committee consists of representatives of each of the communities to work together on a regional basis to promote education about and protection of the aquifer. The well is located downgradient (north) of a point at which two, one-half mile wide, buried valley (Manhan River and Moose Brook) aquifers merge and discharge further to the north and east into the Connecticut River Valley. The aquifer is comprised of glacially deepened bedrock valleys that were filled with sand and gravel during the glacial recession (melting) some 10,000 years ago. Glacial Lake Hitchcock was formed throughout much of the Connecticut River Valley leaving some areas with an extensive clay confining unit. The College Highway well is a flowing artesian well due to a thick, confined clay unit located in the immediate vicinity of the well. However, the confining clay unit thins out and is non-existent in some portions of the Zone II. Much of the recharge to the aquifer occurs in the unconfined portions of the aquifer and some potentially from the bedrock.

The wells are located in an aquifer with a high vulnerability to contamination due to the absence of a continuous hydrogeologic barrier (i.e. clay) that can prevent contaminant migration from the ground surface. Please refer to the attached map to view the boundaries of the Zone II.

Water from the College Highway well is not treated prior to distribution. Soda ash is added to the water from the Holyoke surface water supply to adjust the pH for corrosion control and disinfected with chlorine prior to distribution. For current information on water quality and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The Zone II for Southampton has primarily residential and agricultural land uses; there are a few commercial, and some industrial land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Non-conforming Zone I
2. Residential land uses
3. Transportation corridors
4. Hazardous materials storage and use
5. Oil or hazardous material contamination sites
6. Comprehensive wellhead protection planning
7. Agricultural activities
8. Rights-of-Way

The overall ranking of susceptibility to contamination for the system is high, based on the presence of several high threat land uses within the water supply protection areas, as seen in Table 2. However, there are numerous safeguards in place to minimize the threat from some of the potential threats. The following summarizes the potential threats and recommendations.

**1. Non-conforming Zone I** – The Zone I for the well is a 400 foot radius around the wellhead. Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Only water supply activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's promulgation of regulations and contain non water supply activities such as homes and public roads. The Zone I for well 01G and the replacement well extends into College Highway. It is unlikely that the Water Department will be able to acquire ownership of the entire Zone I. The Water Department owns the remaining land area within the Zone I for the wells.

### Zone I Recommendations:

- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non-water supply activities out of the Zone I.

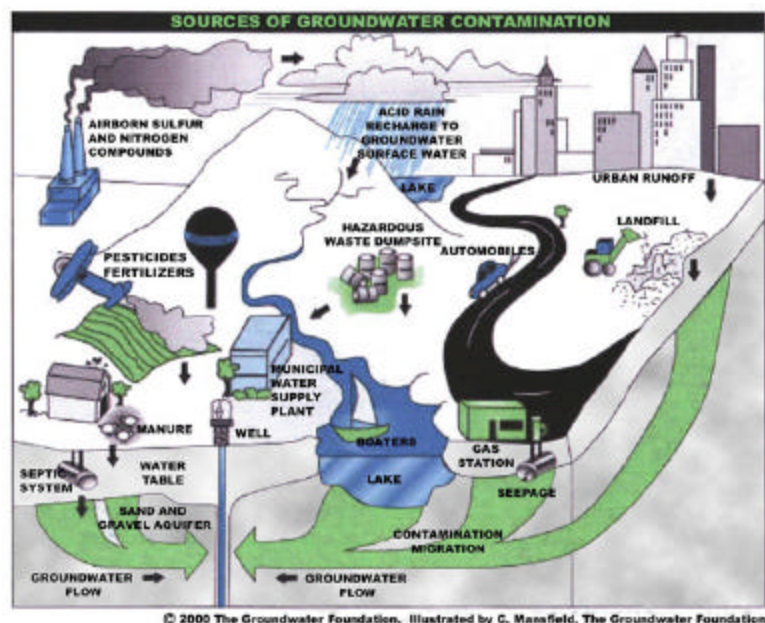

**2. Residential Land Uses** – Approximately 14% of the Zone II land area is residential. The entire Zone II, with the exception of that one commercial area on the northern edge of the Zone II is served by on-site septic disposal systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

© 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Transportation Corridors** – Many state routes run through the Zone IIs of the wells. Local roads are common throughout the Zone IIs. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catch basins.

### Transportation Corridor Recommendations:

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone IIs.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff. For information on DEP's Nonpoint Competitive Grants Program Upcoming Funding Opportunity refer to: <http://www.state.ma.us/dep/brp/mf/mfpubs.htm#wpa>.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone IIs can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.
- ✓ Notify City and town officials of potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP).

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Agricultural</b>			
Dairy Farms	2	M	Manure (microbial contaminants): improper handling
Fertilizer Storage or Use orchards/crops	Several	M	Fertilizers: leaks, spills, improper handling, or over-application
Livestock Operations other than dairy	3	M	Manure (microbial contaminants): improper handling
Pesticide Storage or Use Orchards/crops	Several	H	Pesticides: leaks, spills, improper handling, or over-application
Pesticide/Fertilizer Storage—Farm store	1	H	Leaks, spills, improper handling
<b>Commercial</b>			
Cemeteries	1	M	Over-application of pesticides: leaks, spills, improper handling; historic embalming fluids
Furniture Stripping and Refinishing	1	H	Hazardous chemicals: spills, leaks, or improper handling
Gas Stations	1	H	Automotive fluids and fuels: spills, leaks, or improper handling or storage
Golf Courses	1	M	Fertilizers or pesticides: over-application or improper handling
Junk Yards and Salvage Yards	5	H	Automotive chemicals, wastes, and batteries: spills, leaks, or improper handling
Medical Facilities	1	M	Biological, chemical, and radioactive wastes: spills, leaks, or improper handling or storage
Sand And Gravel Mining/Washing	2	M	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
Hazardous Materials Storage	Several	H	Hazardous materials: spills, leaks, or improper handling or storage
Confirmed Hazardous Waste Sites	2	-	Refer questions to Bureau of Waste Site Cleanup

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Industrial</b>			
Forestry Operation—Sawmill	1	M	Herbicides or pesticides, equipment maintenance materials: leaks, spills, or improper handling; road building
<b>Miscellaneous</b>			
Clandestine Dumping	Numerous	H	Debris containing hazardous materials or wastes
Landfills (closed/capped)	1	H	Seepage of leachate
Small quantity hazardous waste generators	Numerous	M	Hazardous materials and waste: spills, leaks, or improper handling or storage
Rights-of-Way - Type: Natural gas	1	L	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors	Numerous	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Underground Storage Tanks	4	H	Stored materials: spills, leaks, or improper handling
Utility Substation Transformers	1	L	Chemicals and other materials including PCBs: spills, leaks, or improper handling
Very Small Quantity Hazardous Waste	Numerous	L	Hazardous materials and waste: spills, leaks, or improper handling or storage
Stormwater Drains/ Retention Basins	Numerous	L	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Railroad Tracks	1 spur	H	Herbicides; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

- ✓ Storm Drain Stenciling Program - Work with local watershed groups to institute a Storm Drain Stenciling Program. For more information on how to develop a storm drain stenciling program go to <http://www.earthwater-stencils.com>

**4. Hazardous Materials Storage and Use** – A small percentage (less than 1%) of the land area within the Zone IIs is commercial/industrial land use. Even though it is a small percentage of land use, many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store hazardous materials in UST/AST (see Appendix B for a list of registered facilities). If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships among businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure “Industrial Floor Drains” for more information.
- ✓ Promulgate a local hazardous materials handling regulation, conduct routine inspections and provide assistance to businesses.
- ✓ The USDA has various funding sources for government, non-government organizations and agricultural facilities in small communities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. Additional information is available on the web site [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Paul D. Geoffroy, Rural Development Manager at the local office in Hadley at 413-585-1000 ex.4.

**5. Presence of Oil or Hazardous Material Contamination Sites** – The Zone II contains DEP Tier Classified Oil and/or Hazardous Material Release Sites

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ➊ Reduces Risk to Human Health
- ➋ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ➌ Supports municipal bylaws, making them less likely to be challenged
- ➍ Ensures clean drinking water supplies for future generations
- ➎ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water is a place people want to live and businesses want to locate.

indicated on the map as Release Tracking Numbers 1-0011448 and 1-0000264. Refer to the attached map and Appendix 3 for more information.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.

**6. Agricultural Activities** – There are several farms within the Zone IIs. Approximately 29% of the land use within each of the Zone IIs is as cropland and pasturelands. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Review the fact sheet available on line and call the local office (Amherst 413-253-4350) of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Encourage the farmers and golf course managers to incorporate an Integrated

Pest Management (IPM) approach into their pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.

- ✓ Work with farmers, nurseries, and golf courses to ensure that pesticides and fertilizers are being stored within a structure designed to prevent runoff.
- ✓ The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available on line and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

**7. Protection Planning** – Currently, the Town has water supply protection controls. However they do not meet DEP's Wellhead Protection regulation 310 CMR 22.21(2). In addition, the Easthampton water supply Zone II is within Southamptton but that area is not protected by Southamptton's bylaws. Westfield does have an ordinance protecting Southamptton's Zone II. Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells.

**Protection Planning Recommendations:**

- ✓ Develop a Wellhead Protection Plan. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Coordinate efforts with local officials to compare local wellhead protection controls with current MA Wellhead Protection Regulation 310 CMR 22.21 (2). If there are no local controls or they do not meet the current regulation, adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ If local controls do not regulate floor drains, be sure to include floor drain controls that meet 310 CMR 22.21(2).

**8. Rights-of-Way** – There are two rights-of-way within the Zone IIs: railroad and electric. Rail corridors that serve passenger and/or freight trains are a potential source of contamination due to chemicals released during normal use, track maintenance, and accidents. Leaks or spills of transported chemicals or train/track maintenance chemicals are also potential sources of contamination to the water supply. Normal maintenance of any right-of-way, including electrical line rights-of-way, can introduce contaminants to a water supply through herbicide application for vegetation control. The over-application or improper handling of herbicides is a potential source of contamination.

**Rights-of-Way Recommendations:**

- ✓ Review the railroad and electricity right-of-way Yearly Operating Plan to

**What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

**Additional Information**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

ensure Best Management Practices are implemented with regard to vegetation control in the Zone II, and that the utility has accurate information regarding the locations of the wells and the Zone I. Review the maps the utilities use, and provide them with up-to-date maps if necessary.

- ✓ Work with your local fire department to review emergency response plans. Updates to this plan should include the railroad rights-of-way including coordination with the owner/operator of the pipeline, electricity lines, and track and trains using the right-of-way.
- ✓ Request emergency response teams to coordinate Emergency Response Drills and practice containment of potential contaminants from train accidents within the Zone II, which should attempt to include representatives from the owner/operator of the trains utilizing the right-of-way.

Other land uses and activities within the Zone II that are potential sources of contamination are included in Table 2. There are several salvage yards and junk yards within the Zone II. [The Board of Health is aware of these areas and is considering various actions to minimize or eliminate the threat from these facilities.](#) Refer to Appendix B for more information about these land uses. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Inventorying many of the land uses throughout the Zone II.
- Persistent efforts resulting in the removal of a 125,000 tire pile, 500 yards from the well at a cost of more than 3 million dollars.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Coordinate and implement a plan for Easthampton and surrounding communities to remove underground storage tanks to protect the unconfined aquifer from contamination.
- ✓ Monitor progress on any ongoing remedial action conducted for the known contamination sites.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Develop and implement a Wellhead Protection Plan.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

#### **➤ Plan for the Future:**

One of the most effective means of protecting water supplies is local planning, including adoption of local controls to protect land use, regulations related to watersheds and groundwater protection. These controls may include health

ordinances/regulations, discharge prohibitions, general ordinances, and zoning bylaws/ordinances that prohibit or control potential sources of contamination within the protection areas.

➤ **Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	Follow Best Management Practices (BMPs) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone I posted with “Public Drinking Water Supply” Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>YES</b>	Continue monitoring non-water supply activities in Zone Is.
<b>Municipal Controls</b> (Zoning By -laws/Ordinances, Health Regulations, and General By -laws/Ordinances)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>Partial</b>	The Town does have wellhead protection by-laws but they do not meet DEP regulatory requirements. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model by-laws and health regulations and continue efforts to pass by-laws.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>YES</b>	Westfield has ordinances protecting the aquifer.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Develop a wellhead protection plan. Follow “Developing a Local Wellhead Protection Plan” available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	<b>NO</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Establish committee; include representatives from citizens’ groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>Partial</b>	For more guidance see “Hazardous Materials Management: A Community’s Guide” at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>YES</b>	Aim additional efforts at commercial, industrial and municipal uses within the Zone II.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Southwick Water Department**

### What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Southwick Water Department
<i>PWS Address</i>	454 College Highway
<i>City/Town</i>	Southwick, MA 01077
<i>PWS ID Number</i>	1279000
<i>Local Contact</i>	Mr. Peter Jakobowski
<i>Phone Number</i>	(413) 569-6772

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate Best Management Practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

*MA GIS Zone II #: 320*

*Susceptibility: High*

<i>Well Names</i>	<i>Source IDs</i>
Well #1 (Great Brook Well)	1279000-01G

The Town of Southwick is a growing, rural residential community in south western Massachusetts along the Connecticut border. Southwick has recreational activities in the Congamond Lake region and increased pressure in residential, light industry and commercial development. The Southwick Water Department is served by a single source, well #1 (01G). During times of peak demand, water is purchased from the Springfield Water & Sewer Commission system. A separate SWAP report has been completed for the Springfield water system and is attached to this report. The well is located in the northeastern section of Southwick near Feeding Hills Road. The Zone I for the well is a 400 foot radial area and the Zone II recharge area was delineated utilizing empirical data, analytical modeling and geologic mapping. The aquifer is an extensive, very productive, unconfined, sand and gravel, buried valley aquifer; there is no evidence of a confining clay layer in the aquifer. Groundwater flows north to the Westfield River and two other community supplies withdraw from the same aquifer. The source (01G) has an approved maximum daily withdrawal rate of 1.02 million gallons per day (mgd) and a Water Management Act Registration and Permit to withdraw an average, annual daily withdrawal of 0.69 mgd based on historic and projected demand. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers (i.e. clay) that can prevent contaminant migration. Please refer to the attached map to view the boundaries of the Zone II.

The well water does not receive treatment at this time. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The Zone II for Southwick is a mixture of forest, residential and agricultural land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Nonconforming activities in Zone I
2. Residential land uses
3. Transportation corridors and right of way
4. Hazardous materials storage and use
5. Agricultural activities
6. Comprehensive wellhead protection planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection area, as seen in Table 2.

**1. Nonconforming Activities in Zone I** – The Zone I for the well is a 400 foot radius around the wellhead. Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. The Southwick Water Department owns or controls the entire Zone I area. Presently, only water supply activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and contain non water supply activities such as homes and public roads. The Zone I for the system's well contains an area previously used for sand and gravel mining.

**Zone I Recommendations:**

- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Control access and keep all new non water supply activities out of the Zone I.

**2. Residential Land Uses** – Approximately 13% of the Zone II contains residential areas with 8% being high density residential development around the lakes. The Town is in the process of installing municipal sewers along the west side of the Zone II area that will eventually include the lakes area. Presently the majority of the area utilizes on-site septic systems. It appears from the proposed plans that most of the Lakes area will be served by municipal sewer. However, the schools are not at this time proposed to be included. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products

used in homes are potential sources of contamination.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Transportation Corridors and Right of Way** - Local roads run throughout the Zone II. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and washed into catch basins.

A natural gas right of way also run through the watershed. Normal maintenance of any right of way can introduce contaminants to a water supply through herbicide application for vegetation control. The over-application or improper handling of herbicides on right of ways is a potential source of contamination.

**Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and properly cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff. For information on DEP's Nonpoint Competitive Grants Program Upcoming Funding Opportunity refer to: <http://www.state.ma.us/dep/brp/mf/mfpubs.htm#wpa>.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency

response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

- ✓ Notify town officials of potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP).
- ✓ Storm Drain Stenciling Program - Work with local watershed groups to institute a Storm Drain Stenciling Program. For more information on how to develop a storm drain stenciling program go to <http://www.earthwater-stencils.com>.

**Right of Way Recommendations:**

- ✓ Review the right of way Yearly Operating Plan (YOP) for utilities to ensure best management practices are implemented with regard to vegetation control and that the utility has accurate information regarding the locations of the protection zones. Review the

*(Continued on page 6)*

**What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**For More Information**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Agricultural</b>			
Fertilizer Storage or Use	2	M	Fertilizers: leaks, spills, improper handling, or over-application
Livestock Operations	1	M	Manure (microbial contaminants): improper handling
Pesticide Storage or Use	2	H	Pesticides: leaks, spills, improper handling, or over-application
<b>Commercial</b>			
Bus Terminals	1	H	Fuels and maintenance chemicals: spills, leaks, or improper handling.
Sand & Gravel Operation	1	M	Fuels and maintenance chemicals: spills, leaks, or improper handling.
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Schools	3	M	Laboratory, art, photographic, machine shop, cleaning and other chemicals: spills, leaks, or improper handling or storage
Hazardous Waste Generator	—	M	Note: The Schools and Bus Garage are currently registered hazardous waste generators. The Garage does have an industrial holding tank. Hazardous materials spills, discharges, leaks, or improper handling or storage.

**Notes:**

- When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
- For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
- For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

- ✓ maps the utilities use.
- ✓ Continue current efforts toward working with local emergency response planners. Be sure that local emergency response teams are aware of the protection areas and coordinate Emergency Response Drills.

**4. Hazardous Materials Storage and Use** – The Zone II contains facilities that store or use hazardous materials. Many small businesses, schools, and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/ASTs. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

The schools and bus maintenance facility are served by on-site septic system. The bus maintenance facility is presently permitted for an industrial holding tank. There is no record of the facility being registered as a hazardous waste generator. The schools all utilize on-site septic and there is no record of a separate tank for the laboratory wastewater.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Work with the Board of Health, local businesses and facilities to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floor drain requirements. See brochure “Industrial Floor Drains” for more information.
- ✓ The USDA has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. If it is needed, funding may be available for the school and bus terminal. Additional information is available on the web site [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Paul

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

D. Geoffroy, Rural Development Manager at the local office in Hadley at 413-585-1000 ex.4.

**5. Agricultural Activities** – There is pastureland on the western edge of the Zone II and cropland on the eastern edge of the Zone II. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Commercial facilities may be eligible for funding BMPs through the Department of Food and Agriculture or the NRCS. Contact the NRCS about the Environmental Quality Incentives Program (EQIP).

**6. Protection Planning** – Currently, the Town does have water supply protection controls that meet DEP’s Wellhead Protection regulations 310 CMR 22.21(2). Protection planning protects drinking water by managing the land area that

*(Continued on page 7)*

supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells.

#### **Protection Planning Recommendations:**

- ✓ Develop a Wellhead Protection Plan. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Coordinate efforts with local officials to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21 (2). If they do not meet the current regulations, adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ If local controls do not regulate floordrains, be sure to include floordrain controls that meet 310 CMR 22.21(2).
- ✓ Work with town boards to review and provide recommendations on proposed development within your water supply protection areas. To obtain information on build-out analyses for the town, see the Executive Office of Environmental Affairs' community preservation web site, <http://commpres.env.state.ma.us/>.

Other land uses and activities within the Zone II are listed in Table 2. Refer to Table 2 and Appendix 2 for more information about these land uses. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system's Zone II contains potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with local schools and businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Develop and implement a Wellhead Protection Plan.

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

**Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

**➤ Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships between businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

**➤ Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to groundwater contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained, it could be a potential source of microbial contamination. Animal waste is also a source of microbial contamination.

**➤ Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located; what types of land uses and activities pose threats; and how their efforts can enhance protection.

**➤ Plan for the Future:**

One of the most effective means of protecting water supplies is local planning, include adoption of local controls to protect land use, regulations related to watersheds and ground water protection. These controls may include health ordinances/regulations, discharge prohibitions, general ordinances, and zoning bylaws that prohibit or control potential sources of contamination within the protection areas.

**➤ Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available on line and call the local office (Amherst 413-253-4350) of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: when funds are available, each spring DEP posts a new Request for Response for the grant program (RFR).

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

**Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

<b>Protection Measures</b>	<b>Status</b>	<b>Recommendations</b>
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>YES</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>YES</b>	Continue monitoring non-water supply activities in Zone I.
<b>Municipal Controls</b> (Zoning By -laws, Health Regulations, and General By-laws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>YES</b>	The Town "Aquifer Protection District" bylaw meets DEP's 310 CMR 22.21(2).
Do neighboring communities protect the Zone II areas extending into their communities?	<b>N/A</b>	
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Southwick does have a bylaw that complies with DEP regulation. Supplement that protection with a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Continue the current coordination of emergency response drills with local teams.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Establish committee; include representatives from citizen groups, planning groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> . Adopt hazardous materials and UIC regulations and conduct inspections of industries in town.
Does the PWS provide wellhead protection education?	<b>YES</b>	Continue current efforts in education.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREA

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
50494	Powder Mill Middle School	94 Powder Hill Rd	Southwick	Plant	Air Quality Permit Minor	School
211896	School Bus Maintenance Garage	Powder Mill Rd	Southwick	Industrial Wastewater	IWW Holding Tank	Maintenance Garage
378253	Southwick Tolland Regional Schools	80b Powder Mill Rd	Southwick	Handler	Small Quantity Generator Waste Oil/PCBs	Maintenance Garage

### Underground Storage Tanks

Facility Name	Address	Town	Description	Tank Type	Tank Leak Detection	Capacity (gal)	Contents
Saunder's Boat Livery Inc.	120 Congamond Rd	Southwick	Boat Livery	1 Wall	Approved In-Tank Monitor	4000	Gasoline

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitellst.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1: Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)**

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0014428	97 Feeding Hills Road	Southwick	Oil

For more location information, please see the attached map. The map lists the release sites by RTN.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
SODOM MOUNTAIN CAMPGROUND

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 25, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Sodom Mountain Campground
<i>PWS Address</i>	233 South Loomis St
<i>City/Town</i>	Southwick, Massachusetts
<i>PWS ID Number</i>	1279002

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1279002-01G	258	650	High	Moderate
Well #2	1279002-02G	100	410	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1279002-01G)**

Zone I = 258 ft.  
IWPA = 650 ft.

### How Was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic system components within the Zone Is and/or the IWPAs. The **moderate** susceptibility to potential non-microbial threats is based on the parking areas within the Zone Is and/or the IWPAs.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, a Sanitary Survey, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment and Protection (SWAP) Report for The Ranch Golf Club

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department  
of Environmental Protection,  
Bureau of Resource  
Protection,  
Drinking Water Program

Date Prepared:  
June 3, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road de-icing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Ranch Golf Club is an 18-hole golf course and clubhouse located in the town of Southwick, a small primarily agricultural/residential community with some industrial land uses, located in southwestern Massachusetts along the Connecticut border. The Ranch owns and operates two water supply sources. Well #1 (01G) serves the maintenance shop and clubhouse and Well #2 (02G) serves a small bathroom on the north side of the course.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The Zone I is the protected area immediately surrounding the wellhead while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and IWPA radii for the Ranch wells were based on approved pumping rates determined following extended duration pumping tests conducted on each well as part of the New Source Approval process. The Zone I and IWPA for Well #1 are 183 feet and 488 feet, respectively. The Zone I and IWPA for Well #2 are 100 feet and 424 feet, respectively. The wells were approved through the NSA and therefore are in compliance with the Zone I requirement that prohibits all but water supply activities from the Zone I. Please refer to the attached map of the Zone I and IWPA.

Geologic mapping of the area indicates the overburden material at the site is glacial till of varying thickness; the underlying bedrock aquifer from which the wells withdraw is composed of the Deerfield Arkose, which is equivalent to the New Haven Arkose of the Triassic Period. Although there is some material overlying the bedrock aquifer utilized by the Ranch sources, there is no evidence of a significant hydraulic barrier at the surface. Wells located in these geologic conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Refer to Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

The protection areas for the wells include few activities that pose significant threats to the aquifer. There are a few residences and the golf course within the IWPA.

#### Key issues include:

1. **Golf course**
2. **Transportation corridor**
3. **Residential land use**

The overall ranking of susceptibility to contamination for the Ranch water supply wells is moderate based on the presence of several moderate ranked potentially threatening

**Table 2: Table of Activities within the Water Supply Protection Areas for Both Sources**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Golf course	No	Yes	Moderate	Integrated Pest Management should be used at the course. Review regulatory restrictions of pesticides in IWPA's.
Transportation corridor	No	Yes	Moderate	Limit road salt usage and provide drainage away from wells
Residential development	No	Yes	Moderate	Supply BMPs to residents
Septic	No	Yes	Moderate	Supply BMPs to residents.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

land uses or activities in the IWPA. Continued monitoring and use of Best Management Practices (BMPs) is recommended to prevent accidents and minimize threats within the protection areas of the wellhead. Please note that the well cap on Well #2 at the time of the assessment was not a sanitary or secure well cap and there was soil slumping around the well casing providing a potential conduit for surface runoff to impact the well. It is recommended that you replace the cap prior to the first seasonal sampling of the well and correct the drainage around the wellhead to provide drainage away from the casing. In addition, there is a small intermittent drainage area adjacent to Well #2. Be sure that seasonal and intermittent drainage does not flow toward the wellhead.

**1. Golf course** – The system is part of a golf course. Pesticides, fertilizers and hazardous materials utilized as part of the normal operation of a course, have the potential to contaminate a drinking water source if improperly stored, applied, or disposed.

Very often golf courses have maintenance garages for

equipment and may have storage tanks for hazardous materials. The Ranch is not registered as a hazardous waste generator. The maintenance garage is located outside of the protection areas and topographically downgradient from the wells. However, as noted previously, the IWPA does not provide a scientific determination of the contribution area to a well. If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store. We recommend the use of BMPs for all activities that are a potential source of contamination.

#### **Golf Course Recommendations:**

- ✓ Incorporate an Integrated Pest Management (IPM) approach into the course management program. IPM is an ecologically based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Pesticide applicators at the course must be made aware of the IWPA areas. The Massachusetts Pesticide Bureau regulates products that may be applied in water supply protection areas.
- ✓ Review the use of hazardous materials in the maintenance facility and determine if the facility should be registered as a hazardous waste generator.
- ✓ Promote the use of BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

**2. Transportation corridor** – Well #2 is located adjacent to a rural residential road. The potential threats from the road are deicing materials, runoff, accidental spills or access by the public.

#### **Recommendations:**

- ✓ Work with the Town to ensure that road runoff is directed where feasible, to an area downgradient (southeast) of the well.
- ✓ Prepare an Emergency Response Plan that includes coordination among the DEP, the Water Department, the Town and State Police in the event of an accident near the wellhead.

**3. Residential Land Uses** – There are few residences located within the protection area. None of the areas have public sewers to treat wastewater; therefore on-site septic systems are used. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they might be a potential source of microbial contamination.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** - Catchbasins transport stormwater from roadways and adjacent properties to the ground and streams. Flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

## Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

## 4. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. Please review and adopt the key recommendations above and the following:

### Priority Recommendations:

- ✓ Incorporate IPM into course management.

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Prohibit public access to the well. Secure caps, gating roads, and posting signs as appropriate.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ Re-grade the area around the wellhead and ensure it slopes away from well casing. Any natural periodic drainage or runoff near the well should be controlled and directed away from the well.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.

### Planning:

- ✓ Work with local officials in Southwick to include the IWPA's into the Aquifer Protection District.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory

to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

Copies of this report have been forwarded to the water supplier and Town officials.

- Recommended Source Protection Measures Fact sheet
- Your Septic System Brochure

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Springfield Water and Sewer Commission**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

### Introduction

We are all concerned about the quality of the water we drink. Drinking water reservoirs may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

## Glossary Protection Zones

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

## Section 1: Description of the Water System

### *System Susceptibility:*

Moderate

<i>Source Name</i>	<i>Source ID</i>	<i>Susceptibility</i>
--------------------	------------------	-----------------------

Cobble Mountain Reservoir	1281000-02S	Moderate
Borden Brook Reservoir	1281000-04S	Moderate
Sedimentation Basin	1281000-05S	Moderate

Springfield, the largest municipality in western Massachusetts, is located in the Connecticut River Valley near the Connecticut border. Springfield Water and Sewer Commission (SWSC) provides water for the greater Springfield metropolitan area including Springfield, Agawam, Longmeadow, East Longmeadow and Ludlow; it also provides a back-up/supplemental supply for Southwick, Westfield and West Springfield. The SWSC utilizes the Cobble Mountain Reservoir system located in the Little River watershed partially located in the towns of Russell, Tolland, Blandford, Granville, Westfield and Otis. The system includes Cobble Mountain Reservoir (1281000-02S), the adjacent Borden Brook Reservoir (1281000-04S) and Sedimentation Basin (1281000-05S) located at the in-take to the water filtration plant, the West Parrish Filters. SWSC also maintains Ludlow Reservoir 1281000-01S as an Emergency Source. As a reserve for severe drought conditions, the SWSC also has water rights to 86 feet of water elevation from the Littleville Reservoir which is designated as an Emergency Source of water 1281000-03S. This report does not address the land uses in the Emergency Source watersheds.

The Cobble Mountain/Borden Brook watershed is located in the foothills of the Berkshires on the eastern side of the Berkshire Massif. The topography of the watershed consists primarily of steeply sloping brook valleys and rolling hills. The overburden material within the watershed is predominantly a thin cover of glacial till, often referred to as hard pan, with significant areas of exposed bedrock. Some of the brook valleys have limited deposits of glacial, stratified drift (sand and gravel) or recent alluvium which are locally mined. The bedrock in the watershed is mapped as several formations consisting of igneous and metamorphic rocks. The structural geology of the region is highly complex with four stages of folding and several faults resulting in numerous unconformities between rock types in the area.

The SWSC owns approximately 47% of the Cobble Mountain/Borden Brook system watershed; an additional 25% of the remaining watershed is forest or agriculture land (Chapter 61). Land use within the Cobble Mountain/Borden Brook watershed is primarily forested upland (nearly 80%) with the remaining watershed consisting of residential and agricultural activities (both commercial and non-commercial) such as crop land, animal husbandry and forestry; a small percentage of land is utilized as commercial and transportation related land use. The SWSC owns about 97% of Sedimentation Basin watershed; about 80% of the watershed is forest and the remaining land use is associated with water supply related activities. Please refer to the attached map to view the boundaries of the protective zones.

Water from the reservoirs is treated through a rapid sand or slow sand filtration

system, then chlorinated for disinfection and pH adjusted with soda ash for corrosion control. For current information on water quality monitoring results and treatment processes, please contact Katherine Pederson at 413-787-6256 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

There are few activities that pose significant anthropogenic threats to the reservoirs. However, due to the nature of surface water supplies the source is considered highly vulnerable to natural and anthropogenic potential contamination. Land uses and activities that are considered potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Activities in Zone A
2. Residential land use
3. Transportation corridors and Rights-of-way
4. Agriculture and Golf course
5. Hazardous material handling
6. Protection planning

The overall ranking of susceptibility to contamination for the system is moderate, based on the presence of at least one moderate threat land use within the water supply protection areas, as seen in Table 2.

**1. Activities in Zone A** - The Zone A for a reservoir includes all areas within 400 feet of the reservoir shoreline and within 200 feet of either side of all streams and feeder ponds that flow into the reservoir. The Zone A is the area closest to the reservoir and its tributaries, therefore land uses within the Zone A are of particular concern. Activities that could potentially threaten water quality if improperly managed are restricted by 310 CMR 22.20B. Activities that store, use, or dispose of hazardous materials can be potential sources of contamination if improperly managed. Wild animals, farm animals and domestic pets can be carriers of waterborne diseases such as Giardia, Cryptosporidium, Salmonella, etc.

The SWSC owns or controls 95% of the Zone A land around the reservoirs and 47% of the total watershed lands. The following activities occur in the Zone A of the system's reservoirs:

**Cobble Mountain Reservoir (02S)** - Activities include: state and interstate highways, local roads, agriculture, residential homes (all of which are on private septic systems), utility rights-of-way, a hydroelectric generation station, two gravel pit operations and a few commercial facilities. Most of these activities, with the exception of the hydroelectric generation station and the SWSC gravel pit, occur within the Zone A of tributary streams remote from the reservoir. The transformers at the hydroelectric generation facility have been relocated outside of the Zone A and a

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

MODIFIED FROM © 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

Figure 1: Sample watershed with examples of potential sources of contamination

decreased hazard mineral oil is used in oil-bearing machinery. In addition, stormwater runoff at the facility has been addressed by reconstruction of the access road and the installation of an oil-water separator and deep sump catch basins. A tarmac drain still exists on the access road, posing a potential threat in the event of an accident. However, the facility upgrades have significantly improved source protection at the facility. The facility is a very small quantity hazardous waste generator and must maintain best management practices and exceptional housekeeping to protect the source.

The SWSC owns three gravel pits, but uses them infrequently. Two pits are located within the Zone A. The threat associated with gravel operations include: petroleum products from equipment used or stored on site, erosion and runoff from the facility, access by off-road vehicles and illegal dumping of potentially harmful materials.

**Borden Brook Reservoir (04S)** - Activities include local roads, agriculture, residential homes (utilizing private septic systems), and at least one small commercial facility. The resident manager's home is located within the Zone A of Borden Brook Reservoir. That facility has a single family residence and a maintenance garage with four above ground petroleum storage tanks. The two diesel tanks for equipment refueling located at the maintenance garage have secondary containment and a roof over the tanks; the other two fuel oil tanks located in the basement of the residence do not have containment and the fuel lines are not sleeved, however, the floor is cement, there are no cracks and there are no floor drains. There is only minor maintenance work conducted at the garage with waste oil stored on a containment pallet. The small amounts of fuel (gasoline) kept on-site is stored in a metal "flammables" cabinet. The Borden Brook garage is not a registered hazardous waste generator.

**Sedimentation Basin (05S)** - The Zone A extends 400 feet downstream of the intake structure on Sedimentation Basin. Therefore, the land use table on the

SWAP map indicates activities other than forest and water within the Zone A of Sedimentation Basin. However, only water supply activities are conducted in the watershed and all of the treatment facilities are located downgradient of the pond, outside of the watershed.

#### Zone A Recommendations:

- ✓ To the extent possible, remove all prohibited activities from the Zone A to comply with DEP's Zone A requirements.
- ✓ To the extent feasible, remove all petroleum products from the Zone A. For those facilities that are required, provide containment for fuel oil and sleeve delivery lines. Monitor delivery of products and removal of waste products.
- ✓ Review the use of hazardous materials and amount of waste generated to determine if registration is warranted.
- ✓ Continue the current use of BMPs for the storage, use, and disposal of hazardous materials such as maintenance chemicals.
- ✓ Storage of pesticides, fertilizers or road deicing materials within the Zone A should be covered and contained.

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### Source Protection Decreases Risk

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watersheds**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Areas

Activities	Quantity	Threat*	Source ID	Potential Source of Contamination
<b>Agricultural</b>				
Livestock Operations (commercial and non-commercial)	12	M	02S, 04S	Manure (microbial contaminants, nutrients): improper handling, erosion.
Forestry Operations	Numerous	M	02S, 04S	Leaks and spills, improper handling of petroleum products in equipment. Erosion.
Nurseries	1	M	02S	Fertilizers, pesticides, and other chemicals: leaks, spills, improper handling, or over-application.
Agriculture—Pesticide/Fertilizer Storage or Use	Numerous	M	02S, 04S	Pesticides/fertilizers: leaks, spills, improper handling, or over-application. Petroleum products management for equipment.
<b>Commercial</b>				
Cemeteries	3	L	02S, 04S	Pesticide usage, historic embalming fluids. Spills from lawn equipment, management of petroleum products.
Confirmed Oil or Hazardous Material Release Sites	1	--	02S	Tier Classified Oil or Hazardous Materials Sites are not ranked due to their site-specific character. Individual sites are identified in Appendix B.
Road and Maintenance Garage/Depots	3	M	02S	Deicing materials, automotive fluids, fuel storage, and other chemicals: spills, leaks, or improper handling or storage.
Schools	1	M	02S	Fuel oil, laboratory, art, photographic, machine shop, and other chemicals: spills, leaks, or improper handling or storage.
Very Small/Small Quantity Hazardous Waste Generators	Few	M	02S	Hazardous materials and waste: spills, leaks, or improper handling or storage.
Quarry/Mining	4	M	02S, 04S	Petroleum products and waste: spills, leaks, or improper handling or storage. Illegal dumping and erosion.
Hazardous Materials Storage/Use	Few	M	02S	Hazardous materials and waste: spills, leaks, or improper handling or storage.

Activities	Quantity	Threat*	Source ID	Potential Source of Contamination
<b>Miscellaneous</b>				
Stormwater Drains/ Retention Basins	Numerous	L	02S, 04S	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns.
Residential	Numerous	M	02S, 04S	Fuel oil: spills, leaks, or improper handling. Household hazardous materials, fertilizers, pesticides, etc.
Transportation Corridors	Numerous	M	02S, 04S	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling.
Underground Storage Tanks	12	M	02S	Stored materials: spills, leaks, or improper handling.
Aboveground Storage Tanks	Numerous	M	02S, 04S	Stored materials: spills, leaks, or improper handling.
Utility Rights-of-Way	2	L/M	02S, 04S	SWSC has requested that utilities do not use pesticides.

**Table 2 Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

- ✓ To the extent possible, inform landowners within the Zone A regarding the use of BMPs.
- ✓ Prohibit all new non-water supply activities from the Zone A.
- ✓ Continue increased patrols and enforce the no trespassing requirement.
- ✓ Continue the practice of prioritizing land to be acquired. Acquiring land and/or acquiring conservation easements is critical to source protection.
- ✓ Closely monitor activities at the hydroelectric generation station to ensure the use of BMPs and good housekeeping practices.
- ✓ Review the Spill Prevention Control and Countermeasure Plan (SPCC) for the hydroelectric generation station with the utility to be sure it includes specific response plans in the event of an accident either inside or on the access road to the facility. Ensure the plan is readily available and staff are familiar with the plan.
- ✓ Carefully manage all activities at the gravel pit operations within the Zone A, specifically erosion. Implement BMPs for the storage, use, and disposal of hazardous materials related to equipment. Control access to prohibit off road vehicles and dumping.
- ✓ Where it is appropriate, consider developing a closure plan for unused portions of the gravel pits and for long term reclamation to minimize erosion and prevent trespassing.

**2. Residential Land Uses** – There are numerous residences located within the Cobble Mountain and Borden Brook Reservoir watersheds. None of the areas have public sewers to treat wastewater, therefore on-site septic systems are used. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Continue current efforts of negotiating fee simple purchase, Right of First refusal agreement, conservation restrictions and Memorandum of Understanding for land not currently owned or controlled by the SWSC.
- ✓ Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

**Top 5 Reasons to Develop a Local Surface Water Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

**3. Transportation Corridors and Rights-of-way** - The Massachusetts Turnpike runs through the northern edge of the Cobble Mountain watershed. There are also numerous local roads throughout both the Cobble Mountain and the Borden Brook watersheds, including many dirt roads. Although most roadways in the watersheds are relatively low-use, even typical roadway maintenance and low use pose a potentially significant source of contamination from accidents and washouts along both the paved and dirt roads, especially in the Zone A. Larger, heavily traveled roads pose a greater threat. De-icing materials, petroleum chemicals and other debris on roads are picked up by stormwater, washed and discharge into the feeder streams and reservoirs. Uncontrolled erosion contributes sediment, various contaminants and pathogens into the reservoirs. Clandestine dumping is identified as a significant threat to water supplies because roadways can be sites for illegal dumping of hazardous or other potentially harmful wastes. The SWSC has closed off access to one of the roadways near the reservoir, reducing illegal dumping that had occurred at that location.

There are numerous unpaved roadways as well as legal (authorized) and illegal (unauthorized) trails throughout the watershed. Erosion poses a significant threat to water quality in areas that are proximal to feeder streams and the reservoirs,

potentially resulting in additional water treatment costs if they continue unchecked. Uncontrolled erosion contributes sediment, various contaminants and pathogens into the contributing waters and reservoirs. SWSC does not allow public access to their watershed land except by License Agreement, or under the terms of the Massachusetts Department of Environmental Management (DEM) Conservation Restriction purchased on 1,450 acres. Unmanaged access may result in vandalism and/or illegal dumping which might cause water quality impairment.

The SWSC has an approved Surface Water Protection Plan and a Watershed Management Program. The SWSC's watershed management strategy included hiring a forester who also is the resident site manager and conducts watershed inspections. The plan also includes continued forest management, prioritizing road and trail maintenance, and watershed access control. The team is preparing an inventory of the existing conditions within the watershed and it has determined numerous areas of uncontrolled access and erosion problems. The team will develop and implement BMPs including the replacement of culverts or the use of temporary bridges. The SWSC maintains a "no access without written permission" policy for all but the 1,450 acres of land most recently purchased through the Aquifer Land Acquisition (ALA) program. Access to the land purchased through ALA funding is governed by the DEM Conservation Restriction that details allowable activities and public access to that land; there is no formal access management plan.

Electric and natural gas rights-of-way also run through the watershed. Normal maintenance of any right-of-way can introduce contaminants to a water supply through herbicide application for vegetation control. The SWSC has requested that utilities use only mechanical methods to control vegetation on rights-of-way within the Little River watershed.

#### **Transportation Corridor Recommendations:**

- ✓ Continue regular inspection of watersheds for signs of access, illegal dumping and spills.
- ✓ Work with local emergency response teams to ensure that any spills within the protection areas can be effectively contained.
- ✓ Continue current efforts toward working with host communities and the MAHD to have catch basins inspected, maintained, and cleaned on a regular schedule.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps are not yet available, work with town and State officials to investigate mapping options. This recommendation applies primarily to Route 23 and the Turnpike.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Continue increased patrols of watershed land and enforce no trespassing.
- ✓ Notify community officials within your watershed of potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.rurdev.usda.gov](http://www.rurdev.usda.gov) or call the Rural Development Manager at the local office in Hadley at 413-585-1000. Review the fact sheet available online and call the NRCS office in Amherst 413-253-4350 for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Continue investigating disposition of all roads, ways and "trails" and pursue as appropriate, closing or controlling access.
- ✓ Evaluate existing conditions throughout the watershed with respect to current illegal use of watershed land. Determine where access is being gained and the destination points to facilitate development of a management

#### **For More Information**

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, town boards, and the local media.

strategy to eliminate or control access. As appropriate, coordinate management strategies with the communities within the watersheds.

- ✓ Continue to evaluate past forest management practice and update a water supply forest management plan as appropriate.

#### **Rights-of-way Recommendations:**

- ✓ Continue current practice of reviewing the right-of-way Yearly Operating Plan (YOP) for utilities to ensure they continue use of only manual control of vegetation and that the utility has accurate information regarding the locations of the protection zones. Review the maps the utilities use.
- ✓ Continue current efforts toward working with local emergency response planners. Be sure that local emergency response teams are aware of the protection areas and coordinate Emergency Response Drills.

#### **4. Agricultural Activities and Golf Course** – The watersheds include a small

percentage, approximately 3%, of land for agricultural activities and a golf course. Pesticides, fertilizers and manure have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store. Frequently, farms and golf courses have maintenance garages for equipment and storage tanks.

**Agricultural Activities and Golf Course Recommendations:**

- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Review the fact sheet available online and call the local office of the NRCS in Hadley at 413-585-1000 for assistance or online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Encourage farmers and golf course managers to incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Promote the use of BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.
- ✓ Continue your current work with farmers, and include nurseries and the golf course to ensure that pesticides and fertilizers are being stored within a structure designed to prevent runoff.
- ✓ The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>. This may be appropriate for host communities.
- ✓ Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

**5. Protection Planning** – The SWSC has an approved Water Supply Protection Plan, however, plans periodically require updating to reflect completed tasks and new conditions. An updated plan has recently been submitted to the Department for review. An effective overall protection plan will not only include detailed land use, but also includes: coordinated community efforts which identify protection strategies, establishing a timeframe for implementation, and provides a forum for public education and outreach. The watershed is primarily woodland with a large portion of the land managed through forestry operations. Good forest management of both SWSC land and private land can beneficially impact water quality and health of the watershed forests.

**Protection Planning Recommendations:**

- ✓ Continue active watershed protection planning and forest management for water supply protection in a comprehensive watershed plan.
- ✓ Encourage and support efforts by private land owners in active forest management for water supply protection.
- ✓ Continue working with communities and their local officials and boards in the watershed in active watershed protection planning and education efforts.

Land uses and activities within the watershed that are potential sources of contamination are included in Table 2. Identifying potential sources of contamination is an important initial step toward protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system's watershed contains potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- re-establishing a resident manager at the reservoir,
- investigating the legal disposition of roads and ways in the watershed and controlling access to the watershed,
- active involvement in inspecting and inventorying land uses in the watershed,
- proactive involvement with host communities by assisting with grant proposals for watershed protection projects,
- proactive land acquisition and acquisition of conservation restrictions to control activities in the Zone As, and
- fostering cooperative relationships with communities and land owners within the watersheds.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Continue inspection of the Zone A protection areas regularly, and when feasible, remove or manage any non-water supply activities, specifically the maintenance activities and fuel oil storage in Zone A.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Continue cooperation and communication with emergency response teams to ensure that they are aware of the boundaries of the watershed for notification of spills or accidents.
- ✓ Continue working with landowners in your protection areas to make them aware of your water supply and to encourage the use of best management practices for residential and recreational uses.
- ✓ Update the Watershed Protection Plan for water supply protection to include a management plan for the areas open to public access.
- ✓ Evaluate stormwater drainage specifically in the Zone A along roads throughout the watershed. Make every effort to ensure stormwater discharges and run-off is detained prior to release to protection areas. Consider various strategies to detain/slow the flow and retain sediments to keep the runoff out of tributaries and the reservoirs.
- ✓ If local controls do not regulate floor drains, encourage communities to adopt floor drain controls and hazardous waste management strategies.
- ✓ Request that local highway departments inspect, maintain, and clean catch basins on a regular schedule.
- ✓ Continue a forest management program to establish a healthy and ideal watershed forest, which will buffer anthropogenic and natural environmental impacts on water quality and quantity.
- ✓ In locations where residential and commercial land uses are within the Zone A, consider conducting stream flow and water quality monitoring to determine potential effects of these activities on water quality.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues, above and in Appendix A.

#### ➤ **Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships among businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

#### ➤ **Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to water supply contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Animal waste is also a source of microbial contamination.

#### ➤ **Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the source protection areas are located, what types of land uses and activities pose threats, and how their efforts can enhance protection.

#### ➤ **Plan for the Future:**

One of the most effective means of protecting water supplies is local planning, including adoption of local controls to protect land use and regulations related to watershed protection. These controls may include health regulations, discharge prohibitions, general ordinances, and zoning bylaws/ordinances that prohibit or control potential sources of contamination within the protection areas.

➤ **Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=equip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online and call the local office (Hadley 413-585-1000) of the NRCS for assistance or online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>. The Department's Grant Programs provide funds to assist public water suppliers and their partners in addressing various local projects. Protection recommendations discussed in this document may be eligible for funding under these grant programs. If funds are available, each spring DEP posts a new Request for Response (RFR) for the grant programs. Visit the DEP online at <http://www.state.ma.us/dep/brp/mf/othergrt.htm> and <http://www.state.ma.us/dep/brp/dws/grants.htm> for information about available funds.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help establish local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the protection areas. Use this information to establish priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Areas
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone A?	<b>YES (95%)</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Continue efforts to acquire critical land for protection.
Is the Zone A posted with "Public Drinking Water Supply" or "No Trespassing" signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone A regularly inspected?	<b>YES</b>	Continue regular inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone A?	<b>YES</b>	Continue monitoring non-water supply activities in Zone As.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, Ordinances and General Bylaws)		
Do the watershed municipalities have Surface Water Protection Controls that meet 310 CMR 22.20C?	<b>NO</b>	Granville is working on an Open Space Plan to address land use in the town. The Blandford Watershed Protection bylaw for the Long Pond watershed complies with DEP's regulation. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws, health regulations, and current regulations.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>NO</b>	Work with neighboring municipalities to include the watershed in their protection controls.
<b>Planning</b>		
Does the PWS have a local surface water supply protection plan?	<b>YES</b>	Update the Plan as appropriate to address newly identified threats and to adjust protection priorities as tasks are completed.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Update the Plan as appropriate by developing a joint emergency response plan with the Fire Department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams. Complete vulnerability assessment as appropriate for the system.
Does the municipality have a watershed protection committee?	<b>NO</b>	Consider establishing a committee that includes representatives from citizens' groups, communities that your watershed is within, and the business community.
Do the Boards of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> . However, there are very few hazardous materials users in the watershed.
Does the PWS provide watershed protection education?	<b>YES</b>	Aim additional efforts at commercial, industrial and municipal uses within the watershed.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREAS

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
38152	Ma Turnpike Auth	Old Chester Rd Blandford Maint	Blandford	Hazardous Waste Generator	SQG-MA	Highway Maintenance Garage
				Hazardous Waste Generator	VSQG	
178320	Mobil Oil Corp SS Ken	Mm 29 - Ma Tnpk East Bound	Blandford	Hazardous Waste Generator	VSQG	Garage
38152	MTA Blandford Maintenance Depot	Mass Tnpk East Mm 26, Old Chester Rd	Blandford	Fuel Dispenser	Fuel Dispenser	Gasoline Station
366334	Circle K Store 2704492	Mass Turnpike East Mm 29.1	Blandford	Fuel Dispenser	Fuel Dispenser	Gasoline Station
MAV000016827	Town Of Blandford, Hwy Dept.	Otis Road	Blandford	Hazardous Waste Generator	VSQG	Garage
	Chester Granite Company	Algerie Road	Blandford	Hazardous Waste Generator	VSQG	Earth Removal/ Mining
MAV000018678	Northeast Generation Services Co.	Cobble Mountain Station	Granville	Hazardous Waste Generator	VSQG	Power Generation Station

## Underground Storage Tanks

Facility Name	Address	Town	Description	Tank Type	Tank Leak Detection	Capacity (gal)	Contents
Blandford Maintenance Depot	Old Chester Rd	Blandford	Mass Turnpike Authority			6,000	Waste Water
				2 Walls	Interstitial Monitoring	4,000	Heating Oil
				2 Walls	Interstitial Monitoring	10,000	Gasoline
				2 Walls	Interstitial Monitoring	10,000	Diesel
Tosco #2704492	Mm 29 Mass' Pike Eastbound	Blandford	Tosco Refining Lp	2 Walls	Interstitial Monitoring	6,000	Diesel
				2 Walls	Interstitial Monitoring	10,000	Gasoline
				2 Walls	Interstitial Monitoring	10,000	Gasoline
				2 Walls	Interstitial Monitoring	10,000	Gasoline
						550	Waste oil
Town Of Blandford Hwy Dept	114 Otis Rd	Blandford	Town Of Blandford Hwy Dept	2 Walls	Interstitial Monitoring	1,000	Diesel
				2 Walls	Interstitial Monitoring	1,000	Gasoline

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site:

<http://www.state.ma.us/dfs/ust/ustHome.htm>

Additional information provided by individual owners

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitelist.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0000877	MTA Maintenance Depot	Blandford	Oil

For more location information, please see the attached map. The map lists the release sites by RTN.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for

**Stockbridge Water Department**

**What is SWAP?**

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

**Susceptibility and Water Quality**

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Stockbridge Water Department
<i>PWS Address</i>	6 Main Street
<i>City/Town</i>	Stockbridge
<i>PWS ID Number</i>	1283003
<i>Local Contact</i>	Mr. Michael Buffoni
<i>Phone Number</i>	413-298-4067

**Introduction**

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential contaminant sources, including stormwater runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

**Purpose of this report:**

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

**This report includes the following sections:**

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

## Glossary Protection Zones

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

## Section 1: Description of the Water System

*System Susceptibility:*

*Moderate*

*Source Name*

*Source ID*

*Susceptibility*

Lake Averic

1283003-01S

Moderate

Stockbridge is a small rural and residential community located in southwestern Massachusetts in the Berkshire Hills. Stockbridge is located within the Taconic-Hoosic 'bowl' surrounded by West Stockbridge Mountain to the west, Rattlesnake Hill to the east and Bear Mountain and Monument Mountain to the south. The Housatonic River flows west through the southern section of the town before it turns to flow south again through Great Barrington. The town center is located along the Housatonic River valley.

Stockbridge Water Department supplies water to the town center from Lake Averic Reservoir located in the west central section of town. The watershed for the reservoir is located on West Stockbridge Mountain. The topography of the watershed is steep sloped valley with one small feeder brook. The overburden material within the watershed is predominantly a thin cover of glacial till, often referred to as hard pan, with significant areas of exposed bedrock. The brook valley has limited deposits of recent alluvium and swamp deposits. The bedrock in the watershed is mapped as several formations consisting of metamorphic rocks and igneous intrusive rocks of the Walloomsac and Stockbridge Formations, predominantly schist and marble, respectively part of the Berkshire massif. The structural geology of the region is highly complex with several stages of folding, faulting and significant structural movement. The watershed is located within an area of faulted, overturned synclines and anticlines.

Approximately 99% of the watershed is protected from development through Town or State ownership or land held in conservation restrictions. Land use within the Lake Averic watershed is primarily forested upland (86%) with the remaining watershed consisting of water, wetland and residential activities. Please refer to the attached map to view the boundaries of the protective areas.

Water from the reservoir is treated through a Trident, rapid sand filtration system, then chlorinated for disinfection and pH adjusted with sodium hydroxide for corrosion control. For current information on water quality monitoring results and treatment processes, please refer questions for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

There are few activities that pose significant anthropogenic threats to the reservoirs. However, due to the nature of surface water supplies, these sources are considered highly vulnerable to potential contamination threats. Land uses and activities that are considered potential sources of contamination are listed in Table 2.

### Key Land Uses and Protection Issues include:

1. Activities in Zone A
2. Residential land use
3. Transportation corridors
4. Forestry
5. Protection planning

The overall ranking of susceptibility to contamination for the system is moderate, based on the presence of at least one moderate threat land use within the water supply protection areas, as seen in Table 2.

**1. Activities in Zone A** - The Zone A for a reservoir includes all areas within 400 feet of the reservoir shoreline and within 200 feet of either side of all streams and feeder ponds that flow into the reservoir. The Zone A is the area closest to the reservoir and its tributaries. Therefore, land uses within the Zone A are of particular concern. Activities that could potentially threaten water quality if improperly managed are restricted by 310 CMR 22.20B. Activities that store, use, or dispose of hazardous materials can be potential sources of contamination if improperly managed. Wild animals, farm animals and domestic pets can be carriers of waterborne diseases such as Giardia, Cryptosporidium, Salmonella, etc. Beavers periodically populate the watershed.

Overall, the watershed is sparsely populated; approximately 90% of the watershed is forested. Averic Road crosses through the Zone A of the reservoir. The area is patrolled by police and the land and reservoir are posted for no trespassing. The lower reservoir, south of Lake Averic is no longer used, eliminating some residential and agricultural land uses within the Zone A. Although Averic Road is the only non-conforming land use within the Zone A, due to its proximity to the reservoir, use should be strictly monitored and the road closed to traffic if access cannot be controlled.

### Zone A Recommendations:

- ✓ Direct all stormwater to the south, outside of the watershed. Inspect the roadway for susceptibility to erosion. Determine what, if any BMPs are needed and implement improvements as required.
- ✓ Prohibit all new non-water supply activities from the Zone A on land within your control.
- ✓ Maintain patrols and enforce the no trespassing requirement. Consider requesting that the road be closed to public access and gated if access cannot be controlled.
- ✓ The Department has a policy for responding to beavers that may threaten water quality in a watershed. Please refer to the website for guidance at <http://www.state.ma.us/dep/brp/dws/protect.htm>.

**2. Residential Land Uses** – There are only a few residences located within the watershed in a small development on the east side of the watershed. None of the

### Benefits of Source Protection

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

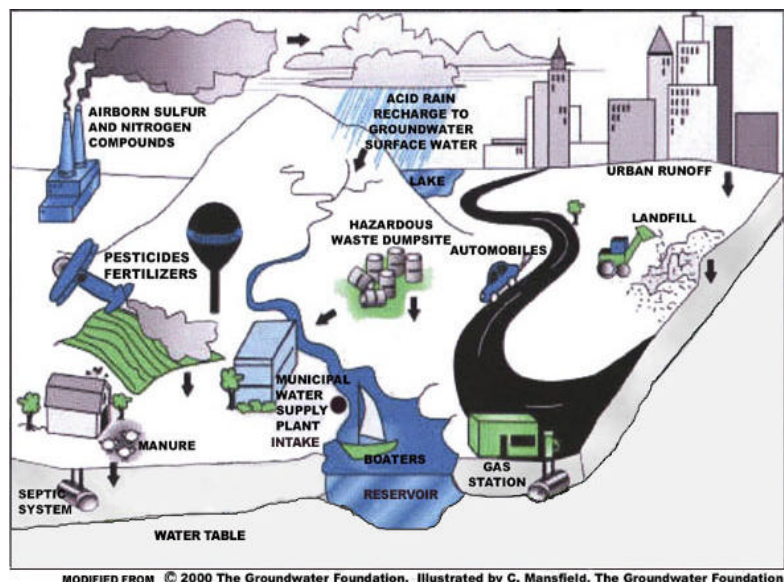

Figure 1: Sample watershed with examples of potential sources of contamination

areas have public sewers to remove wastewater, therefore on-site septic systems are used. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Establish efforts for negotiating fee simple purchase, Right of First refusal agreement, conservation restrictions and Memorandum of Understanding for land not currently owned or controlled by the District.
- ✓ Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.
- ✓ Educate residents regarding the no trespassing policy of the Water Department.

**3. Transportation Corridors** - There are very few roads within the watershed. Averic Road passes over the lower section of the watershed and there is one development on the eastern edge of the watershed with very few trails into the watershed. Even typical roadway maintenance and low use pose a potentially significant source of contamination from accidents and washouts and pesticide application for vegetation control along both the paved and dirt roads, especially in the Zone A. Erosion poses a potentially significant threat to water quality in areas that are proximal to feeder streams and the reservoirs, by contributing sediment, various contaminants and pathogens which may result in additional water treatment costs if they continue unchecked.

The Water Department does not allow public access to watershed land that it owns, however, Averic Road is a public way. The road has been closed to truck traffic and is patrolled at least twice per day. There is

#### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watersheds**

Activities	Quantity	Threat*	Source ID	Potential Source of Contamination
<b>Agricultural</b>				
Forestry Operations	Few	M	01S	Leaks and spills, improper handling of petroleum products in equipment. Erosion.
<b>Residential</b>				
Fuel oil storage (at residences)	Few	M	01S	Fuel oil household hazardous materials: spills, leaks, or improper handling
Lawn care / Gardening	Few	M	01S	Pesticides: over-application or improper storage and disposal
Septic systems	Few	M	01S	Microbial contaminants and improper disposal of hazardous chemical
Transportation corridors	Few	M	01S	Potential threats: petroleum products and transported hazardous materials—accidental leaks or spills; pesticides—over-application or improper handling; erosion.

#### Notes:

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

little evidence of illegal access to the watershed on trails by ATVs. The Water Department has an approved Surface Water Protection Plan that addresses patrolling of the watershed. Recently, the Water Department has implemented forestry in the watershed and the Department recommends that the Water Department prepare a forest management plan that incorporates BMPs in forestry operations to protect water quality.

#### Transportation Corridor Recommendations:

- ✓ Continue regular inspections of the watershed for signs of access, illegal dumping and spills and continue to enforce the no trespassing policy.
- ✓ Work with local emergency response teams to ensure that any spills within the protection areas can be effectively

contained.

- ✓ Inspect Averic Road to determine if improvements to the road are required to prevent stormwater runoff and erosion to the reservoir. If it is determined that road improvements are necessary, develop a plan and implement improvements. USDA funding may be available for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.rurdev.usda.gov](http://www.rurdev.usda.gov) or call the Rural Development Manager at the local office in Hadley at 413-585-1000. Alternatively, review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf> or call the NRCS office in Pittsfield 413-443-6867 ext. 3 for assistance.
- ✓ Visit the DEP Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm> for more information on other grants and loans.

**4. Forestry and Protection Planning** – The Water Department has an approved Water Supply Protection Plan. However, plans periodically require updating to correct errors in the original plan, to reflect completed tasks and new conditions. The watershed is primarily woodland and the Water Department owns nearly 100% of the watershed. Good forest management of watershed land can beneficially impact water quality and health of the watershed forests. The Water Department recently has implemented a forest cutting policy in the watershed and is working with a contract forester. According to the Water Department, a forest management plan will be developed.

**Forestry Protection Planning Recommendations:**

- ✓ Establish active watershed protection planning and forest management for water supply protection in a comprehensive watershed plan. Update the current plan to include the comprehensive forest management plan specifically designed for a water supply watershed. Implement the plan including BMPs for wetlands and stream crossings and in compliance with forestry regulations as appropriate.
- ✓ Encourage and support efforts by private land owners in active forest management for water supply protection as appropriate.
- ✓ Continue to monitor all activities on privately held land within the watershed.

Land uses and activities within the watershed that are potential sources of contamination are included in Table 2. Identifying potential sources of contamination is an important initial step toward protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

**Current Land Uses and Source Protection:**

As with many water supply protection areas, the system's watershed contains potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Preparing and implementing a Water Supply Protection Plan (WSPP),
- Detailed knowledge of the watershed and active involvement in inspecting and inventorying land uses in the watershed, and
- Working with the community to prohibit truck traffic from Averic Road.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Continue inspection of the Zone A protection area and watershed regularly, and when feasible, remove or manage any non-water supply activities.
- ✓ Continue cooperation and communication with emergency response teams to ensure that they are aware of the boundaries of the watershed for notification of spills or accidents.
- ✓ Through the implementation of the WSPP, provide information to landowners in your protection areas to make them aware of your water supply and to encourage the use of best management practices for residential and recreational uses and other ways they can help you to protect drinking water sources.
- ✓ Update the Watershed Protection Plan and include a review of Averic Road and a comprehensive forest management plan.
- ✓ As part of the stormwater evaluation and mitigation plans, identify problem areas specifically in the Zone A along

roads throughout the watershed. Make every effort to ensure stormwater discharge and runoff is detained prior to release to protection areas. Consider various strategies to detain/slow the flow and retain sediments to keep the runoff out of the reservoirs. Direct runoff out of the watershed if feasible.

- ✓ Once the forest management plan has been approved, implement the plan to establish/maintain a healthy and ideal watershed forest, which will buffer anthropomorphic and natural environmental impacts on water quality and quantity.

#### Conclusions:

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues, above and in Appendix A.

#### ➤ Provide Outreach to the Community:

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the source protection areas are located, what types of land uses and activities pose threats, and how their efforts can enhance protection.

#### ➤ Other Funding Sources:

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS for assistance.

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection. The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help establish local drinking water protection priorities. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the protection areas. Use this information to establish priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

#### Section 4: Appendices

- A. General Protection Recommendations

#### Top 5 Reasons to Develop a Local Surface Water Protection Plan

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

#### For More Information

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, town boards, and the local media.

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone A?	<b>NO</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Continue to monitor activities on Averic Road and control access.
Is the Zone A posted with "Public Drinking Water Supply" or "No Trespassing" signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone A regularly inspected?	<b>YES</b>	Continue regular inspections of drinking water protection areas. Increase patrols as appropriate and develop a plan to control access in critical areas.
Are water supply-related activities the only activities within the Zone A?	<b>YES</b>	Continue monitoring non-water supply activities in Zone A.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, Ordinances and General Bylaws)		
Do the watershed municipalities have Surface Water Protection Controls that meet 310 CMR 22.20C?	<b>NO</b>	The Water Department owns nearly the entire watershed. The small portions of the watershed that are privately held are at this time fully developed.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>N/A</b>	
<b>Planning</b>		
Does the PWS have a local surface water supply protection plan?	<b>YES</b>	Update the Plan as appropriate to address newly identified threats, inventories that may not been included and to adjust protection priorities as tasks are completed such as the stormwater management plan and the forest management plan.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Update the plan as appropriate by reviewing joint emergency response plans with the Fire Department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams. Complete vulnerability assessment as appropriate for the system.
Does the municipality have a watershed protection committee?	<b>NO</b>	Consider establishing a committee that includes representatives from municipal and citizens' groups.
Do the Boards of Health conduct inspections of commercial and industrial activities?	<b>N/A</b>	
Does the PWS provide watershed protection education?	<b>YES</b>	Continue efforts to provide information about BMPs to residents.

**Massachusetts Department of Environmental Protection**  
**Source Water Assessment and Protection (SWAP) Report**  
**For**  
**Berkshire Country Day School, Inc.**

**What is SWAP?**

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

**SWAP and  
Water Quality**

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
January 6, 2004

**Introduction**

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

**Purpose of this report:**

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

**This report includes:**

1. Description of the Water System
2. Discussion of Land Uses in the Protection Areas
3. Protection Recommendations
4. Attachments, including a Map of the Protection Areas

**1. Description of the Water System**

Berkshire Country Day School, Inc. is located in the small, rural town of Stockbridge, in southwestern Massachusetts on State Route 183. The school is located immediately south of the Lenox town line. The school has a student and staff population of approximately 340 people. Although there is a municipal water system and wastewater treatment plants in both Stockbridge and in Lenox, they do not serve this section of town. Therefore, the school water is supplied through one on-site well and wastewater is discharged to an on-site septic system.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The Zone I protection area for a well is the area immediately around the well that is considered most vulnerable to contamination. The Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual recharge area (Zone II) has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The DEP allows only activities related to supplying water or other non-threatening activities within the Zone I. Many systems that were developed prior to the DEP requirements are grandfathered, but any expansion or changes to the facility require DEP approval and compliance with Zone I restrictions.

The school's well is located immediately adjacent to a soccer field, within 50 feet of one of the school buildings and within 20 feet of a brook. In the late 1990's the school constructed the soccer field and added and expanded buildings within the Zone I of Well #1. The DEP allowed the school to continue using the non-conforming Well #1, but required the school to decrease their water use to 1,250 gallons per day and to provide an alternate water source either by developing a conforming well through the New Source Approval Process or by connecting to an existing, adjacent municipal/public water supply. The school signed an Administrative Consent Order agreeing to these conditions. To date, the school has not reduced their water use, and has not developed a conforming well or secured an agreement to connect to a municipal/public water supply source.

The geologic mapping of the area indicates varying thickness of overburden material, primarily till, with numerous exposures of bedrock in the upland areas. Geologic mapping indicates a complex series of folds and faults within the Taconic-Berkshire Zone. The primary bedrock mapped in the vicinity of the school is the Wollumscac Formation, phyllite with limestone. Mapping indicates a dark grey calcitic schistose marble.

As noted, the DEP established the school well Zone I and IWPA protection area radii are 115 and 428 feet, respectively, based on the required maximum water use of 1,250 gallons per day. However, a review of the annual statistics reports from 1998 through 2002 showed the average daily water use for the two highest months of water use during that period was approximately 2,316 gallons per day. **Therefore, the DEP herein is reestablishing the Zone I and IWPA for Well #1 based on reported water use. The Zone I and IWPA protection area radii for that volume of water use are 155 feet and 452 feet, respectively.** The Zone I protection area of 155 feet

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-	-	Contact DEP prior to expanding the facility or conducting any work in the Zone I.
Fuel storage (AST/UST)	Yes	Yes	Moderate /High	Spills, leaks, or improper handling of fuel oil
Transportation corridors and parking	Yes	Yes	Moderate	Be sure emergency responders are aware of the location of your wells.
School	Yes	Yes	Moderate	Continue policy of not using pesticides and fertilizers. Manage septic system and facilities.
Floor drain in boiler room	No	Yes	Moderate	Contact UIC coordinator in the region to discuss compliance.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

includes many activities that pose a potential risk of contamination to the well such as the school's buildings and fuel storage tanks. The remainder of the school facilities including the 10,000-gallon underground fuel oil storage tank, parking, the school and headmaster's house leachfields are located within the IWPA of the well.

The water supplied to the school is not treatment at this time. The DEP requires public water suppliers to routinely monitor the quality of the water. For current information on monitoring results, please contact the Public Water System contact person listed above in Table 1. Drinking water monitoring reporting data is also available on the web at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html), EPA's Envirofacts website.

## 2. Discussion of Land Uses in the Protection Areas

There are numerous land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **School facilities and athletic field;**
3. **Fuel storage tanks (UST/AST);**
4. **Floor drain in boiler room; and**
5. **Transportation and parking.**

The overall ranking of susceptibility to contamination for the wells is high, based on the presence of at least one high threat land use or activity in the protection areas, as seen in Table 2.

**1. Non-conforming Zone I** – Currently, the well does not meet DEP's restrictions, which require the system to own or control the entire Zone I area and allow only water supply related or other non-threatening activities in Zone I.

### Recommendations:

- ✓ Comply with the current requirements to provide an alternate source of water.
- ✓ Do not allow any new non-water supply activities in the Zone I.

- ✓ Monitor and control all activities near the well.
- ✓ Monitor all fuel deliveries.

**2. School facilities and athletic fields** – Elementary schools generally use only household hazardous materials for cleaning. There are state and federal regulations controlling some of the activities and products used at schools to promote "healthy schools". All of the school's facilities are located within the Zone I or IWPA of the well, including fuel oil tanks, parking, septic components and leachfields. Stormwater may also pose a risk. Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from parking areas and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required. Do not use fertilizers and pesticides in the Zone Is.
- ✓ Investigate Integrated Pest Management and Best Management Practices within the IWPA as necessary.
- ✓ Use secondary containment for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or deicing materials within Zone I.
- ✓ Review your emergency response plan regarding accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they could be a potential source of microbial contamination.
- ✓ Refer to the Massachusetts Public Health Association's Healthy Schools website for additional information, online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html).

**3. Fuel Storage Tanks– Underground/Aboveground Storage Tank (UST/AST) –** If managed improperly, underground fuel oil storage tanks and the associated fuel oil lines can be a potential source of contamination due to leaks or spills of the chemicals they store. The fuel oil lines from the UST to the buildings it serves are sleeved to protect against leaks in the lines. In addition, there is an AST fuel oil tank in the basement of the Administration Building boiler room along with a sump pump that reportedly discharges to the septic system. The school also has propane USTs that do not pose as significant a threat as the fuel oil UST.

### Recommendations:

- ✓ Any modifications to the UST/AST must be accomplished in a manner consistent with Massachusetts' plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.
- ✓ Monitor deliveries of oil as many spills are related to delivery.
- ✓ Containment of the fuel system to prevent accidental releases to the floor is important. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. DEP recommends that you require that your boiler maintenance contractor use containment, protect the well and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.

**4. Floor Drain in Boiler Room –** There is a floor drain in the boiler room in the Administration building that reportedly discharges to the septic system; there is also an AST fuel oil storage tank in the basement. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and the UIC regulations prohibit dry wells in areas where hazardous materials or petroleum may enter the floor drain. The floor drain must be protected to prevent boiler blow down, oil or other prohibited discharges through the floor drain.

### Recommendations:

- ✓ Be sure that the floor drains are in compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - ◆ Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207).
- ✓ Containment to prevent accidental releases to the floor drain may be an option. Contact the regional DEP contact for the

UIC program listed above. Oil lines from the tank to the boiler should be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. We recommend that you require your boiler maintenance contractor use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.

- ✓ Determining the discharge location of the drains. Seal all cracks in the floor and the floor drain if it is not needed to protect the building from flooding and if it cannot be adequately protected to prevent a prohibited discharge.

**5. Transportation corridor and parking** – Internal roadways and facility parking are located within the Zone I and IWPA. Accidents and normal use and maintenance of corridors and parking areas may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills, as well as, waste from wildlife and pets.

**Recommendations:**

- ✓ Prepare an Emergency Response Plan that includes coordination among town emergency responders to be sure they are aware of the location of your well.
- ✓ Continue to manage on-site stormwater to ensure it flows away from the well.

In addition, at the time of the assessment, the DEP noted three pole-mounted transformers within the Zone I that appeared to be relatively old and did not carry a label identifying them as being free of PCBs. If those transformers have not yet been replaced, contact the local utility company and request that they confirm the transformers are in compliance with current requirements or have them replaced.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The school is commended for utilizing propane for one building's fuel source, however there are significant threats that need to be addressed at the school. The water supplier should review and adopt the key recommendations above and the following:

**Priority Recommendations:**

- ✓ Provide an alternate water source for the facility as required.
- ✓ Monitor fuel oil delivery and activities within close proximity to the wells. Do not use or store hazardous materials in the vicinity of the wells.

**Zone I:**

- ✓ Keep all new non-water supply activities out of the Zone I.
- ✓ Post the area with "Public Drinking Water Supply Recharge Area" signs at appropriate locations away from the actual wells.
- ✓ Monitor all existing activities within the Zone I.
- ✓ Inspect the well and the cap regularly. Ensure the cap is watertight and secure and that there is no standing water at the well.

**Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Incorporate groundwater education into the school curriculum and community.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the area and is treated according to DEP guidance.

**Facilities Management:**

- ✓ If it is feasible in the future, consider upgrading all of heating systems to propane for the purpose of removing fuel oil storage from the school.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on school property.
- ✓ Keep the area near transformers free of tree limbs that could endanger the transformer in a storm.
- ✓ Contact the UIC coordinator to address any floor drains in areas where hazardous materials could discharge to the ground or to a septic system.

**Planning:**

- ✓ Work with local officials in town to develop an Aquifer Protection District with bylaws and include the facility's IWPA in the District, along with other public water supply wells in town and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funding is available, each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

- Recommended Source Protection Measures Fact Sheet

**Massachusetts Department of Environmental Protection**  
**Source Water Assessment and Protection (SWAP) Report**  
**For**  
**Kripalu Center for Yoga & Health**

**What is SWAP?**

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

**SWAP and  
Water Quality**

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
November 21, 2003

Well #3	1283014-03G	100	422	Moderate
Well #4	1283014-04G	100	422	Moderate

**Introduction**

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

**Purpose of this report:**

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

**This report includes:**

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

**1. Description of the Water System**

Kripalu is a yoga and holistic health center located in Stockbridge, on the Lenox town line, overlooking Stockbridge Bowl in south Berkshire County. Kripalu has a residential community and accommodates day and overnight visitors and students year round; the facility can accommodate up to 450 people. The facility previously

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

functioned as a Jesuit Monastery, Shadowbrook. Kripalu owns and maintains its own water supply system and wastewater disposal facility; to supplement their water supply, Kripalu purchases water from the Lenox Water Department. At one time, Kripalu had six wells. Wells #1 and #2 are currently the only active potable water supply wells. Wells #3 and #4 have been inactive since 1992 and Well #5 was abandoned and physically decommissioned to accommodate expansion and repair of a parking area. Well #6 was installed in 1988 but was never activated due to low productivity. The facility's wastewater is discharged to a wastewater treatment facility southwest of the main campus.

Well #1 is a 6-inch diameter, 162 feet deep bedrock well that is located immediately adjacent to the parking area behind the main building. Well #2 is a 6-inch diameter, 242-foot deep bedrock well that is located west of the maintenance building formerly the printing shop. In mid-November 2003, Kripalu was in the process of deepening Wells #1 and #2 due to a loss of capacity in those wells. At the time this report was prepared, the DEP did not have final completion depths of those wells. Wells #3 and #4 are located within 100 feet of each other, adjacent to the old greenhouses along Richmond Road. Well #3 is a 6-inch diameter, 382 feet deep bedrock well and Well #4 is a 6-inch diameter, 402 feet deep bedrock well.

The Zone I is the protected area immediately surrounding the well, while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual (Zone II) recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii for this facility's wells are as follows: Well #1 – Zone I is 283 feet and IWPA is 769 feet; Well #2 – Zone I is 283 feet and IWPA is 769 feet; Well #3 – Zone I is 100 feet and IWPA is 422 feet Well #4 – Zone I is 100 feet and IWPA is 422 feet respectively. These protection area radii are based on the historic water withdrawal rates from these wells.

The Zone I area for Well #1 includes approximately half of the main facility, including parking, transformers and compactor/composter. The Zone I for Well #2 includes roadways, the maintenance/printing shop, vehicle storage and deicing materials (covered). The Zone Is for Wells #3 and #4 include a former very small, non-commercial greenhouse and a residence. The IWPAs for Well #1 and #2 include the rest of the main campus facilities except the wastewater treatment plant, which is topographically downgradient from the wells and outside of the protection areas.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Maintenance garage/print shop	Well #2	Well #2	High	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills
Underground and Above Ground Storage Tanks	No	Well #1	High	Proper maintenance and upgrades to fuel tanks to prevent releases from occurring
Institution Uses	Well #1	Well #2	Moderate	Encourage residents and staff in proper storage, disposal, and application of pesticides
Transportation Corridors/Parking	Well #1	All	Moderate	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

The geologic mapping of the area indicates varying thickness of overburden material, primarily till with numerous exposures of bedrock in the upland areas. Data from the water supplier indicate casing lengths of over 100 feet in Wells #1 and #2, while Well #3 and #4 have approximately 25 feet of casing. Geologic mapping indicates a complex series of folds and faults. The primary bedrock is the Wollumsac Formation, a phyllite with limestone, with nearby contacts with the Everett Formation, chloritoid-rich schist and carbonates of the Stockbridge Formation.

Although wells #3 and #4 are free flowing artesian wells, there is no evidence of a continuous hydrogeologic barrier (clay layer) in the vicinity of the wells. Therefore, the aquifer is considered to have a high vulnerability to contamination. Nonetheless, the hydrogeologic barrier that does exist provides some protection relative to impeding the downward migration of contaminants from areas overlying the barrier. Please refer to the attached map of the Zone I and IWPA.

The wells serving the facility have no treatment at this time. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Residential Land Uses;**
3. **Institutional Uses;**
4. **Underground and Above Ground Storage Tanks and,**
5. **Transportation Corridor**

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use or activity in the protection areas of at least one of the wells, as seen in Table 2.

**1. Non-conforming Zone I** – Currently, none of the wells meet DEP's Zone I restrictions, which allow only water supply related activities or other non-threatening activities within the Zone I. The Zone I contains driveways, roads, parking spaces, institutional facilities, maintenance facilities and a residence. Systems not meeting DEP Zone I requirements must notify the DEP, receive approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Although it is impossible to remove all activities within the Zone Is, Kripalu should continue to work toward prohibiting/limiting/impeding parking in close proximity to the well and using BMPs to protect the water supplies.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Continue to direct driveway and parking lot drainage in

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

the Zone I away from the well.

- ✓ Continue investigating options for development of additional sources.

**2. Institutional use** – The facility is a residential and institutional facility with all associated activities including dormitories, an infirmary, recreational facilities, classrooms, dining commons, etc. In addition, there are all of the accompanying activities associated with maintenance and services provided to the facility including fuel oil storage, gasoline, transformers, maintenance facilities, roads and lawn maintenance.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Recommendations:

- ✓ Continue the use and maintenance of BMPs for activities within close proximity to the wells.
- ✓ Continue monitoring and managing stormwater runoff, directing it away from the wellhead.
- ✓ Do not use pesticides or fertilizers within the Zone I of the wells. Consider the use of Integrated Pest Management on campus to minimize the use of pesticides and nutrients in fertilizers.
- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Underground Storage Tanks (UST)** – There are four USTs located on the campus within the IWPA of the Well #1. All but one of the tanks contain fuel oil; one tank (a double walled tank with interstitial monitoring) is for gasoline storage. The tanks are approximately 17 years old, are double walled and have over-fill containment.

### Recommendations:

- ✓ USTs in close proximity to the water supply should be closely monitored, especially during deliveries. Review stormwater flow direction and anticipate control of a potential spill during delivery. Replace and upgrade tanks as appropriate.
- ✓ Continue to evaluate and consider a replacement well location and use of alternative fuel, as is feasible.
- ✓ Any upgrades and modification to fuel storage facilities must meet current construction standards and be done consistent with Massachusetts’ plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.
- ✓ Require that fuel lines are sleeved to protect from leaks.
- ✓ Review construction details for the tanks to ensure that they include overfill protection. Retrofit those without containment, as is feasible.
- ✓ Ensure that a spill response plan is included in the school emergency response plans and ensure spill containment equipment is available. Include plans of storm drain systems in the emergency response plan.

V Monitor deliveries so that any spills can be readily contained.

**4. Transportation corridors and parking** – Even minor roads and internal facility roads are potential sources of contamination due to salting of roadways and leaks or spills of fuels and other hazardous materials during accidents.

**Recommendation:**

- ✓ Contact the local fire department to ensure that the IWPA is included in Emergency Response Planning.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Kripalu is commended for past efforts to protect water supplies through management of hazardous materials and controlling stormwater runoff. The facility should continue efforts in water supply protection through reviewing and adopting the key recommendations above and the following:

**Zone I:**

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Restrict use of salt within Zone I and drain stormwater away from well.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

**Training and Facilities Management:**

- ✓ Continue proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, and certified operator. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility properties.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.
- ✓ As is feasible, replace the supply wells or remove threats such as the USTs.

**Planning:**

- ✓ Work with local officials in town to include the facility's IWPA in Aquifer Protection District Bylaws if the town establishes such bylaws in the future.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the wells and is treated according to DEP guidance.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Each program year, if funds are available, the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

- Map of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheet

# Source Water Assessment Program (SWAP) Report For White Pines Condominiums

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 3, 2001

**Table 1: Public Water System (PWS) Information**

<i>PWS ID Number</i>	1283015
<i>Local Contact</i>	Douglas A. Weaver
<i>Phone Number</i>	413-637-1140

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1283015-01G	288	800	High
Well #2	1283015-02G	288	800	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The White Pines Condominiums, located in Stockbridge, has its water supply for 70 connections: 68 condominiums, office building, and pool building. The condominium community is served by on-site septic disposal systems. The two wells that serve the facility are nearly identical, 6-inch in diameter and 310 feet deep. Both wells are lined to a 210-foot depth with 4-inch casing to prevent surface water infiltration through the well casing annulus to minimize historical bacterial contamination. The Zone I and Interim Wellhead Protection Area (IWPA) radii for both wells are 288 feet and 800 feet, respectively.

The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The protective areas have been calculated based on the

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

highest volume pumped as reported to the Department in the 1996 Annual Statistics Report. The actual recharge area to the well may be significantly larger or smaller than the IWPA.

The wells are located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. USGS mapping shows the bedrock of the area as carbonate rock, mainly biotite-rich quartzose schist. The water from the two wells is treated by reverse osmosis (with pre-filtration) for hardness removal. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Nonconforming activities in the Zone I;**
2. **Underground Storage Tank;**
3. **Septic System;**
4. **Internal Transportation Corridors; and**
5. **Storm Water Catch Basins.**

The overall ranking of susceptibility to contamination for the well is high, based on the presence of two high threat land uses or activities in the Zone I and IWPA, as seen in Table 2.

**1. Nonconforming activities in the Zone I** – Currently, the water supplier does not own or control the entire Zone I area. Please note that systems not meeting DEP Zone I requirements for ownership or control must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. There are non-water supply activities occurring within the Zone I, such as structures (indoor pool), parking, and fertilizer use (Scott's Turf Builder).

### Recommendations:

- ✓ Control access to the wellhead area and make every effort to acquire Zone I control or ownership.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Road Salt and Sand Storage	Well #2	All Wells	Moderate	Use containment
Low Density Housing	All Wells	All Wells	Moderate	Use BMPs, encourage participation in household hazardous waste collection days
Internal Transportation Corridors and Parking	All Wells	All Wells	Moderate	Limit road salt usage and provide drainage away from wells
Hazardous Materials Storage	All Wells	No	High	Use containment or store outside of Zone I
Septic System	No	All Wells	Moderate	See attached brochure
Underground Storage Tank	Well #2	No	High	300-gallon tank, monitor for leaks, overfills.

\* For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 feet to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

**2. Underground Storage Tank (UST)** – There is a UST located on the southeast side of the office building, with a maximum content of 300 gallons of #2 fuel oil, within Zone I. If managed improperly, USTs can be a potential source of contamination due to leaks or spills of the chemicals they store.

### Recommendation:

- ✓ USTs in close proximity to the water supply should be closely monitored especially during deliveries. Any upgrades and modification must meet current construction standards and be done consistent with Massachusetts' plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.

**3. Septic Systems** – The facility's septic system is located within the IWPA. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste.

### Recommendations:

- ✓ Provide residents and staff with information about proper maintenance and disposal practices for septic systems. Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.

**4. Internal Transportation Corridors** -- The Zone I and IWPA contain roads and parking areas developed and maintained by the White Pines Condominiums. Transportation corridors can be a potential source of contamination from road salt and automotive leaks or spills.

### Recommendations:

- ✓ Monitor parking areas and roads for accidental leaks and spills.
- ✓ Do not use salt or deicers within the Zone I.
- ✓ Restrict access where possible.

**5. Storm Water Catch Basins** – Catch basins transport storm water from the roadway and adjacent properties to the ground. As flowing storm water travels, it picks up debris and contaminants from streets, parking areas and lawns. Common potential sources of

contamination include lawn chemicals, pet waste, leakage from dumpsters, household hazardous waste, and contaminants from vehicle leaks, maintenance, washing or accidents.

### Recommendation:

- ✓ Work with the Town to have the catch basins inspected, maintained, and cleaned on a regular schedule. Additionally, street and parking lot sweeping reduces the amount of potential contaminants in storm runoff.

Other potential threats noted during the site visit include sand and salt storage in the IWPA, low-density housing, and potentially hazardous materials stored in the Zone I. The salt and sand mixture is covered with a tarp and enclosed within a wooden fence. The condominiums are all located within the IWPA, some within the Zone I. Encourage residents to utilize local household hazardous waste collection days, and supply information about BMPs for household hazardous waste management. Chlorine for the pool is stored in the west side of the pool building. Secondary containment is recommended for this storage if removing it from the Zone I is not feasible.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. White Pines Condominiums is commended for using natural gas as the heating source. White Pines Condominiums should review and adopt the key recommendations above and the following:

#### Priority Recommendations:

- ✓ Remove all reasonable non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Prohibit public access to the well by locking facilities and posting signs.

#### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any above ground tanks for leaks, etc.
- ✓ Use BMPs within the Zone I and restrict activities that could pose a threat to the water supply.
- ✓ Do not use pesticides and fertilizers in Zone I.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.
- ✓ Redirect road and parking lot drainage in the Zone I away from well.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Upgrade to propane or natural gas for power sources in areas utilizing fuel oil.

#### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

#### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, refer to <http://www.state.ma.us/dep/bwp/dhm/files/sqgsum.pdf> for the Requirements for Small Quantity Generators.
- ✓ Eliminate non-sanitary wastewater discharges to on-site septic systems. Instead, in areas using hazardous materials, discharge drains to a tight tank or sanitary sewer.
- ✓ Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides

and pesticides on facility property.

- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ Concrete pads should slope away from well and well casing should extend above ground.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.
- ✓ The facility is currently not registered as a generator of hazardous waste or waste oil. Review enclosed document "A Summary of Requirements for Small Quantity Generators of Hazardous Waste" to determine your status and regulatory requirements.

**Planning:**

- ✓ Work with local officials in Stockbridge to include White Pines Condominiums' IWPA in Aquifer Protection District Bylaws, and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response for the Grant program (RFR). On or about May 1 the new RFR is available and the application is due back on or about June 31. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Shaggy Dog Studios

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 11, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Shaggy Dog Studios complex is located off of Route 7 in the town of Stockbridge in south Berkshire County. The facility served by the public water system consists of two buildings: a 10 unit, 18-bedroom apartment building and the barn, a former music studio that is now vacant. Stockbridge does have a municipal water and wastewater treatment system but they do not serve this section of town. There is no municipal sewer available and therefore all of the facilities are served by on-site wastewater disposal.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Water is supplied by a single source, Well #1 that is located between the barn and the pond, approximately 60 feet south of the barn. Well #1 is a 720 feet deep, 6-inch diameter well drilled into the bedrock aquifer. There are two other wells on site that are both severed from the system. Well #2 is located east of the facility across the access road; Well #3 is located immediately west of the apartments and was abandoned as a source to accommodate an expansion of the facility. Only Well #1 is addressed in this report; both of the other wells should be secured at all times to ensure no down-hole contamination is possible. The facility is served by an on-site wastewater disposal system located northeast of the facility.

The Zone I is the area immediately around the wellhead, while the Interim Wellhead Protection Area (IWPA) is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wells may be smaller or much larger than the IWPA. The Zone I and IWPA radii for Well #1 are 114 feet and 428 feet, respectively. The protective radii were based on maximum water use at the facility. Please refer to the attached map that shows the Zone I and IWPA radii.

The complex is located in an area where the geologic mapping indicates thin till overburden covering the bedrock. The bedrock at the site is mapped as carbonate rocks, primarily quartzite and dolomitic marble of the Stockbridge Formation. There is no evidence of a protective till or clay layer in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

The facility's well water is treated through an ion exchange unit to remove iron and hardness utilizing potassium chloride. Public water suppliers are required to monitor water quality at the facility. For current information on monitoring results, please review the Consumer Confidence report (CCR) that is issued annually by the water supplier or refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

There are land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-	-	Contact DEP before expanding or modifying the facility.
Transportation corridors/parking	Yes	Yes	Moderate	Manage stormwater and limit road salt usage.
Above ground storage tank (fuel oil)	No	Yes	Moderate/High	Fuel lines are sleeved but the basement floor is dirt under the tanks and there is a sump and pump in the basement.
High density/low density residential	No	Yes	Moderate	Provide BMPs for household hazardous waste management. Use IPM for lawn maintenance.
Septic system components	Yes	Yes	Moderate	Leachfield is located outside of the protection areas. Some components are within the Zone I and IWPA.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Key issues include:

1. **Non-conforming Zone I;**
2. **Transportation corridors/parking; and,**
3. **Residential development.**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of several moderate threat land use or activity in the Zone I and/or IWPA, as seen in Table 2.

**1. Non-conforming Zone I** – Zone I restrictions allow only water supply related activities or other non-threatening activities in Zone I. Currently, the system does not meet DEP's Zone I requirements as the Zone I includes road, parking, housing, fuel oil tanks and septic system components. Although the fuel lines from the oil tanks are sleeved, part of the basement is dirt and a potential conduit for oil to seep into the ground in the event of a spill.

## Recommendations:

- ✓ Do not allow any additional non-water supply activities in the Zone I.
- ✓ Inspect the casing regularly to ensure the integrity of the cap and seal and to ensure there is no standing water near the casing.
- ✓ Continue to prohibit storage and use of hazardous materials in Zone I.
- ✓ Control activities in Zone I as is reasonable.
- ✓ Provide containment for the oil tanks in the basement to prevent a release from an overflow or leak.

**2. Transportation corridor/parking** – Wallace Road and the facility roadways and parking are located within the Zone I and IWPA. Accidents and normal use and maintenance of corridors and parking areas may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as, waste from wildlife and pets.

## Recommendations:

- ✓ Prepare an Emergency Response Plan that includes coordination among town emergency responders to be sure they are aware of the location of your well.
- ✓ Continue to manage on-site stormwater to ensure it flows away from the well.

**3. Residential Land Uses** – The apartment complex consists of 18 units and there are a few private homes within the protection areas. The facility utilizes a single on-site septic disposal system; the leachfield is outside of the IWPA although some components are within the Zone I. The private homes use private septic systems located within the IWPA. The complex utilizes oil for heat and although the tanks are new and the lines are sleeved, the two storage tanks are located in a partially dirt floored basement. If a release occurred in the basement, the dirt floor would act as a direct conduit to the ground. It is unknown what fuel sources the surrounding residences utilize. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they could be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their piping can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” attached to this report and at the DEP website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Provide containment for the tanks and the furnace to prevent potential for a leak. A dirt floor and the sump and pump in the basement may be pathways for an accidental release of oil to migrate into the environment. Consider alternatives for containment of the tanks.
- ✓ Contact the Underground Injection Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - ◆ Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207 or Tony Zaharias 413-755-2122).
- ✓ Containment of the fuel system to prevent accidental releases to the floor drain may be an option. Contact the regional DEP contact for the UIC program listed above. Oil lines from the tank to the boiler are presently sleeved so that any leaks would drain back to the tank or minimal oil would leak to the room. Prepare a policy and a plan for maintenance operations, especially when oil filters are changed. DEP recommends that you require that your boiler maintenance contractor use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.
- ✓ Seal all cracks in the floor and the floor drain if it cannot be adequately protected to prevent a prohibited discharge.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Review and adopt the key recommendations above and the following:

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Direct stormwater away from well.
- ✓ Conduct regular inspections of the Zone I.

- ✓ Do not use or store pesticides, fertilizers, petroleum products or road salt within the Zone I.
- ✓ Consider providing containment for the oil tanks.
- ✓ Ensure that Well #2 is secured or decommission the well in accordance with the DEP guidance.

#### **Facilities Management:**

- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.
- ✓ Continue to educate the residents and control the use of household hazardous materials in the Zone I.

#### **Planning:**

- ✓ Request that the Planning Board include your IWPA in the Aquifer Protection District along with IWPA's for other public water supplies in town.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Continue long term planning for the system that includes maintenance of the water and wastewater systems.

#### **Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the program fact sheet. Each program year, if funds are available, the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## **4. Attachments**

- Map of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheet

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Sunderland Water District**

### What is SWAP?

The Source Water Assessment Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

<i>PWS Address</i>	12 School Street
<i>City/Town</i>	Sunderland, Massachusetts
<i>PWS ID Number</i>	1289000
<i>Local Contact</i>	Stanley Wasilauski
<i>Phone Number</i>	(413) 548-9362

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

*System Susceptibility;* High

*Zone II #: 446* *Susceptibility:* Moderate

Well Names	Source IDs
Ralicki Well	1289000-01G

*Zone II #: 445* *Susceptibility:* High

Well Names	Source IDs
Hubbard Well	1289000-02G

Sunderland is a small, but growing, agricultural, rural/residential community in the central Connecticut River Valley in western Massachusetts. The Sunderland Water District maintains and operates two gravel packed wells and a reservoir. The reservoir is maintained as an emergency source only and will not be further addressed in this report. The wells for Sunderland Water District are located in two different aquifers and have two distinct Zone II recharge areas. Both wells are located east of Route 116 with the Ralicki Well located approximately in the center of town while the Hubbard Well is located in the south of town near the borders of Leverett and Amherst. The Zone II for the Hubbard Well extends in to Leverett while the Zone II for the Ralicki well lies entirely within Sunderland. The wells are located within stratified drift, sand and gravel deposited during the retreat (melting) of the glaciers some 10,000 years ago. The Ralicki well is located at the edge of the buried valley near Dry Brook at the base of a bedrock hill. The Zone II recharge area for the well is fairly limited in extend. The Hubbard well is located at the base of a large glacial delta, a sand and gravel deposit created by meltwater flowing into a lake that formed along what is now the Connecticut River valley. Glacial Lake Hitchcock was formed during the glacial retreat and fine grained lake bottom clays were deposited further into the lake. Fast moving water, deposited sand and gravel in the delta and along the lake edge. There is no evidence of a confining clay unit above the productive sand and gravel in either the Ralicki or the Hubbard well. The bedrock in the area is mapped as the sedimentary rocks of the turners falls and Sugarloaf formations and the metamorphic Joshua Schist to the west of long Plain Brook in Leverett.

Each well has a Zone I protective radius of 400 feet. The aquifers utilized by the wells are considered to have high vulnerability to contamination due to the absence of hydrogeologic barriers (i.e. clay) that can prevent contaminant migration. Please refer to the attached map to view the boundaries of the Zone II.

For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

The Zone IIs for Sunderland Water District are a mixture of forest, cropland,

sand and gravel mining, and residential land uses (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

**Key Land Uses and Protection Issues include:**

1. Nonconforming Zone I
2. Residential land uses
3. Transportation corridors
4. Sand and Gravel Mining
5. Agricultural activities
6. Comprehensive wellhead protection planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Non-conforming Zone I** – The Zone I for each of the wells is a 400 foot radius around the wellhead. Massachusetts drinking water regulations (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. The two (2) Zone Is for the wells are not entirely owned or controlled by the public water system. Only water supply activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and contain non water supply activities such as homes and public roads. The following non water supply activities occur in the Zone Is of the system wells:

Zone I for Ralicki Well (01G) - contains parts of two residential lots.

Zone I for Hubbard Well (02G) - contains small portions of few local roads.

**Zone I Recommendations:**

- ✓ To the extent possible, remove all non-water supply activities from the Zone Is to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and household chemicals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Keep any new non water supply activities out of the Zone I.

**2. Residential Land Uses** – Approximately 9% of the Zone II for the Ralicki well (01G) and 28% of the Zone II for the Hubbard well (02G) consist of residential land use areas. The residential areas near the Ralicki well (01G) have public sewers available however, the residential areas near the Hubbard well (02G) all utilize septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of

**Benefits  
of Source Protection**

Source Protection helps protect public health and is also good for fiscal fitness:

- Protects drinking water quality at the source
- Reduces monitoring costs through the DEP Waiver Program
- Treatment can be reduced or avoided entirely, saving treatment costs
- Prevents costly contamination clean-up
- Preventing contamination saves costs on water purchases, and expensive new source development

Contact your regional DEP office for more information on Source Protection and the Waiver Program.

© 2000 The Groundwater Foundation. Illustrated by C. Mansfield, The Groundwater Foundation

contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can also be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** - Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.

**3. Transportation Corridors** - Routes 116 and Route 63 run through the Zone II for the Hubbard Well (02G). Local roads are common throughout the Zone IIs. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing salt, automotive chemicals and other debris on roads are picked up by stormwater and wash in to catch basins.

Railroad tracks run through the Zone II for the Hubbard Well (02G). Rail corridors serving passenger or freight trains are potential sources of contamination due to chemicals released during normal use, track maintenance, and accidents. Accidents can release spills of train engine fluids and commercially transported chemicals.

#### **Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage system along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Work with local emergency response teams to ensure that any spills within the Zone II can be effectively contained.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If

(Continued on page 6)

#### **What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### **For More Information**

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

#### **Source Protection Decreases Risk**

Figure 2: Risk of contamination decreases as source protection increases. This is true for public water systems of any susceptibility ranking, whether High, Moderate, or Low.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas (Zones I and II)**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Activities	Quantity	Zone II	Threat*	Potential Source of Contamination
<b>Agriculture</b>				
Fertilizer Storage or Use	Several	#445	M	Fertilizers: leaks, spills, improper handling, or over-application
Livestock Operations	3	#445	M	Manure (microbial contaminants): improper handling
Landscaping	Several	#445	M	Fertilizers and pesticides: leaks, spills, improper handling, or over-application
Manure Storage or Spreading	3	#445	H	Manure (microbial contaminants): improper handling
Nurseries	1	#445	M	Fertilizers, pesticides, and other chemicals: leaks, spills, improper handling, or over-application
Pesticide Storage or Use	Several	#445	H	Pesticides: leaks, spills, improper handling, or over-application
<b>Commercial</b>				
Cemeteries	1	#445	M	Over-application of pesticides: leaks, spills, improper handling; historic embalming fluids
Railroad Tracks	1	#445	H	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills
Sand And Gravel Mining/Washing	2	#445	M	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
<b>Industrial</b>				
Asphalt, Coal Tar, And Concrete Plants	1	#445	M	Hazardous chemicals and wastes: spills, leaks, or improper handling or storage
Hazardous Materials Storage	1	#445	H	Hazardous materials: spills, leaks, or improper handling or storage
Hazardous Waste Storage, Treatment and Recycling	1	#445	H	Hazardous materials: spills, leaks, or improper handling or storage

Activities	Quantity	Zone II	Threat*	Potential Source of Contamination
<b>Residential</b>				
Fuel Oil Storage (at residences)	Numerous	Both	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	Both	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	Both	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>				
Clandestine Dumping	1	#445	H	Debris containing hazardous materials or wastes
Stormwater Drains/ Retention Basins	Several	#445	L	Debris, pet waste, and chemicals in stormwater from roads, parking lots, and lawns
Transmission Line Rights-of-Way	2	#445	L	Corridor maintenance pesticides: over-application or improper handling; construction
Transportation Corridors	Several	Both	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
<b>Notes:</b> <ol style="list-style-type: none"> <li>When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.</li> <li>For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.</li> <li>For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.</li> </ol> <p>* <b>THREAT RANKING</b> - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.</p>				

maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

- ✓ Work with local officials during their review of the railroad right of way Yearly Operating Plans to ensure that water supplies are protected during vegetation control.

**4. Sand and Gravel Mining** – Eight percent (8%) of the land area within the Zone II for the Hubbard Well (02G) is sand and gravel mining. Sand and gravel mining, like many small businesses and industries uses hazardous materials, produces hazardous waste products, and/or store large quantities of hazardous materials in UST/AST or on-site equipment. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet "Businesses Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.
- ✓ Continue working with local businesses that use hazardous materials/generate hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water

- ✓ protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure “Industrial Floor Drains” for more information.
- ✓ Review local by-laws controlling sand and gravel mining operations. The Department advocates prohibiting excavation within 10 feet of the historic high water table.

**5. Agricultural Activities** – There are several farms throughout the Zone IIs. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water.

**Agricultural Activities Recommendation:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies.
- ✓ Be sure that all facilities that may be regulated under the DFA pesticide regulations are aware they are in the Zone II.

**7. Protection Planning** – Currently, the Town does not have water supply protection controls that meet the Department’s Wellhead Protection regulations 310 CMR 22.21(2). Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells. Leverett does have water supply protection bylaws in place to control activities with the Zone II.

**Protection Planning Recommendations:**

- ✓ Develop a Wellhead Protection Plan. Establish a protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP’s guidance, “Developing a Local Wellhead Protection Plan”.
- ✓ Coordinate efforts with local officials to compare local wellhead protection controls in Sunderland and Leverett with current MA Wellhead Protection

**Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ➊ Reduces Risk to Human Health
- ➋ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ➌ Supports municipal bylaws, making them less likely to be challenged
- ➍ Ensures clean drinking water supplies for future generations
- ➎ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

Regulations 310 CMR 22.21(2). If the local controls do not meet the current regulations, adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.

- ✓ If local controls in Leverett and Sunderland do not regulate floor drains, be sure to include floor drain controls that meet 310 CMR 22.21(2).
- ✓ As noted previously, review local by-laws controlling sand and gravel mining operations. The Department’s regulations require local bylaws to have a minimum separation from groundwater of 4 feet in sand and gravel operations. However, the Department advocates more stringent controls and refer to the Cape Cod Commission’s recommendation of prohibiting excavation within 10 feet of the historic high water table as a more protective measure.
- ✓ For existing facilities, be sure that the enforcement authority conducts inspections as appropriate. Continue working with the businesses to support their continued use of BMPs to minimize their liability and protect the environment.

Other land uses and activities within the Zone II are listed in Table 2. Refer to

*(Continued on page 8)*

Table 2 and Appendix 2 for more information about these land uses.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through local bylaws and regulations providing guidance for gravel removal.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Ensure that all farms within the Zone IIs are aware they are in the protection area to assist them in complying with pesticide regulations.
- ✓ Develop and implement a Wellhead Protection Plan.

#### ➤ **Partner with Local Businesses:**

Since many businesses and industries, including small businesses, use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships between businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

#### ➤ **Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located; what types of land uses and activities pose threats; and how their efforts can enhance protection. Work with neighboring communities.

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

➤ **Plan for the Future:**

One of the most effective means of protecting water supplies is planning, such as the adoption of local controls to protect watersheds and ground water. These controls may include health regulations, general ordinances, and zoning by laws that prohibit potential sources of contamination from wellhead protection areas. Encourage and support the use of BMPs.

**Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

**Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b>	When possible, purchase Zone I lands, pursue conservation restrictions, or otherwise work to keep non-water supply activities out of the Zone Is.
Is the Zone I posted with “Public Drinking Water Supply” Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue monitoring non-water supply activities in Zone Is.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>NO</b>	The Town does not have controls that meets DEP’s requirements for wellhead protection. Refer to <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> for model bylaws and health regulations, and current regulations.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>NO</b>	Work with Leverett to include Zone IIs in their wellhead protection controls.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Develop a wellhead protection plan. Follow “Developing a Local Wellhead Protection Plan” available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	<b>NO</b>	Develop a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams in Sunderland and in Leverett.
Does the municipality have a wellhead protection committee?	<b>NO</b>	Establish committee; include representatives from citizens’ groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>YES</b>	For more guidance see “Hazardous Materials Management: A Community's Guide” at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide wellhead protection education?	<b>NO</b>	Aim efforts at residential, commercial, and municipal uses within the Zone II.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREA

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
132830	Warner Brothers	RTE 116	Sunderland	Recycler of Hazardous Waste	Large Quantity Generator of Hazardous Waste	Sand and Gravel Mining
				Plant	Restricted Air Emission Status Approved	Sand and Gravel Mining

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

# Source Water Assessment and Protection (SWAP) Report For Cliffside Apartments

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
June 2, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	<b>Cliffside Apartments</b>
<i>PWS Address</i>	<b>248 Amherst Road</b>
<i>City/Town</i>	<b>Sunderland, Massachusetts</b>
<i>PWS ID Number</i>	<b>1289001</b>

<i>Phone Number</i>	<b>413-665-3958</b>

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone 1 (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1289001-01G	310	953	Moderate
Well #2	1289001-02G	310	953	Moderate
Well #3	1289001-03G	310	953	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Cliffside Apartments complex is located on Route 116 in the center of the rural/residential and agricultural community of Sunderland. The complex has 280 residential units within nine buildings. Municipal sewer serves the community and there is natural gas pipeline and electric heat available; there is no on-site heating oil although there is an above ground propane tank. The facility is served by three bedrock wells

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

located on the side of the hill behind the facility. Although there is no information about Well #1, data indicate Well #2 is approximately 260 feet deep while Well #3 is approximately 277 feet deep. Well #3 serves as the main well with Well #1 and Well #2 supplementing the lead well. Historical information indicates casing to depths of approximately 50 feet in both wells #2 and #3 and all three wells have 5 hp pumps installed.

The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. Actual recharge areas to the wells may be significantly larger or smaller than the IWPA. The size of the Zone I and IWPA protective radii are based on the volume of water withdrawn from the well. Since there is only a master meter recording total usage, the Zone I and IWPA radial areas are based on an estimated withdrawal of approximately 17 gpm from each well. The Zone I and Interim Wellhead Protection Area (IWPA) radii for all three wells are 310 feet and 953 feet, respectively.

The apartments are located on the edge of the Connecticut River valley floor with the majority of the facility located within the valley and the sources located on the hill behind the facility. The valley is a bedrock valley filled with sand and gravel during the glacial retreat (melting) some 10,000 years ago. The bedrock in the area is mapped as the sedimentary rocks of the Turners Falls and Sugarloaf Formations and the metamorphic Joshua Schist to the west of long Plain Brook in Leverett. There is no evidence of a protective confining unit in the vicinity of the wells. Wells located in this type of an aquifer are considered to be highly vulnerability to contamination due to the absence of hydrogeologic barriers, such as clay, that can prevent contaminant migration from the surface.

At the time this report was prepared, the water at Cliffside Apartments did not require treatment. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are several activities within the drinking water supply protection areas that are potential sources of contamination.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
High density residential housing	No	Yes	Moderate	Use BMPs, encourage participation in household hazardous waste collection days. Prohibit vehicle maintenance.
Transportation corridors and parking	No	Yes	Moderate	Limit road salt usage and provide stormwater drainage away from well.
Public access	Yes	Yes	Moderate	Secure wellheads from vandalism and access.
Maintenance garage	No	Yes	Moderate	Use BMPs, review usage to determine if hazardous waste generator registration is required.

\* For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Key issues include:

1. **Nonconforming Zone 1**
2. **High density residential housing,**
3. **Transportation corridors/parking,**
4. **Maintenance garage.**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of several moderate threat land uses or activities in the IWPA, as seen in Table 2.

**1. Nonconforming Zone I** – Currently, the water supplier does not own or control the entire Zone I area for the wells. Please note that systems not meeting DEP Zone I requirements for ownership or control must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. There are only passive non-water supply activities occurring within the Zone I, such as trails. However, there is evidence that hiking and trail bikes are used along the trails. There is also anecdotal information about incidents of minor vandalism to the wellheads.

## Recommendations:

- ✓ Control access to the wellheads. Consider fencing in the wellheads and prohibiting access to the wells.
- 2. Residential Land Uses** – The entire facility is located within the IWPA of the wells. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
  - **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

## Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.

**4. Transportation corridors/parking** -- The Zone I and IWPA contain a municipal road, internal roads and parking. Transportation corridors can be a potential source of contamination from road salt and automotive leaks or spills. As storm water travels, it picks up debris and contaminants from streets, parking areas and lawns. Common potential sources of contamination include lawn chemicals, pet waste, leakage from dumpsters, household hazardous waste, etc.

#### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and the town boards.

#### Recommendations:

- ✓ Monitor parking areas and roads for accidental leaks and spills.
- ✓ Do not allow vehicle maintenance at the facility unless strictly limited and controlled.
- ✓ Continue the current practice of not using salt or deicers within the Zone I.

Encourage residents to utilize local household hazardous waste collection days and supply information about BMPs for household hazardous waste management.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Cliffside Apartments is commended for initial design of the system and efforts to minimize access to the wellhead efforts to protect the water supply. You are encouraged to review and adopt the key recommendations listed in the Wellhead Protection Plan, those listed above and those following:

#### Priority Recommendations:

- ✓ Prohibit public access to the well by locking facilities and installing a fence as necessary. Fencing is an eligible project under the Department's competitive Wellhead Protection Grant Program. If funds are available, each spring DEP posts a new Request for Response for the grant program (RFR). Visit the DEP websites for information at <http://www.state.ma.us/dep/brp/mf/othergrt.htm> and <http://www.state.ma.us/dep/brp/dws/grants.htm>.

#### Zone I:

- ✓ Prohibit any new non-water supply activities in Zone I.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping and evidence of vandalism.
- ✓ Use BMPs within the Zone I and restrict activities that could pose a threat to the water supply.
- ✓ If it is not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.

#### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, and the certified operator. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations away from the wellhead.

#### Facilities Management:

- ✓ Review uses within the maintenance department and facilities and implement standard operating procedures regarding proper storage, use and disposal of hazardous materials.
- ✓ Upgrade all hazardous material storage tanks to incorporate proper containment and safety practices.
- ✓ Encourage or supply opportunities for use of household hazardous waste drop off.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

**Planning:**

- ✓ Work with local officials in Sunderland to include Cliffside Apartments IWPA in Aquifer Protection District Bylaws, and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available. Refer to the Wellhead protection Plan prepared for your facility and follow the recommendations.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding Sources:**

The Department's Source Protection Grant Program provides funds to assist public water suppliers and their partners in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under this grant program. Please note: if funds are available, each spring DEP posts a new Request for Response for the grant program (RFR). Visit the DEP <http://www.state.ma.us/dep/brp/mf/othergrt.htm> and <http://www.state.ma.us/dep/brp/dws/grants.htm> for information about available funds.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to promote discussion of local drinking water protection measures.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Pond Ridge Condominium complex is located on the east side of Route 47, Montague Road, in Sunderland. The facility served by the public water system consists of three buildings: the Mt. Toby Apartments, the condominiums and the "farm house", with a total of 30 units that are heated by a natural gas fuel source. Currently, approximately 90 people reside at the complex. Sunderland does have a municipal water system but it does not serve this section of town. There is no municipal sewer available and therefore all of the facilities are served by on-site wastewater disposal.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

Water is supplied by a single source, Well #1. Well #1 is located immediately adjacent to the Pond Ridge Condominium building and is a 400 feet deep, 6-inch diameter well drilled into the bedrock aquifer. The well is set within an underground pit. The casing extends 8-inches above the floor of the pit which is cement.

The Zone I is the area immediately around the wellhead, while the Interim Wellhead Protection Area (IWPA) is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wells may be smaller or much larger than the IWPA. The Zone I and IWPA radii for Well #1 are 240 feet and 600 feet, respectively. The protective radii were based on maximum water use at the facility. Please refer to the attached map that shows the Zone I and IWPA radii.

The complex is located in an area where the overburden is mapped as sand and gravel less than 50 feet deep. The bedrock is mapped as the Mt. Toby Formation, Jurassic age sedimentary rocks, conglomerate and arkosic sandstone. There is no evidence of a protective till or clay layer in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

The Condominium well water is not treated at this time. Public water suppliers are required to monitor water quality at the facility. For current information on monitoring results, please review the Consumer Confidence report (CCR) that is issued annually by the water supplier or refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

There are land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Non-conforming Zone I;**
2. **Transportation corridors/parking; and,**
3. **Residential development.**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of several moderate threat land uses or activities in the Zone I and/or IWPA, as seen in Table 2.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-	-	Contact DEP before expanding or modifying the system.
Transportation corridors/parking	Yes	Yes	Moderate	Continue working with the community to manage stormwater and limit road salt usage.
High density/low density residential	No	Yes	Moderate	Provide BMPs for household hazardous materials management. Use IPM for lawn maintenance.
Septic system components	Yes	Yes	Moderate	Maintain systems and educate residents regarding disposal of waste.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**1. Non-conforming Zone I** – Zone I restrictions allow only water supply related activities or non-threatening activities in Zone I. Currently, the system does not meet DEP's Zone I requirements as the Zone I includes a road, parking, housing and septic system components.

### Recommendations:

- ✓ Do not allow any additional non-water supply activities in the Zone I.
- ✓ Inspect the casing regularly to ensure the integrity of the cap and seal and to ensure there is no standing water near the casing.
- ✓ Continue to prohibit storage and use of hazardous materials in Zone I.
- ✓ Control activities in Zone I as is reasonable.

**2. Transportation corridor/parking** – Montague Road and residential and facility parking are located within the Zone I and IWPA. Accidents and normal use and maintenance of corridors and parking areas may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as, waste from wildlife and pets.

### Recommendations:

- ✓ Prepare an Emergency Response Plan that includes coordination among town emergency responders to be sure they are aware of the location of your well.
- ✓ Continue to manage on-site stormwater to ensure it flows away from the well.

**3. Residential Land Uses** – The condominium complex consists of 30 units and there are approximately 6 other residences. All utilize on-site septic disposal systems, which are within the IWPA with some components within the Zone I. The complex utilizes electric heat. However, it is unknown what fuel sources the surrounding residences utilize. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained,

they could be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) and their associated fuel lines can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

#### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" attached to this report and at the DEP website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Pond Ridge Condominium is commended for current practices of limiting access to the wellhead area and not using pesticides or fertilizers near the well. Review and adopt the key recommendations above and following:

#### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Direct stormwater away from well.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Do not use or store pesticides, fertilizers, petroleum products or road salt within the Zone I.

#### Facilities Management:

- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.
- ✓ Continue to educate the residents and control the use of household hazardous materials in the Zone I.

#### Planning:

- ✓ Work with your community to include your IWPA in the water supply protection district along with other public water supplies in town.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Consider long term planning for the system that includes maintenance of the water and wastewater systems.

#### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the

attached program fact sheet. Each program year, if funds are available, the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at the following DEP website: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
TWIN BROOK CAMPING AREA

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 27, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Twin Brook Camping Area
<i>PWS Address</i>	1234 Colebrook River Rd
<i>City/Town</i>	Tolland, Massachusetts
<i>PWS ID Number</i>	1297002

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Spring #1	1297002-01G	112	427	High	Moderate
Spring #2	1297002-02G	150	448	High	Low

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for  
SPRING #1 (1297002-01G)**

Zone I = 112 ft.  
IWPA = 427 ft.

### How Was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the construction and vulnerable nature of the shallow dug wells and past incidents of bacteria reported in the samples from the sources. Water from both sources is disinfected prior to distribution. The **moderate** susceptibility to potential non-microbial threats for 01G is based on the buildings, activities and local roads within the Zone I and the IWPA. The non-microbial threat susceptibility for source 02G is **low**.

This source water assessment report is based on information provided by you on your Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, a Sanitary Survey, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- inspect the Zone I and IWPA regularly;
- work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- do not use pesticides, fertilizers or road salt within the Zone I;
- address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Brookside Village

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Brookside Village is a mobile home park for retired citizens and is located in Wales, a small town in southwestern Massachusetts along the Connecticut border. The park accommodates 64 units with a total population of approximately 80 to 90 residents. There is no municipal water system or wastewater disposal in Wales, therefore, the facility is served by one on-site well with one emergency well and individual septic disposal systems (some are shared systems). The facility is presently proposing upgrades to the wastewater disposal system.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

This report addresses only the active Well #2 (02G) which is located southeast of the main residential area. Well #1 (emergency source) is a 15 feet deep, 9-feet in diameter (caisson type) well located in the center of the facility that was replaced in 1983 with Well #2. Well #2 is an infiltration area that is 46 x 24 x 14 feet deep, (8 feet deep at the shallow end). The area was excavated and backfilled with 1.5-inch stone. In the deeper half of the infiltration area, nine, 6.5 feet diameter well tiles were installed with the source intake set in the center tile. The construction was within an unconfined sand aquifer with an "impervious" material backfilled from 6 feet below grade to the surface with a topsoil finish to grade. The intake is set in the center tile and the centrifugal pump is located in the adjacent pump house.

There is no surficial geology map available for the area; however, based on observations, the source is located on the edge of a narrow valley filled with sand and gravel and wetland deposits. The source construction diagrams indicate the source is on the edge of the bedrock valley and the deposits are primarily fine-grained material underlain by till. The USGS state bedrock map shows metamorphic rock, sulfidic mica schist and amphibolite of the Partridge Formation. There is no record of a confining, protective clay layer in the protection area of the source. Sources located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The Zone I is the area immediately surrounding the well and the Interim Wellhead Protection Area, (IWPA) provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I for an infiltration system, such as this one, is a 250 feet radial area from the outside edges of the source area. The IWPA for the source is a radius of 784 feet centered on the source. The IWPA radius is based on the maximum average daily water use as reported by the system. A review of the annual reports indicates that the system use fluctuates seasonally and is also related to leaks. Although water use has decreased somewhat due to diligence in leak detection and repair, the IWPA remains at 784 feet. Please refer to the attached map of the Zone I and IWPA.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Aquatic wildlife	Yes	Yes	Moderate /High	Control beaver activity to protect the source from flooding.
Fuel Storage Above Ground	Yes	Yes	Moderate	Proper maintenance and upgrades to fuel oil tanks to prevent releases from occurring
Lawn Care/Gardening	Yes	Yes	Moderate	Encourage residents in proper storage, disposal, and application of pesticides.
Transportation Corridor	Yes	Yes	Moderate	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brn/dws/](http://www.state.ma.us/dep/brn/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-feet to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

The well serving the facility has no treatment at this time however, water is disinfected prior to distribution. The DEP requires public water suppliers to monitor the quality of the water frequently. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Zone I;**
2. **Aquatic wildlife;**
3. **Residential Land Uses; and**
4. **Transportation Corridor.**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of at least one moderate threat land use or activity in the IWPA, as seen in Table 2.

1. **Zone I** – The facility owns the Zone I area around the source and the land uses include an access road, woods, water storage tank and wetland. The system is in compliance with Zone I restrictions.

### Recommendations:

- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Direct driveway and parking lot drainage in the Zone I away from the source.
- ✓ Control beaver activity to prevent flooding near the source.

2. **Aquatic wildlife** - A wetland and pond are located within the Zone I and IWPA. Beavers, ducks and other wildlife waste in and around the pond is a potential source of contamination to the water supply.

### Recommendation:

- ✓ Control the beaver activities to prevent flooding of the source area. Contact DEP

for assistance in permitting beaver controls.

3. **Residential Land Uses** – Brookside Village utilizes on-site septic disposal and is presently working with the DEP to stay in compliance with wastewater requirements. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store. Require that fuel lines are sleeved to protect from leaks.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on the following DEP website [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Consider a bylaw requiring that replacement heating/hotwater systems not be fueled by fuel oil or kerosene. Encourage maintenance of those tanks that exist and encourage conversion to propane.

4. **Transportation Corridor** – Even minor roads and parking areas are potential sources of contamination due to salting of roadways and leaks or spills of fuels and other hazardous materials during accidents.

### Recommendation:

- ✓ Contact the local emergency responders to ensure that the IWPA is included in Emergency Response Planning and monitor activities in Brookside to ensure residents manage hazardous household waste.

Implementing the following recommendations will reduce the system’s susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the source’s susceptibility to contamination. Brookside Village is commended for past efforts to protect the sources by posting signs in the Zone I and educating tenants on wellhead protection issues. The facility should continue efforts in water supply protection through reviewing and adopting the key recommendations above and the following:

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Restrict the use of salt within Zone I and drain stormwater away from the source.
- ✓ Conduct regular inspections of the Zone I especially with respect to beaver activity and the integrity of sanitary seals.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Consider well relocation or installation of a deep well if water quality at the source deteriorates or land uses cannot be controlled.

### Facilities Management:

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility properties.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement.

Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

- ✓ Continue to educate residents regarding BMPs for household hazardous waste management and septic management.
- ✓ Maintain septic systems.

### Planning:

- ✓ Work with local officials in town to assist in the development of an Aquifer Protection District with appropriate Bylaws and include the facility’s IWPA within the district.

- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the wells and is treated according to DEP guidance.
- ✓ Continue efforts to maintain and upgrade wastewater disposal systems.

**Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at the following DEP website: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

**4. Attachments**

- Map of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheet

# Source Water Assessment Program (SWAP) Report for Wales Elementary School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
May 31, 2001

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Wales Elementary School
<i>PWS Address</i>	41 Main Street, State Route 19
<i>City/Town</i>	Wales, Massachusetts
<i>PWS ID Number</i>	1306004
<i>Local Contact</i>	Ms. Rosemary Joseph, Superintendent
<i>Phone Number</i>	508-347-3077

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well 1	1306004-01G	140	442	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Wales Elementary School, an elementary school with a total staff and student population of approximately 230 people, is located immediately on the west side of Main Street, State Route 19 in the center of Wales, a rural, residential setting. Well 1 is the sole source of water for the school and is on the northeast side of the school, within 12 feet of the school wall. The Zone I protective radius for Well 1 is 121 feet and the Interim Wellhead Protection Area (IWPA) radius is 430 feet. The protective radii were based on metered usage for the two highest months on record. Please refer to the attached map that shows the Zone I and IWPA. The Zone I is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wellhead may be larger or smaller. The actual recharge area for the Wales Elementary

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

School well is likely larger than the mapped IWPA, at least in the northeasterly direction. A confirmed hazardous materials release site located at 12 Haynes Hill, has been identified by the DEP as the source of volatile organic compounds reported in the school water supply as well as several other private wells in the immediate vicinity. That location is outside of the mapped IWPA.

Well 1, a 6-inch diameter well, is reportedly drilled to a final depth of approximately 240 feet. The well is located in a 5-foot deep pit, with a locking bulkhead cover; the wellhead extends approximately 4 feet above the bottom of the pit. A drain was installed to prevent flooding of the pit. There is no record of final construction of the well or of the materials encountered during drilling. Geologic mapping of the area indicates the overburden material at the school consists of undifferentiated sand and gravel deposits but does not indicate the depth of the deposits. Because of the depth of the well, it is assumed to be a bedrock well. The bedrock is mapped as quartzofeldspathic gneiss and sillimanite schist, the upper schist member, of the Hamilton Reservoir Formation. Bedrock wells drilled in these conditions are considered to be highly vulnerable to potential contamination from the ground surface because there is no significant barrier to prevent surface contamination from migrating into the bedrock aquifer.

### Water Quality

The Wales Elementary School well water is treated for removal of volatile organic compounds and disinfected prior to distribution. In 1997, 1,1-Dichloroethylene and trichloroethylene (TCE) were reported in the water supply at the school. MA DEP conducted an investigation, which identified a source location of a TCE release that also impacted several private wells initiating a "clean-up" at the release site. The water at the school is treated and filtered to remove naturally occurring iron and manganese and then passes through granular activated carbon adsorption filters to remove the volatile organic compounds then is disinfected by an ultraviolet disinfection unit. The sediment filter backwash water is stored in a tight tank that is pumped out approximately once per month. For current information on monitoring results, please refer questions to the water supply contact listed above in Table 1. For further information on the status of the release site, refer to the information in Appendix A and contact the Bureau of Waste Site Cleanup (BWSC) at 413-784-1100 about Tier 1B site Release Tracking Number (RTN – 1-11899).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contamination*	Zone I	IWPA	Threat	Comments
Confirmed hazardous materials/oil release site, septic system	No	No	**	Tier 1B - RTN 1-11899 disposal of TCE through septic system (see Appendix A)
Fuel Storage Below Ground (UST)	Yes	No	High	Underground heating oil tank
Auto repair/body shop (Very Small Quantity Generator – VSQG)	No	Yes	High	Petroleum products use and storage
Septic tank & Tight tank	No	Yes	Moderate	See septic systems brochure in the attachments
Low density residential w/septic	No	Yes	Moderate	See septic system/pesticide attachments
Floor drain	Yes	No	Moderate	Boiler room
School Structures, athletic fields Parking lot & roads	Yes	Yes	Moderate	Fertilizer and pesticide usage. Road salt and disposal of household type hazardous waste

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/). \*\* See Appendix A

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½-mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material, such as clay, that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## 2. Discussion of Land Uses in the Protection Areas

Several land uses and activities within the drinking water supply protection areas are potential sources of contamination.

### Key issues include:

1. **Non-conforming Activities in Zone I**
2. **Confirmed Release Site RTN 1-11899**
3. **An Underground Fuel Oil Storage Tank in Zone I**
4. **Auto Repair/Body Shop**
5. **Floor drain in boiler room**

The overall ranking of susceptibility to contamination for the well is high, based on the presence of at least one high and several moderately ranked land uses or activities in the IWPA, as seen in Table 2.

**1. Non-conforming activities in Zone I** – Currently, the well does not meet DEP's restrictions that allow only water supply related activities in Zone I. The facility's Zone I contains school buildings, roads, parking areas, and property owned by an auto repair and autobody repair facility. The public water supplier does not own all land encompassed by the Zone I and therefore has no control over some of the activities. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Do not conduct any new activities within Zone I.
- ✓ Do not use or store pesticides, fertilizers or deicing materials within the Zone I.
- ✓ If the existing threats cannot be mitigated, and pose increased threat, consider investigating an alternative site for a new well.

**2. Confirmed Release Site RTN 1-11899** – The location identified by the DEP as the source of the TCE impacting the school well as well as several other nearby wells was a residential septic system through which solvents were improperly disposed of. The site 12 Haynes Hill Road is located approximately 2,300 feet from the school.

### Recommendation:

- ✓ For complete information regarding this site, contact the DEP BWSC and ask about Tier 1B site RTN 1-11899. Periodically monitor the status of the site.

**3. Underground Fuel Oil Storage Tank (UST)** – The fuel oil storage tank was replaced in 1994 in compliance with current requirements for double wall construction and leak detection. An UST in the Zone I containing petroleum products is a concern due to the potential threat posed by a release of large quantities of fuel.

### Recommendations:

- ✓ Closely monitor activities associated with the fuel tank refilling and usage.
- ✓ Any further modifications to the UST must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.

**4. Auto Repair/Body Shop** - Part of the Zone I extends to the adjacent property, which is an auto body shop. The potential threats are from petroleum products, solvents and paints stored and used on site as well as the vehicles parked on site. Proper management of hazardous materials

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

minimizes the threat from commercial activities. Currently, there is no evidence indicating adverse environmental impact from this facility. The facility is a registered Very Small Quantity Generator of Hazardous Waste (VSQG) – MAV000015464.

### Recommendations:

- ✓ Maintain communication with the business owner and support their efforts to use Best Management Practices for the handling of hazardous materials and salvage vehicles.

**6. Floor Drain** - The floor drain in the boiler room may be required to protect the school from accidental plumbing failure. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system and requires other discharges to go either to a tight tank or to a sanitary sewer. There is no sanitary sewer available in Wales. Therefore, the floor drain must be protected to prevent discharges through the floor drain such as boiler blowdown or accidental release of oil during maintenance. There are no hazardous materials stored in the boiler room and an outside contractor maintains the boiler.

### Recommendations:

- ✓ Oil lines from the tank to the boiler can be sleeved so that any oil line leaks would drain back to the tank or minimal oil would leak to the boiler room. A policy and plan should be in place during maintenance operations, especially when oil filters are changed. We recommend that you require your boiler maintenance contractor to use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blowdown generated during maintenance.

Other activities noted during the assessments were parking, roadways and storm water catch basins. Catch basins transport storm water from the roadway and adjacent properties to the ground. As flowing storm water travels, it picks up debris and contaminants from streets, parking areas and lawns. Common potential contaminants include lawn chemicals, pet waste, leakage from dumpsters, household hazardous waste, and contaminants from vehicle leaks, maintenance, washing or accidents. Work with the Town to have the catch basins maintained and cleaned. In addition, residential homes surround the school. Residential homes pose minimal threat to public and private water supplies provided home owners use Best Management Practices with respect to septic system maintenance and disposal practices, household hazardous waste, auto car and lawn and pest control. Work with your community to continue providing information regarding the use of Best Management Practices. The DEP can provide your community with information on how to develop public outreach and support local protection measures.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The staff of the Wales Elementary School is commended for their current attention to detail regarding the treatment unit and protection

measures. The Wales Elementary School in conjunction with the district and local officials should review and adopt the key recommendations above and the following:

### Zone I and IWPA:

- ✓ Keep any new non-water supply activities out of the Zone I.
- ✓ Maintain the tight tank as appropriate.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Monitor all non-compliant activities in the Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.

- ✓ Prohibit public access to the well by locking facilities and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check area for accidental spills and leaks, etc.
- ✓ Maintain road and parking lot drainage and catch basins.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Consider raising the wellhead above grade to prevent flooding of the wellhead.

### **Training and Education:**

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous materials.
- ✓ Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies or other references).
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

### **Facilities Management:**

- ✓ Monitor water quality from the treatment unit regularly to determine efficiency of the treatment. Conduct diligent maintenance on the units and recommend alternative treatment as required to maintain water quality.
- ✓ Prohibit non-sanitary wastewater discharges to on-site septic systems. Post sinks as appropriate.
- ✓ Do not store any hazardous materials in rooms with floor drains that drain to the ground or septic systems.
- ✓ Generally there is little use of hazardous materials in an elementary school. However, periodically during cleaning or maintenance, household hazardous waste is generated. Contact the Massachusetts Office of Technical Assistance at 617-626-1061 regarding proper hazardous material use, storage, disposal, emergency response, and best management practices. Develop a procedure for storage and disposal of any hazardous materials either through the Town's hazardous waste collection days or through other appropriate means. Make the process simple to ensure participation of all appropriate custodial staff. The school will have to register as a Very Small Generator of Hazardous Waste to dispose of small quantities of hazardous materials. Include custodial staff, groundskeepers, certified operator, and food preparation staff in the training.
- ✓ Implement Best Management Practices (BMPs) for the use of pesticides on facility property.
- ✓ Septic system components should be inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ Wellheads should be raised above grade to prevent accidental flooding of the well.
- ✓ Concrete wellhead protective pads should slope away from well and well casing should extend above ground.
- ✓ For utility transformers, including pole mounted transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Contact the utility if the area near the transformer has tree limbs that could endanger the transformer in a storm.

### **Planning:**

- ✓ Work with local officials in Wales to encourage the development of and implementation of Aquifer Protection Bylaws that would include the school's IWPA. The Department can assist your community in developing wellhead protection bylaws.
- ✓ Review and update as appropriate, your plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers address Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Wellhead Protection Grant or the Source Water Protection Technical Assistance/Land Management Grant Program. For additional information, please refer to the attached program fact sheet. Please note that each year the program is funded, the Department posts a new Request for Response (RFR – grant application form) for the Grant programs on the internet on or about May 1; the due date is generally on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## **4. Attachments**

- Wellhead Protection Grant Program Fact Sheet
- Source Protection Sign Order Form

## **5. Appendices**

1. APPENDIX 1 – Table of Tier Classified Oil and/or Hazardous Material Sites

# **APPENDIX 1**

## **Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Sites Within or Proximal to Wellhead Protection Areas**

DEP's data layer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitellst.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Tier Classification</b>	<b>Town</b>	<b>Contaminant Type</b>
1-11899	12 Haynes Hill	Tier 1B	Wales	Solvents

For more location information, please see the attached map. The map lists the release sites by RTN.

# Source Water Assessment Program (SWAP) Report For Silver Meadow

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 10, 2001

Well #2	1306006-02G	172	467	Low

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Silver Meadow is a residential complex for the elderly, serving 40 residents in the rural community of Wales. The community is served by on-site septic disposal systems and two, 6-inch diameter bedrock water supply wells. Well #1 is 342-feet deep with an approved daily withdrawal rate of 3,046 gallons per day (GPD). Well #2 is 242-feet deep with an approved daily withdrawal rate of 2,970 GPD. The Zone I and Interim Wellhead Protection Area (IWPA) radii for both are 172 feet and 467 feet, respectively. The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

As previously mentioned, both wells are bedrock-drilled wells. There is no surficial geology map available; however, based on the observed bedrock outcrops and topography at the site, it is assumed the surficial geology is a thin layer of till. The bedrock in the area USGS maps as metamorphic rocks, mainly gneisses and schists. There is no record of a confining, protective clay layer in the vicinity of the well. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

The well water serving the facility has no treatment at this time. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

Both wells for Silver Meadow were approved through the DEP NSA (New Source Approval) in 2000. As a result, the Zone I is in full compliance and the IWPA has few activities that are potential sources of contamination.

### Key issues within the IWPA include:

1. **High density housing with associated septic system;**
2. **Floor drains in boiler rooms; and**
3. **Internal transportation corridors and parking.**

The overall ranking of susceptibility to contamination for wells 1 and 2 is low, based on the presence of few threatening land uses or activities in the Zone I and IWPA.

**1. High density housing with associated septic system** – Most of the facility is located within the IWPA of the wells, along with associated parking, driveways and sewer lines to the septic. The most significant threats from residential areas are the septic systems due to lack of maintenance and improper disposal of non-sanitary waste. Another potential threat from residential users is mismanagement of household waste.

### Recommendations:

- ✓ Provide residents with information about proper maintenance and disposal practices for septic systems. Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Encourage residents to utilize local household hazardous waste collection days.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
High density housing with associated septic system	No	Well #1	Low	See septic system brochure, leach field outside IWPA
Floor Drains in Boiler Rooms	No	Well #1	Low	Leach field outside IWPA, be sure the floor drains are in compliance with Department Regulations
Internal Transportation Corridors and Parking	No	Both Wells	Moderate	Limit road salt usage and provide drainage away from wells
Underground Storage Tank (Propane)	No	Both Wells	Low	Propane storage less of a threat
Herbicide and Pesticide use	No	Both Wells	Moderate	Do not use herbicides or pesticides in Zone I

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

- ✓ Supply residents with information about BMPs for household hazardous waste management.

**2. Floor Drains in Boiler Room** – Oil storage is in aboveground tanks located in the boiler room with adequate secondary containment. Floor drains in the boiler room, discharge to the septic system and are equipped with oil/water separators. Title 5 prohibits disposal of any wastewater other than sanitary waste to a septic system. The floor drain must be protected to prevent boiler blow down or other prohibited discharges through the floor drain. Oil/water separators must be maintained to provide adequate protection. In addition, in the case of a catastrophic failure the separator may be overwhelmed.

**Recommendations:**

- ✓ Be sure that the floor drains are in compliance with Department Regulations (refer to Industrial Floor Drain Brochure attached).
  - Contact the UIC coordinator for the Western Region Office of the Department (Rick Larson 413-755-2207).
- ✓ Maintain oil/water separator and keep any hazardous materials from the septic system.
- ✓ Oil lines from the tank to the boiler can be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. Require a policy and a plan should be in place during maintenance operations, especially when oil filters are changed. We recommend that you require your boiler maintenance contractor to use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. The contractor should be responsible for the off-site disposal of any boiler blow down generated during maintenance.

**3. Internal transportation corridors and parking** – Within the IWPA of both wells, there are roadways into and around the facility and parking. Potential exists for hazardous material spills or leaks from any vehicle traveling in these areas.

**Recommendations:**

- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Prepare an emergency response plan for responding to an accidental release.
- ✓ Monitor roadside for spills and leaks.

Other potential threats in the IWPA at the time of the site visit include an Underground Storage Tank (UST) for propane fuel, and herbicide and pesticide use. A UST is categorized as a high potential threat for contamination; however, since the fuel stored is propane the threat is minimal. Pesticide and herbicide use is prohibited in the Zone I, and should be used minimally if at all in the IWPA.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Silver Meadow is commended for the facility design that directs storm water runoff away from the wells, utilizing propane fuel and fully complying with DEP's Zone I requirements. Silver Meadow should review and adopt the key recommendations above and the following:

**Priority Recommendations:**

- ✓ Lock all raw well water sample stations.
- ✓ Consult your cross connection inspector regarding the integrity of the sampling taps.
- ✓ Eliminate non-sanitary wastewater discharges to on-site septic systems. Consult with the regional UIC program coordinator.

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Prohibit public access to the well and pump house by locking facilities, gating roads, and posting signs.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, leaks of above ground tanks, etc.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, and certified operator.
- ✓ Post drinking water protection area signs at key visibility locations.

### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials. To learn more, refer to <http://www.state.ma.us/dep/bwp/dhm/files/sqgsum.pdf> for the Requirements for Small Quantity Generators.
- ✓ Floor drains in areas where hazardous materials or wastes might reach them need to drain to a tight tank, be sealed, or be connected to a sanitary sewer (refer to attachment "Industrial Floor Drain Brochure").
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.
- ✓ Concrete or earthen protective wellhead collars should slope away from well and well casing.
- ✓ Keep the area near electrical transformers free of tree limbs that could endanger the transformer in a storm.

### Planning:

- ✓ Work with local officials in Wales to develop wellhead protection bylaws and include the Silver Meadow IWPA in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Funding:

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response for the Grant program (RFR). On or about May 1 the new RFR is available and the application is due back on or about June 31. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed

Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## **4. Attachments**

- Recommended Source Protection Measures Fact Sheet
- Your Septic System Brochure
- Pesticide Use Fact Sheet
- Industrial Floor Drains Brochure
- Wellhead Protection Grant Program Fact Sheet
- Source Protection Sign Order Form

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Ware Water Department**

### What is SWAP?

The Source Water Assessment and Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<i>PWS Name</i>	Ware Water Department
<i>PWS Address</i>	Ware Department of Public Works 4 ½ Church Street
<i>City/Town</i>	Ware, Massachusetts
<i>PWS ID</i>	1309000
<i>Local Contact</i>	Mr. Gilbert St. George-Sorel
<i>Phone Number</i>	(413) 967-9620

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells and reservoirs may be threatened by many potential contaminant sources, including stormwater runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate Best Management Practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Section 1: Description of the Water System

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

The attached map shows Zone I and II protection areas for your groundwater supplies.

### System Susceptibility:

**High**

### Groundwater Sources

MA GIS Zone II ID #: 490

Susceptibility: High

Well Name	Source ID#
Wells 1/2/3	1309000-01G
Well #4 — Snow Pond	1309000-02G
Cistern	1309000-04G

MA GIS Zone II ID #: 193

Susceptibility: High

Well Name	Source ID#
Dismal Swamp Well	1309000-03G

Ware is a medium sized, west-central Massachusetts town located just south of the Quabbin Reservoir in the foothills of the central highlands. The town developed primarily as an industrial mill center in the mid-1800s utilizing waterpower from the Ware River. A few of the mills still exist, but Ware is now primarily a rural, residential community. The Ware Water Department maintains and operates four groundwater sources located within two distinct sand and gravel aquifers. Wells 1/2/3 (01G) is a set of three, 8 x 18-inch diameter, gravel packed wells installed in 1978 to replace a shallow tubular wellfield just north of Pines Pond. Well #4, Snow Pond Well (02G), is an 18 x 24-inch diameter, gravel packed well located just north of Pines Pond and just south of Snow Pond.

The Cistern (04G) is a 41-foot diameter, caisson (collection cistern) located adjacent to the Pines Pond that served as the original water source for the Town for a few years in the late-1800s. These three sources (01G, 02G and 04G) are located within the same relatively shallow, unconfined sand and gravel aquifer along the Muddy Brook valley. The Zone II (GIS ID # 470) for wells (01G, 02G and 04G) was delineated as part of the SWAP program utilizing empirical data, analytical modeling and geologic mapping. Part of the Zone II #470, in the Muddy Brook valley for sources 01G and 02G, is served by municipal sewer, however, there is no sewer in the northern part of the Zone II. The Zone II #470, (upgradient extent terminates at the positive recharge boundary, Hardwick Pond.)

The Dismal Swamp well (03G), is a 12 x 18-inch diameter gravel packed well located immediately adjacent to the Ware River. The Ware River valley is also a relatively shallow, unconfined sand and gravel aquifer. The Dismal Swamp Well (03G) was developed to supplement the existing wells during times of peak demand. The Zone II #193, in the Ware river valley for the Dismal Swamp well, was delineated as part of the New Source Approval Process utilizing empirical data from an extended pumping test, geologic mapping and a numerical model. The Zone II area includes a small private airstrip, the river, a few residences, a propane distributor and a small office. There are no municipal sewers in this area.

Data from well development and geologic mapping indicate both aquifers are glacially deepened bedrock valleys that were filled with sand and gravel during the glacial recession (melting) some 12,000 years ago. The sand and gravel deposits in the narrow bedrock valley aquifers utilized by these wells are mapped as glacial outwash deposits of kames, kame terraces and recent stream outwash deposits. Boring logs indicate some local, isolated fine sand, silt or clay deposits overlying the coarse aquifer sand and gravel, however, there is no indication of a continuous confining unit.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

The bedrock underlying the area is primarily mapped as schist of the Littleton Formation, the Monson Gneiss and the Hardwick Quartz Diorite.

Wells located in unconfined aquifers are considered to be highly vulnerable to contamination because the hydrogeologic barrier (i.e. clay) is not continuous throughout the developed recharge area. Please refer to the attached map to view the boundaries of the Zone II for each well.

Water from the wells is not treated. A chlorinator is available for disinfected prior to distribution if it is required.

For current information on monitoring results and treatment and for a copy of the most recent Consumer Confidence Report, please contact the Public Water System contact person listed above in Table 1. Drinking water monitoring reporting data is also available on the web at <http://www.epa.gov/safewater/ccr1.html>.

### Section 2: Land Uses in the Protection Areas

The Zone II area (# 490) for the wells located in Muddy Brook valley is 55%

forest, water or wetland, with the remaining area a mix of low to high density residential land use (22%), a few commercial activities and agricultural activities. The most densely developed southern portion of the Zone II near the wells in the Muddy Brook valley is served by municipal sewer. However, the area immediately upgradient of the Snow Pond Well (04G) is not served by municipal sewer. The Zone II (# 193) for the Dismal Swamp well is primarily wetland, forest and open land (57%). The proximity of recreational, residential and commercial activities that utilize

on-site septic disposal pose the greatest threat to the water sources. Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

#### Key Land Uses and Protection Issues include:

1. Non-conforming Zone I
2. Residential Land Uses
3. Transportation Corridors/Utility Right-of-way
4. Hazardous Materials Storage and Use
5. Comprehensive Wellhead Protection Planning

The overall ranking of susceptibility to contamination for the entire system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Non-conforming Zone I** – The Zone I for the wells is a 400-foot radial area around each of the wellheads. Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Activities other than those directly related to the public water supply are prohibited within the Zone I. However, many public water supply sources were developed prior to promulgation of the Department's regulation and contain non-water supply activities such as homes and public roads. The Town owns the entire Zone I for the recently developed Dismal Swamp well (03G). The wells in the Muddy Brook valley are non-conforming, with residential and recreational land uses in the Zone I. The Zone I of the Cistern source has a baseball field with vehicle parking, residential homes that are connected to the sewer system and the Water Department's maintenance garage.

### What is a Zone III?

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II.
2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

The following non-conforming activities are located within the Zone I of the wells:

**Wells #1, 2 and 3 (01G)** - Wells #1, 2 and 3 (source 01G) are located within a residential area of town. A portion of Pleasant Street, two homes and portions of two other lots are located within the Zone I of source 01G; the three lots with homes are served by Town sewer and water. There is also a town baseball field within the Zone I; parking occurs within the Zone I during events at the field.

**Well #4 (02G)** - Well #4 is located north of the source 01G (Wells 1, 2 and 3). A portion of Pleasant Street, two homes (one served by a private septic system and one served by the Town sewer system) are located within the Zone I.

**Cistern (04G)** - The Cistern (04G) is located south of source 01G. The baseball field and parking area, the Water Department's motor control building (old pumping station), the storage (maintenance) garage and residential backyards are within the Zone I of the Cistern. The motor control building has secondary containment for the petroleum products stored on site.

### What are "BMPs?"

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

### Zone I Recommendations:

- ✓ To the extent feasible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements. Prohibit new non-water supply activities in the Zone I.
- ✓ Ensure that residents are aware of best management practices (BMPs) with respect to household hazardous materials and lawn chemicals.
- ✓ Where it is feasible, remove all hazardous materials from the Zone I of the cistern. Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals, specifically at the maintenance garage.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I. Ensure that the Town does not use pesticides or fertilizers on the baseball field.
- ✓ Periodically inspect the stormwater runoff in the vicinity of the sources to ensure the runoff is directed away from the sources.
- ✓ Agreement Options - Until land is available for acquisition or preservation, attempt to obtain a Memorandum of Understanding and Right of First Refusal. A Memorandum of Understanding (MOU) is an agreement between the landowner and public water supplier in which the landowner agrees not to engage in specific threatening activities. The MOU should be specific to the land use or activity. For instance, if the land is residential with a septic system,

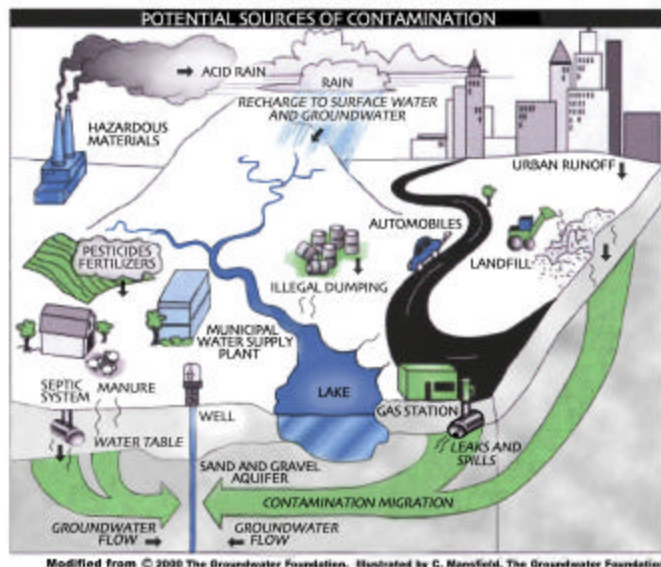

Figure 1: Sample watershed with examples of potential sources of contamination

the owner could agree not to place chemicals, petroleum products, or other hazardous or toxic substances, including septic system cleaners, into the septic system, and agree that the system will be pumped at a specific frequency. Understanding how an activity threatens drinking water quality is an important component of developing an effective MOU.

A Right of First Refusal is a legal document that gives the water supplier the first chance to purchase land when it becomes available. See Right of First Refusal in the Appendices.

**3. Residential Land Uses** – The Muddy Brook Zone II (#470) area has 20% residential land use; the Ware River Zone II (#193) has 6% residential land use. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Water Supply Protection Areas**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Zone II	Potential Contaminant Sources*
<b>Agriculture</b>				
Dairy Farm	1	H	470	Improper handling of manure (microbial contaminants); pesticides, petroleum products (handling, storage)
Crop land	Few	H	470	Pesticides, petroleum products from farm equipment
Livestock Operations (Non-commercial)	1	M	470	Improper handling of manure (microbial contaminants) pesticides, petroleum products (handling, storage)
<b>Miscellaneous</b>				
21E Release sites	2	-	470	Refer questions to the Bureau of Waste Site Cleanup for current status of sites
Aquatic Wildlife	Occasional	M/H	470	Microbial contaminants
Transportation Corridors/Utility Right-of-way	Numerous	M/H	Both	Accidental leaks or spills of fuels and other hazardous materials, over-application or improper handling of pesticides
Sand & Gravel operations	2	M	470	Accidental leaks or spills of fuels and other hazardous materials; clandestine dumping
Cemeteries	2	M	470	Leaks and spills of petroleum products (lawn care), historic and recent embalming fluids
Auto Repair Shops/Construction	1	H	470	Leaks and spills of petroleum products and other hazardous materials
Airport (private small grass strip)	1	L/M	193	Leaks and spills of petroleum products and other hazardous materials
Railroad Tracks	1	H	193	Accidental leaks or spills of fuels and other hazardous materials, over-application or improper handling of pesticides
Propane distributor	1	M	193	Delivery vehicles
Auto Sales	1	H	470	Accidental leaks or spills of fuels and other hazardous materials
<b>Residential</b>				
Fuel Oil Storage (at residences)	Numerous Few	M/H	470 193	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening/ Hay	Numerous Few	M	470 193	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Few	M	Both	Hazardous chemicals: microbial contaminants, and improper disposal

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

**\*THREAT RANKING** - Where there are two rankings, the first is for surface water, the second for groundwater sources. The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** - Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with the Board of Health, the DPW and the Department to identify areas within the Zone I and Zone II where source protection would occur if municipal sewer was available.

**4. Transportation Corridors and Utility Rights-of-way** - There are numerous roads and a utility right-of-way through the Muddy Brook Zone II (#470). There are roadways, railroad tracks, and an airport (private with a short, grass runway) in the Ware River Zone I (#193). Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, or accidental spills. Clandestine dumping is identified as a significant threat to the water supplies and roadways; remote roadways in particular, are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. Right-of-way maintenance can also be a source of contamination. Water suppliers should ensure that the utility managers are using accurate maps of source protection areas.

Railroad tracks run directly through the Zone II and Zone III of the Dismal Well. Rail corridors serving passenger or freight trains are potential sources of contamination due to chemicals released during normal use, track maintenance, and accidents. Accidents can release spills of train engine fluids and commercially transported chemicals.

**Transportation Corridor Recommendations:**

- ✓ Regularly inspect Zone IIs for illegal dumping and spills.
- ✓ Continue working with local emergency response (ER) teams to ensure that any spills within the protection areas can be effectively contained. Be sure that ER teams for the highway, fire and police departments and the railway company are aware of the protection areas. Provide them with an updated map, if necessary.
- ✓ Work with the municipality or MA Highway to have catch basins inspected, maintained, and cleaned on a regular schedule. Regular street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Consider working with local watershed groups to institute a Storm Drain Stenciling Program, if there is not a local program. For more information on how to develop a storm drain stenciling program go to <http://www.earthwater-stencils.com>.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet

available, work with town officials to investigate mapping options such as the upcoming NPDES Phase II Stormwater Rule requiring some communities to complete stormwater outfall mapping. For additional information, refer to the Stormwater Management Information at <http://www.state.ma.us/dep/brp/ww/wwpubs.htm#storm>.

- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Work with local officials during their review of the railroad and other utility right-of-way Yearly Operating Plans (YOP) to ensure that water supplies are protected during vegetation control or maintenance of the utility.
- ✓ Review potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call the local office in Hadley at 413-585-1000. Review the fact sheet available on line and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Visit DEP's Nonpoint Source Pollution web site for additional information and assistance at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**5. Hazardous Materials Storage and Use** – Approximately 1% of the Muddy Brook Zone II (#470) is mapped as commercial/industrial land use. Many businesses use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground. Vehicle washing is a restricted activity under the UIC regulations. Review the attached fact sheet for additional information about vehicle washing activities.

Activities within the Zone III may also pose a potential threat to the water supply. Specifically, under conditions when the river contributes water to the aquifer, an accidental release to the river may pose a threat to water quality. This report does not include facilities located upgradient of the wells along the Ware River.

### Top 5 Reasons to Develop a Local Wellhead Protection Plan

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

### Hazardous Materials Storage and Use Recommendations:

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet "Businesses Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.
- ✓ Work with the local Board of Health and businesses to register facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts and local floor drain requirements. See the brochure "Industrial Floor Drains" for more information.
- ✓ The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities in small communities through programs such as those listed on the USDA web site <http://search.sc.egov>.

usda.gov/. Additional information is available on the web site [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call the local office in Hadley at 413-585-1000.

**4. Agricultural Activities** – A small percentage, approximately 3%, of the watershed is agricultural land use. Pesticides, fertilizers and manure have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. Frequently, farms and other large commercial facilities have maintenance garages for equipment and storage tanks. If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the products they store.

**Agricultural Activities Recommendations:**

- ✓ Inform commercial farmers in your protection areas of your water supply protection area and encourage them to work with (or continue working with) the USDA Natural Resources Conservation Service (NRCS) and to have a farm plan to protect water supplies. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS in Hadley at 413-585-1000, for assistance
- ✓ Encourage farmers and any large commercial property owners to incorporate an Integrated Pest Management (IPM) approach into their pest (plant and insect) management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Very often farms and large commercial properties store maintenance equipment and associated petroleum products on site. Promote the use of BMPs for fuel storage, hazardous material handling, storage, disposal, and emergency response planning.
- ✓ Encourage farmers and property managers to ensure that pesticides and fertilizers are being stored within a structure designed to prevent runoff.
- ✓ The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One

program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

- ✓ Consider providing hobby farmers with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources. Planning Boards, Boards of Health and Conservation Commissions may be able to provide information on BMPs to hobby farmers as well.

**6. Protection Planning** – Protection planning protects drinking water by managing the land area that supplies water to a well or reservoir. The Ware Planning Board recently adopted protective bylaws that area in compliance with DEP's Wellhead Protection regulation 310 CMR 22.21(2). A Wellhead Protection Plan coordinates community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. Ware currently does not have a Wellhead Protection Plan.

In some circumstances, under stressed "pumping" conditions, rivers may "lose" or contribute water to an aquifer when the well is located near the river. Therefore, activities within the Zone III along a river that flows into the Zone II, may pose a potential threat to water supply wells adjacent to rivers. Specifically, under conditions when the river contributes water to the aquifer, a release of hazardous materials to the river from an industry or an automobile/train accident may pose a threat to water quality in the well. This report does not include facilities located upgradient of the Zone II along the Ware River or north of Hardwick Pond.

**What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

**Protection Planning Recommendations:**

- ✓ Prepare a Wellhead Protection Plan and establish a protection team. Refer to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan" and continue current efforts in wellhead protection planning.
- ✓ Inventory facilities upstream within the Zone III, and incorporate any potentially high threat facilities into your Emergency Response Action Plan.

Other land uses and activities within the Zone II that are potential sources of contamination are included in Table 2. Refer to Appendix B for more information about these land uses.

Contact facilities and industries on the river to be sure they include the Water Department in their Emergency Response contact list if there is a release to the river that may impact water quality. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

**Section 3: Source Water Protection Conclusions and Recommendations****Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone II and watersheds contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- adopting protective bylaws, and
- proactive inspections and knowledge of the Zone II protection areas.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone Is regularly, and when feasible, remove any non-water supply activities.
- ✓ As funds are available and it is feasible, consider extending municipal sewer lines to areas within the Zone I and II that are closest to the wells.
- ✓ Educate residents on ways they can help protect drinking water sources.
- ✓ Continue working with emergency response teams to ensure that they are aware of the stormwater drainage in the Zone II and to cooperate on responding to spills or accidents.
- ✓ Consider working with the local fire department to inventory, as appropriate, non/commercial and residential USTs within the Zone IIs.
- ✓ Partner with local businesses in the Zone II and the Zone III areas to ensure the proper storage, handling, and disposal of hazardous materials and to include the Water Department in their emergency response plans.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Develop and implement a Wellhead Protection Plan.
- ✓ Visit DEP's Nonpoint Source Pollution web site for additional information and assistance on NPS pollution at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

**Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

**For More Information**

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier and the town boards.

➤ **Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships among businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

➤ **Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to water supply contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained, it is a potential source of microbial contamination. Animal waste is also a source of microbial contamination.

➤ **Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge areas are located, what types of land uses and activities pose threats, and how their efforts can enhance protection.

➤ **Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office (Hadley 413-585-1000) of the NRCS for assistance.

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the grant program. Each spring, if funding is available, DEP posts a new Request for Response for the grant program (RFR) on the website <http://www.comm-pass.com/>.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the protection areas. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities
- C. Underground Storage Facility
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>NO</b> <b>01G, 02G and 04G</b> <b>YES</b> <b>03G</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Monitor activities in Zone I.
Are the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Are the Zone I regularly inspected?	<b>YES</b>	Continue inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Monitor non-water supply activities in Zone I; investigate options for removing these activities.
<b>Municipal Controls</b> (Zoning Bylaws/Ordinances, Health Regulations, and General Bylaws/Ordinances)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2) ?	<b>YES</b>	Reference <a href="http://mass.gov/dep/brp/dws/">mass.gov/dep/brp/dws/</a> for model bylaws, health regulations, drinking water regulations and current/updated guidance documents.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>NO</b>	Contact communities upstream of the sources on the Ware River and provide them with information that your sources are downstream. Assist and encourage them in the active protection of the watershed lands.
<b>Planning</b>		
Does the PWS have a local surface water and wellhead protection plan?	<b>NO</b>	Develop a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Consider augmenting the plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams. Communicate with facilities upstream of the Dismal Swamp well to be sure they are aware that the Water Department should be included in their ER plans in the event of a release to the river.
Does the municipality have a watershed and wellhead protection committee?	<b>YES</b>	Continue the committee and include representatives from citizens' groups, neighboring communities, and the business community.
Do the Boards of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	Request that the Board of Health consider adoption of hazardous materials handling regulations. For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> .
Does the PWS provide watershed protection education?	<b>YES</b>	Currently, the only outreach is through the annual Consumer Confidence Report. Increase residential outreach through bill stuffers, school programs, Drinking Water Week activities, and coordination with local groups. Aim additional efforts at commercial, industrial and municipal uses within the Zone II and Zone III.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREAS

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class	Facility Description
	Gilbertville Bottled Gas	109 Gilbertville Road	Ware	Hazardous Waste Generator	Very Small Hazardous Waste Generator	Propane delivery
	Hardwick Auto Sales	551 Greenwich Road	Ware	Hazardous Waste Generator	Very Small Hazardous Waste Generator	Auto Sales
	D. Petracon & Sons/ D & P Bus Co.	100 Pleasant Street	Ware	Waste Oil Generator	Very Small Hazardous Waste Generator/Oil	Sales Repair/Bus terminal
	Four Seasons Repair	53 Crescent Street	Ware	Hazardous Waste Generator	Very Small Hazardous Waste Generator/Oil	Sales Repair/Bus terminal
	Construction & Auto Repair Company		Ware	Not registered		Auto Body & Repair

For information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>  
Additional information provided by individual owners

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitelist.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-12283	Residence	Ware	Oil
1-12042	Residence	Ware	Oil

For more location information, please see the attached map. The map lists the release sites by RTN.

# Source Water Assessment and Protection (SWAP) Report For Oakwood Park

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
April 18, 2002

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	<b>Oakwood Park</b>
<i>PWS Address</i>	<b>Monson Turnpike Road</b>
<i>City/Town</i>	<b>Ware, Massachusetts</b>
<i>PWS ID Number</i>	<b>1309001</b>

<i>Phone Number</i>	<b>603-578-9200</b>

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1309001-01G	266	683	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Oakwood Park is a residential, mobile home park, located in a rural section of Ware. The park has approximately 65 trailers with 211 residents. The community is served by an on-site septic disposal with individual septic tanks serving multiple trailers, force mains and a central leachfield located outside of the Zone I. There is a single, 6-inch diameter, 220 feet deep well that serves the facility. The Zone I and Interim Wellhead Protection Area (IWPA) radii for the well are 266 feet and 683 feet, respectively.

The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

area has not been delineated. The protective areas have been calculated based on the metered water usage reported to the Department. The actual recharge area to the well may be significantly larger or smaller than the IWPA.

USGS mapping shows the area indicates coarse sand and gravel overburden with no indication of a confining, protective clay layer. The bedrock in the area is generally mapped as a biotite-feldspar rich gneiss of the Massabessic Gneiss Complex. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers, such as clay, that can prevent contaminant migration. At the time this report was prepared the water did not require and was not treated. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the well and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are several activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Nonconforming activities in the Zone I;**
2. **Aboveground storage tanks;**
3. **Septic system;**
4. **Residential homes; and**
5. **Transportation corridor.**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of several moderate threat land uses or activities in the Zone I and IWPA, as seen in Table 2. The facility does have a Wellhead Protection Plan prepared by Northeast Rural Water Association.

**1. Nonconforming activities in the Zone I** – Currently, the water supplier does not own or control the entire Zone I area. Please note that systems not meeting DEP Zone I requirements for ownership or control must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. There are non-water supply activities occurring within the Zone I, such as structures (residents), parking, roadway, sewer force main at the time of the visit there were several vehicles parked

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
High Density Housing	Yes	Yes	Moderate	Use BMPs, encourage participation in household hazardous waste collection days. Prohibit or control vehicle maintenance.
Transportation Corridors and Parking	Yes	Yes	Moderate	Limit road salt usage and provide drainage away from well
Aboveground Storage Tanks	Yes	Yes	Moderate	Require replacement, maintenance, containment and monitoring of tanks. Consider conversion to propane.
Septic system components	Yes	Yes	Moderate	Tanks, pressure main, leach field. See attached brochure

\* For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

behind the abandoned residence. In addition, there was standing water in the well house with the distribution line under water. The facility has located the emergency generator and fuel outside of the Zone I and has not permitted any new trailers within the Zone I. However, the generator is a diesel fuel generator. The Park has a policy to not use any salt, pesticides or fertilizers in Zone I.

### Recommendations:

- ✓ Continue the current controls for access to the wellhead area.
- ✓ Consider well replacement if existing threats cannot be mitigated.
- ✓ Continue current practice of no use or storage of pesticides, fertilizers or road salt within the Zone I.
- ✓ Raise the wellhead out of the pit and ensure that there is no standing water in the pit.

**2. Aboveground Storage Tank (UST)** – There are numerous ASTs located in the IWPA. Although the facility has been diligent in removing the emergency generator and fuel source to outside of the Zone I, the majority of the homes are located topographically upgradient of the well and have outdoor ASTs for fuel oil. If managed improperly, ASTs can be a potential source of contamination due to leaks, spills or overfills of the chemicals they store.

### Recommendation:

- ✓ ASTs in close proximity to the water supply should be closely monitored especially during deliveries. Any upgrades and modification must meet current construction standards and be done consistent with Massachusetts' plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs.
- ✓ Require all of the homes with tanks 10 years of age or older to be replaced or have secondary containment. All tanks must be painted and on a pad. Consider a requirement to convert to propane over time.

**3. Septic Systems** – The facility's septic system is located within the IWPA. The most significant threats from a septic system are from lack of maintenance and improper disposal of non-sanitary waste.

### Recommendations:

- ✓ Provide residents with information about proper maintenance and disposal practices for septic systems. Septic system components should be located, inspected, and

maintained on a regular basis. Refer to the attachments for more information regarding septic systems.

- ✓ Prohibit septic tank cleaners, especially those with acids and solvents.

**4. Transportation Corridors** -- The Zone I and IWPA contain a municipal road, internal roads and parking. Transportation corridors can be a potential source of contamination from road salt and automotive leaks or spills. As storm water travels, it picks up debris and contaminants from streets, parking areas and lawns. Common potential sources of contamination include lawn chemicals, pet waste, leakage from dumpsters, household hazardous waste, etc.

### Recommendations:

- ✓ Monitor parking areas and roads for accidental leaks and spills.
- ✓ Do not allow vehicle maintenance at the facility unless strictly limited and controlled.
- ✓ Continue the current practice of not using salt or deicers within the Zone I.
- ✓ Restrict access as is feasible.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and the town boards.

- ✓ Inspect the roadway near the water supply to ensure the runoff is directed away from the well.
- ✓ Work with the Town to have the road maintenance and runoff issues addressed as necessary.

Other potential threats noted during the site visit include vehicles stored within the Zone I behind the abandoned house. Encourage residents to utilize local household hazardous waste collection days and supply information about BMPs for household hazardous waste management.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The Oakwood Park is commended for its staff's past efforts to protect the water supply. You are encouraged to review and adopt the key recommendations listed in the Wellhead Protection Plan, those listed above and those following:

### Priority Recommendations:

- ✓ Remove as is reasonable, all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.
- ✓ Consider well relocation if Zone I threats cannot be mitigated; investigate the potential to acquire land in the event a new source must be developed.
- ✓ Prohibit public access to the well by locking facilities and installing a fence as necessary. Fencing is an eligible project under the competitive grant program.

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, check any above ground tanks for leaks, etc.
- ✓ Use BMPs within the Zone I and restrict activities that could pose a threat to the water supply.
- ✓ Continue policy of not using pesticides and fertilizers in Zone I.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.
- ✓ Redirect road and parking lot drainage in the Zone I away from well.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Upgrade to propane for power sources in areas utilizing fuel oil.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.

- ✓ Post drinking water protection area signs at key visibility locations away from the wellhead.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

### Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of hazardous materials.
- ✓ Upgrade all oil/hazardous material storage tanks to incorporate proper containment and safety practices.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on all facility property.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Provide technical information about proper disposal practices.
- ✓ Encourage the use of household hazardous waste drop off.

- ✓ Well casing should extend above ground and there should be no standing water around the wellhead. Install a passive drain if necessary. Take whatever steps are necessary to prevent flooding of wellhead.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

### **Planning:**

- ✓ Work with local officials in Ware to include Oakwood Park's IWPA in Aquifer Protection District Bylaws, and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available. Refer to the Wellhead protection Plan prepared for your facility and follow the recommendations.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response for the Grant program (RFR). On or about May 1 the new RFR is available and the application is due back on or about June 31. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Warren Water District

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Warren Water District obtain its water supply from a tubular wellfield located on the eastern shore of Comins Pond, approximately 9,000 feet north of Massachusetts Turnpike (Route I-90), and approximately 1,500 feet west of Bemis Road. The wellfield consists of twenty one 2-1/2 -inch wells and five (5) 8-inch wells. The wellfield has a Zone I which is essentially a 250 foot buffer around the perimeter of the wellfield. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The well is located in an aquifer with a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration. Please refer to the attached map to view the boundaries of the Zone I and Zone II. The Warren Water District is currently in the approval process for another drinking water source which will

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

July 2, 2003

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

be located south of the current wellfield. An assessment of the proposed groundwater source is not included in this report.

The well is treated with sodium hydroxide solution for corrosion control. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment and for a copy of the most recent Consumer Confidence Report, please contact the Public Water System contact person listed above in Table 1.

Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

The majority of the land within the Zone II is forested with small areas of residential uses. Land uses and activities within the drinking water supply protection areas that are potential sources of contamination area as follows:

#### Key issues include:

1. **Inappropriate Activities in Zone I; and**
2. **Aquatic wild life.**

The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of only moderate threat land use or activity in the Zone II, as seen in Table 2.

1. **Zone I** – Currently, the well does not meet DEP's restrictions, which only allow water supply related activities in Zone Is. The facility's Zone I contains a home which is on town sewer, and some parking areas used by beach goers. Portable bathrooms are used on the town beach, which belongs to the town. The public water supplier owns and controls all land encompassed by the Zone 1. Please note that systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

#### Recommendations:

- ✓ Remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Parking areas	Yes	Yes	Moderate	Provide drainage away from wells
Aquatic Wildlife	Yes	Yes	Low	Comins Pond
Structures (Served by public sewer)	Yes	Yes	Low	Non-water supply structures in Zone I

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

- ✓ Continue practicing the your no salt policy in the Zone 1.

2. **Aquatic wildlife** – Comins Pond lies in the protection area of the water supply. Ducks and other wildlife waste in and around the river are potential sources of contamination in the water supply.

### Recommendation:

- ✓ Discourage wildlife by prohibiting the feeding of ducks and wildlife.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Warren Water District should review and adopt the key recommendations above and the following:

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ If the resident intends to continue utilizing the structures in the Zone I, use BMPs and restrict activities that could pose a threat to the water supply.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.

### Facilities Management:

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### Planning:

- ✓ Work with local officials in Warren to include the facility Zone II in Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet.

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Please note: each program year the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in “Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation” at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## **4. Attachments**

- Map of the Public Water Supply (PWS) Protection Area.
- Recommended Source Protection Measures Factsheet
- Wellhead Protection Grant Program Fact Sheet

### **For More Information:**

Contact **Josephine Yemoh-Ndi** in DEP's **Worcester Office** at **(508) 792-7650 x 4030** for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

Copies of this assessment have been made available to the public water supplier and town boards.

# Source Water Assessment Program (SWAP) Report for Warwick Community School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
June 15, 2001

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	Warwick Community School
<i>PWS Address</i>	Winchester Road
<i>City/Town</i>	Warwick, Massachusetts

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well #1	1312012-01G	115	428	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

### The Well

Warwick Community School is a rural, elementary school located on the east side of Winchester Road (State Route 78) in Warwick. The school student and staff population is approximately 100 people per day and is served by a single potable supply well (Well #1) located south of the school.

The well has a Zone I protective radius of 115 feet and an Interim Wellhead Protection Area (IWPA) radius of 428 feet based on pumping test data and Zone I restrictions. The

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

well was tested and was shown to have a Safe Yield of 12,960 gallons per day (9.0 gpm) under the New Source Approval Process. However, due to Zone I land use restrictions that allow only drinking water activities within the Zone I, the approved rate for the well is restricted to 1,260 gpd (0.875 gpm). Well #1 is a 6-inch diameter well drilled to a depth of approximately 440 feet below ground. The driller's log states gravel and boulders were encountered from ground level to approximately 16 feet below ground, where bedrock was encountered. The bedrock was apparently highly weathered and the borehole was filled with cement to 70 feet and redrilled to stabilize the walls of the boring. Forty feet of casing was cemented into place with 24-inches above ground. The geologic mapping of the area identified the bedrock as a quartz-mica-sillimanite schist and gneiss of the Ammanousuc volcanics series dating from the Ordovician. Variable amounts of epidote, garnet and shpene are noted. The water does not require and is, at the time this report was prepared, not treated. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the attached maps of the Zone Is and IWPAs and Table 2 for additional assessment information. Please note that the "ortho-photograph" in the attached map was taken prior to the construction of the school and therefore does not show the school. The school is located north of the well and parts of the playing field, the basketball court and the leach field are within the IWPA.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, it was noted the few land uses and activities within the drinking water supply protection areas are potential sources of contamination.

#### Key issues include:

1. **Septic System components in the IWPA**
2. **Floor drain in boiler room**

The well is located in an aquifer with a high vulnerability to contamination due to the absence of a significant hydrogeologic barrier to prevent contaminant migration. The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of at least one moderate threat land use or activity in the IWPA, as seen in Table 2.

1. **Septic systems** - The septic system leach field is located within the IWPA of the wells. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Improper disposal of household hazardous chemicals to septic systems or discharge from the boiler room are also potential sources of contamination to the water supply.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Septic System components (leachfield)	No	Yes	Moderate	Refer to attached septic system fact sheet.
Floor Drain in the boiler room to septic system	No	Yes	Moderate	Floor drain must be protected from accidental spills
Passive Recreation	No	Yes	Low	Athletic Fields

- **-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).**

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Recommendations:

- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator.
- ✓ Refer to the appendices for more information regarding septic systems. The school is currently not registered as a generator of hazardous waste or waste oil. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" to determine regulatory requirements. If you wish to participate in the Town household hazardous waste pick-up day.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis.

2. **Floor drain in the boiler room** – Floor drains may be required in boiler rooms to provide drainage in the event of a plumbing failure. If there is a potential for hazardous materials to flow accidentally into the floor drain, however, preventive measures should be taken. Floor drains in an area that contains hazardous materials must be discharged to a sewer or a tight tank. The boiler room at the Warwick Community School has a floor drain that is assumed to discharge to the septic system.

## Recommendations:

- ✓ Oil lines from the tank to the boiler can be sleeved so that any leaks would drain back to the tank or minimal oil would leak to the boiler room. A written policy and plan should be in place during maintenance operations, especially when oil filters are changed. Request that your boiler maintenance contractor use containment, protect the drain and have absorbent materials on hand to prevent accidental leaks while conducting routine maintenance. Please note that boiler blow down generated during routine maintenance cannot be discharged through the floor drain and must be disposed of off site.

Other activities that were noted during the assessment were the multiple earth removal operations. The sand and gravel mining operations appear to be located down gradient to the well. The school's oil tank was constructed in accordance with current standards for containment and is located outside of the IWPA.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The Warwick Community School is commended for current protection measures.

Please review and adopt the key recommendations listed above and as follows:

### Zone I and IWPA:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I. Look for evidence of unauthorized access.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider gating the wellhead.
- ✓ Post drinking water supply signs key location such along the access road and in the parking area.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

- ✓ Provide information to staff about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Use Best Management Practices (BMPs) for the use of fertilizer lawn care, pesticides and household hazardous waste.

### Training and Education:

- ✓ Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies).

### Facilities Management:

- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ Concrete or earthen collars around the wellhead should slope away from well.
- ✓ Staff should be instructed on the proper disposal of spent household chemicals. Include custodial staff, groundskeepers, and certified operator. In order to participate in a Community Hazardous Waste Pick-up day, the school must be registered as a Very Small Quantity Generator. The school is currently not registered as a generator of hazardous waste or waste oil. Review the enclosed document "A SUMMARY OF REQUIREMENTS FOR SMALL QUANTITY GENERATORS OF HAZARDOUS WASTE" and register to participate.

### Planning:

- ✓ Work with local officials in Warwick to include the school well's IWPA in an Aquifer Protection District Bylaws and to assist you in securing protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Funding:

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the 2001 "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note that each program year, on or about May 1 the Department posts a new Request for Response (RFR), grant application form. Generally, the applications are due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at

<http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## 4. Attachments

- Map of the Public Water Supply (PWS) Protection Area.

- Your Septic System Brochure
- Grant Program Fact Sheet
- Source Protection Sign Order Form
- Very Small Quantity Generator (VSQG) information

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
BUCKSTEEP MANOR

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 27, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Bucksteep Manor
<i>PWS Address</i>	885 Washington Mountain Road
<i>City/Town</i>	Washington, Massachusetts
<i>PWS ID Number</i>	1313006

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1313006-01G	100	410	High	High
Well # 2	1313006-02G	203	507	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #2  
(1313006-02G)**

Zone I = 203 ft.  
IWPA = 507 ft.

### How Was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **high** susceptibility to potential non-microbial threats is based on the underground storage of fuel oil within the Zone I and IWPA. Other moderate non-microbial threats include buildings, local roads and vehicle parking within the Zone Is and IWPAs.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, Sanitary Survey, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone Is and IWPAs regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the wells (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone Is;
- ✓ do not use pesticides, fertilizers or road salt within the Zone Is;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
DEM WENDELL STATE FOREST

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 24, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	DEM Wendell State Forest
<i>PWS Address</i>	392 Montague Rd.
<i>City/Town</i>	Wendell, Massachusetts
<i>PWS ID Number</i>	1319001

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
HQ Bldg Well	1319001-01G	150	448	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for  
HEADQUARTERS BLDG  
WELL (1319001-01G)**

Zone I = 150 ft.  
IWPA = 448 ft.

### How was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **high** susceptibility to potential non-microbial threats is based on the storage of hazardous materials such as gasoline, oil, or paint within the Zone I and the IWPA. Other moderate threats include local roads and parking areas within the Zone I and/or the IWPA.

This source water assessment report is based on information provided by you on your 1999 Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- inspect the Zone I and IWPA regularly;
- work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- do not use pesticides, fertilizers or road salt within the Zone I;
- address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

## Source Water Assessment Program (SWAP) Report

### for

## Lake Grove School

#### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

#### SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 8, 2003

**Table 1: Public Water System (PWS) Information**

<i>PWS Name</i>	<b>Lake Grove School</b>
<i>PWS Address</i>	<b>6 Farley Street</b>
<i>City/Town</i>	<b>Wendell, Massachusetts</b>

<i>Phone Number</i>	<b>978-544-6913</b>

<i>Well Name</i>	<i>Source ID#</i>	<i>Zone I (in feet)</i>	<i>IWPA (in feet)</i>	<i>Source Susceptibility</i>
Well # 1	11319004-01G	143	443	High
Well # 4	11319004-04G	190	489	High

#### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. School officials, citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your school.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

### 1. Description of the Water System

Lake Grove School is a residential school located in the community of Wendell, for males age 12 to 18 with behavioral disabilities. Wendell does not have municipal water or wastewater disposal, therefore the facility is served by on-site water supply, and on-site septic disposal. The school maintains two active bedrock well sources, Well #1 (1319004-01G) and Well #4 (1319004-04G). Two wells, Wells #2 and #3 (02G and 03G), have been disconnected from the potable water system and reclassified as emergency sources. The school continues to maintain the wells and utilizes them as non-potable water sources. Emergency sources will not be addressed further in this

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

report. Well #1 is a 6inch diameter bedrock well, adjacent to the Administration Building and serves only day use facilities on the north side of Farley Street. Metered use for Well #1 is 1,932 gallons per day. Well #4 was installed and permitted through the New Source Approval Process in 2000 when the school expanded and renovated their facilities. Well #4 is a bedrock well, 440 feet deep and has an approved withdrawal rate of 3,981 gallons per day or 2.76 gallons per minute.

The Zone I for a well is the protected area immediately surrounding the wellhead while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual recharge area (Zone II) has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and IWPA for the Well #1 is 143 feet and 443 feet, respectively; the Zone I and IWPA radii for Well #4, as approved in 2000, are 190 feet and 489 feet, respectively. The Zone I radius for Well #1 was based on metered water use in 2000.

The school is located in the Massachusetts central highlands; the bedrock is mapped as the Poplar Mountain Gneiss. The overburden is a relatively thin layer of till (ground moraine) with bedrock commonly exposed. There is no record of a confining, protective clay layer in the vicinity of the wells. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface.

Water from the wells serving the facility is not treated at this time. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone Is and IWPAs and Table 1 for additional information regarding the location of the wells and activities within the protection areas.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Residential High School	Well #1	Both	Moderate	Well #1 is non-conforming; all school facilities within IWPA Well #4.
Transformers	Yes	Both	Low	MODF (oil) – potential leaks. If there is any question about PCBs in the transformers oil, request confirmation from the electric company.
Maintenance facilities	No	Both	High	Use BMPs for handling, storage and use of hazardous materials.
Parking lots, internal transportation corridors	Well #1	Both	Moderate	Request limited use of road salt and provide drainage away from well.
Septic system components	Yes	Both wells	Moderate	Use BMPs to maintain system and prohibit disposal of non-sanitary waste to systems. School utilizes a Bioclere wastewater treatment system for wastewater disposal.
Athletic fields/landscaping	No	Well #4	Low	Do not use pesticides and fertilizers. Consider IPM if it is appropriate.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I,**
2. **Institutional use - residential high school,**
3. **Transportation corridors, and**
4. **Hazardous materials management.**

The overall ranking of susceptibility to contamination for the system is high, based on the presence of one or more high ranking land uses or activities in the Zone I and IWPA of one of the sources, as seen in Table 2. The water use for development of the Zone I for Well #1 was based on data from 2000. The use has decreased since Well #4 has come on-line and it is anticipated that the Zone I radius will decrease to 100 feet and the IWPA will decrease somewhat to approximately 420 feet. In addition, the water supplier is planning to relocate the maintenance facility outside of the IWPA of both wells. If these changes occur, the system susceptibility could be lowered to moderate based on the removal of the high-risk threat (the maintenance facility) from the protection areas. The Department recommends the continued use of BMPs at that facility and that the new maintenance facility be designed with containment.

**1. Non-conforming Zone I**– Well #4, the school's main well, is in conformance with the Zone I requirements. Well #1, which has limited use, is non-conforming with respect to the Zone I requirements. DEP approval is required prior to increasing water use or modifying systems for sources that are not in conformance with Zone I requirements.

### Recommendations:

- ✓ Continue to monitor activities within the Zone I.
- ✓ Use Best Management Practices for handling all household hazardous materials, stormwater runoff, and septic system maintenance.
- ✓ Consider relocation of Well #1 if potential threats cannot be mitigated and water quality is impacted.

**2. Institutional use – Residential high school** - The facility is a residential school with all associated activities including dormitories, infirmary, recreational facilities, classrooms, maintenance facilities, parking, etc. Maintenance and services provided to the facility include all household hazardous materials including petroleum products for maintenance vehicles (lawn mowers, tractors, etc) paints and cleaning materials.

### Recommendations:

- ✓ Use BMPs for activities within close proximity to the wells.
- ✓ Continue monitoring and managing stormwater runoff, directing it away from the wellhead.
- ✓ Do not use pesticides or fertilizers within the Zone I of the wells. Utilize Integrated Pest Management (as practical) on campus to minimize the use of pesticides and nutrients in fertilizers.

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

**3. Transportation corridors** – There are internal walkways/access roads within the IWPA of Well #4 and a main road through the protection area of Well #1. Roadway construction, maintenance, and typical use, even on low use roads can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals such as fuel oil. De-icing materials, automotive chemicals and other debris on roads and in parking areas, are picked up by stormwater and wash into catchbasins or to swales. Stormwater management issues on town roads should be addressed in cooperation with the Town.

#### Transportation Corridor Recommendations:

- ✓ Identify stormwater drains and the drainage system along transportation corridors.
- ✓ Work with local emergency response teams to ensure that any spills within the protection areas can be effectively contained.
- ✓ Use minimal road deicers within the protective areas, and monitor the parking lot and roadside for spills and leaks.

**4. Hazardous Materials Storage and Use** – The school has small amounts of hazardous materials associated with maintenance at the school. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to discharge into a floor drain leading to the ground or directly to the ground. This includes floor drains in boiler rooms. The facility uses propane as a fuel source. However, floor drains in areas that hazardous materials make be discharged to, including boiler rooms, may not discharge to the septic system and should be connected to a tight tank. Contact the DEP Underground Injection Control Program (Rick Larson at 413-755-2207) if you require additional information.

#### Hazardous Materials Storage and Use Recommendations:

- ✓ Educate staff on best management practices for storage, use and handling of hazardous materials for protecting water supplies.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the wells' susceptibility to contamination. Lake Grove School is commended for developing Well #4 as an alternate source. Continue monitoring activities in the protection areas and review and adopt the key recommendations above and as follows:

#### Priority Recommendations:

- ✓ Review activities and practices at the maintenance facility. Continue use of BMPs for use and handling of hazardous materials.
- ✓ Maintain septic systems and prohibit inappropriate disposal into the systems.

#### Zone I:

- ✓ Prohibit any new non-water supply activities from the Zone I of Well #1.
- ✓ Conduct regular inspections of the Zone I. Look for evidence of leaks or spills and regularly inspect the integrity of the well caps and seals around the wells.
- ✓ Do not use or store pesticides, fertilizers or hazardous materials within the Zone I.

#### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices, including custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at locations where BMPs should be used.

**Facilities Management:**

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property. Do not use pesticide in Zone I. Incorporate an Integrated Pest Management (IPM) approach into their pest management programs. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Ensure that stormwater runoff is directed away from the water supplies.

**Planning:**

- ✓ Working with local officials in Wendell to include the Lake Grove School Zone I (Well #1) and the IWPA's in their emergency planning and to assist you in improving protection.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

- ❖ Recommended Source Protection Measures Fact Sheet

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**West Springfield Water Department**

### What is SWAP?

The Source Water Assessment and Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

<i>PWS ID Number</i>	1325000
<i>Local Contact</i>	Mr. Jeffrey Auer, Superintendent
<i>Phone Number</i>	413-263-3230

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells and reservoirs may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Section 1: Description of the Water System

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

### System Susceptibility:

**High**

### Groundwater Sources

MA GIS Zone II #: 205

Susceptibility: High

Well Name	Source ID#
GP Well #1 Southwick	1325000-01G
GP Well #1 Southwick	1325000-02G
GP Well #1 Southwick	1325000-03G
GP Well #1 Southwick	1325000-04G

### Surface Water Sources

Source Name	Susceptibility: High
Bear Hole Reservoir	1325000-01S

West Springfield is a mid-sized industrial, residential community in western Massachusetts. West Springfield Water Department receives its water from four wells and one reservoir, and also purchases water from the Springfield Water & Sewer Commission. A copy of the SWAP report for the Springfield system will be forwarded upon completion. The four wells for the West Springfield Water Department are located in the Town of Southwick near the border with Westfield. The wells are in relatively close proximity to each other within the same unconfined, sand and gravel aquifer. Each well has a Zone I of 400 feet and the Zone II recharge area was delineated utilizing empirical data, analytical modeling and geologic mapping. The aquifer is an extensive, very productive, sand and gravel, buried valley aquifer. The aquifer was formed during the recession of the glaciers about 14,000 years ago when the water from the melting glaciers deposited sand and gravel in the bedrock valleys. There are two other municipalities, Westfield and Southwick, that have wells located within the same aquifer. The Zone II for West Springfield's wells extends to the aquifer watershed boundary, south of the Congomond Lakes, and is partially within the town of Suffield, Connecticut. There is no evidence of a protective, confining clay layer above the sand and gravel aquifer. Wells located in this type of an aquifer are considered to be highly vulnerable to contamination from activities on the ground surface due to the absence of hydrogeologic barriers (i.e. confining clay layer) that can prevent contaminant migration. The water from the wells is

treated through a granular activated carbon unit to remove the pesticides (ethylene dibromide) EDB and (dichloropropane) DCP, and disinfected prior to distribution. EDB and DCP are chemical compounds that had been used on fields located adjacent to the wells. Please refer to the attached map of the Zone II.

The Bearhole Reservoir is located in West Springfield and its watershed extends into the cities of Holyoke and Westfield. The majority of the watershed includes steep-sided valley walls, although the center of the watershed lies within a broad, brook valley along the Paucatuck Brook and extending north into Holyoke. The Ashley Pond Reservoirs, part of Holyoke's water supply, are located in the northern part of the Bearhole Reservoir watershed. The overburden material in the valley is primarily stratified drift, composed of sand and gravel, while the steeper valley walls and in the upland areas there is a thin cover of glacial till or exposed bedrock. The bedrock in the watershed is

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

mapped as the volcanic and sedimentary rocks of the Hartford Basin. Please refer to the attached map of the watershed.

Water from the reservoir is filtered and disinfected prior to distribution. For current information regarding water quality monitoring results and treatment, please contact the Public Water System contact person listed in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web at <http://www.epa.gov/safewater/ccr1.html>

### Section 2: Land Uses in the Protection Areas

The Zone II and watershed for West Springfield are primarily a mixture of agriculture, forest and residential land uses, with smaller portions consisting of commercial and industrial land uses (refer to attached maps for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

#### Key Land Uses and Protection Issues include:

1. Non-conforming Zone I
2. Activities in Zone A
3. Residential Land Uses
4. Transportation Corridors
5. Hazardous Materials Storage and Use
6. Agricultural Activities
7. Comprehensive Wellhead Protection Planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Non-conforming Zone I** – The Zone I for each of the wells is a 400 foot radius around the wellhead. Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. West Springfield owns or controls the Zone Is for Wells 01G and 04G, but does not own or control the Zone Is for Well 02G and 03G. Only water supply activities or non-threatening activities are allowed in the Zone I. However, many public water supplies were developed prior to the Department's regulations and contain non-water supply activities such as homes and public roads. The following non-water supply activities occur in the Zone Is of the system wells:

**Well 02G** - A tobacco field extends into the Zone I for Well 02G.

**Well 03G** - A hayfield extends into the Zone I for Well 03G.

#### Zone I Recommendations:

- ✓ To the extent possible, remove all activities from the Zone Is that are not related to water supply to comply with DEP's Zone I requirements.
- ✓ Notify landowners in the Zone Is to be sure they are aware they are in a Zone I and/or Zone II and comply with all regulations that may be applicable to activities they are conducting, such as the use of pesticides.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Enter into an agreement of Right of First Refusal with land owners in the Zone Is and/or try to acquire conservation restrictions.
- ✓ Do not use or store pesticides, fertilizers or deicing materials within the Zone Is.

### What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

- ✓ Prohibit new non-water supply activities from the Zone Is.

**2. Activities in Zone A** - The Zone A for reservoirs includes all areas within 400 feet around the reservoir and within 200 feet of either side of all streams that flow into the reservoir. Land use activities within the Zone A for Bear Hole Reservoir which may have an impact on surface water sources include: transportation corridors, including the Mass. Turnpike (I-90) and local roads; active railroad tracks; stormwater runoff; and aquatic wildlife. Wild animals and domestic pets can be carriers of waterborne diseases such as Giardia, Cryptosporidium, Salmonella, etc.

**Zone A Recommendations:**

- ✓ To the extent possible, remove all prohibited activities from the Zone A to comply with DEP's Zone A requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Storage of pesticides, fertilizers or road salt within the Zone A should be covered and contained.
- ✓ Prohibit new non-water supply related activities from the Zone A.

**What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**3. Residential Land Uses** – Approximately 16% of the Zone II and a small portion of the watershed consist of residential areas. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Some of the areas have access to public sewers, while other areas within the protection areas rely on septic systems for wastewater management. Common potential sources of contamination from residential areas include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems leach to the ground. If septic systems fail or are not properly maintained they can be a source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the stored fuel oil.

Figure 1: Sample watershed with examples of potential sources of contamination

- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Water Supply Protection Areas**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Areas

Land Uses	Quantity	Threat	Zone II	Watershed	Potential Contaminant Sources*
<b>Agricultural</b>					
Fertilizer Storage or Use	Numerous	M	Yes	-	Leaks, spills, improper handling, or over-application of fertilizers
Forestry Operation	Numerous	M	Yes	Yes	Herbicides or pesticides, equipment maintenance materials: leaks, spills, or improper handling; road building
Livestock Operations	Numerous	M	Yes	-	Manure (microbial contaminants): improper handling
Manure Storage or Spreading	Numerous	H	Yes	-	Manure (microbial contaminants): improper handling
Pesticide Storage or Use (tobacco)	Numerous	H	Yes	-	Leaks, spills, improper handling, or over-application of pesticides, leaching
Slaughterhouse	1	M	Yes	-	Manure and other waste products (microbial contaminants): improper handling
<b>Commercial</b>					
Gas Stations	1	H	Yes	-	Automotive fluids and fuels: spills, leaks, or improper handling or storage
Auto Repair Shops / Service Stations	4	H	Yes	-	Spills, leaks, or improper handling of automotive fluids, and solvents (1 in CT)
Boat Yards/Builders (Marina)	1	H	Yes	-	Fuels, paints, and solvents: spills, leaks, or improper handling
Bus Terminals	1	H	Yes	-	Fuels and maintenance chemicals: spills, leaks, or improper handling
Junk Yards and Salvage Yards	1	H	Yes	-	Automotive chemicals, wastes, and batteries: spills, leaks, or improper handling
Golf course	2	M	Yes	-	Leaks, spills, of hazardous materials, over application of pesticides and herbicides
Repair Shops (Engine, Appliances)	1	H	Yes	-	Engine fluids, lubricants, and solvents: spills, leaks, or improper handling or storage
Mining	2	M	Yes	Yes	Heavy equipment, fuel storage, clandestine dumping: spills or leaks
Railroad Track and Depot	1	H	-	Yes	Spills, leaks, or improper handling of maintenance and shipped materials

Lawn Care / Gardening	Numerous	M	Yes	Yes	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Yes	Yes	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>					
Aboveground Storage Tanks	Several	M	Yes	Yes	Materials stored in tanks: spills, leaks, or improper handling (1 in CT)
Aquatic Wildlife	Some	L/H	Yes	Yes	Microbial contaminants
Underground Storage Tanks	2	H	Yes	-	1 in CT (oil), 2 in MA (gasoline/diesel)
Clandestine Dumping	Some	H	Yes	Yes	Improper use or storage of fuels and other chemicals
Fishing/Boating	Some	L/M	Yes	-	Fuel and other chemical spills, microbial contaminants
Schools	3	M	Yes	-	Laboratory, art, photographic, machine shop, and other chemicals: spills, leaks, or improper handling or storage
Transportation Corridors	Numerous	H	Yes	Yes	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

**4. Transportation Corridors** - Interstate 90, the Mass. Pike, runs through the Zone A for Bear Hole Reservoir. Local roads and trails are common in the Zone II and watershed. Roadway construction, maintenance, typical highway use and illegal or inappropriate trail use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include contaminants from automotive leaks, maintenance, washing, or accidents.

There are numerous unpaved, roadways as well as legal (authorized) and illegal (unauthorized) trails throughout the watershed and Zone IIs. Most of these roadways and trails through the watershed are not maintained at all or are minimally maintained. The resulting erosion poses a significant threat to water quality in areas that are proximal to feeder streams and the reservoirs, potentially resulting in additional drinking water treatment costs if they continue unchecked and pose a potential threat to public health and safety. Uncontrolled erosion contributes sediment, various contaminants and pathogens into the contributing waters and reservoirs. Evidence of access to the watershed was observed and anecdotal information indicates access throughout the watershed. Unmanaged access may also result in vandalism, illegal dumping and access to the reservoir, resulting in water quality impairment.

Railroad tracks run through the Zone A and watershed. Rail corridors serving passenger or freight trains are potential sources of contamination due to chemicals released during normal use, track maintenance, and accidents. Accidents can release spills of train engine fluids and commercially transported chemicals.

**Transportation Corridor Recommendations:**

- ✓ Regularly inspect the watershed and Zone II for illegal dumping and spills.
- ✓ Work with local emergency response teams to ensure that any spills within the protection areas can be effectively contained.
- ✓ Work with the City and Massachusetts Highway Department to have catch basins inspected, maintained, and cleaned on a regular schedule. Regular street sweeping reduces the amount of potential contaminants in runoff.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to

investigate mapping options such as the NPDES Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Work with local officials during their review of the railroad right of way Yearly Operating Plans to ensure that water supplies are protected during vegetation control.
- ✓ Notify City and host town officials of potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP).

**5. Hazardous Materials Storage and Use** – A small portion of the Zone II for West Springfield’s wells has commercial or industrial land uses. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in USTs/ASTs. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a septic system or floor drain leading directly to the ground.

There are mining operations within both the watershed and the Zone II. The MA DEP recommends continued vigorous monitoring of these activities with respect to hazardous materials management and closure activities at those facilities.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between

**What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II .
2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

**Top 5 Reasons to Develop a Local Wellhead and Surface Water Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

businesses, water suppliers, and communities enhance successful public drinking water protection practices.

- ✓ Educate local businesses on Massachusetts floor drain requirements. See brochure “Industrial Floor Drains” for more information.
- ✓ The USDA has various funding sources for governmental agencies, non-governmental organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. If it is needed, funding may be available for the school and bus terminal in Southwick. Additional information is available on the web site [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Paul D. Geoffroy, Rural Development Manager at the local office in Hadley at 413-585-1000 ext.4.

**6. Agricultural Activities, Hobby Farmers and Golf Course** – The Zone II consists of approximately 17% agricultural land use including animals and cropland. There are also two golf courses and several non-commercial farms. Please note that this percentage does not include the area located in Connecticut that contains large tobacco farms within the Zone II. Massachusetts pesticide regulations do not apply in Connecticut. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed and those permitted to be applied in protection areas are regulated by the MA Pesticide Bureau. Often farms and golf courses use and store hazardous materials. Proper handling, management and disposal of hazardous materials is imperative in protection areas. In addition, if managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the stored fuel oil.

**Agricultural Activities, Hobby Farmers and Golf Course Recommendations:**

- ✓ Work with farmers in your protection areas to make them aware of your

water supply and to encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Recommend that they contact NRCS for assistance.

- ✓ Encourage the farmers and lawn and course managers to incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Promote the use of best management practices (BMPs) for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.
- ✓ Work with farmers and lawn and course managers to ensure that pesticides and fertilizers are being stored within a structure designed to prevent runoff.
- ✓ Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.
- ✓ The USDA has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP), may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ A copy of this report will be sent to the planner in the Town of Suffield, CT.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

#### **For More Information**

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier and the town boards.

**7. Protection Planning** – Protection planning protects drinking water by managing the land area that supplies water to a well or reservoir. Currently, West Springfield has a watershed protection bylaw, but should update it to be in compliance with DEP's Surface Water Protection regulations 310 CMR 22.20 (b) and (c). Holyoke and Westfield do not have local controls that meet DEP's Surface Water Protection regulations 310 CMR 22.20 (b) and (c) to protect the watershed lands. Southwick's water supply protection district includes the West Springfield Zone II. The Southwick bylaws meet DEP's Wellhead Protection regulations 310 CMR 22.21(2). Wellhead Protection and Surface Water Supply Protection Plans coordinate community efforts, identify protection strategies, establish timeframes for implementation, and provide a forum for public participation. West Springfield has a Surface Water Supply Protection Plan which should be implemented and updated as necessary to reflect actions taken and new or changing conditions that occur. There are resources available to help communities develop plans for protecting drinking water supply sources.

#### **Protection Planning Recommendations:**

- ✓ Develop a Wellhead Protection Plan. Establish a protection team with officials from Southwick and Suffield, CT and refer to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ If local controls do not regulate floor drains, be sure to include floor drain controls that meet 310 CMR 22.21(2).
- ✓ If local surface water supply protection controls do not meet the current regulations, adopt controls that meet 310 CMR 22.20 (b) and (c). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ Work with town boards to review and provide recommendations on proposed development within your water supply protection areas. To obtain information on build-out analyses for the town, see the Executive Office of Environmental Affairs' community preservation web site, <http://commpres.env.state.ma.us/>.

- ✓ Work together with the Town of Southwick to establish a working relationship with the town of Suffield Connecticut regarding wellhead protection. Contact Lori Mathieu of the CT Department of Public Health at 860-509-7333 or the CT DEP for more information about how CT regulates activities within water supply protection areas. The MA DEP has forwarded an outline of the protection area within CT to the CT DPH and information regarding the land uses observed. A copy of this SWAP report has also been forwarded to the Suffield, CT Town Planner for their review and consideration.

During the SWAP assessment for Southwick and West Springfield, it was noted by the Southwick Water Department and confirmed through review of CT DPH online information, a public water system West Service Corp., is located within the West Springfield Zone II, and owns and operates two wells just over the CT border in Suffield. The MA DEP was not able to obtain any information about potential sources of contamination in this area other than what was observed through a windshield survey of the Zone II area. There is a metal building between what are believed to be the well houses for the system with several vehicles parked at the facility. A fuel pump was observed behind the metal building. It is not clear if the fuel pump was connected to an underground or aboveground storage tank. There is a crane parked immediately adjacent to what appeared to be the well house for one of the wells. The majority of the land use in the Zone II area within Connecticut is tobacco fields and residential development. There is one small commercial area that included an auto body repair shop with numerous stored vehicles on-site, a fuel oil business with service trucks and an office/garage. The fire department is also located within the Zone II and appears to have a UST on-site.

Other land uses and activities within the Zone II that are potential sources of contamination are included in Table 2. Facilities observed in Connecticut are also included in Table 2. Refer to Appendix B for more information about the land uses in Massachusetts. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### **Section 3: Source Water Protection Conclusions and Recommendations**

#### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone II and watershed contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Land acquisition within the watershed, protecting a total of 77% of the watershed lands.
- Adding gates to discourage unauthorized access to the watershed land, especially the use of All Terrain Vehicles.
- Working cooperatively with local quarries, railroad, and other businesses in the watershed.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone Is and Zone A regularly, and when feasible remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and watershed and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Develop and implement a Wellhead Protection Plan.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community.

➤ **Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships among businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

➤ **Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to groundwater contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained, it could be a potential source of microbial contamination. Animal waste is also a source of microbial contamination. Farmers may find BMPs helpful in managing manure, pesticides and fertilizers. Provide information or refer them to the DEP's website

➤ **Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located; what types of land uses and activities pose threats; and how their efforts can enhance protection.

➤ **Plan for the Future:**

One of the most effective means of protecting water supplies is local planning, including adoption of local controls of land use, regulations related to watersheds and groundwater protection. These controls may include health ordinances/regulations, discharge prohibitions, general ordinances, and zoning bylaws that prohibit or control potential sources of contamination within the protection areas.

➤ **Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available on line and call the local office (Amherst 413-253-4350) of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.

The Department's Source Protection Grant Program provides funds to assist public water suppliers and their partners in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under this grant program. If funds are available, each spring DEP posts a new Request for Response for the grant program (RFR). Visit the DEP <http://www.state.ma.us/dep/brp/mf/othergrt.htm> and <http://www.state.ma.us/dep/brp/dws/grants.htm> for information about available funds.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I and Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I ?	<b>YES</b> 01G, 04G <b>NO</b> 02G, 03G	Follow best management practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
Are the Zone I and Zone A posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Are the Zone I and Zone A regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>YES</b> 02G, 03G <b>NO</b> 01G, 04G	Monitor non-water supply activities in Zone I (agricultural areas) and prohibited activities in Zone A, and investigate options for removing these activities.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Surface Water Protection Controls that meet 310 CMR 22.20C and Wellhead Protection Controls that meet 310 CMR 22.21(2) ?	<b>YES - Zone II</b> <b>NO - Watershed</b>	Southwick has a bylaw in compliance with 310 CMR 22.21(2). Watershed lands in West Springfield are not protected by a Watershed Protection bylaw. Work with the Planning Board to compare land use controls to see that they meet current requirements of 310 CMR 22.20C. Refer to mass.gov/dep/brp/dws/ for model bylaw/ordinance and health regulations, and current regulations.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>YES - Zone II in Southwick</b> <b>NO - Watershed</b>	Southwick actively protects the Zone II through bylaws and an active Board of Health. There is no information regarding Suffield's bylaws. Contact Suffield or CT DPH. Work with the communities of Holyoke and Westfield to encourage them to protect watershed lands.
<b>Planning</b>		
Does the PWS have a local surface water and wellhead protection plan?	<b>YES - Surface</b> <b>NO - Wellhead</b>	Develop a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> . Update Watershed Resource Protection Plan as noted in watershed inspection reports and as appropriate.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment the plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams in Southwick and in Holyoke as appropriate.
Does the municipality have a watershed and wellhead protection committee?	<b>NO</b>	Establish committee and include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> . Encourage and assist Boards of Health in conducting inspections of commercial and industrial facilities as appropriate.
Does the PWS provide watershed protection education?	<b>YES</b>	Increase residential outreach through bill stuffers, school programs, Drinking Water Week activities, and coordination with local groups. Aim additional efforts at commercial, industrial and municipal uses within the Zone II and watershed.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREAS

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class
34340	Rods Customs & Restorations	106b Foster Rd	Southwick	Generator Of Hazardous Waste	Very Small Quantity Generator
131583	More Parts Of Southwick Inc	40 Sam West Rd	Southwick	Generator Of Hazardous Waste	Very Small Quantity Generator
50494	Powder Mill Middle School	94 Powder Hill Rd	Southwick	Plant	Air Quality Permit
50583	Western Mass Rendering Co Inc.	94 Foster Rd	Southwick	Generator Of Hazardous Waste	Small Quantity Generator of Waste Oil or PCBs
211896	Bus Maintenance Garage	Powder Mill Rd	Southwick	Sewer Connection Or Groundwater Discharge	Industrial Waste Water To Sewer
275553	Southwick Tolland Regional High School	93 Feeding Hills Rd	Southwick	Generator Of Hazardous Waste	Very Small Quantity Generator
280450	B & E Tool Company Inc	10 Hudson Drive	Southwick	Generator Of Hazardous Waste	Small Quantity Generator
275553	Southwick Tolland Regional High School	93 Feeding Hills Rd	Southwick	Plant	Air Quality Permit
281212	Moosehead Harvesting Corp	49 Sam West Rd	Southwick	Generator Of Hazardous Waste	Small Quantity Generator Of Waste Oil Or PCBs
283488	Whalley Precision Inc	28 Hudson Dr	Southwick	Generator Of Hazardous Waste	Small Quantity Generator Of Waste Oil Or PCBs
324974	Thomcast Communications Inc - Comark Div	104 Feeding Hills Road	Southwick	Generator Of Hazardous Waste	Small Quantity Generator

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class
MV4135695688	D&S Manufacturing Co	10 Hudson Dr	Southwick	Generator Of Hazardous Waste	Very Small Quantity Generator

339044	Westfield Gage Co	34 Hudson St	Southwick	Generator Of Hazardous Waste	Very Small Quantity Generator
378898	Pioneer Dairy Inc	214 Feeding Hills Rd	Southwick	Generator Of Hazardous Waste	Very Small Quantity Generator

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## Underground Storage Tanks

Facility Name	Address	Town	Description	Tank Type	Tank Leak Detection	Capacity (gal)	Contents
Saunder's Boat Livery Inc.	120 Congamond Rd	Southwick	Boat Livery	1 Wall	Approved In-Tank Monitor	4,000	Gasoline

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm>

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitelist.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0000536	81 Point Grove Rd	SOUTHWICK	Unlisted
1-0014428	97 Feeding Hills Rd	SOUTHWICK	Oil

For more location information, please see the attached map. The map lists the release sites by RTN.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**West Stockbridge Water Department**

### What is SWAP?

The Source Water Assessment Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

<b>PWS Name</b>	West Stockbridge Water Department
<b>PWS Address</b>	9 Main Street, P.O. Box 525
<b>City/Town</b>	West Stockbridge
<b>PWS ID Number</b>	1326000
<b>Local Contact</b>	Mr. Preston Lockenwitz
<b>Phone Number</b>	(413) 232-0309

### Introduction

We are all concerned about the quality of the water we drink. Drinking water supplies may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection Conclusions and Recommendations
4. Appendices

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

## Section 1: Description of the Water System

**System Susceptibility**

**High**

**Zone II #: 539**

**Susceptibility: High**

Well Names	Source IDs
Swamp Rd. Well #1	1326000-05G
Swamp Rd. Well #2	1326000-06G

The town of West Stockbridge is a small residential community in south Berkshire County, Massachusetts. West Stockbridge, settled in the 1700's, was established as an agrarian town, then developed with marble mining and mills along the waterways. Today the town hosts tourism and seasonal and year round residents. The West Stockbridge Water Department maintains two active water supply wells: Swamp Rd. Well #1 (05G) and Swamp Rd. Well #2 (06G). The Water Department also lists one surface water supply, Sartori Quarry 02S as an emergency source of water. The emergency source will not be addressed further in this report.

Wells #1 and #2 are located approximately 55 feet apart, within the same, relatively narrow, unconfined, sand and gravel aquifer that lies within the flood plain along the Cone Brook valley and are used alternately. Well #1 is a 6 x 12-inch diameter gravel packed well, 51 feet deep, installed in the 1993 to replace the surface water supply that was inadequate. Well #2, a back-up source, is an 8 x 12-inch diameter naturally developed well, approximately 48 feet deep, 55 feet from Well #1. Wells #1 and #2 are located within the same hydrogeologic regime, and therefore share the same Zone II contribution area. Well #1 was pump tested at a rate of approximately 100 gpm and has an approved withdrawal rate of 69.4 gpm (99,936 gpd). Well #2 was also tested at a rate of approximately 100 gpm and has an approved withdrawal rate of 30 gpm. The Town owns the 400-foot Zone I radial area around Well #1. However, the Town could not easily acquire additional land for the 400 foot Zone I radius for Well #2. Therefore, the approved withdrawal rate for Well #2 is limited to 30 gpm (43,200 gpd) by the Town's ownership of Zone I radial area of 345 feet. The Zone II (#539) is within the towns of West Stockbridge and Richmond.

The aquifer is a glacially deepened, bedrock valley that was filled in with sand and gravel deposited during the recession (melting) of the glaciers some 12-18,000 years ago. Streams and rivers have reworked and eroded the glacial deposits and recent streams have deposited additional alluvial material. Boring logs and maps in the Cone Brook valley indicate sand and gravel from ground surface to about 20-feet below grade underlain by a layer of silt and sand. That semi-confining layer of silt and fine sand is underlain by the principal aquifer which consists of channel deposits ranging from fine sand to coarse sand and gravel deposits up to 55 feet in depth. Although boring logs indicate silt and fine sand, there is no evidence of a continuous confining clay layer in the Cone Brook aquifer. Due to the proximity of wells to the Cone Brook, under extended duration pumping conditions it is likely that the Cone Brook contributes water to the aquifer supplying the wells.

The topography of the Zone II watershed is steep sloped valley with the narrow Cone Brook valley widening to the southwest at the confluence of Cone Brook and Furnace Brook at Shaker Pond. West Stockbridge Mountain borders on the southeast and Cone Hill on the northwest. The overburden material on the uplands in the watershed is predominantly a thin cover of glacial till, often referred to as hard pan, with significant areas of exposed bedrock. The brook valley has limited deposits of recent alluvium and swamp deposits underlain by stratified drift. The bedrock beneath the Zone II and Zone III is mapped as the Stockbridge Formation consisting of dolostone and marble. The structural geology of the region is highly complex with several stages of folding, faulting and significant structural movement with the Berkshire Massif to the east and the Taconic range to the west. The watershed is located within an area of faulted, overturned synclines and anticlines.

The Zone II for the wells was delineated as part of the SWAP program through the use of analytical modeling and geologic mapping. Aquifer characteristics were determined from data collected during extended duration pumping tests and borings drilled during groundwater exploration. The Cone Brook aquifer is considered to be highly vulnerable to contamination from land uses on the ground surface due to the absence of a hydrogeologic barrier (i. e. clay) that can prevent contaminant migration from activities on the land surface. Please refer to the attached map to view the boundaries of the Zone II and consult the Consumer Confidence report for current water quality data.

Water from the aquifer has a relatively high hardness and therefore Aqua-Mag phosphate sequestering agent is added to the water from the wells to prevent calcium precipitation in the distribution system. Water is also chlorinated for disinfection prior to distribution. For current information on water quality monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

## Section 2: Land Uses in the Protection Areas

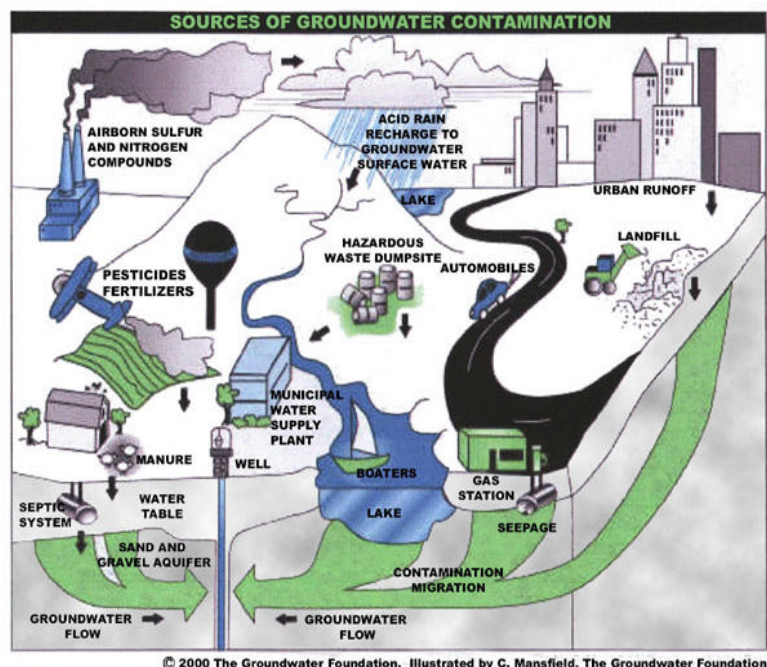

The land use within the Zone II for the Water Department wells is a mixture of forest, cropland, grazing and residential (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Zone I
2. Residential land uses
3. Transportation corridors
4. Agricultural activities
5. Comprehensive wellhead protection planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Zone Is** – The Zone I for Well #1 is a 400 foot radius around the wellhead while the Zone I for Well #2 is 345 feet. Currently, Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water) requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction, Memorandum of Understanding or other legal mechanism as approved by the DEP. The public water supplier does own the entire Zone I for both of the wells but the

withdrawal is limited on Well #2 by the size of the Zone I. Only activities directly related to the water supply, or other non-threatening activities, as determined by the DEP, are allowed in the Zone I. The Department encourages ownership or control of the Zone I through various means as outline below.

The wells are located within the floodplain of Cone Brook and adjacent to a pasture for cattle. The Water Department applied for and was awarded a grant to improve the sanitary seals on the wells and observation wells, to construct a berm to protect the wells from flooding and ice damage, and to install a fence to prevent grazing animals from accessing the Zone I. The property immediately adjacent to the Zone I is part of a farm that has heavy equipment and associated petroleum and other products stored within the Zone II and Zone III of the wells. Although the facility is on the opposite side of Cone Brook and not within the Zone I, it is within close proximity to the wells.

#### **Zone I Recommendations:**

- ✓ Prohibit any new non-water supply activities from the Zone I.
- ✓ Consider for future expansion, options for purchasing land and/or negotiating a conservation restriction for land adjacent to the existing Zone I.
- ✓ Agreement Options - Until land is available for acquisition or restriction, attempt to obtain a Memorandum of Understanding and Right of First Refusal.
  - A Memorandum of Understanding (MOU) is an agreement between the landowner and public water supplier in which the landowner agrees not to engage in specific threatening activities. The MOU should be specific to the land use or activity. For example, if the land is residential with a septic system, the owner could agree to not place chemicals, petroleum products, or other hazardous or toxic substances, including septic system cleaners, into the septic system, and agree that the system will be pumped at a specific frequency. As another example, the portions of fields within the Zone I would not have manure, fertilizers or pesticides spread on them. Understanding how an activity threatens drinking water quality is an important component of developing an effective MOU.
  - A Right of First Refusal is a legal document that gives the water supplier the first chance to purchase land when it becomes available. Please refer to the example of the Right of First Refusal documents attached in the Appendices.

The Department commends the West Stockbridge Water Department for its proactive efforts to acquire property and control activities within the Zone I and recommends continued efforts in establishing a program for planning to acquire ownership or control of additional property within the areas critical to protecting water quality. If there is no other reasonable method to secure rights and protect these sources, the Water Department may wish to consider taking necessary water supply land by

#### **What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

#### **For More Information**

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier, board of health, and the town.

## Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Protection Areas**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Areas

Activities	Quantity	Threat*	Potential Source of Contamination
<b>Agriculture</b>			
Fertilizer/Pesticide Storage or Use—Crops	1	H	Fertilizers: leaks, spills, improper handling, or over-application
Livestock Operations	1	M	Manure (microbial contaminants): improper handling
Manure Storage	1	H	Microbial and nutrient contamination to surface and groundwater
Hazardous materials	Few	M	Fuel storage, petroleum products for equipment
<b>Residential</b>			
Fuel Oil Storage (at residences—ASTs/USTs)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Transportation corridors	1	M	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Pole mounted electrical transformers	1	L	MODF and possibly PCBs: spills, leaks, or improper handling. Contact the electric company to ensure there are no PCBs within the transformers.

### Table 2 Notes:

- When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
- For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
- For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

eminent domain to protect the sources. This recommendation is not only for the existing sources but also should be considered for future development of sources, if they are needed. We recommend consulting your Solicitor regarding land takings in another community.

**2. Residential Land Uses** – Approximately 20% of the Zone II consists of residential areas. The Zone II areas are not connected to municipal sewer and therefore utilize on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (UST and AST) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to control new residential developments in the water supply protection areas.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Consider working with the Fire Chief to inventory fuel sources and storage methods in the Zone II. Provide BMPs to homeowners for fuel oil storage.

**3. Transportation Corridors** - Swamp Road and several other local roads run throughout the Zone II protection area. Roadway construction, stormwater runoff, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are also frequent sites for illegal dumping of hazardous or other potentially harmful wastes. De-icing materials, automotive chemicals and other debris on roads are picked up by stormwater and wash into catch basins or directly into streams and brooks.

**Transportation Corridor Recommendations:**

- ✓ Identify stormwater drains and the drainage along transportation corridors. Wherever possible, ensure that drains discharge stormwater outside of the Zone II. Where it is practical, recommend water quality swales to slow stormwater flow and settle out sediments before they discharge to surface water.
- ✓ Contact the Town to ensure stormwater systems are inspected, maintained, and cleaned on a regular schedule. Street sweeping reduces the amount of potential contaminants in runoff.
- ✓ Continue current efforts of working and planning with local emergency response teams to ensure that any spills within the Zone II can be effectively contained and the Water Department is notified.

**4. Agricultural Activities** – There are a few farms (crop, hay and pasture) throughout the Zone II. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure piles and field application are potential sources of contamination to ground and surface water supplies. In addition, farms and large commercial facilities often conduct their own maintenance on their equipment and have storage of hazardous materials and waste.

### **Agricultural Activities Recommendation:**

- ✓ If appropriate, work with the DEP to negotiate Conservation Restrictions for these land areas.
- ✓ Work with commercial farmers in your protection areas to make them aware of your water supply and to encourage the use of a USDA Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf> and call the local office of the NRCS in Pittsfield at 413-443-6867 for assistance.
- ✓ Encourage farmers and property managers to incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Promote the use of BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning. Request that farmers evaluate their status as hazardous waste generators and register with DEP, as appropriate.

### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with a watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow into the Zone II.
2. The groundwater in this area discharges to a surface water feature such as a river, rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

- ✓ Continue your current efforts with farmers to ensure that pesticides, fertilizers and manure are being stored within a structure designed to prevent runoff.

- ✓ The USDA has various funding sources for government agencies, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online at <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>, and call the local office of the NRCS for assistance.

- ✓ Work with hobby farmers by supplying them with information about protecting their own wells, surface waters and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

**5. Comprehensive Protection Planning** – Currently, the Towns of West Stockbridge and Richmond do not have water supply protection controls that meet the requirements of the Department's Wellhead Protection regulation 310 CMR 22.21(2). Protection planning protects drinking water by managing the land area that supplies water to a well. A Wellhead Protection Plan can coordinate community and inter-community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public participation. There are resources available to help communities develop a plan for protecting drinking water supply wells.

### **Top 5 Reasons to Develop a Local Wellhead Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased groundwater monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [mass.gov/dep/brp/dws](http://mass.gov/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

### **Protection Planning Recommendations:**

- ✓ Consider preparing a Wellhead Protection Plan. Establish a protection team that includes participants from the Town of Richmond, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Request that the West Stockbridge and Richmond Boards of Health adopt floor drain controls and hazardous materials handling regulations and that the Planning Boards propose wellhead protection bylaws for the Zone II.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply. Other land uses and activities within the Zone II are listed in Table 2.

## **Section 3: Source Water Protection Conclusions and Recommendations**

### **Current Land Uses and Source Protection:**

As with many water supply protection areas, the system's Zone IIs contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Proactively pursuing land acquisition and protection options in the Zone I,
- Maintaining detailed knowledge of activities within the protection areas,
- Efforts to work with land owners to control and manage manure and runoff.

### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone I regularly, and prohibit any non-water supply activities within the Zone I.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone II and to cooperate on responding to spills or accidents.
- ✓ Consider inventorying USTs within the Zone IIs.
- ✓ Continue working with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Develop and implement a Wellhead Protection Plan and continue efforts to include Richmond in source protection efforts.

### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community. When funds are available, the Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Each spring, if funds are available, DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the protection area. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

### **A. Protection Recommendations and Additional Documents on Source Protection**

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>YES</b>	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials. Continue working with land owners to negotiate a Conservation Restriction or ownership to acquire additional land for protection.
Is the Zone I posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b>	Continue to keep other land uses out of the Zone Is. Continue working with land owners to negotiate a CR, MOU and other forms of protection.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2)?	<b>NO</b>	Work with the community Planning Board and Board of Health to adopt wellhead protection measures.
Do neighboring communities protect the Zone II areas extending into their communities?	<b>NO</b>	Richmond does not have wellhead protection measures in place that meet 310 CMR 22.21(2). Continue efforts to encourage neighboring communities to adopt bylaws and regulations to protect resources.
<b>Planning</b>		
Does the PWS have a Wellhead Protection Plan?	<b>NO</b>	Consider developing a plan and include strategies for future source development and protection. Refer to "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> . Include Richmond officials in the plan development and implementation.
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Continue to work with the Fire Department, Board of Health, DPW, and local and state emergency officials.
Does the municipality have a wellhead protection committee?	<b>YES</b>	Include representatives from citizens' groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>N/A</b>	
Does the PWS provide wellhead protection education?	<b>YES</b>	Aim additional efforts at residential and agricultural uses within the Zone II and as appropriate Zone III.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For Mill Pond Trailer Park

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 29, 2003

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The well for Mill Pond Trailer Park is located northeast of Albany Road. There is municipal water and wastewater available in West Stockbridge, however only waste water disposal is available to the Mill pond facility. The Well No. 2 is a gravel developed well that was installed to replace a shallow dug well (Well No. 1). The well was installed and tested under the requirements of the New Source Approval Process. The well is within a confined aquifer, where there is a thick clay layer between the ground surface and the well screened in the sand and gravel.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

The well has a Zone I radius of 250 feet and an Interim Wellhead Protection Area radius of 622 feet based on a approved withdrawal rate. The IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. There is a hydrogeologic barrier (clay layer) at least in the immediate vicinity of the well. However, unless this hydrogeologic barrier is known to exist throughout the IWPA, the aquifer is considered to have a high vulnerability to contamination. Nonetheless, the hydrogeologic barrier that does exist provides some protection relative to impeding the downward migration of contaminants from areas overlying the barrier. Please refer to the attached map of the Zone I and IWPA.

The well serving the facility has no treatment at this time. The DEP requires public water suppliers to monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web via EPA's Envirofacts website at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html).

## 2. Discussion of Land Uses in the Protection Areas

There are a number of land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Non-conforming Zone I;**
2. **Residential Land Uses;**
3. **Railroad Tracks; and,**
4. **Transportation Corridor**

The overall ranking of susceptibility to contamination for the well is high, based on the presence of at least one high threat land use or activity in the IWPA, as seen in Table 2.

1. **Non-conforming Zone I** – Currently, the well does not meet DEP's restrictions, which only allow water supply related activities or other non-threatening activities within the Zone I. The Zone I contains driveways, roads, parking spaces, and residences. Systems not meeting DEP Zone I requirements must notify the DEP, receive approval and address Zone I issues prior to increasing water use or modifying systems.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Railroad Tracks	No	Yes	High	Herbicides: over-application or improper handling; fuel storage, transported chemicals, and maintenance chemicals: leaks or spills
Fuel Storage Above Ground	No	Yes	Moderate	Proper maintenance and upgrades to fuel oil tanks to prevent releases from occurring
Lawn Care/Gardening	Yes	Yes	Moderate	Encourage residents in proper storage, disposal, and application of pesticides.
Transportation Corridor	Yes	Yes	Moderate	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Recommendations:

- ✓ Based upon the current location of homes it may not be possible to prohibit vehicle parking within the Zone I; however, Mill Pond Trailer Park should work toward prohibiting/limiting/impeding parking in close proximity to the well.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Direct driveway and parking lot drainage in the Zone I away from the well.

**2. Residential Land Uses** – Mill Pond Trailer Park and the surrounding residences are on town sewer. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store. Require that fuel lines are sleeved to protect from leaks.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

## Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Consider a bylaw requiring that replacement heating/hotwater systems not be fueled by fuel oil or kerosene. Encourage maintenance of those tanks that exist and encourage conversion to propane.

**3. Railroad tracks** - Railroad tracks cross the IWPA. Over-application or improper handling of herbicides on the railroad right-of-way is a potential source of contamination. Leaks or spills of transported chemicals or train maintenance chemicals are also potential sources of contamination to the water supply.

## Recommendations:

- ✓ Work with local officials during their review of the railroad right-of-way Yearly Operating Plans to ensure that the portion of right-of-way within the facility IWPA is not sprayed with herbicides.
- ✓ Work with your local fire department to ensure that the IWPA is included in Emergency Response Planning.

**4. Transportation Corridor** - Major roads are potential sources of contamination due to salting of roadways and leaks or spills of fuels and other hazardous materials during accidents.

## Recommendation:

- ✓ Contact the local fire department to ensure that the IWPA is included in Emergency Response Planning.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

#### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

#### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and town boards.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. Mill Pond Trailer Park is commended for their past efforts to utilize municipal wastewater disposal, replacing the shallow well with a deep well, posting signs in the Zone I, and educating tenants on wellhead protection issues. The facility should continue efforts in water supply protection through reviewing and adopting the key recommendations above and the following:

#### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Restrict use of salt within Zone I and drain stormwater away from well.
- ✓ Consider well relocation if Zone I threats cannot be mitigated.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

#### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, and certified operator. Post labels as appropriate on raw materials and hazardous waste.

#### Facilities Management:

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility properties.
- ✓ For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

#### Planning:

- ✓ Work with local officials in town to include the facility's IWPA in Aquifer Protection District Bylaws if the town establishes such bylaws in the future.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the wells and is treated according to DEP guidance.

#### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the

attached program fact sheet. Each program year, if funds are available, the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Westfield Water Department**

### What is SWAP?

The Source Water Assessment and Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

**Table 1: Public Water System Information**

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate Best Management Practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Section 1: Description of the Water System

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

**Zone A:** is the most critical for protection efforts. It is the area 400 feet from the edge of the reservoir and 200 feet from the edge of the tributaries (rivers and/or streams) draining into it.

**Zone B:** is the area one-half mile from the edge of the reservoir but does not go beyond the outer edge of the watershed.

**Zone C:** is the remaining area in the watershed not designated as Zones A or B.

The attached map shows Zone A and your watershed boundary.

### System Susceptibility:

**High**

### Groundwater Sources

MA GIS Zone II ID #: 149

Susceptibility: High

GP Well #6	1329000-06G

### Surface Water Sources

Source Name	Susceptibility: Moderate
Granville Reservoir	2153000-02S

Westfield is a mid-sized, residential and industrial city located in southwestern Massachusetts. Westfield Water Department receives its water from 8 wells and 1 reservoir. Westfield also purchases water from the Springfield Water & Sewer Commission supply. The Springfield system SWAP report will be forwarded to the Westfield water Department once it is completed.

The eight wells serving the Westfield Water Department are located in three different aquifers and therefore have different Zone II, recharge contribution areas. The aquifers utilized by the Westfield Water Department are part of a series of prolific, buried bedrock valley aquifer systems trending north-south. Portions of the aquifer flow north discharging into the Connecticut and Westfield River and some portions flow south discharging to the Westfield River. The aquifers were formed when bedrock valleys were filled with sand and gravel during the recession, (melting) of the glaciers approximately 14,000 years ago. The aquifer area north of the Westfield River is known as the Barnes Aquifer and the Broad Brook Basin of the Barnes Aquifer has been designated by EPA as a Sole Source Aquifer. Groundwater from the aquifer tapped by wells 01G, 02G, 07G, and 08G, flows south to the Westfield River while groundwater from the aquifer tapped by wells 03G and 04G, flows north to the Westfield River. There is no evidence of a protective clay

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

layer above the aquifer utilized by Westfield's wells. Wells located in this type of aquifer are considered to be highly vulnerable to contamination due to the absence of hydrogeologic barriers (i.e. confining clay layer) that can prevent contaminant migration from activities on the land surface. In fact, parts of the aquifer utilized by well #3 and #4 have been contaminated with compounds used as a fumigant on agricultural fields in the past. Drinking water supplies may be treated to remove contaminants prior to distribution. The bedrock beneath the sand and gravel aquifer is mapped as Triassic arkose, sandstone and siltstone.

Zone II #149 for wells 01G, 02G, 07G, and 08G extends from Westfield into Holyoke and Southampton in the sand and gravel aquifer and is part of the Barnes Aquifer. The Zone II #515 for inactive wells 03G and 04G extends from Westfield into the town of Southwick. This aquifer is also utilized as a public water supply for West Springfield and Southwick. Parts of this aquifer have been contaminated with ethyl dibromide (EDB) a soil fumigant and gasoline additive used until the 1980s. West Springfield currently treats the water from their wells while Southwick's wells are not impacted by the contamination in the aquifer. Westfield is required to treat the water prior to reactivating wells 03G and 04G. DEP has approved plans submitted by the Westfield Water Department to install granular activated carbon (GAC) units to remove the EDB and chlorinate the water prior to distribution.

Inactive Wells 05G and 06G are located in a small, unconfined sand and gravel aquifer near the municipal boundary with Russell. The Zone II (#293) for wells 05G and 06G, is largely within Westfield, with a small portion of the aquifer extending into the town of Russell. Well 06G has a Zone I protective radius of 400 feet while Well 05G has a Zone I radius of 300 feet. Please refer to the attached map of the Zone II.

The watershed for the Granville Reservoir lies almost entirely within the Town of Granville. The majority of the watershed is located in the steep sloped highlands west of the reservoir on a bedrock geologic formation known as the North Granby Dome. The bedrock includes the Collinsville Formation, a sequence of schist, granitic gneiss, amphibolites and coticles, the Straits Schist and the Hartland Formation composed of various types of schist. The

bedrock is primarily covered with a relatively thin layer of glacial till. Stratified drift (sand and gravel) deposits are mapped immediately surrounding the reservoir to the north, west and south and are associated with stagnant ice flows in the Dickinson-Holliston Brook area. Please refer to the attached map for an outline of the reservoir watershed.

The water from wells 01G, 02G, and 07G are pH adjusted for corrosion control. The water from the Granville Reservoir is filtered, disinfected, and treated for corrosion control. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Drinking water monitoring reporting data is also available on the web at <http://www.epa.gov/safewater/ccr1.html>

## Section 2: Land Uses in the Protection Areas

The land uses within the Zone II and watershed protection area for Westfield's water supplies are a mixture of forest, residential, commercial and agricultural land uses with some small areas of industrial use (refer to attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Activities in Zone I

### What is a Watershed?

A watershed is the land area that catches and drains rainwater down-slope into a river, lake or reservoir. As water travels down from the watershed area it may carry contaminants from the watershed to the drinking water supply source. For protection purposes, watersheds are divided into protection Zones A, B and C.

2. Activities in Zone A
3. Residential Land Uses
4. Transportation Corridors
5. Hazardous Materials Storage and Use
6. Agricultural activities and Golf Course
7. Confirmed Oil or Hazardous Material Contamination Sites
8. Comprehensive Wellhead Protection Planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2.

**1. Activities in Zone I** – The Zone I for each of the wells, except well #5, is a 400 foot radius around the wellhead. The Zone I radius for well #5 is 300 feet. Massachusetts drinking water regulation (310 CMR 22.00 Drinking Water)

requires public water suppliers to own the Zone I, or control the Zone I through a conservation restriction. Westfield owns or controls the Zone I for wells 01G, 03G, 04G, 05G, 06G, 07G and 08G. Westfield does not own or control the Zone I for well 02G. Regulation limits activities in the Zone I to only those related to water supply. However, many public water supplies were developed prior to promulgation of the Department's regulation and contain non-water supply activities such as homes and public roads. The following non-water supply activities occur in the Zone Is of the system wells:

**Well 02G** - Two homes with on-site septic systems and two local roads are within the Zone I for Well 02G.

**Well 07G** - There is a mowed grassy area within the Zone I for Well 07G that acts as a buffer around Runway 33 for the City airport. There is also heavy illegal traffic around the wells resulting in vandalism of monitoring wells and the protective fencing.

**Well 08G** - A large beaver pond periodically has been flooded adjacent to the wellhead within the Zone I.

#### **Zone I Recommendations:**

- ✓ To the extent possible, remove all non water supply activities from the Zone Is to comply with DEP's Zone I requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Do not use or store pesticides, fertilizers or road deicing within the Zone I.
- ✓ Prohibit any new non-water supply activities from Zone I.

Figure 1: Sample watershed with examples of potential sources of contamination

#### **What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

- ✓ Increase patrols, educate the local population regarding the no trespassing policy and enforce no trespassing requirement. Anecdotally, other communities have had success in aggressively patrolling water supply areas, ticketing trespassers, pursuing violators and impounding vehicles used illegally on protected land.
- ✓ Monitor the extent of the beaver pond and take appropriate action to protect the wellhead from flooding.
- ✓ Consider a Memorandum of Understanding or a Right of First Refusal for Zone I land not currently owned or controlled. These legal agreements can secure the land uses for the future.

**2. Activities in Zone A** - A Zone A for a reservoir includes the area within 400 feet of the reservoir shore line and within 200 feet of either side of all streams and feeder ponds that flow into the reservoir. Because the Zone A is the area closest to

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Zone II Number	Reservoir Watershed	Potential Contaminant Sources*
<b>Agricultural</b>					
Fertilizer Storage or Use	Numerous	M	515, 149	-	Leaks, spills, improper handling, or over-application of fertilizers
Livestock	Several	M	All	-	Manure, pesticides
Forestry Operation	1	M	515	-	Herbicides or pesticides, equipment maintenance materials: leaks, spills, or improper handling; road building
Pesticide Storage or Use	Numerous	H	515, 149	-	Leaks, spills, improper handling, or over-application of pesticides
<b>Commercial</b>					
Auto Repair/body Shops	9	H	149	-	Spills, leaks, or improper handling of automotive fluids, and solvents
Golf Courses	1	M	149	-	Over-application or improper handling of fertilizers or pesticides
Airport	1	H	149	-	Spills, leaks, or improper handling of petroleum fluids, and solvents, deicers
Junk Yards and Salvage Yards	1	H	149	-	Automotive chemicals, wastes, and batteries: spills, leaks, or improper handling
Landfill (closed)	1	H	149	-	There is an uninvestigated landfill at the east end of the runway. The other landfill on the west end of the runway has been removed. Leachate.
Medical Facilities	1	M	149	-	Automotive chemicals, wastes, and batteries: spills, leaks, or improper handling
Railroad Tracks and Yards	1	H	149	-	Over-application or improper handling of herbicides, leaks or spills of transported chemicals and maintenance chemicals; fuel storage
Sand & Gravel	2	M	149, 515	-	Spills, leaks, or improper handling of petroleum fluids, and solvents
<b>Industrial</b>					
Food Processors	1	L	515	-	Cleaners, other chemicals, microbial contaminants: spills, leaks, or improper handling or storage
Industry/Industrial Parks	2	H	149, 515	-	Industrial chemicals and metals: spills, leaks, or improper handling or storage

Land Uses	Quantity	Threat*	Zone II Number	Reservoir Watershed	Potential Contaminant Sources*
Machine/ Metalworking Shops	6	H	149, 515	-	Solvents and metal tailings: spills, leaks, or improper handling
<b>Residential</b>					
Fuel Oil Storage (at residences)	Numerous	M	All	Yes	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	All	Yes	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	All	Yes	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>					
Aquatic Wildlife	Numerous	H	-	Yes	Microbial contaminants
Clandestine Dumping	Few	H	149, 515	-	Improper use or storage of fuels and other chemicals
Schools	3	M	515	-	Laboratories, cleaning, automotive
Oil or Hazardous Material Sites	2	--	515	-	Tier Classified Oil or Hazardous Materials Sites are not ranked due to their site-specific character. Individual sites are identified in Appendix B.
Maintenance De- pot	1	M	515	-	Deicing materials, automotive fluids, fuel storage, and other chemicals: spills, leaks, or improper handling or storage
Transmission Line Rights-of-Way: <u>Electric</u>	4	H/L	149, 515	Yes	Construction and corridor maintenance, over-application or improper handling of herbicides
Transportation Corridors	Numerous	H/M	All	Yes	Accidental leaks or spills of fuels and other hazardous materials, over-application or improper handling of pesticides
Underground Storage Tanks	Numerous	H	149	-	Spills, leaks, or improper handling or storage of hazardous materials and waste
Aboveground Storage Tanks	Numerous	M	149, 515	-	Spills, leaks, or improper handling or storage of hazardous materials and waste

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - Where there are two rankings, the first is for surface water, the second for groundwater sources. The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

the reservoir and its tributaries, land uses within the Zone A are of particular concern. Therefore, certain activities that could potentially threaten water quality if improperly managed are restricted by 310 CMR 22.20B. Activities that store, use, or dispose of hazardous materials can be potential sources of contamination if improperly managed. Wild animals and domestic pets can be carriers of waterborne diseases such as Giardia, Cryptosporidium, Salmonella, etc. The following activities occur in the Zone A of the system's reservoir:

**Granville Reservoir (01S)** - There is a local road and two or three private homes, that utilize onsite septic systems, in the Zone A of the reservoir. There is also evidence of extensive access by off road vehicles on both legal and illegal trails throughout the watershed, most notably near the reservoir.

#### **Zone A Recommendations:**

- ✓ To the extent possible, remove all prohibited activities from the Zone A to comply with DEP's Zone A requirements.
- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals and maintenance chemicals.
- ✓ Storage of pesticides, fertilizers or road salt within the Zone A should be covered and contained.
- ✓ Keep any new prohibited activities out of the Zone A.
- ✓ Increase patrols and enforce no trespassing requirement.
- ✓ Consider a Memorandum of Understanding or a Right of First Refusal for Zone A land not currently owned or controlled. These legal agreements can secure the land uses for the future.

**3. Residential Land Uses** – The Granville Reservoir watershed is predominantly wooded with the City owning 82% of the watershed. Approximately 14% of the combined Zone IIs and watershed consists of residential areas; only 1% of the watershed has residential development. The few residences in the watershed use septic systems while some of the areas in the Zone IIs have public sewers, and

some use septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not

#### **Top 5 Reasons to Develop a Local Wellhead and Surface Water Protection Plan**

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

properly maintained they can be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

**Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Continue working with City planners to control new and existing land uses and residential developments in the water supply protection areas.

**4. Transportation Corridors** - There are several local roads located throughout the watershed of the reservoir, including many dirt roads; there are numerous roads throughout the Zone IIs. Though most roadways in the reservoir watershed are low-use, even typical roadway maintenance and use pose a potentially significant source of contamination from accidents and washouts along the dirt road. Larger, heavily traveled roads pose a greater threat. De-icing materials, petroleum chemicals and other debris on roads are picked up by stormwater washed and discharge into the reservoirs. Uncontrolled erosion contributes sediment, various contaminants and pathogens into the reservoirs. Additionally, illegal dumping is evident along some of the roads accessible by street vehicles. Clandestine dumping is a significant threat to the water supplies. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes.

There are numerous unpaved ways as well as legal (authorized) and illegal (unauthorized) trails throughout the watershed. Most of these roads and trails are not maintained at all or are minimally maintained. The resulting erosion poses a significant threat to water quality in areas that are proximal to feeder streams and the reservoir, potentially resulting in additional water treatment costs if it continues unchecked. Uncontrolled erosion contributes sediment, various contaminants and pathogens into the contributing waters and reservoirs. Access to the reservoir was observed and anecdotal information indicates evidence of

camping near the reservoir and throughout the watershed. Unmanaged access may result in vandalism, illegal dumping and access to the reservoir resulting in water quality impairment.

The Water Department has retained a consultant to prepare a watershed management plan to address stormwater management and erosion control on City property and throughout the watershed. The plan is to prepare an inventory of the existing conditions within the watershed, and determine numerous areas of uncontrolled access and erosion problems and propose BMPs.

Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include contaminants from automotive leaks, maintenance, washing, or accidents.

Railroad tracks run directly through one of the Zone IIs. Rail corridors serving passenger or freight trains are potential sources of contamination due to chemicals released during normal use, track maintenance, and accidents. Accidents can release spills of train engine fluids and commercially transported chemicals.

There is also an airport within one of the Zone IIs. The airport has military, commercial and industrial activities as well as a working airport. The same threats associated with other transportation, commercial and industrial uses apply to the airport. Airports pose additional threats from large quantities of fuel stored on site, oil water separators and stormwater runoff.

**Transportation Corridor Recommendations:**

- ✓ Regularly inspect the watershed and Zone IIs for illegal dumping and spills.
- ✓ Work with local emergency response teams to ensure that any spills within the protection areas can be effectively contained.
- ✓ Work with the municipality or State to have catch basins inspected, maintained, and cleaned on a regular schedule.

**What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II.
2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

Regular street sweeping reduces the amount of potential contaminants in runoff. For information on DEP's Nonpoint Competitive Grants Program Upcoming Funding Opportunity refer to: <http://www.state.ma.us/dep/brp/mf/mfpubs.htm#wpa>.

- ✓ Work with local watershed groups to institute a Storm Drain Stenciling Program. For more information on how to develop a storm drain stenciling program go to <http://www.earthwater-stencils.com>.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping. For additional information, refer to the Stormwater Management Information at <http://www.state.ma.us/dep/brp/ww/wwpubs.htm#storm>.
- ✓ Promote BMPs for stormwater management and pollution controls.
- ✓ Work with local officials during their review of the railroad right of way Yearly Operating Plans to ensure that water supplies are protected during vegetation control.
- ✓ Notify host community officials of potential USDA funding for mitigation and prevention of runoff pollution through the Environmental Quality Incentives Program (EQIP). The USDA web site is [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Paul D. Geoffroy, Rural Development Manager at the local office in Hadley at 413-585-1000 ex.4. Review the fact sheet available on line and call the local office (Amherst 413-253-4350) of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>.
- ✓ Investigate disposition of all roads, ways and "trails".
- ✓ Increase patrols of watershed land and enforce no trespassing.
- ✓ Evaluate all options for management of access to ways. Include evaluation of continuing the current practice of full access, closing roads to all traffic, closing road to all commercial traffic and limiting access only to residents with a locked gate and key for residents only.
- ✓ Evaluate existing conditions throughout the watershed with respect to current illegal use of watershed land. Determine where access is being gained and what are the destination points. Develop a strategy and

management plan to eliminate or control access. Coordinate with the host communities for management strategies.

**5. Hazardous Materials Storage and Use** – Approximately 10 % of the Zone II for Westfield's wells is commercial or industrial land uses. Many areas presently are not served by municipal sewers. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground. There may be businesses within the water supply protection areas that are not aware that they should be registered as hazardous waste generators. Very often businesses that generate very small quantities of hazardous waste are not aware of the regulatory requirement.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet "Businesses Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP's for common business issues.
- ✓ Work with local Boards of Health and businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure "Industrial Floor Drains" for more information.
- ✓ If it is needed, funding may be available for the school and bus terminal located in Southwick. The USDA has

**Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

**For More Information**

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier and the town boards.

various funding sources for government, non-government organizations and agricultural facilities in small communities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. Additional information is available on the web site [www.ruraldev.usda.gov](http://www.ruraldev.usda.gov) or call Paul D. Geoffroy, Rural Development Manager at the local office in Hadley at 413-585-1000 ex.4.

**6. Agricultural Activities and Golf Course** – The Zone IIs for the wells include agricultural land uses and golf courses. Pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store. Very often farms and golf courses also store and use hazardous materials and generate hazardous waste through use and maintenance of equipment.

**Agricultural Activities and Golf Course Recommendations:**

- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service (NRCS) farm plan to protect water supplies. Review the fact sheet available online and call the local office (Amherst 413-253-4350) of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf>.
- ✓ Encourage the farmers and golf course managers to incorporate an Integrated Pest Management (IPM) approach into their pest management program. IPM is an ecologically-based approach to pest control that links together several related components, including monitoring and scouting, biological controls, mechanical and/or other cultural practices, and pesticide applications. By combining a number of these different methods and practices, satisfactory pest control can be achieved with less impact on the environment.
- ✓ Promote Best Management Practices (BMPs) for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.
- ✓ Work with farmers, nurseries, and golf courses to ensure that pesticides and fertilizers are being stored within a structure designed to prevent runoff.
- ✓ The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online and call the local office of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmland/2002/pdf/EQIPFct.pdf>. This may be appropriate for host communities.
- ✓ Work with hobby farmers by supplying them with information about protecting their own wells and the public water supply by encouraging the use of BMPs. Refer to <http://www.state.ma.us/dep/brp/dws/dwspubs.htm> and <http://www.state.ma.us/dep/consumer/animal.htm#dwqual> for additional resources.

**7. Confirmed Oil or Hazardous Material Contamination Sites** – The Zone II contains DEP Tier Classified Oil and/or Hazardous Material Release Sites indicated on the map as Release Tracking Numbers 1-0000288, 1-0014428, 1-0000536 and 1-0012886. Refer to the attached map and Appendix 3 for more information.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites. Contact the Bureau of Waste Site Cleanup for more information on these sites.

**8. Protection Planning** – Protection planning protects drinking water by managing the land area that supplies water to a well or reservoir. Currently, Westfield and Southwick do have water supply protection controls that meet DEP's Wellhead Protection regulation 310 CMR 22.21(2) and Surface Water Protection regulation 310 CMR 22.20 (b) and (c). Wellhead Protection and Surface Water Supply Protection Plans coordinate community efforts, identify protection strategies, establish a timeframe for implementation, and provide a forum for public participation. Westfield does have a Surface Water Supply Protection Plan but does not have a Wellhead Protection Plan. Westfield is an active member of the Barnes Aquifer Protection Committee (BAPC) that coordinates efforts for water supply protection among the communities of Southampton, Westfield and Easthampton served by and overlying the aquifer. The BAPC is facilitated through the regional planning agency.

There are also many private wells for commercial and residential uses located within the aquifer protection areas. The State has guidance for development of local controls to manage private wells and educate owners regarding protection of water supplies. The DEP Drinking Water Program staff can assist communities in development and adoption of local controls.

**Protection Planning Recommendations:**

- ✓ Consider formalizing some of the efforts started in BAPC through the development of a Wellhead Protection Plan and include the area of the Southwick wells. Establish a protection team with Southwick and refer to current measures used by BAPC and the website <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan."
- ✓ If local controls in all communities that serve as hosts to Westfield's water supplies do not regulate floor drains, be sure to include floor drain controls that meet 310 CMR 22.21(2) in all water supply protection planning.
- ✓ Work with City and Town boards to review and provide recommendations on proposed development within your water supply protection areas. Although there is only 18% of the watershed not owned by the City, work with the town of Granville to review information on build-out analyses for the town, see the Executive Office of Environmental Affairs' community preservation web site, <http://commpres.env.state.ma.us/> and their planning efforts.
- ✓ Refer to the DEP website <http://www.state.ma.us/dep/brp/dws/privwell.htm> for private well guidelines and model regulations. The Department recommends methods for cataloguing existing wells and educating private well owners regarding supply protection.

Other land uses and activities within the Zone II that are potential sources of contamination are included in Table 2. Refer to Appendix B for more information about these land uses. Identifying potential sources of contamination is an important initial step in protecting your drinking water sources. Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

**Section 3: Source Water Protection Conclusions and Recommendations****Current Land Uses and Source Protection:**

As with many water supply protection areas, the system Zone IIs and watershed contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Aggressive land acquisition within the watershed for source protection,
- Pursuing the installation of sanitary sewers in existing residential areas within the City,
- Education about drinking water and source protection to elementary schools and the public,
- Extensive efforts to protect the Zone IIs through ordinances and active monitoring of hazardous waste generators and storage tanks (along with their removal) within the Zone II,
- Active involvement in review and comment on development plans within protection areas.

**Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Inspect the Zone Is and A regularly, and when feasible, remove any non-water supply activities.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your Zone IIs and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Work with farmers in your protection areas to make them aware of your water supply and to encourage the use of a NRCS farm plan to protect water supplies.
- ✓ Develop and implement a Wellhead Protection Plan.

**Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

➤ **Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships among businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

➤ **Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to groundwater contamination. Hazardous materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained, it could be a potential source of microbial contamination. Animal waste is also a source of microbial contamination.

➤ **Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located; what types of land uses and activities pose threats; and how their efforts can enhance protection.

➤ **Plan for the Future:**

One of the most effective means of protecting water supplies is local planning, including adoption of local controls to protect land use, regulations related to watersheds and ground water protection. These controls may include health regulations, discharge prohibitions, general ordinances, and zoning by-laws/ordinances that prohibit or control potential sources of contamination within the protection areas.

➤ **Other Funding Sources:**

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>. The USDA also has various funding sources for government, non-government organizations and agricultural facilities through programs such as those listed on the USDA web site <http://search.sc.egov.usda.gov/nrcs.asp?qu=eqip&ct=NRCS>. One program in particular, the Environmental Quality Incentives Program (EQIP) may be utilized in a variety of projects from DPW stormwater management to farm nutrient management designed to protect surface and groundwater. Review the fact sheet available online and call the local office (Amherst 413-253-4350) of the NRCS for assistance <http://www.nrcs.usda.gov/programs/farmbill/2002/pdf/EQIPFct.pdf>. The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: if funds are available, each spring DEP posts a new Request for Response for the grant program (RFR).

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I and Zone A</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I and/or Zone A?	<b>YES</b> 01G, 03G, 04G, 05G, 06G, 07G and 08G	Follow Best Management Practices (BMP's) that focus on good housekeeping, spill prevention, and operational practices to reduce the use and release of hazardous materials.
	<b>NO</b> 02G, 02S	To the extent possible, remove prohibited activities in Zone A to comply with DEP's Zone A requirements. City owns 82% of the watershed.
Are the Zone I and Zone A posted with "Public Drinking Water Supply" Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Are the Zone I and Zone A regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>NO</b> 02G, 07G and 08G	Monitor non-water supply activities in Zone I (the electrical transmission line in the Zone I of 05G) and prohibited activities in Zone A, and investigate options for removing these activities. Plan to replace diesel drive generator at 01G with a propane generator.
<b>Municipal Controls</b> (Zoning Bylaws/Ordinances, Health Regulations, and General Bylaws/Ordinances)		
Does the municipality have Surface Water Protection Controls that meet 310 CMR 22.20C and Wellhead Protection Controls that meet 310 CMR 22.21(2) ?	<b>NO</b>	Continue working with the Planning Boards to compare land use controls to see that they meet current requirements of 310 CMR 22.21(2) and 310 CMR 22.20C. Refer to <a href="http://mass.gov/dep/brp/dws/">mass.gov/dep/brp/dws/</a> for model by-laws and health regulations, and current regulations.
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>YES</b>	Work with the community of Southwick to assist and encourage them in the active protection of the Zone II lands.
<b>Planning</b>		
Does the PWS have a local surface water and wellhead protection plan?	<b>YES</b> - Surface <b>NO</b> - Well-head	Develop a wellhead protection plan. Follow "Developing a Local Wellhead Protection Plan" available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal "Emergency Response Plan" to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a watershed and wellhead protection committee?	<b>NO</b>	Develop a committee to include representatives from citizens' groups, neighboring communities, and the business community. Include the town of Southwick.
Do the Boards of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	Floor drain regulations are proposed. Conduct inspections in conjunction with DEP. For more guidance see "Hazardous Materials Management: A Community's Guide" at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a> . Work with your host communities for consistent management of hazardous materials.
Does the PWS provide watershed protection education?	<b>YES</b>	Currently, the only outreach is through the annual Consumer Confidence Report. Increase residential outreach through bill stuffers, school programs, Drinking Water Week activities, and coordination with local groups. Aim additional efforts at commercial, industrial and municipal uses within the Zone IIs and watershed. Work with Southwick in this effort.

## APPENDIX B: REGULATED FACILITIES WITHIN THE WATER SUPPLY PROTECTION AREA

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class
34340	Rods Customs & Restorations	106b Foster Rd	Southwick	Generator of Hazardous Waste	Very Small Quantity Generator
131583	More Parts Of Southwick Inc	40 Sam West Rd	Southwick	Generator of Hazardous Waste	Very Small Quantity Generator
50494	Powder Mill Mid School	94 Powder Hill Rd	Southwick	Plant	Air Quality Permit
50583	Western Mass Rendering Co Inc	94 Foster Rd	Southwick	Generator of Hazardous Waste	Small Quantity Generator of Waste Oil or PCBs
211896	Bus Maintenance Garage	Powder Mill Rd	Southwick	Sewer Connection or Groundwater Discharge	Industrial Waste Water to Sewer
280450	B & E Tool Company Inc	10 Hudson Drive	Southwick	Generator of Hazardous Waste	Small Quantity Generator
275553	Southwick Tolland Regional High School	93 Feeding Hills Rd	Southwick	Plant/ Generator of Hazardous Waste	Air Quality Permit/ Very Small Quantity Generator
281212	Moosehead Harvesting Corp	49 Sam West Rd	Southwick	Generator of Hazardous Waste	Small Quantity Generator of Waste Oil or PCBs
283488	Whalley Precision Inc	28 Hudson Dr	Southwick	Generator of Hazardous Waste	Small Quantity Generator of Waste Oil or PCBs
324974	Thomcast Communications Inc - Comark Div	104 Feeding Hills Road	Southwick	Generator of Hazardous Waste	Small Quantity Generator
	Al's Tire	918 Southampton Rd	Westfield	Generator of Hazardous Waste	Very Small Quantity Generator
	Ames	1111 Southampton Rd	Westfield	Generator of Hazardous Waste	Very Small Quantity Generator

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class
	Air Flyte Inc	32 Airport Dr	Westfield	Generator of Hazardous Waste	Very Small Quantity Generator
	Barnes USAF: 104th Ang	175 Falcon Dr	Westfield	Generator of Hazardous Waste	Small Quantity Generator
	Berkshire Industries	109 Apremont Way	Westfield	Generator of Hazardous Waste	Small Quantity Generator
	Brookside Automotive	233 Union St	Westfield	Generator of Hazardous Waste	Very Small Quantity Generator
	Charis Air Corp	110 Airport Rd	Westfield	Generator of Hazardous Waste	Very Small Quantity Generator
	Cloot's Auto Body	825 North Rd	Westfield	Generator of Hazardous Waste	Very Small Quantity Generator

Northwest Road	Residential	Westfield				1,000	Htg Oil
Northwest Road	Residential	Westfield				1,000	Htg Oil
Northwest Road	Residential	Westfield				500	Htg Oil

For more information on underground storage tanks, visit the Massachusetts Department of Fire Services web site: <http://www.state.ma.us/dfs/ust/ustHome.htm> or the Westfield Fire Chief for information about tanks in Westfield.

Note: This appendix includes only those facilities within the water supply protection area(s) that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's datalayer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitelist.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0000288	Barnes MAB Buck Ponds Rd	Westfield	Unlisted
1-0012886	918 Southampton Rd	Westfield	Oil
1-0014428	97 Feeding Hills Road	Southwick	Oil

For more location information, please see the attached map. The map lists the release sites by RTN.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report For White Oak School

## What is SWAP?

The Source Water Assessment and Protection (SWAP) program, established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

White Oak School is a private elementary school, serving students with special needs, located in Westfield, a medium sized City in western Massachusetts. There is municipal water and wastewater disposal available in Westfield, however only wastewater disposal is available to the White Oak School. A single well serves the school. The well was installed and tested under the requirements of the DEP New Source Approval Process in 1997.

Well #1 is a 6-inch diameter 411 feet deep, bedrock well that is located in the schoolyard, approximately 450 feet south of the school. Geologic mapping in the area indicates thin

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

till cover over bedrock. The bedrock is mapped as sandstones of the Mesozoic Basin. Well logs reports confirm bedrock was encountered at 35 feet below grade and the bedrock encountered was sandstone. Water quality during development indicated dissolved inorganic compounds, in the water. Sodium, chloride and fluoride were reported at concentration near or above the guideline or secondary standard for those constituents. There are no enforceable standards for these constituents. The school monitors the levels and reports the current concentrations as required. For current information on monitoring result

The Zone I is the protected area immediately surrounding the well, while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual (Zone II) recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii for this facility's well are 177 feet and 472 feet, respectively, based on an approved withdrawal rate of 3,240 gpm. There is no evidence of a hydrogeologic barrier (till or clay layer) to impede the downward migration of contaminants from land uses at the ground surface, therefore the aquifer is considered to have a high vulnerability to contamination. Please refer to the attached map of the Zone I and IWPA.

The well serving the facility has no treatment at this time. The DEP requires public water suppliers to frequently monitor the quality of the water. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1. Drinking water monitoring reporting data is also available at [http://www.epa.gov/enviro/html/sdwis/sdwis\\_query.html](http://www.epa.gov/enviro/html/sdwis/sdwis_query.html), the EPA's Envirofacts website.

## 2. Discussion of Land Uses in the Protection Areas

There are few uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

#### 1. Passive recreational activity

The overall ranking of susceptibility to contamination for the well is low, based on the presence of only one low threat land use or activity in the Zone I and IWPA, as seen in Table 2. However, the DEP notes that there is inconclusive information regarding the source of the high sodium and chloride in the school well water with respect to whether or not the elevated levels are natural or due to anthropogenic activities. Shallow bedrock makes the bedrock aquifer vulnerable to activities on the surface. In addition, since the actual recharge area for the well has not been determined, the IWPA is only a guide for reviewing activities that may pose a potential threat to the water quality.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Passive recreation	Yes	Yes	Low	Continue current practice of not using pesticides and fertilizers. Inspect the wellhead regularly to ensure the integrity of the cap and seal and that there is no pooling of water.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

There may be activities outside of the IWPA that pose a threat to the water supply. An example may be the salvage/storage yard south of the school or nearby manufacturing facilities. However, there is presently little information to determine the actual recharge area for the well or that any of these facilities may impact the well.

1. **Passive recreational activity** – Passive recreation is the only activity within the protection areas. Potential threats from this activity is related to access and pesticide and fertilizer use.

### Recommendations:

- ✓ Continue current practice of not using fertilizers and pesticides.
- ✓ Inspect the well casing regularly to ensure the integrity of the seal and cap and to ensure there is no ponding of water near the well.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. White Oak School is commended for efforts to utilize municipal wastewater disposal and development of a deep well away from activities. We recommend continued monitoring of the water quality and assessment of appropriate treatment if it becomes necessary to reduce the levels of inorganic constituents in the water. The facility should continue efforts in water supply protection through reviewing and adopting the key recommendations above and the following:

### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Restrict use of salt within Zone I and drain stormwater away from well.
- ✓ Conduct regular inspections of the Zone I.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, and certified operator. Post labels as appropriate on raw materials and hazardous waste.

### Facilities Management:

- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility properties.

### Planning:

- ✓ Work with local officials in town to include the facility's IWPA in Aquifer Protection District Bylaws if the town establishes such bylaws in the future.
- ✓ Have a plan to address short-term water shortages and

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier and city boards.

long-term water demands. Keep the phone number of a bottled water company readily available.

- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and the facility and treated according to DEP guidance.
- ✓ Review water quality at the school regularly to determine if treated is required.
- ✓ Continue to monitor activities near the school that may impact the water quality.

### Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Each program year, if funds are available, the Department posts a new Request for Response for the Grant program (RFR). Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation". Documents are available at the DEP website: <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

## 4. Attachments

- Recommended Source Protection Measures Fact Sheet

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Dion Label Printing, Inc.

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road deicing, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Dion Label Printing, Inc. is located in Westfield, a medium sized city in southwestern Massachusetts. Dion Label Printing, Inc. is a flexographic printing company specializing in pressure sensitive labels, tags and tickets and associated printers. The total staff is approximately 40 people per day and has recently undergone an expansion of their business. Although the city of Westfield has public water and municipal wastewater sewers, only the sewer serves this area of the City and therefore water is supplied by a single potable supply well (01G) located north of the building. The

## What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

facility is a registered small quantity generator of hazardous waste for printing chemicals, a very small quantity generator of waste oil and is registered through the Environmental Results Program for printers. During the assessment, the facility appeared to use very good hazardous materials handling practices and BMPs. There were no violations noted in the most recent inspection by the DEP Bureau of Waste Prevention.

The Zone I is the protected area immediately surrounding the well while the Interim Wellhead Protection Area (IWPA) provides an interim protection area for a water supply well when the actual (Zone II) recharge area has not been delineated. The actual recharge area to the well may be significantly larger or smaller than the IWPA. The Zone I and Interim Wellhead Protection Area (IWPA) radii for this facility's well are 100 feet and 413 feet, respectively, based on estimated water use of approximately 600 gallons per day. This volume was based on the estimated use at the time the facility was registered as a public water system. In 2001, a meter was installed to record actual usage. Based on two years worth of metered data, the Department may review and revise the Zone I and IWPA based on actual data. It is likely that the Zone I and IWPA will be revised slightly based on a review of the current data, which shows monthly usage ranging from approximately 1,000 to 1,500 gallons per day.

The overburden in the area is mapped as a thin covering of glacial till over bedrock. There are no records of the construction of the well so that depth to bedrock cannot be confirmed, however, well logs from an abutting facility indicates approximately 35 feet of casing, seated in sound bedrock. The bedrock is mapped as New Haven arkose.

There is no evidence of a protective barrier of either thick till or of a confining, protective clay layer in the vicinity of the well. Wells located in this type of geologic setting are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface. Please refer to the attached map of the Zone I and IWPA.

For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1. Refer to Table 2 for additional information regarding the location of the well and activities within the protection areas.

**Table 2: Table of Activities within the Water Supply Protection Areas for Both Sources**

Potential Contaminant Sources	Zone I	IWPA/ Zone II	Threat	Comments
Non-conforming Zone I	--	--	--	Contact DEP prior to increasing use or conducting additional activities in Zone I
Hazardous materials storage and use	Yes	Yes	High	Continue the use of BMPs and coordinate with emergency responders.
SQG (Hazardous Waste)/VSQG (Waste oil)	Yes	Yes	Moderate /Low	Hazardous materials
Machine shop	-	-	High	This facility is just outside the current IWPA. Solvents and metal tailings: spills, leaks, or improper handling
School	No	Yes	Moderate	Household hazardous waste, laboratory materials, fuel, parking: spills, leaks, or improper handling or storage

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/den/brn/dws/](http://www.state.ma.us/den/brn/dws/).

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Residential land use	No	Yes	Moderate	Limit road deicing materials and monitor drainage upgradient of the well
Transportation corridors/parking	Yes	Yes	Moderate	Fuels and other hazardous materials: accidental leaks or spills; pesticides: over-application or improper handling
Printer/photo processor	Yes	Yes	Moderate /High	Printing inks and chemicals: spills, leaks, or improper handling or storage
Transformer (ground mounted)	Yes	Yes	Low	Although most transformers today do not contain PCBs, the oils may pose a threat due to the proximity to the well.

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## 2. Discussion of Land Uses in the Protection Areas

The protection areas for Well #1 includes the entire facility, North Road, residential homes, an elementary school; a machine shop is located just outside of the IWPA. Municipal sewer serves the entire area.

### Key issues include:

1. **Non-conforming activities within Zone I,**
2. **Residential land uses,**
3. **Transportation corridors, and**
4. **Hazardous materials storage and use.**

The overall ranking of susceptibility to contamination for Dion's water system is high, based on the presence of several moderate and two high threat ranked land uses or activity in the Zone I and IWPA. However, Dion is commended for their diligent management of hazardous materials on-site. Please refer to Table 2 for more details.

**1. Non-conforming activities within Zone I** – Currently, the water supplier does own the entire Zone I area however, the activities conducted within the Zone I are non-conforming and pose a potential threat to the water supply. Systems not meeting DEP Zone I requirements for ownership or control or have non-conforming uses in the Zone I, must get DEP approval and address Zone I activities prior to increasing water use or modifying facilities. The well is located immediately adjacent to the building. The facility is connected to the municipal sewer but there is hazardous materials storage, parking and a printing company (Dion) within the Zone I. The well is inaccessible and had a sanitary cap at the time of the inspection.

### Recommendations:

- ✓ Consider relocation of the well if potential threats cannot be mitigated and water quality is impacted by current activities.
- ✓ To the extent feasible, remove all non-water supply activities from the Zone I to comply with DEP's Zone I requirements. Prohibit new non-water supply activities in the Zone I.
- ✓ Where it is feasible, remove all hazardous materials from the Zone I. Continue current good housekeeping practices and the use of BMPs for the storage, use, and disposal of hazardous materials.
- ✓ Carefully monitor the delivery, handling and storage of chemicals and products.
- ✓ Inspect the well casing and cap regularly to ensure it is sanitary and watertight.

**2. Residential Land Uses** – The IWPA has medium-density residential land use. If managed improperly, activities associated with residential areas can contribute to

Figure 1: Example of how a well could become contaminated by different land uses and activities.

drinking water contamination. Common potential sources of contamination include:

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** - Catch basins transport stormwater from roadways and adjacent properties to the ground and streams. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents. Visit the Nonpoint Source pollution web site for additional information at <http://www.state.ma.us/dep/brp/wm/nonpoint.htm>.

#### Residential Land Use Recommendations:

- V Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and online at the MA DEP website - [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.

**3. Transportation corridor/parking** – North Road is located within the IWPA and the access and parking areas for the facility are within Zone I and the IWPA. Accidents and normal use and maintenance of roads pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills, as well as, waste from wildlife and pets.

#### Transportation Recommendations:

- V Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they are aware of the location of your well.

**4. Hazardous Materials Storage and Use** – Dion utilizes hazardous materials and generates hazardous waste. There were no floor drains observed during the assessment and it appears that hazardous materials are handled appropriately. Spill kits and signs designating areas of storage were noted during the visit. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, septic system or floor drain leading directly to the ground. It should be noted that vehicle washing is a restricted activity under the UIC regulations. Review the attached fact sheet for additional information about vehicle washing activities.

#### Hazardous Materials Storage and Use Recommendations:

- V Continue current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further enhance the protection of the well and minimize its susceptibility to contamination. Review and consider adopting the key recommendations above and the following:

#### Priority Recommendations:

- V Consider relocation of the well if potential threats cannot be mitigated and water quality is impacted.
- V Inventory activities in the IWPA and catalog any new potential threats identified.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:  
[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

- ✓ Continue current good hazardous materials management.

### Zone I:

- ✓ Prohibit any new non-water supply activities from the Zone I.
- ✓ Prohibit public access to the well and pump house with locking facilities, gating roads, and posting signs as appropriate.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of access or vandalism.
- ✓ Inspect and ensure road and parking area drainage in the Zone I continues to be directed away from well.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### Training and Education:

- ✓ Continue training staff on proper hazardous material use, disposal, emergency response, and best management practices. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations away from the immediate wellhead area.

### Planning:

- ✓ Work with local officials in Westfield to review the Aquifer Protection District ordinance for compliance with 310 CMR 22.000 and to include Dion's IWPA in that district.
- ✓ Have a plan to address short-term water shortages and long-term water demands.
- ✓ Keep the phone number of a bottled water company readily available in the event of an emergency.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Businesses and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
KOSINSKI FARM

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Kosinski Farm
<i>PWS Address</i>	420 Russellville Rd
<i>City/Town</i>	Westfield, Massachusetts
<i>PWS ID Number</i>	1329006

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1329006-01G	100	406	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1329006-01G)**

Zone I = 100 ft.  
IWPA = 406 ft.

### How was My Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I or IWPA. The **high** susceptibility to potential non-microbial threats is based on the storage and use of hazardous materials and agricultural uses within the Zone I and IWPA. Other moderate threat activities within the Zone I and the IWPA are local roads and parking.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report for Westhampton Elementary School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
June 15, 2001

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

### The Well

Westhampton Elementary School is a rural, elementary school located on the south side of Kings Highway in Westhampton. The school student and staff population is approximately 175 people per day and is served by a single potable supply well (Well #1) located north of Hathaway Road.

The well has a Zone I protective radius of 180 feet and an Interim Wellhead Protection Area (IWPA) radius of 467 feet based on pumping test data and Zone I restrictions. The well was tested at a rate of 2.8 gallons per minute (gpm) under the New Source Approval Process and was granted an approved withdrawal rate of 3,024 gallons per day (2.1 gpm). Well #1 is a 6-inch diameter well drilled to a depth of approximately 405 feet below

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

ground. The driller's log states that sandy glacial till and boulders were encountered from ground level to approximately 85 feet below ground, where bedrock was encountered. The driller logged the bedrock as granite and sandstone to the final well depth. However, the geologic map of the area states that the bedrock is primarily a phyllite and carbonaceous schist with quartz and quartz marble intrusions of the Gile Formation dating from the Lower Devonian. One hundred twelve feet of casing was grouted into place with approximately 24-inches of casing above ground. The water is treated by aeration for removal of radon, which naturally occurs in some water. You may request additional information regarding the quality of the water, from the local contact listed in Table 1.

Please refer to the attached maps of the Zone Is and IWPAs and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

There are a few land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Residential Uses in IWPA**
2. **Passive Recreation in Zone I**

The well is located in an aquifer with a high vulnerability to contamination due to the absence of a significant hydrogeologic barrier to prevent contaminant migration. The overall ranking of susceptibility to contamination for the well is moderate, based on the presence of at least one moderate threat land use or activity in the IWPA, as seen in Table 2.

1. **Residential Uses in the IWPA** – Two residences are located within the IWPA of the well. Normal residential activities pose minimal threat to the water quality of the public water supply as well as their own private supply provided, they are aware of the potential hazards of household waste, lawn care chemicals and misuse of septic systems and utilize best management practices. The properties are topographically downhill from the well site.

### Recommendations:

- ✓ Provide information to residents about the potential hazards of household chemicals, lawn care chemicals and fertilizers. Provide information on Best Management Practices (BMPs) for the use of fertilizer lawn care, pesticides and household hazardous waste.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Residential properties	No	Yes	Moderate	Household hazardous waste, lawn and septic systems.
Passive Recreation	Yes	Yes	Low	Evidence of low frequency passive activity.

- -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/de/p/brp/dws/](http://www.state.ma.us/de/p/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material, such as clay that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well

- ✓ Provide educational outreach to residents regarding septic system maintenance and disposal practices.

2. **Passive Recreation in Zone I and IWPA** – Well #1 is fairly well protected and meets DEP's restrictions that only allow water supply related activities through the Zone I. There is some evidence of passive recreation through the Zone I and the IWPA along a nearby trail. Passive recreation poses minimal threat provided access to the wellhead is prevented.

### Recommendations:

- ✓ Conduct routine inspections of the wellhead and monitor for activities near the wellhead.
- ✓ If there is evidence of unauthorized access to the wellhead, consider fencing off the wellhead area. Fencing for the wellhead is an eligible project under the Wellhead Protection grant program. (See Funding below).
- ✓ Protective collars (either concrete or earthen) around the wellhead should slope away from the casing to prevent surface runoff from infiltrating along the casing.

Other activities that were noted during the assessment were the Westhampton Landfill and the multiple earth removal operations. The landfill and the gravel mining operations appear to be located down and/or cross gradient to the well.

Implementing the following recommendations will reduce the system's susceptibility to contamination.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The Westhampton Elementary School is commended for current protection measures.

Please review and adopt the key recommendations listed above and as follows:

### Zone I and IWPA:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Conduct regular inspections of the Zone I. Look for evidence of unauthorized access.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider gating the wellhead.
- ✓ Post drinking water supply sign at the intersection of Hathaway Road and Kings Highway.
- ✓ Provide information to residents about the potential hazards of household chemicals, lawn care chemicals and fertilizers.
- ✓ Provide information on Best Management Practices (BMPs) for the use of fertilizer lawn care, pesticides and household hazardous waste.
- ✓ Provide educational outreach to residents regarding septic system maintenance and disposal practices.

### Training and Education:

- ✓ Post drinking water protection area signs at key visibility locations such as at the intersection of Hathaway Road and Kings Highway.
- ✓ Incorporate groundwater education into school curriculum (K-6 curricula available; contact DEP for copies).

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier, town boards, the town library and the local media.

### Facilities Management:

- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the appendices for more information regarding septic systems.
- ✓ Concrete or earthen pads should slope away from well to prevent surface runoff from ponding around the wellhead.

### Planning:

- ✓ Work with local officials in Westhampton to include the school well's IWPA in an Aquifer Protection District Bylaw and to assist you in securing protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### Funding:

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the 2001 "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note that each program year, on or about May 1 the Department posts a new Request for Response (RFR), grant application form. Generally, the applications are due on or about June 30. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at

<http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
OUTLOOK FARM

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
March 4, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Outlook Farm
<i>PWS Address</i>	136 Main Rd., Rte 66
<i>City/Town</i>	Westhampton, Massachusetts
<i>PWS ID Number</i>	1331009

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1331009-01G	100	417	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1331009-01G)**

Zone I = 100 ft.  
IWPA = 417 ft.

### How Was My Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and the IWPA. The **high** susceptibility to potential non-microbial threats is based on the local roads, the storage and use of hazardous materials and agricultural activities within the Zone I and the IWPA.

This source water assessment report is based on information provided by staff during a site visit, water quality data and/or from other sources of information.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report For Whately Water District

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
January 14, 2002

Table 1: Public Water System (PWS) Information

<i>PWS Name</i>	<b>Whately Water District</b>
<i>PWS Address</i>	<b>Chestnut Plain Road</b>

Well #2	1337000-02G	245	605	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Many potential contaminant sources, including septic systems, road salt and improperly disposed of hazardous materials may threaten the quality of water from drinking water wells. Citizens and local officials can work together to better protect drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Whately Water District is small, rural water supply that serves the center of the Town of Whately with a total of 43 connections. The area includes residents, town offices, the post office and a restaurant; all are served by on-site septic disposal. The District maintains three wells; two active wells, Wells #1 (01G) and #2 (02G) that pump simultaneously to a gravity tank, located in a secure facility. A booster pump is used to pressurize the system by pumping to a hydropneumatic tank. There is an unapproved well #3 (03G) kept as an emergency source. Although this report does not address that well specifically, well #3 is located in the same vicinity as the active wells. The system does not have a back-up power source.

The Zone I and Interim Wellhead Protection Area radii for Wells #1 and #2 are 245 feet and 605 feet, respectively. The protective radii were based on a maximum month,

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.

- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

average daily pumping rate of 9,240 gallons per day (gpd). Please refer to the attached map that shows the Zone I and IWPA radii. The Zone I is the area immediately around the wellhead while the IWPA is a larger area that likely contributes water to the wellhead. The IWPA is only an interim protection area; the actual area of contribution to the wells may be larger or smaller. The District does not own the entire Zone I for the wells.

Wells #1 is 300-foot deep, 6-inch diameter bedrock wells with an estimated yield of 6 gpm. Well #2, located approximately 140 feet from Well #1, is a 440-foot deep well with an estimated yield of 15 gpm. Both wells are completed with 20 feet of casing and extend approximately 2 feet above grade. The wells are located on an upland area underlain by till and shallow bedrock. The bedrock is mapped as the Conway Formation, an argillite (carbonaceous phyllite) with quartz veins. The bedrock is highly folded and faulted; the Whately fault is mapped near the well site. Wells drilled in these conditions are considered highly vulnerable to potential contamination from the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the bedrock aquifer.

The Whately Water District well water does not require and does not have treatment at this time. For current information on monitoring results, please review the Consumer Confidence report (CCR) that is issued annually by the water supplier or refer questions to the water supply contact listed above in Table 1.

## 2. Discussion of Land Uses in the Protection Areas

There are few land uses and activities within the drinking water supply protection areas that are potential sources of contamination. The overall ranking of susceptibility to contamination for the wells is moderate, based on the presence of at least one moderate threat land use or activity in the Zone I and IWPA, as seen in Tables 2. The District is commended for current efforts to protect the water supply.

#### Key land use issues include:

1. **Non-conforming Zone I**
2. **Residential homes**
3. **Septic system**

**1. Non-conforming Zone Is** – The Zone Is for Wells #1 and #2 are non-conforming with respect to MA DEP land use restrictions, which allow only water supply related activities in Zone Is and requires ownership or control of the land. Although there are no activities other than passive recreation within the Zone I, the District does not own the entire Zone I for the supply wells. Please note that systems not meeting DEP Zone I requirements must

**Table 2: Table of Activities Common to the Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Transformers (above grade)	Well #1	Well #2	Moderate	Potential release of MODF
Septic system components	No	Both Wells	Moderate	All components in IWPA
Residential homes, lawns and parking	No	Both Wells	Moderate	Household hazardous materials, pesticides and herbicides
Passive recreation	Both Wells	Both Wells	Low	Some evidence of passive recreation

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

receive DEP approval and address Zone I issues prior to increasing water use, modifying systems or conducting any activities within Zone I.

**Recommendations:**

- ✓ Do not conduct any additional activities within the Zone I. Contact MA DEP prior to conducting any activities within Zone I.
- ✓ Prepare an emergency response plan for responding to an accidental release.
- ✓ Consider entering into an agreement for the right of first refusal to purchase the land if it becomes available for purchase or consider purchasing the development rights (Conservation Restriction).
- ✓ Record water meter data to monitor water use and help assess system for potential leaks.
- ✓ Consider testing well #3 so that it may be utilized as a supplemental source for the system. Decommission all unused wells/borings to prevent contamination of the aquifer.
- ✓ Monitor the transformer near the wells. Eliminate limbs and trees that may pose a threat to the transformers. Contact the utility to ensure that the oil in the transformers does not contain PCBs.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

**2. Residential homes** – Residential development includes homes nearest to the wells. Normal residential activities pose minimal threat to the water quality of the public water supply provided homeowners are aware of the potential hazards of household waste, lawn care chemicals, animal waste and improper disposal through septic systems and they utilize best management practices.

**Recommendations:**

- ✓ Provide residents with information about protecting the facilities resources. Include information on Best Management Practices (BMPs) for the use of pesticides, household hazardous waste and septic system maintenance and disposal practices.
- ✓ Encourage residents to utilize the Franklin County Solid Waste Management facilities for household hazardous waste and paint exchange.

**3. Septic systems** - Septic systems are located within the IWPA of the wells. If a septic system fails or is not properly maintained it could be a potential source of microbial contamination. Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the water supply. The systems all appear to be topographically downgradient from the wells.

**Recommendations:**

- ✓ Refer to recommendations under item 2.
- ✓ Septic system components should be located, inspected, and maintained on a regular basis. Refer to the attachments for more information regarding septic systems.
- ✓ Avoid septic tank cleaners, especially those with acids and solvents.

Other activities noted were evidence of passive recreation, hiking trail, near the wells. If there is evidence of increased use or loitering, consider fencing off the area or relocating the trail. Work with the DEP and local officials such as the Police, Fire and Highway Departments regarding protecting the water supplies through emergency response coordination.

### 3. Protection Recommendations

To reduce the system's susceptibility to contamination, please review and adopt the following recommendations:

**Priority Recommendation:**

- ✓ Test well #3 for use as a supply and decommission all unused wells.

**Zone I and IWPA:**

- ✓ Keep all non-water supply activities out of the Zone I.
- ✓ Please note that water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use, modifying their system or conducting any additional non-conforming activities in Zone I.
- ✓ Prohibit public access to the wells by locking facilities and posting signs at the facility entrance. Check the integrity of the well caps regularly and replace as necessary. Decommission or seal any old wells that did not produce water.
- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping and evidence of vandalism.

## Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on DEP's web site at:  
[www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws).

Copies of this assessment have been provided to the public water supplier and town boards.

- ✓ Work with the local fire department, DEP, State highway, and local officials regarding protecting the water supplies through emergency response coordination.
- ✓ Be sure that the town is aware that your facility is a public water supply so that you can be notified of any accidents or threats from accidents. Ask that your facility be included in Town wide water supply protection efforts.

## Training and Education:

- ✓ Continue staff training on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, certified operator, and other appropriate staff.
- ✓ Maintain the drinking water protection area signs at key visibility locations.

## Facilities Management:

- ✓ Implement standard operating procedures regarding proper storage, use and disposal of any hazardous materials at the facility. To learn more, see the hazardous materials guidance manual at [www.state.ma.us/dep/bwp/dhm/dhmpubs.html](http://www.state.ma.us/dep/bwp/dhm/dhmpubs.html).
- ✓ Continue utilizing Best Management Practices (BMPs) for the use of fertilizers pesticides on facility property.
- ✓ Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm.

## Planning:

- ✓ Work with local officials in town to include the facility IWPA in an Aquifer Protection District Bylaws and to assist you in improving protection.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

## Funding:

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response for the Grant program (RFR). On or about May 1 the new RFR is available and the application is due back on or about June 31. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

## Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws), including:

- Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.

## 4. Attachments

- Maps of the Public Water Supply (PWS) Protection Areas
- Recommended Source Protection Measures Fact Sheet
- Pesticide Use Fact Sheet
- Fertilizer Use Fact Sheet
- Septic system brochures
- Wellhead Protection Grant Program Fact Sheet
- Excerpt from Guidelines for Well Decommissioning

Massachusetts Department of Environmental Protection  
Source Water Assessment and Protection (SWAP) Report  
for  
**Whately Water Department**

### What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection.

### Susceptibility and Water Quality

Susceptibility is a measure of a water supply's potential to become contaminated due to land uses and activities within its recharge area.

A source's susceptibility to contamination does *not* imply poor water quality.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, disinfecting, filtering, or treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Actual water quality is best reflected by the results of regular water tests. To learn more about your water quality, refer to your water supplier's annual Consumer Confidence Reports.

### Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential contaminant sources, including storm runoff, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

#### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures.

Refer to Table 3 for Recommendations to address potential sources of contamination. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

#### This report includes the following sections:

1. Description of the Water System
2. Land Uses within Protection Areas
3. Source Water Protection
4. Appendices

## Section 1: Description of the Water System

### Glossary

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material (i.e. clay) that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. This area should be owned or controlled by the water supplier and limited to water supply activities.

**Zone II:** The primary recharge area for the aquifer. This area is defined by hydrogeologic studies that must be approved by DEP. Refer to the attached map to determine the land within your Zone II.

### Groundwater Sources

Zone II #: 203

Susceptibility: High

**Well Name**

**Source ID#**

Well #1 (01G)

1337010-01G

Well #2 (02G)

1337010-02G

Whately is a mid-sized agricultural and growing residential community in the Connecticut River valley in western Massachusetts. The Whately Water Department operates and maintains two wells. The two wells are located within approximately 40 feet of each other west of I-91 in the south-central portion of Town. Well 01G is a 6-inch diameter gravel developed well and serves as the back-up well for the Water Department; Well #2 (02G), the main source, is a 12-inch diameter, gravel developed well. Both wells are screened at depths of approximately 200 feet. The Water Department was formed in the mid-1980's and the wells developed after it was determined that numerous, shallow, private wells were contaminated with the pesticides ethylene dibromide (EDB) and aldicarb (Temik). The wells are developed in a confined, sand and gravel aquifer, with a thick clay layer protecting the lower aquifer from potential contaminants from the fields. Recharge to the lower aquifer comes from more remote areas along the edge of the valley and areas to the north. Each well has a Zone I protective radius of 400 feet. The Conceptual Zone II for the wells was delineated as part of the New Source Approval process and based on approved withdrawal rates of 100 gpm for Well #1 and 150 gpm for Well #2. Because of

the close proximity of the wells, the Zone II for the wells is the same and extends to the south into Hatfield and north to near the Whately—Deerfield border.

The wells are located in a deep, buried bedrock valley aquifer, filled with sand and gravel deposited during the recession (melting) of the glaciers some 12,000 to 18,000 years ago. At that time, Glacial Lake Hitchcock was formed in this area leaving a thick layer of lake clay in some areas overlying the deeper sand and gravel aquifer. The Whately wells are screened in a sand and gravel deposit that is overlain by the clay layer that is estimated to become thicker to the east and thinner to the west where the upland areas are. There is some evidence that the clay layer “pinches out” to the west where much of the aquifer recharge is likely to occur. Hydrogeological investigations indicated a channel of coarse sand and gravel trending north/ south that the wells are screened in.

The wells are located in an aquifer with a high vulnerability to contamination. Although there is a confining clay unit where the wells are located and in a portion of the Zone II, the confining unit is not contiguous throughout the area and therefore, due to the absence of hydrogeologic barriers (i.e. confining clay layer) that can prevent contaminant migration from the ground surface, the aquifer is considered vulnerable. Recharge primarily enters the aquifer along edges of the valley and in areas north of the wells. The confining unit provides some protection to the aquifer from the activities conducted on the land in the immediate area of the wells. Please refer to the attached map for the Zone II delineation outlines.

The water from the wells is treated to sequester manganese and chlorinated prior to distribution. Periodically, very low levels of volatile organic compounds are reported at concentrations well below drinking water standards. The Whately Water Department conducts an annual groundwater monitoring program that includes both water level and water quality monitoring. For current information on monitoring results and treatment, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report.

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and a Zone II protection area.

## Section 2: Land Uses in the Protection Areas

The Zone II watershed area is primarily forested, with smaller portions consisting of agriculture, residential, and commercial/industrial land uses (refer to the attached map for details). Land uses and activities that are potential sources of contamination are listed in Table 2, with further detail provided in the Table of Regulated Facilities and Table of Underground Storage Tanks in Appendix B.

### Key Land Uses and Protection Issues include:

1. Agricultural activities
2. Residential Land Uses
3. Transportation Corridors
4. Hazardous Materials Storage and Use
5. Oil or Hazardous Material Contamination Sites
6. Comprehensive Wellhead Protection Planning

The overall ranking of susceptibility to contamination for the system is high, based on the presence of at least one high threat land use within the water supply protection areas, as seen in Table 2. The Whatley Water Department owns the

Zone I of both wells. There are no activities within the Zone I that are not related to the water supply. The water is treated to sequester manganese and disinfected; the motor control and treatment building along with the formerly used backwash settling basin are located within the Zone I. In addition, a spring source for the neighboring farm is located on the Water Department property.

### Zone I Recommendations:

- ✓ Use BMPs for the storage, use, and disposal of hazardous materials such as water supply chemicals.
- ✓ Continue annual groundwater monitoring program.

**1. Agricultural Activities** – There are numerous farms throughout the protection areas. In fact 30% of the Zone II area consists of farmland and a small, farm is located immediately adjacent to the well site. As Whatley is well aware, pesticides and fertilizers have the potential to contaminate a drinking water source if improperly stored, applied, or disposed. If not contained or applied properly, animal waste from barnyards, manure pits and field application are potential sources of contamination to ground and surface water. The clay layer in the immediate vicinity of the well site provides some protection from activities in the area. However, there is the potential for contaminants to enter the aquifer from more remote recharge areas.

### Agricultural Activities Recommendation:

- ✓ Continue working with farmers in your protection areas to make them aware of your water supply and to encourage the use of a US Natural Resources Conservation Service farm plan to protect water supplies. Offer information on acquiring assistance from Department of Food and Agriculture (DFA) and NRCS.
- ✓ Establish and maintain communication with DFA regarding the use of pesticides and the various crops throughout the Zone II.

**2. Residential Land Uses** – Approximately 8% of the Zone II consists of residential areas. All of the areas use septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained they can be a potential source of microbial contamination.
- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used

### For More Information

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and assistance on improving current protection measures.

Copies of this report have been provided to the public water supplier and town boards.

in homes are potential sources of contamination.

- **Heating Oil Storage** - If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

#### **Residential Land Use Recommendations:**

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet “Residents Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
- ✓ Work with planners to manage new residential developments in the water supply protection areas.

#### **What are "BMPs?"**

Best Management Practices (BMPs) are measures that are used to protect and improve surface water and groundwater quality. BMPs can be structural, such as oil & grease trap catch basins, nonstructural, such as hazardous waste collection days or managerial, such as employee training on proper disposal procedures.

**3. Transportation Corridors** - Interstate 91 runs along the eastern side of the Zone II protection area just outside for the Zone I for the wells. Local roads are present in the protection areas of the Zone IIs and watershed. Roadway construction, maintenance, and typical highway use can all be potential sources of contamination. Accidents can lead to spills of gasoline and other potentially dangerous transported chemicals. Roadways are frequent sites for illegal dumping of hazardous or other potentially harmful wastes. Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include contaminants from automotive leaks, maintenance, washing, or accidents.

Railroad tracks also run along the eastern edge and through a small area of the Zone II. Rail corridors serving passenger or freight trains are potential sources of contamination due to chemicals released during normal use, track maintenance, and accidents. Accidents can release spills of train engine fluids and commercially transported chemicals.

#### **Transportation Corridor Recommendations:**

- ✓ Continue to regularly inspect the Zone II area for illegal dumping and spills.
- ✓ Work with local emergency response teams to ensure the Water Department is notified of spills and that any spills within the protection areas can be effectively contained.
- ✓ Work with the Town and State to have catch basins inspected, maintained, and cleaned on a regular schedule. Regular street sweeping reduces the amount of potential contaminants in runoff.
- ✓ If storm drainage maps are available, review the maps with emergency response teams. If maps aren't yet available, work with town officials to investigate mapping options such as the upcoming Phase II Stormwater Rule requiring some communities to complete stormwater mapping.

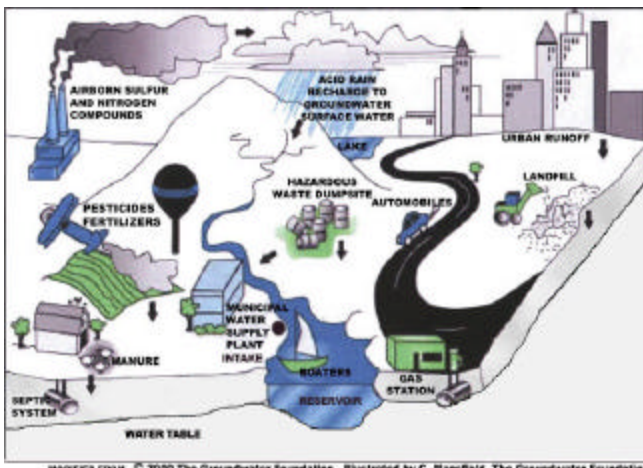

Figure 1: Sample watershed with examples of potential sources of contamination

- ✓ Promote BMPs for stormwater management and pollution controls. Contact MA Highway Department to ensure they are aware of the portions of Route 91 that run through the Zone II for purposes of stormwater and emergency management.
- ✓ Work with local officials during their review of the railroad right of way Yearly Operating Plans to ensure that water supplies are protected during vegetation control. Be sure that the railroad is aware of the areas within the Zone II.

**5. Hazardous Materials Storage and Use**—Less than 1% of the Zone II for Whately's wells is utilized as

(Continued on page 6)

### Potential Source of Contamination vs. Actual Contamination

The activities listed in Table 2 are those that typically use, produce, or store contaminants of concern, which, if managed improperly, are potential sources of contamination (PSC).

It is important to understand that a release may never occur from the potential source of contamination provided facilities are using best management practices (BMPs). If BMPs are in place, the actual risk may be lower than the threat ranking identified in Table 2. Many potential sources of contamination are regulated at the federal, state and/or local levels, to further reduce the risk.

**Table 2: Land Use in the Watershed**

For more information, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area

Land Uses	Quantity	Threat	Potential Contaminant Sources*
<b>Agricultural</b>			
Forestry Operation	1	M	Equipment and maintenance materials: leaks, spills, or improper handling; road building
Nurseries	2	M	Fertilizers, pesticides, and other chemicals: leaks, spills, improper handling, or over-application
Dairy Farms	2	M	Management of manure (microbial contaminants)
Fertilizer / Pesticide Storage or Use	7	H	Fertilizers, pesticides, and other chemicals: leaks, spills, improper handling, or over-application
<b>Commercial</b>			
Railroad Tracks	1	H	Handling/ use of pesticides/herbicides, leaks or spills of transported chemicals and maintenance chemicals; fuel storage
Former Gas Station/ Body Shop	1	H	Petroleum products
Sand and Gravel Mining/ Washing	2	M	Heavy equipment, fuel storage, clandestine dumping: spills or leaks.
<b>Residential</b>			
Fuel Oil Storage (at residences)	Numerous	M	Fuel oil: spills, leaks, or improper handling
Lawn Care / Gardening	Numerous	M	Pesticides: over-application or improper storage and disposal
Septic Systems / Cesspools	Numerous	M	Hazardous chemicals: microbial contaminants, and improper disposal
<b>Miscellaneous</b>			
Oil or Hazardous Material Sites	1	--	Tier Classified Oil or Hazardous Materials Sites are not ranked due to their site-specific character. Individual sites are identified in Appendix B.
Transmission Line Rights-of-Way Type: electric line	1	L	Construction and corridor maintenance, over-application or improper handling of herbicides
Transportation Corridors	Numerous	M	Accidental leaks or spills of fuels and other hazardous materials, over-application or improper handling of pesticides

**Notes:**

1. When specific potential contaminants are not known, typical potential contaminants or activities for that type of land use are listed. Facilities within the watershed may not contain all of these potential contaminant sources, may contain other potential contaminant sources, or may use Best Management Practices to prevent contaminants from reaching drinking water supplies.
2. For more information on regulated facilities, refer to Appendix B: Regulated Facilities within the Water Supply Protection Area information about these potential sources of contamination.
3. For information about Oil or Hazardous Materials Sites in your protection areas, refer to Appendix C: Tier Classified Oil and/or Hazardous Material Sites.

\* **THREAT RANKING** - Where there are two rankings, the first is for surface water, the second for groundwater sources. The rankings (high, moderate or low) represent the relative threat of each land use compared to other PSCs. The ranking of a particular PSC is based on a number of factors, including: the type and quantity of chemicals typically used or generated by the PSC; the characteristics of the contaminants (such as toxicity, environmental fate and transport); and the behavior and mobility of the pollutants in soils and groundwater.

commercial or industrial land. Many small businesses and industries use hazardous materials, produce hazardous waste products, and/or store large quantities of hazardous materials in UST/AST. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be disposed of to a septic system or floor drain leading directly to the ground.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Educate local businesses on best management practices for protecting water supplies. Distribute the fact sheet “Businesses Protect Drinking Water” available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMP’s for common business issues.
- ✓ Work with local businesses to register those facilities that are unregistered generators of hazardous waste or waste oil. Partnerships between businesses, water suppliers, and communities enhance successful public drinking water protection practices.
- ✓ Educate local businesses on Massachusetts floordrain requirements. See brochure “Industrial Floor Drains” for more information.

**7. Presence of Oil or Hazardous Material Contamination Sites** – The Zone II contains a DEP Tier Classified Oil and/or Hazardous Material Release Site indicated on the map as Release Tracking Number 1-000488. Refer to the attached map and Appendix 3 for more information.

**Oil or Hazardous Material Contamination Sites Recommendation:**

- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites. Contact the DEP Bureau of Waste Site Cleanup (BWSC) for additional information about the site at (413) 784-1100 or visit the DEP web site <http://www.state.ma.us/dep/bwsc/sites/report.htm>.

**8. Protection Planning** – Protection planning protects drinking water by managing the land area that supplies water to a well or reservoir. Currently, the Town does not have water supply protection controls that meet DEP’s Wellhead Protection regulations 310 CMR 22.21(2). Wellhead Protection Plans coordinate community efforts, identifies protection strategies, establishes a timeframe for implementation, and provides a forum for public participation. Wellhead Protection Plans coordinate community efforts, identify protection strategies, establish a timeframes for implementation, provide a forum for public education and outreach, and can help to pass bylaws or regulations for landuse controls. The development of a successful Plan is outlined in five steps in DEP’s “Developing a Local Wellhead Protection Plan” (see Appendix A for the full report) as:

- Establish a protection committee or team
- Define the Water Source Protection Areas
- Identify potential sources of contamination
- Protect and manage the source protection areas
- Conduct ongoing public education and outreach

Franklin County Regional Council of Governments has been retained by the Town through a Wellhead Protection

Grant awarded by the DEP to complete a wellhead protection plan. The committee, along with FRCOG should compile the information supplied in the Zone II reports, this and other reports; include copies of maps outlining the protection areas (Zone I and Zone II) and detail the protection measures in place. Outline a plan with a time line for completion of the various plan components. Submit your written report to the DEP Regional office and/or Boston office for approval.

#### Protection Planning Recommendations:

- ✓ Develop a Wellhead Protection Plan. Work with the protection team, and refer them to <http://mass.gov/dep/brp/dws/protect.htm> for a copy of DEP's guidance, "Developing a Local Wellhead Protection Plan".
- ✓ Coordinate efforts with local officials in Whately to compare local wellhead protection controls with current MA Wellhead Protection Regulations 310 CMR 22.21(2). If they do not meet the current regulations, adopt controls that meet 310 CMR 22.21(2). For more information on DEP land use controls see <http://mass.gov/dep/brp/dws/protect.htm>.
- ✓ If local Board of Health controls do not regulate floordrains, be sure to include floordrain controls that meet 310 CMR 22.21(2).
- ✓ Include provisions for controlling public access to the Zone Is and watershed in any future planning.
- ✓ Part of the strategy for protection of the public water supply should include Right of First Refusal, purchase of land or conservation restrictions.

Other land uses and activities within the Zone IIs and watershed that are potential sources of contamination are included in Table 2. Refer to Appendix B for more information about these land uses. In addition, there are numerous commercial facilities along State Road that are immediately adjacent to the Zone II and are within the Zone III or secondary recharge area. Although the potential risk from

these facilities is somewhat diminished, an inventory of these land uses provides additional information to local emergency responders and the use of BMPs at all facilities protects the environment and minimizes additional threat to the aquifer.

Identifying potential sources of contamination is an important initial step in protecting your drinking water sources.

#### Top 5 Reasons to Develop a Local Wellhead and Surface Water Protection Plan

- ❶ Reduces Risk to Human Health
- ❷ Cost Effective! Reduces or Eliminates Costs Associated With:
  - ♦ Increased monitoring and treatment
  - ♦ Water supply clean up and remediation
  - ♦ Replacing a water supply
  - ♦ Purchasing water
- ❸ Supports municipal bylaws, making them less likely to be challenged
- ❹ Ensures clean drinking water supplies for future generations
- ❺ Enhances real estate values – clean drinking water is a local amenity. A community known for its great drinking water in a place people want to live and businesses want to locate.

Further local investigation will provide more in-depth information and may identify new land uses and activities that are potential sources of contamination. Once potential sources of contamination are identified, specific recommendations like those below should be used to better protect your water supply.

### Section 3: Source Water Protection Conclusions and Recommendations

#### Current Land Uses and Source Protection:

As with many water supply protection areas, the system Zone II and watersheds contain potential sources of contamination. However, source protection measures reduce the risk of actual contamination, as illustrated in Figure 2. The water supplier is commended for taking an active role in promoting source protection measures in the Water Supply Protection Areas through:

- Daily inspections of Zone I and II watershed lands.

- Purchase of additional watershed land.
- The preparation of a Wellhead Protection Plan for the watershed.

#### **Source Protection Recommendations:**

To better protect the sources for the future:

- ✓ Continue to inspect the Zone Is regularly.
- ✓ Educate residents on ways they can help you to protect drinking water sources.
- ✓ Work with emergency response teams to ensure that they are aware of the stormwater drainage in your protection areas and to cooperate on responding to spills or accidents.
- ✓ Partner with local businesses to ensure the proper storage, handling, and disposal of hazardous materials.
- ✓ Monitor progress on any ongoing remedial action conducted for the known oil or contamination sites.
- ✓ Develop and implement a Wellhead Protection Plan.

#### **Conclusions:**

These recommendations are only part of your ongoing local drinking water source protection. Additional source protection recommendations are listed in Table 3, the Key Issues above and Appendix A.

#### **Partner with Local Businesses:**

Since many small businesses and industries use hazardous materials and produce hazardous waste products, it is essential to educate the business community about drinking water protection. Encouraging partnerships between businesses, water suppliers, and communities will enhance successful public drinking water protection practices.

#### **Educate Residents:**

If managed improperly, household hazardous waste, septic systems, lawn care, and pet waste can all contribute to groundwater contamination. Hazardous

materials include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. If a septic system fails or is not properly maintained, it could be a potential source of microbial contamination. Animal waste is also a source of microbial contamination.

#### **Provide Outreach to the Community:**

Public education and community outreach ensure the long-term protection of drinking water supplies. Awareness often generates community cooperation and support. Residents and business owners are more likely to change their behavior if they know where the wellhead protection recharge area is located; what types of land uses and activities pose threats; and how their efforts can enhance protection.

#### **Plan for the Future:**

One and of the most effective means of protecting water supplies is local planning, include adoption of local controls to protect land use, regulations related to watersheds and ground water protection. These controls may include health ordinances/regulations, discharge prohibitions, general ordinances, and zoning by laws that prohibit or control potential sources of contamination within wellhead protection areas.

*(Continued on page 9)*

#### **What is a Zone III?**

A Zone III (the secondary recharge area) is the land beyond the Zone II from which surface and ground water drain to the Zone II and is often coincident with the watershed boundary.

The Zone III is defined as a secondary recharge area for one or both of the following reasons:

1. The low permeability of underground water bearing materials in this area significantly reduces the rate of groundwater and potential contaminant flow to the Zone II .
2. The groundwater in this area probably discharges to surface water feature such as a river rather than discharging directly into the aquifer.

The land uses within the Zone III are assessed only for sources that are shown to be groundwater under the direct influence of surface water.

#### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. These recommendations are only part of your ongoing local drinking water source protection.

DEP staff, informational documents, and resources are available to help you build on this SWAP report as you continue to improve drinking water protection in your community.

The Department's Wellhead Protection Grant Program and Source Protection Grant Program provide funds to assist public water suppliers in addressing water supply source protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the Grant Program. Please note: each spring DEP posts a new Request for Response for the grant program (RFR).

Other grants and loans are available through the Drinking Water State Revolving Loan Fund, the Clean Water State Revolving Fund, and other sources. For more information on grants and loans, visit the Bureau of Resource Protection's Municipal Services web site at: <http://mass.gov/dep/brp/mf/mfpubs.htm>.

The assessment and protection recommendations in this SWAP report are provided as a tool to encourage community discussion, support ongoing source protection efforts, and help set local drinking water protection priorities. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures. The water supplier should supplement this SWAP report with local information on potential sources of contamination and land uses. Local information should be maintained and updated periodically to reflect land use changes in the Zone II. Use this information to set priorities, target inspections, focus education efforts, and to develop a long-term drinking water source protection plan.

## **Section 4: Appendices**

- A. Protection Recommendations
- B. Regulated Facilities within the Water Supply Protection Area
- C. Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas
- D. Additional Documents on Source Protection

**Table 3: Current Protection and Recommendations**

Protection Measures	Status	Recommendations
<b>Zone I</b>		
Does the Public Water Supplier (PWS) own or control the entire Zone I?	<b>YES</b>	Continue to inspect and protect open space in the Zone 1. Where land is not available for purchase, consider the use of conservation restrictions.
Are the Zone I and II posted with “Public Drinking Water Supply” Signs?	<b>YES</b>	Additional economical signs are available from the Northeast Rural Water Association (802) 660-4988.
Is the Zone I regularly inspected?	<b>YES</b>	Continue daily inspections of drinking water protection areas.
Are water supply-related activities the only activities within the Zone I?	<b>YES</b>	Monitor activities in Zone I.
<b>Municipal Controls</b> (Zoning Bylaws, Health Regulations, and General Bylaws)		
Does the municipality have Wellhead Protection Controls that meet 310 CMR 22.21(2) ?	<b>NO</b>	Work with the Planning Board and the Board of Health to compare land use controls to see that they meet current requirements of 310 CMR 22.21(2). Refer to <a href="http://mass.gov/dep/brp/dws/">mass.gov/dep/brp/dws/</a> for model bylaws and health regulations, and current regulations. Whately does have hazardous Materials Handling by laws
Do neighboring communities protect the water supply protection areas extending into their communities?	<b>NO</b>	Hatfield does have protective by laws. However, the protection area must be revised to include the newly delineated Zone II for the Omasta well.
<b>Planning</b>		
Does the PWS have a local wellhead protection plan?	<b>In process</b>	Develop a wellhead protection plan. Follow “Developing a Local Wellhead Protection Plan” available at: <a href="http://www.state.ma.us/dep/brp/dws/">www.state.ma.us/dep/brp/dws/</a> .
Does the PWS have a formal “Emergency Response Plan” to deal with spills or other emergencies?	<b>YES</b>	Augment plan by developing a joint emergency response plan with fire department, Board of Health, DPW, and local and state emergency officials. Coordinate emergency response drills with local teams.
Does the municipality have a watershed and wellhead protection committee?	<b>YES</b>	Encourage past committee to reconvene, and also include representatives from citizens’ groups, neighboring communities, and the business community.
Does the Board of Health conduct inspections of commercial and industrial activities?	<b>NO</b>	There are no commercial or industrial activities in the watershed, but there are some that should be inspected within the Zone IIs. For more guidance see “Hazardous Materials Management: A Community’s Guide” at <a href="http://www.state.ma.us/dep/brp/dws/files/hazmat.doc">www.state.ma.us/dep/brp/dws/files/hazmat.doc</a>
Does the PWS provide watershed protection education?	<b>NO</b>	Currently outreach is mainly to school groups. Increase residential outreach through bill stuffers, Drinking Water Week activities, and coordination with local groups. Aim additional efforts at commercial, industrial and municipal uses within the Zone IIs.

## APPENDIX B: REGULATED FACILITIES NEAR THE WATER SUPPLY PROTECTION AREA

**Note:** All of these facilities are outside of the Zone IIs for the system wells. However, they are within the Zone III, very near the border of the Zone II, and so runoff from a spill or leak at these facilities could drain to the Zone II.

### DEP Permitted Facilities

DEP Facility Number	Facility Name	Street Address	Town	Permitted Activity	Activity Class
131813 *	West Track, Inc. *	164 West St Rte 5	Hatfield	Generator of Hazardous Waste	Very Small Quantity Generator
*	C.N. Wood Co. Inc. *	69 State Road	Whately	Generator of Hazardous Waste	Very Small Quantity Generator
205621*	Federal Express Corp. *	173 West St Route 5 & 10	Hatfield	Generator of Hazardous Waste	Very Small Quantity Generator
328650 *	Hatfield Equipment Co. *	Mountain Rd	Hatfield	Generator of Hazardous Waste	Very Small Quantity Generator
*	Orchard Trailers *	78 State Road	Whately	Generator of Hazardous Waste	Very Small Quantity Generator

Note: This appendix includes only those facilities that meet state reporting requirements and report to the appropriate agencies. Additional facilities may be located within the water supply protection area(s) that should be considered in local drinking water source protection planning.

\* These facilities are located just outside of the Zone II area.

## **APPENDIX C – Table of Tier Classified Oil and/or Hazardous Material Sites within the Water Supply Protection Areas**

DEP's data layer depicting oil and/or hazardous material (OHM) sites is a statewide point data set that contains the approximate location of known sources of contamination that have been both reported and classified under Chapter 21E of the Massachusetts General Laws. Location types presented in the layer include the approximate center of the site, the center of the building on the property where the release occurred, the source of contamination, or the location of an on-site monitoring well. Although this assessment identifies OHM sites near the source of your drinking water, the risks to the source posed by each site may be different. The kind of contaminant and the local geology may have an effect on whether the site poses an actual or potential threat to the source.

The DEP's Chapter 21E program relies on licensed site professionals (LSPs) to oversee cleanups at most sites, while the DEP's Bureau of Waste Site Cleanup (BWSC) program retains oversight at the most serious sites. This privatized program obliges potentially responsible parties and LSPs to comply with DEP regulations (the Massachusetts Contingency Plan – MCP), which require that sites within drinking water source protection areas be cleaned up to drinking water standards.

For more information about the state's OHM site cleanup process to which these sites are subject and how this complements the drinking water protection program, please visit the BWSC web page at <http://www.state.ma.us/dep/bwsc>. You may obtain site -specific information two ways: by using the BWSC Searchable Sites database at <http://www.state.ma.us/dep/bwsc/sitelist.htm>, or you may visit the DEP regional office and review the site file. These files contain more detailed information, including cleanup status, site history, contamination levels, maps, correspondence and investigation reports, however you must call the regional office in order to schedule an appointment to view the file.

The table below contains the list of Tier Classified oil and/or Hazardous Material Release Sites that are located within your drinking water source protection area.

**Table 1:** Bureau of Waste Site Cleanup Tier Classified Oil and/or Hazardous Material Release Sites (Chapter 21E Sites) - Listed by Release Tracking Number (RTN)

<b>RTN</b>	<b>Release Site Address</b>	<b>Town</b>	<b>Contaminant Type</b>
1-0000488	361 West St	HATFIELD	Oil and Hazardous Material
1-0010136*	Depot Road	HATFIELD	Oil and Hazardous Material

For more location information, please see the attached map, which has the release sites located by RTN and refer to <http://www.state.ma.us/dep/bwsc/sitelist.htm> for additional site information.

\* Site is just outside of the Zone II area.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
SNOW FARM

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 24, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Snow Farm
<i>PWS Address</i>	5 Clary Rd
<i>City/Town</i>	Williamsburg, Massachusetts
<i>PWS ID Number</i>	1340001

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #1	1340001-01G	100	415	High	Moderate
Well #2	1340001-02G	135	438	High	Moderate
Well #3	1340001-03G	123	432	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1340001-01G)**

Zone I = 123 ft.  
IWPA = 432 ft.

### How was my Well's Susceptibility Determined?

Your wells' **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I and IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the parking areas, buildings and local roads within the Zone I and the IWPA.

This source water assessment report is based on information provided by you on your 2000 Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Source Water Assessment Program (SWAP) Report For Sweet Brook Care Centers, Inc.

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
December 5, 2001

Well #5	1341003-05G	319	1043	Moderate

## Introduction

We are all concerned about the quality of the water we drink. Drinking water wells may be threatened by many potential sources of contamination, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential sources of contamination the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

The Sweet Brook Care Centers, Inc., located in Williamstown, consists of two facilities serving a combined population of about 300 residents and staff. The rural community system is served by four wells, and utilizes the town's sanitary sewer line for wastewater disposal. The Zone I is the protected area immediately surrounding the wellhead while the IWPA provides an interim protection area for a water supply well when the actual recharge area has not been delineated. The actual recharge area to the well may be

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

significantly larger or smaller than the IWPA. The Zone I and IWPA radii for wells #1 and 2 have been calculated from available metered data. Well #1 is a 175-foot deep well with a Zone I radius of 175 feet and an IWPA radius of 470 feet. Well #2 is a 288-foot deep well with a Zone I radius of 288 feet and an IWPA radius of 798 feet. These two wells are manifolded together, used as stand-by wells, and are tested regularly to remain active and available. Wells #4 and 5 are manifolded just after well 4. Well #4 is an 8-inch diameter, 590-foot deep well with an approved pumping rate of 19 gpm; the Zone I and IWPA radii are 316 feet and 1008 feet, respectively. Well #5 is a 6-inch diameter, 400-foot deep well with an approved pumping rate of 20 gpm; the Zone I and IWPA radii are 319 feet and 1043 feet, respectively. Wells 4 and 5 were tested and approved under the DEP New Source Approval process and are therefore in compliance with the Zone I restrictions. Well #3 (03G) is an emergency source used only for fire protection and is not addressed in this report.

The mapping by USGS describes the bedrock in this area as phyllite and schist with a thin layer of till over bedrock. The wells utilize the bedrock aquifer and there is no evidence of a confining, protective clay layer in the immediate vicinity of wells 4 and 5. Review of the driller's log indicates the following: well #4 was drilled into limestone bedrock with one foot of till on the surface; well #5 was drilled into limestone bedrock with 17 feet of overburden described as sandy hardpan and gravel. Wells located in these geological conditions are considered to have a high vulnerability to contamination due to the absence of hydrogeologic barriers that can prevent contaminant migration from the surface. Wells utilizing aquifers within a protective clay barrier are considered less vulnerable. Reportedly, wells 1 and 2 are located in an area with clay overburden; however, this information could not be verified specifically for these well locations.

Although the facility utilizes a water softener, there is no other treatment of the water. For current information on water quality monitoring results, please contact the Public Water System contact person listed above in Table 1 for a copy of the most recent Consumer Confidence Report. Please refer to the attached map of the Zone I and IWPA and Table 1 for additional information regarding the location of the wells and activities within the protection areas.

## 2. Discussion of Land Uses in the Protection Areas

There are few activities within the drinking water supply protection areas that are potential sources of contamination.

#### Key issues include:

1. **Nonconforming uses in Zone I;**
2. **Underground Storage Tank;**

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA	Threat	Comments
Fuel Storage - Below Ground (UST)	None	Wells 1, 2 & 4	High	New 10,000 gallon heat oil tank with containment and monitoring
Parking lot & roads	Wells 1 & 2	All Wells	Moderate	Restrict fertilizer, pesticides, and road salt use
Electrical Transformers	Well 2	Wells 1, 2 & 4	Moderate	Request information regarding PCB in MODF change from your electric company
Horse and Dairy cow pastures	None	All Wells	Moderate	Use BMPs for management
Recreational Activities	None	Well 5	Low	Athletic fields and passive recreation
Nursing Home	Wells 1 & 2	All Wells	Low	Nonconforming Zone I (Wells 1 & 2)

\* -For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

### 3. Horse and Dairy cow pastures; and

#### 4. Electrical Transformers.

The overall ranking of susceptibility to contamination for wells 1 and 2 is high, based on the numerous land uses and activities in the Zone I. and IWPA, as seen in Table 2. The ranking of well 5 is moderate due to moderate threat activity in the Zone I of the wells and few threats within the IWPA.

**1. Nonconforming uses in Zone I** – Currently, the water supplier does not own or control the entire Zone I area for wells 1 and 2. Please note that systems not meeting DEP Zone I requirements for ownership or control, must get DEP approval and address Zone I ownership prior to increasing water use or modifying systems. Structures, parking lots, and State Route 7 are all found within the Zone I of these two wells.

#### Recommendations:

- ✓ Control access to the wellhead area and make every effort to acquire Zone I control or ownership, as practical.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides, fertilizers or road salt within the Zone I.
- ✓ Prepare an emergency response plan for responding to an accidental release.
- ✓ Do not conduct any additional activities within the Zone I. Contact MA DEP prior to conducting any activities within Zone I.

**2. Underground Storage Tank (UST)** – There is a UST located between the parking lot and the northern-most building, with a capacity of 10,000 gallons of fuel oil. The UST is relatively new with containment and a monitoring system. If managed improperly, USTs can be a potential source of contamination due to leaks or spills of the chemicals they store.

#### Recommendations:

- ✓ All USTs in close proximity to the water supply should be closely monitored especially during deliveries.
- ✓ Any upgrades and modification in the future must meet current construction standards and be done consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding USTs.

**3. Horse and Dairy Cow Pastures** -- There are livestock activities in and adjacent to the IWPA of the wells. There is a pasture for pleasure horses within the IWPA for wells 4 and 5, and a commercial dairy farm pasture for grazing within the IWPA for wells 1 and 2. Animal wastes, if improperly managed, could potentially cause contamination of the water supply.

#### Recommendations:

- ✓ Attempt to obtain an agreement from the commercial farm owner/operator that they will:
  - Follow all applicable UMASS recommendations on Integrated Pest Management.
  - Become certified in UMASS/Natural Resource Conservation Service Nutrient Management Certification program.
  - Obtain and follow a Farm Plan through Natural Resource Conservation Service. Alternatively, complete and follow a plan developed through the publication *On Farm Strategies to Protect Water Quality: An Assessment and Planning Tool for Best Management Practices*.

Information on funding and other resources for agricultural

#### Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400 foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### For More Information:

Contact Catherine Skiba in DEP's Western Region Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/), including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been made available to the public water supplier, town boards, and the local media.

management is available through the Massachusetts Department of Food and Agriculture at (617) 626-1700 or <http://www.massdfa.org/bureaus.htm>

**4. Electrical Transformers** – Electrical transformers contain Mineral Oil Dielectric Fluids (MODF). Although the use of PCBs is banned in new transformers, historically, PCBs were used in some transformers. If the transformers have not been changed since 1980, they may still contain PCBs.

#### Recommendations:

- ✓ Contact the local utility to determine if the transformers contain PCBs. If PCBs are present, urge immediate replacement of the oil.
- ✓ Keep the area near the transformers free of tree limbs that could endanger the transformer in a storm.

Other activities noted during the site visit were athletic fields and the use of trails for passive recreation. These activities pose minimal threat to the water supply provided no chemical fertilizers or pesticides are used in the immediate vicinity of the wells. Continue communications with the school and monitor recreational activities as necessary.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the Sweet Brook Care Centers' susceptibility to contamination. Sweet Brook Care Centers are commended for utilizing the town's sewer system, using propane for backup fuel sources, and having a well protected main water source. Sweet Brook Care Centers should review and adopt the key recommendations above and the following:

#### Priority Recommendations:

- ✓ Conduct regular inspections of the Zone I. Look for illegal dumping, evidence of vandalism, etc.

#### Zone I:

- ✓ Keep non-water supply activities out of the Zone I.
- ✓ Do not conduct any non-water supply activities within the Zone I to comply with DEP's Zone I requirements.
- ✓ Continue regular monitoring of back-up wells.
- ✓ Control public access to the wells: lock facilities, gate access roads, and post signs at facility entrance and parking areas.
- ✓ If the Town and/or Sweet Brook Care Centers intend to continue utilizing the structures in the Zone I, use BMPs and restrict activities that could pose a threat to the water supply.
- ✓ If it's not feasible to purchase privately owned land within the Zone I at this time, consider a conservation restriction that would prohibit potentially threatening activities or a right of first refusal to purchase the property.
- ✓ Maintain road and parking lot drainage in the Zone I away from well.
- ✓ Do not use or store pesticides, fertilizers or road salt within the Zone I.

### Training and Education:

- ✓ Train staff on proper hazardous material use, disposal, emergency response, and best management practices; include custodial staff, groundskeepers, certified operator, and food preparation staff. Post labels as appropriate on raw materials and hazardous waste.
- ✓ Post drinking water protection area signs at key visibility locations.
- ✓ Work with your community to ensure that stormwater runoff is directed away from the well and is treated according to DEP guidance.

### Facilities Management:

- ✓ Monitor all oil deliveries for accidental spills by overflow.
- ✓ Implement Best Management Practices (BMPs) for the use of fertilizer, herbicides and pesticides on facility property. Do

not use fertilizer, herbicides or pesticides in the Zone I.

- V Protective collars around wellheads should slope away from the well, and the well casing should extend above ground.
- V For utility transformers that may contain PCBs, contact the utility to determine if PCBs have been replaced. If PCBs are present, urge their immediate replacement. Keep the area near the transformer free of tree limbs that could endanger the transformer in a storm. Transformers that were installed before 1980 may contain PCBs.
- V The facility is currently not registered as a generator of hazardous waste or waste oil. Review enclosed document "A Summary of Requirements for Small Quantity Generators of Hazardous Waste" to determine your status and regulatory requirements, if any.

### **Planning:**

- V Work with local officials in Williamstown to include Sweet Brook Care Centers' IWPA's in Aquifer Protection District Bylaws and to assist you in improving protection.
- V Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- V Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a land use inventory to assist in setting priorities, focusing inspections, and creating educational activities.

### **Agricultural:**

- V Encourage commercial farmers in the IWPA to seek assistance from the Natural Resource Conservation Service (NRCS) in addressing soil nutrient and manure management issues. If they do not have a farm plan, recommend the plan developed through the publication *On Farm Strategies to Protect Water Quality: An Assessment and Planning Tool for Best Management Practices* Plan through the Natural Resource Conservation Service.

### **Funding:**

The Department's Wellhead Protection Grant Program provides funds to assist public water suppliers in addressing Wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". For additional information, please refer to the attached program fact sheet. Please note: each program year the Department posts a new Request for Response application package for the Grant program (RFR). On or about May 1 the new RFR is available and the application is due back on or about June 31. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

- Source Protection Sign Order Form

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Waubeeke Springs

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Spring #2	1341004-02G	800	Low

## Introduction

We are all concerned about the quality of the water we drink. Ground water sources may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Waubeeke Springs is a small community system that serves approximately 20 homes in Williamstown. Williamstown is a small community in the northwest corner of Massachusetts with a diverse economic base of education, agriculture, retail, industry and residential activity. Waubeeke Springs maintains two (2) spring sources of water. The

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

bedrock spring sources (01G and 02G) are located in relatively close proximity to each other in the central section of town.

During the early 1990s, the system was completely reconstructed to protect the sources from surface water runoff and influence. The springs are primarily bedrock springs discharging water from fractured dolomite. However, the immediate vicinity of the springs has some minor unconsolidated sand and gravel materials (stratified drift) of undetermined thickness that may contribute some recharge to the spring system. The collection boxes were reconstructed and the area graded to protect the springs from surface influences. The bedrock in the area is mapped as the Stockbridge Formation, a dolomite/marble. There is significant bedrock exposure in the area with some areas of thin to moderate depth of till overlying bedrock. There is no evidence of a significant and continuous protective, confining unit throughout the protection areas. Sources located in aquifers such as this are considered to be highly vulnerable to contamination from activities conducted on the land surface in the recharge areas.

The Zone I is the most protected area around a groundwater source. The Zone I for a spring is a square area centered on the source in the direction of flow with the source 50 feet from the downgradient edge of the Zone I. The lengths of the sides of the square are based on the estimated flow from the spring or estimated volume of water used from the source. The maximum estimated flow from the springs was over 240 gpm and therefore the length of the sides of the square Zone I area is 800 feet. The volume of the discharge ranged from 49 gpm to well over 240 gpm. The USGS was contracted by the DEP to determine the contribution areas (Zone II) to spring sources as part of the SWAP program. Please refer to the enclosed map for the outline of the protection areas for the sources. The entire Zone I and Zone II areas are entirely forest. You may request additional, current information regarding the quality of the water, from the local contact listed in Table 1. Please refer to the attached maps of the Zone I and Zone II protection areas and Table 2 for additional assessment information.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

## 2. Discussion of Land Uses in the Protection Areas

There are few land uses and activities within the drinking water supply protection areas that are potential sources of contamination. The sources have had a low risk ranking for the initial round of Microscopic Particulate Analysis to determine if they area under the influence from surface water.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	Zone II	Threat	Comments
Wildlife/microbial	Yes	Yes	Low	The potential threat to this source, at this time, is from natural sources and not anthropogenic land use at this time.

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

## Key issues include:

### 1. Wildlife/Natural microbial activity

The spring is located in an aquifer with a high vulnerability to contamination due to the absence of a significant hydrogeologic barrier to prevent contaminant migration. Springs are by their nature, considered to have a potential high vulnerability to contamination from activities on the land surface. However, there are no identified land use threats in the Zone I or Zone II of the sources and the initial MPA testing reported a low risk of surface water influence. Therefore, the overall ranking of susceptibility to contamination for the spring is low, based on the presence of one low ranked threatening land use or activity in the IWPA, as seen in Table 2.

**1. Wildlife/Natural microbial activity** – The springs are in relatively remote areas and the first round of microscopic particulate analysis indicates that the spring source is not under the influence of surface water. However, the sources must be protected and maintained to prevent deterioration of the infrastructure by controlling erosion and surface runoff around the springs. Wild animals, farm animals and domestic pets can be carriers of waterborne diseases such as *Giardia*, *Cryptosporidium*, *Salmonella*, etc. Microorganisms are microscopic creatures such as bacteria, viruses, and protozoa. Because some microorganisms are known pathogens, or disease causing agents, microbial contamination of public drinking water supplies poses a serious threat to human health.

Some known contaminants of concern in drinking water include: Bacteria, Escherichia coli (E.coli), Viruses, and Protozoa. Bacteria, viruses, and protozoa when ingested in drinking water can cause a number of infectious waterborne diseases such as cholera, typhoid, hepatitis, and infectious gastrointestinal diseases like cryptosporidiosis and giardiasis. Symptoms of waterborne disease may include fever, fatigue and weight loss (common in viral cases), vomiting, abdominal cramping, diarrhea, and stomachaches. In the most severe cases waterborne diseases can prove lethal.

#### Recommendations:

- ✓ Continue to maintain the infrastructure and control surface runoff.
- ✓ Monitor activities in the Zone I and Zone II. At other facilities, it has recently been confirmed that activities such as logging within the Zone I and II of the springs can have a detrimental impact on water quality due to the disturbance of thin overburden materials.

- ✓ Review ownership and control of lands within the Zone II and consider options for protecting that land.

## 2. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the source's susceptibility to contamination. The association is commended for current and past protection measures including upgrading the infrastructure and ownership of land around the sources. With the delineation of the Zone II contribution areas for the springs, the district should review existing protection strategies, review land ownership in the Zone II and evaluate the potential for future protection of that area. If appropriate, work with the community in development of additional protection strategies.

Please review and adopt the key recommendations listed above as is feasible.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### **Additional Documents:**

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

### **For More Information:**

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at: [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### **Zone I:**

- ✓ Do not permit any non-water supply activities in Zone I.
- ✓ Continue regular inspections of the Zone I. Monitor for evidence of unauthorized access.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider fencing and gating the immediate area around the springs.

### **Facilities Management:**

- ✓ Control surface runoff around the springs to prevent infiltration and erosion.

### **Planning:**

- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available and continue assessment of future needs of the system.
- ✓ Consider reviewing land ownership in the Zone II and acquiring additional land. Monitor proposed activities in the recharge areas; the Department's recent experience with another public water supplier's spring system has shown that activities such as logging upgradient from spring sources may impact water quality.

Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to spur discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
INSTITUTE FOR INTL COOPERATION & DEVLPMNT

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 24, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Institute For Intl Cooperation & Devlpmt
<i>PWS Address</i>	1117 Hancock Rd
<i>City/Town</i>	Williamstown, Massachusetts
<i>PWS ID Number</i>	1341006

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1341006-01G	267	688	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1341006-01G)**

Zone I = 267 ft.  
IWPA = 688 ft.

## How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads, facility buildings and parking areas within the IWPA.

This source water assessment report is based on information provided by you on your 1999 Transient Non-Community Public Water System Sanitary Survey self-audit questionnaire, the Annual Statistical Report, water quality data and from other sources of information. DEP has not verified the accuracy of the information submitted with the survey.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- inspect the Zone I and IWPA regularly;
- work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- do not use pesticides, fertilizers or road salt within the Zone I;
- address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Mt. Greylock Regional High School

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Well #2	1341010-02G	175	471	High

## Introduction

We are all concerned about the quality of the water we drink. Drinking water sources may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide information about funding and other resources that may be available to your community.

### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## Description of the Water System

The Mt. Greylock Regional High School (the school) is located in the south central section of Williamstown, Massachusetts. Williamstown is a small rural town in the northwestern corner of Massachusetts along the Vermont and New York borders. The facility consists of two major school wings located adjacent to each other serving seventh through twelfth grade; the wings are attached to each other. The total school

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

student and staff population is approximately 850 people per day. Although there is a municipal water system and a wastewater treatment facility in Williamstown only the municipal sewer serves this area of town. Therefore, the school and surrounding facilities are served by on-site water supplies.

The school is served by two potable supply wells: Well #1 – 01G and Well #2 - 02G. Both well casings terminated below grade within pits and Wells #1 and #2 are 8-inch diameter bedrock wells, 180-feet and 187-feet deep, respectively. Well #2 is located approximately 30 feet south of the school boiler room and Well #1 is located approximately 15 feet north of the school gymnasium. At the time of the assessment, the bulkheads were not secured. According to the previous reports from the school, at the time of installation, the estimated yield of the wells was 35 gpm. Normally, Well #2 supplies water to the school and cafeteria and Well #1 supplies water to the gymnasium. Either well could supply water to the entire school, however the two systems normally operate separately; valves would have to be opened to redistribute water through the system.

The Zone I is the area immediately around the wellhead where only activities associated with supplying water or other non-threatening activities are allowed to occur. The Interim Wellhead Protection Area (IWPA) is a larger area that potentially contributes water to the well. The IWPA is only an interim protection area until an actual Zone II contribution area is delineated; the actual area of contribution to the wellhead may be larger or smaller than the IWPA. The wells have a Zone I protective radius of 175 feet and an IWPA protective radius of 471 feet. These protective radii were based on metered water use at the school. Please refer to the attached map that shows the Zone I and IWPA.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Sources of Contaminants	Zone I	IWPA	Threat	Comments
Non-conforming Zone I	-	-	-	Contact DEP prior to conducting any work in the Zone I or expanding the system/facility.
Fuel Oil Storage	01G	Both	High	There are three USTs w/leak detection within the Zone I of Well #2.
Athletic fields	02G	Both	Moderate	Prohibit the use of pesticides/fertilizers on school fields in Zone Is. Utilize an IPM for athletic fields.
School (Middle and High Schools)	Both	Both	Moderate	Limit road deicing usage, use BMPs for hazardous materials and monitor parking areas and control stormwater.
Hazardous materials	02G	Both	High	Use BMPs for maintenance hazardous materials and laboratory materials
Transformers	02G	Both	Low	Monitor transformers for potential leaks

**-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).**

## Glossary

**Zone I:** The area closest to a well; a 100 to 400-foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone I. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

The school is located just south of Phelps Knoll summit in an upland area west of the Green River valley. Geologic mapping indicates relatively thin (<50 feet) sand and gravel deposits in the vicinity of the school's wells. Well logs from adjacent facilities on Phelps Knoll indicate thin till overburden deposits over bedrock. The sand and gravel deposits in the vicinity of the school are stratified drift (sand and gravel) deposited during the recession of the glaciers some 18,000 years ago. The bedrock geology in this area is a complex series of folds and faults associated with the Taconic-Berkshire Zone. The bedrock in the immediate area of the school is mapped as carbonates (dolomite/marble) of the Stockbridge Formation.

There is no evidence of a continuous, protective confining layer such as thick clay or till in the vicinity of the wells. Wells drilled in these conditions are considered highly vulnerable to potential contamination from activities on the ground surface because there is no significant hydrogeologic barrier, such as clay, to prevent surface contamination from migrating into the aquifer. The water from the wells is not treated prior to distribution. Water suppliers are required to regularly monitor the quality of the water. You may request additional information regarding the current water quality from the local contact listed in Table 1.

Please refer to the following section, attached maps of the Zone I and IWPA and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

During the assessment, several land uses and activities were identified within the drinking water supply protection areas and in close proximity to the protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I;**
2. **Underground storage tanks;**
3. **School facilities and athletic fields;**
4. **Transportation corridors/parking; and**
5. **Hazardous materials.**

There are several activities within the Zone Is and IWPAs that pose a potential threat to the water supply. The overall ranking of susceptibility to contamination for the well is high based on at least one high threat activity within the protection areas. Please refer to Table 2.

**1. Non-conforming Zone I** – Although the water supplier does own the entire Zone I area, there are numerous activities within the Zone I that are non-conforming. The entire school facility including fuel storage, transformers, school building, sewer lines, and parking are within the Zone I of the wells. Systems not meeting DEP Zone I requirements for ownership or control or non-conforming activities within Zone I must receive DEP approval and address Zone I issues prior to increasing water use or modifying systems/facilities.

### Zone I Recommendations:

- ✓ Prohibit any non-water supply activities within Zone I and, where feasible, remove non-conforming activities within the Zone I areas.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

### For More Information:

Contact Catherine V. Skiba in DEP's Springfield Regional Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at:

[www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

Copies of this assessment have been provided to the public water supplier and town boards.

- ✓ Do not use or store pesticides or fertilizers in Zone I.
- ✓ Inspect the wells regularly to ensure the cap is secure, there is no standing water near the well and to ensure that the bulkheads are secure. If the bulkheads cannot be secured, raise the well casing above grade, provide a secure and watertight cap and protect the casings appropriately.
- ✓ Relocate the wells if they cannot be secured or if water quality is impaired by activities near the wells.
- ✓ Monitor all activities associated with petroleum products within the Zone Is.

**2. Underground petroleum storage tanks** – There are two, 10,000 gallon fuel oil tanks and one, 1,000 gallon diesel tank UST within the Zone I of Well #2 and within the IWPA of 01G. If managed improperly, fuel oil tanks and their associated piping can be a potential source of contamination due to leaks or spills of the materials they store. The tanks were replaced in the early 1990s.

#### Recommendation:

- ✓ Any modifications to the tank must be accomplished in a manner consistent with Massachusetts's plumbing, building, and fire code requirements. Consult with the local fire department for any additional local code requirements regarding ASTs and USTs.
- ✓ Monitor all activities associated with the petroleum products, especially delivery.
- ✓ Have spill containment/absorbent materials available on-site

**3. School facilities and athletic fields** – All of the school's facilities are located within the Zone I and/or IWPA of the wells. Middle schools generally use only household type hazardous materials. Although high school laboratory and photo labs can use potentially harmful materials, the potential threat from disposal of these materials is somewhat minimized because the school is connected to the municipal sewer. There are state and federal regulations controlling some of the activities and products used at schools to promote "healthy schools". Potential also exists for contamination of the wells by onsite use of fertilizers or pesticides on the athletic fields. The shed for lawn maintenance equipment is located outside of the protection areas.

#### Recommendations:

- ✓ Continue the use of Best Management Practices for all activities at the school and at the athletic fields. Consider drought resistant grasses and/or low release nutrient fertilizers in the IWPA, as required.
- ✓ Investigate Integrated Pest Management and Best Management Practices within the Zone I and IWPA.
- ✓ Use secondary containment as necessary for any petroleum products kept for maintenance and lawn care equipment.
- ✓ Use Best Management Practices for handling treatment chemicals and vehicles used to access the area. Do not use or store pesticides or fertilizers within Zone I.
- ✓ Review your emergency response plan regarding to accidental releases within the area. Ensure that emergency responders in town are aware of the locations of your resource areas.
- ✓ For additional information, refer to the Massachusetts Public Health Association's Healthy Schools website online at [http://www.mphaweb.org/pol\\_schools.html](http://www.mphaweb.org/pol_schools.html).

**4. Transportation corridor/parking** – The school's internal transportation corridors and parking are located within the IWPA. Accidents and normal use and maintenance of corridors and parking areas may pose a potential threat to water quality. Catch basins transport stormwater from roadways and adjacent properties to the ground, streams, rivers or reservoir. As flowing stormwater travels, it picks up de-icing materials, petroleum chemicals and other debris on roads and contaminants from streets and lawns. Common potential contaminants in stormwater originate from automotive leaks, automobile maintenance and car washing, accidental spills as well as, waste from wildlife and pets.

**Recommendations:**

- ✓ Prepare an Emergency Response Plan that includes coordination between the emergency responders to be sure they area aware of the location of your well.
- ✓ Limit access to the Zone I areas and direct runoff away from the wells.

**5. Hazardous Materials Storage and Use** – The school utilizes hazardous materials for maintenance and in the laboratories and is a registered generator of hazardous waste and waste oil. Hazardous materials such as paint, thinners, petroleum products, etc. should be kept in containment and used with caution. Cleaning and disposal should not be through the septic system. Spill kits and signs designating areas of storage should be available. If hazardous materials are improperly stored, used, or disposed, they become potential sources of contamination. Hazardous materials should never be allowed to enter a catch basin, or floor drain leading directly to the ground. Review the attached fact sheet for additional information regarding the thresholds for triggering a very small quantity hazardous waste generator.

**Hazardous Materials Storage and Use Recommendations:**

- ✓ Continue current management of hazardous materials on site and consider relocation of the well to minimize any potential threat from an accidental release at the site.
- ✓ Continue to use BMPs for fuel oil storage, hazardous material handling, storage, disposal, and emergency response planning.
- ✓ Ensure that management plans are up to date and staff review BMPs for the handling of hazardous materials.

### 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will further reduce the wells' susceptibility to contamination. The Department encourages diligence in management of activities near the wells.

Please review and adopt the key recommendations listed above and as follows:

**Priority Recommendations:**

- ✓ Consider relocating the wells to areas remote from petroleum storage and intense activity at the school.

**Zone I and IWPA:**

- ✓ Prohibit any new non-water supply activities from Zone I.
- ✓ Conduct regular inspections of the Zone I and IWPA and the wells.
- ✓ Post drinking water supply signs in key location such as along the access road and in the parking areas but away from the wells.
- ✓ Provide information to staff and pertinent school organizations about the potential hazards of household chemicals, lab chemicals, lawn care chemicals and fertilizers.
- ✓ Use Best Management Practices (BMPs) for the use of petroleum products, lawn care products, lab chemicals, pesticides and household hazardous waste.

**Training and Facilities Management:**

- ✓ Incorporate groundwater education into school curriculum (7-12 curricula available; contact DEP for copies).
- ✓ Staff should be instructed on the proper disposal of spent chemicals. Include custodial staff, teachers, groundskeepers, and the certified operator.
- ✓ Staff should be instructed on the proper disposal of spent household chemicals and or lab chemicals. Include custodial staff, groundskeepers, and the certified operator.
- ✓ Manage hazardous materials and waste in accordance with regulation and in a manner protective of the water supplies and public health and safety.

**Planning:**

- ✓ Work with local officials to develop an Aquifer Protection District Bylaw that includes the school wells' IWPA's and to assist you in continued protection of the water supply.
- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available.
- ✓ Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts.

- V Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

**Funding:**

The Department's Wellhead Grant Protection Program provides funds to assist public water suppliers in addressing wellhead protection through local projects. Protection recommendations discussed in this document may be eligible for funding under the "Wellhead Protection Grant Program". If funds are available, the Department posts a new Request for Response (RFR), grant application form. Other funding opportunities are described in "Grant and Loan Programs: Opportunities for Watershed Protection, Planning and Implementation" on the MA DEP website at <http://www.state.ma.us/dep/brp/mf/files/glprgm.pdf>.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment Program (SWAP) Report

For  
THE TACONIC RESTAURANT

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
January 6, 2004

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<b>PWS Name</b>	The Taconic Restaurant
<b>PWS Address</b>	1161 Cold Spring Rd
<b>City/Town</b>	Williamstown, Massachusetts
<b>PWS ID Number</b>	1341023

**Table 2: Well Information**

<b>Well Name</b>	<b>Well (Source) ID#</b>	<b>Zone I Radius (feet)</b>	<b>IWPA Radius (feet)</b>	<b>Microbial Susceptibility*</b>	<b>Non-Microbial Susceptibility**</b>
Well #1	1341023-01G	140	441	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1341023-01G)**

Zone I = 140 ft.  
IWPA = 441 ft.

### How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the Zone I / IWPA. The **high** susceptibility to potential non-microbial threats is based on the storage of hazardous materials such as heating oil within the Zone I and/or the IWPA. Other moderate threats include local roads and parking areas within the Zone I and/or the IWPA. The water from the source is disinfected prior to distribution.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

### Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

#### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

#### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

#### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report

For  
ESTES STORE

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 12, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Estes Store
<i>PWS Address</i>	Rte 9
<i>City/Town</i>	Windsor, Massachusetts
<i>PWS ID Number</i>	1345008

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well #2	1345008-02G	100	422	High	High

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for WELL  
#2 (1345008-02G)**

Zone I = 100 ft.  
IWPA = 422 ft.

## How was my Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the IWPA. The **high** susceptibility to potential non-microbial threats is based on the gasoline USTs and local roads within the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.

# Massachusetts Department of Environmental Protection Source Water Assessment and Protection (SWAP) Report for Worthington Fire District

## What is SWAP?

The Source Water Assessment Program (SWAP), established under the federal Safe Drinking Water Act, requires every state to:

- ? Inventory land uses within the recharge areas of all public water supply sources;
- ? Assess the susceptibility of drinking water sources to contamination from these land uses; and
- ? Publicize the results to provide support for improved protection.

## SWAP and Water Quality

Susceptibility of a drinking water source does *not* imply poor water quality. Actual water quality is best reflected by the results of regular water tests.

Water suppliers protect drinking water by monitoring for more than 100 chemicals, treating water supplies, and using source protection measures to ensure that safe water is delivered to the tap.

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource Protection,  
Drinking Water Program

Date Prepared:  
October 9, 2003

## Introduction

We are all concerned about the quality of the water we drink. Groundwater sources may be threatened by many potential contaminant sources, including septic systems, road salting, and improper disposal of hazardous materials. Citizens and local officials can work together to better protect these drinking water sources.

### Purpose of this report:

This report is a planning tool to support local and state efforts to improve water supply protection. By identifying land uses within water supply protection areas that may be potential contaminant sources, the assessment helps focus protection efforts on appropriate best management practices (BMPs) and drinking water source protection measures. Department of Environmental Protection (DEP) staff are available to provide

### What is a Protection Area?

A well's water supply protection area is the land around the well where protection activities should be focused. Each well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA).

- **The Zone I** is the area that should be owned or controlled by the water supplier and limited to water supply activities.
- **The IWPA** is the larger area that is likely to contribute water to the well.

In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

### What is Susceptibility?

Susceptibility is a measure of a well's potential to become contaminated due to land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA).

information about funding and other resources that may be available to your community.

#### This report includes:

1. Description of the Water System
2. Discussion of Land Uses within Protection Areas
3. Recommendations for Protection
4. Attachments, including a Map of the Protection Areas

## 1. Description of the Water System

Worthington is a small rural "hilltown" community, east of the Berkshire Hills of western Massachusetts. Worthington is primarily a residential and agricultural community that is a natural tourist attraction. The Worthington Fire District provides water for a small section of town, primarily the town center. The District maintains and operates eleven (11) sources of water. The sources are seven bedrock wells (01G-04G and 09G-11G) and four-spring sources (05G-08G); all are located in relatively close proximity to each other in the north central section of town.

During the mid-1990s, the area experienced a dry summer and the District's sources where inadequate to meet demand. Some of the existing wells were deepened and additional wells drilled to meet the system needs. Wells range in depth from 280 to 550 feet and the springs are bedrock fed springs with collection boxes that have been reconstructed and/or otherwise protected from surface water influences. The bedrock in the area is mapped as the lower Goshen Formation, a carbonaceous schist and phyllite. There is significant bedrock exposure with some area of thin to moderate depth of till overlying bedrock. Although some of the wells are flowing artesian wells, there is no evidence of a significant and continuous protective, confining unit throughout the protection areas. Sources located in aquifers such as this are considered highly vulnerable to contamination from activities conducted on the land surface. Recent experience has shown that activities that cause significant disturbance to the land surface such as logging, on areas within the Zone I and Zone II of spring sources with thin overburden or exposed bedrock, can be negatively impacted by increased turbidity in the water.

The Zone I is the most protected area around a groundwater source. The Interim Wellhead Protection Area (IWPA) is an area that is assumed to contribute recharge to the source until a scientifically determine Zone II, contribution area for a groundwater source. The radii of the Zone I and Interim Protection Area (IWPA) for the wells are based on estimated yields of the wells as determined from pumping tests conducted on each well. The estimated yield of the wells ranges from approximately 2 to 15.5 gallons per minute.

**Table 2: Table of Activities within the Water Supply Protection Areas**

Potential Contaminant Sources	Zone I	IWPA/ Zone II	Threat	Comments
Transportation Corridor	01G, 02G, 04G, 05G	All except 06G/07G	Moderate	Limit road deicing materials; monitor and control drainage
Residential	-	All except 05G, 06G, 07G, 08G	Moderate	Provide BMPs to residents
Septic System	-	All except 05G, 6G, 07G, 08G	Moderate	See septic systems brochure in the appendix, relocate septic systems outside of Zone I
Lawn Care/Gardening	-	All except 05G, 06G, 07G, 08G	Moderate	Provide BMPs to residents

-For more information on Contaminants of Concern associated with individual facility types and land uses please see the SWAP Draft Land Use / Associated Contaminants Matrix on DEP's website - [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/).

## Glossary

**Zone I:** The area closest to a well; a 100 to 400 foot radius proportional to the well's pumping rate. To determine your Zone I radius, refer to the attached map.

**IWPA:** A 400-foot to ½ mile radius around a public water supply well proportional to its pumping rate; the area DEP recommends for protection in the absence of a defined Zone II. To determine IWPA radius, refer to the attached map.

**Zone II:** The primary recharge area defined by a hydrogeologic study.

**Aquifer:** An underground water-bearing layer of permeable material that will yield water in a usable quantity to a well.

**Hydrogeologic Barrier:** An underground layer of impermeable material that resists penetration by water.

**Recharge Area:** The surface area that contributes water to a well.

The Zone I for a spring is a square area centered on the source in the direction of flow with the source 50 feet from the downgradient edge of the Zone I. The lengths of the sides of the square are based on the estimated flow from the spring or estimated volume of water used from the source. The USGS was contracted by the DEP to determine the contribution areas (Zone II) to spring sources as part of the SWAP program. Please refer to the enclosed map for the outline of the protection areas for the District's sources. The Zone I, IWPA and Zone II areas are primarily forest with a single dirt road and several residences. Chlorine is added to the water for disinfection prior to distribution. You may request additional, current information regarding the quality of the water, from the local contact listed in Table 1. Please refer to the attached maps of the Zone I, IWPA and Zone II protection areas and Table 2 for additional assessment information.

## 2. Discussion of Land Uses in the Protection Areas

There are few land uses and activities within the drinking water supply protection areas that are potential sources of contamination.

### Key issues include:

1. **Non-conforming Zone I,**
2. **Residential uses, and**
3. **Transportation corridor.**

The sources are located in an aquifer with a high vulnerability to contamination due to the absence of a significant hydrogeologic barrier to prevent contaminant migration. However, the overall ranking of susceptibility to contamination for the system is moderate, based on the presence of at least one moderately ranked land use or activity in the protection areas, as seen in Table 2.

**1. Non-conforming Zone I** – The District does not own or control the entire Zone I for all of its sources. Although the District owns much of the Zone I areas, the district does not own the entire Zone I for sources 01G, 02G, 04G and 05G. The Zone I area for these sources contains a road. DEP's land control restrictions for Zone I only allow water supply related activities in Zone I or activities that do not pose a potential threat.

Figure 1: Example of how a well could become contaminated by different land uses and activities.

Systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying systems.

### Recommendations:

- ✓ Do not use or store pesticides, fertilizers or road deicing materials, as is feasible, within the Zone I.
- ✓ Monitor road runoff to ensure that it does not flow toward the well and springs in the Zone I. Continue current efforts in upgrading and maintaining protection of the well and spring heads.
- ✓ Within the long term planning for the system, consider relocating sources adjacent to the road if activities cannot be controlled or water quality is impacted.

**2. Residential Land Uses** – The residences have on-site septic systems. If managed improperly, activities associated with residential areas can contribute to drinking water contamination. Common potential sources of contamination include:

- **Septic Systems** – Improper disposal of household hazardous chemicals to septic systems is a potential

### Additional Documents:

To help with source protection efforts, more information is available by request or online at [www.state.ma.us/dep/brp/dws](http://www.state.ma.us/dep/brp/dws) including:

1. Water Supply Protection Guidance Materials such as model regulations, Best Management Practice information, and general water supply protection information.
2. MA DEP SWAP Strategy
3. Land Use Pollution Potential Matrix
4. Draft Land/Associated Contaminants Matrix

### For More Information:

Contact Catherine Skiba in DEP's Springfield Office at (413) 755-2119 for more information and for assistance in improving current protection measures.

More information relating to drinking water and source protection is available on the Drinking Water Program web site at: [www.state.ma.us/dep/brp/dws/](http://www.state.ma.us/dep/brp/dws/)

source of contamination to the groundwater because septic systems lead to the ground. If septic systems fail or are not properly maintained, they could be a potential source of microbial contamination.

- **Household Hazardous Materials** - Hazardous materials may include automotive wastes, paints, solvents, pesticides, fertilizers, and other substances. Improper use, storage, and disposal of chemical products used in homes are potential sources of contamination.
- **Heating Oil/Kerosene Storage** - Private residences within the IWPA may heat with fuel oil or diesel fuel. If managed improperly, Underground and Aboveground Storage Tanks (USTs and ASTs) can be potential sources of contamination due to leaks or spills of the fuel oil/kerosene they store.
- **Stormwater** – Catch basins transport stormwater from roadways and adjacent properties to the ground. As flowing stormwater travels, it picks up debris and contaminants from streets and lawns. Common potential contaminants include lawn chemicals, pet waste, and contaminants from automotive leaks, maintenance, washing, or accidents.

### Residential Land Use Recommendations:

- ✓ Educate residents on best management practices (BMPs) for protecting water supplies. Distribute the fact sheet "Residents Protect Drinking Water" available in Appendix A and on [www.mass.gov/dep/brp/dws/protect.htm](http://www.mass.gov/dep/brp/dws/protect.htm), which provides BMPs for common residential issues.
  - ✓ Promote BMPs for stormwater management and pollution controls.
3. **Transportation corridors** – Even low use, rural residential roads can be potential sources of contamination due to use of deicing materials, leaks or spills of fuels and other hazardous materials during accidents and erosion.

### Recommendation:

- ✓ Continue current contacts with local highway department and local emergency responders department to ensure that the protection areas are included in Emergency Response Planning.

## 3. Protection Recommendations

Implementing protection measures and best management practices (BMPs) will reduce the well's susceptibility to contamination. The Worthington Fire District is commended for current and past protection measures including the development of a protection plan, upgrade of the infrastructure and purchase of land around the sources. With the delineation of the Zone II contribution areas for the springs, the district should review the existing protection plan, update information as appropriate and work with the community in development of additional protection strategies as appropriate.

Please review and adopt the key recommendations listed above and as is feasible.

### Zone I:

- ✓ Prohibit any new non-water supply activities from the Zone I.
- ✓ Continue regular inspections of the Zone I. Monitor for evidence of unauthorized access.
- ✓ Monitor activities and if there is evidence of increased activity or access, consider fencing and gating the immediate area around the springs/well

### Facilities Management:

- ✓ Control surface runoff around the springs and wells' casings to prevent infiltration. Earthen or concrete berms or collars should slope away from the source and well casings should extend above ground.
- ✓ Monitor deliveries of chemicals to the facility

### Planning:

- ✓ Have a plan to address short-term water shortages and long-term water demands. Keep the phone number of a bottled water company readily available and continue assessment of future needs of the system.

Supplement the SWAP assessment with additional local information and incorporate it into water supply educational efforts. Use a potential contaminant threat inventory to assist in setting priorities, focusing inspections, and creating educational activities.

These recommendations are only part of your ongoing local drinking water source protection. Citizens and community officials should use this SWAP report to encourage discussion of local drinking water protection measures.

# Transient Non-Community Source Water Assessment and Protection (SWAP) Report For BERKSHIRE PARK CAMPING AREA

Prepared by the  
Massachusetts Department of  
Environmental Protection,  
Bureau of Resource  
Protection, Drinking Water  
Program

Date Prepared:  
February 25, 2004

## What is SWAP?

The Source Water Assessment Protection (SWAP) Program, established under the federal Safe Drinking Water Act, requires every state to:

- inventory land uses within the recharge areas of all public water supply sources;
- assess the susceptibility of drinking water sources to contamination from these land uses; and
- publicize the results to provide support for improved protection of sources.

The Massachusetts Department of Environmental Protection (DEP) Drinking Water Program is undertaking this task. The rankings of susceptibility of your well(s) to potential contamination are listed in Table 1.

**Table 1: Public Water Supply Information**

<i>PWS Name</i>	Berkshire Park Camping Area
<i>PWS Address</i>	530 Harvey Rd
<i>City/Town</i>	Worthington, Massachusetts
<i>PWS ID Number</i>	1349003

**Table 2: Well Information**

<i>Well Name</i>	<i>Well (Source) ID#</i>	<i>Zone I Radius (feet)</i>	<i>IWPA Radius (feet)</i>	<i>Microbial Susceptibility*</i>	<i>Non-Microbial Susceptibility**</i>
Well # 1	1349003-01G	233	570	High	Moderate

\* Common sources of microbial contamination include septic systems, wildlife and livestock operations. These types of activities in the source protection area increase your well's Microbial Susceptibility.

\*\* Sources of non-microbial contamination include inorganic and organic chemicals. Inorganic contaminants include metals and naturally occurring minerals. Organic contaminants include fuels, degreasing solvents, herbicides and pesticides.

## What is the Purpose of This Report?

This report identifies the most significant *potential contaminant sources* that could threaten your well's water quality. Your susceptibility ranking does not imply poor water quality. Actual water quality is best reflected by the results of your regular water tests.

## What is my Well's Source Protection Area?

A well's source protection area is the land around your well where protection activities should be focused. Your public drinking water supply well has a Zone I protective radius and an Interim Wellhead Protection Area (IWPA). The Zone I is the area that should be owned or controlled by the water supplier and limited to water supply activities. The IWPA is the larger area that is likely to contribute water to the well. Refer to **Figure 1** on page 2 for an example of a Zone I and IWPA.

An IWPA is the land located within a fixed radius of the well. The IWPA radius is based upon the average pumping rate of the well. In many instances the IWPA does not include the entire land area that could contribute water to the well. Therefore, the well may be susceptible to contamination from activities outside of the IWPA that are not identified in this report.

## What is Susceptibility?

Susceptibility is a measure of your well's potential to become contaminated by land uses and activities within the Zone I and Interim Wellhead Protection Area (IWPA). Please see the enclosed map for your well's Zone I and IWPA areas.

The possibility of a release from potential contaminant sources is greatly reduced if best management practices (BMPs) are used. The susceptibility determination for your well did not take into account whether BMPs are being used.

Susceptibility of a drinking water well does *not* mean a customer will drink contaminated water. Water suppliers protect drinking water by monitoring water quality, treating water supplies, and using BMPs and source protection measures to ensure that safe water is delivered to the tap.

**Figure 1: ZONE I/ IWPA  
EXAMPLE Source  
Protection Area for Well #1  
(1349003-01G)**

Zone I = 233 ft.  
IWPA = 570 ft.

## How Was My Well's Susceptibility Determined?

Your well's **high** susceptibility to potential microbial threats is based on the septic system components within the IWPA. The **moderate** susceptibility to potential non-microbial threats is based on the local roads and camp facilities within the IWPA.

This source water assessment report is based on information provided by you on your Public Water Supply Annual Statistical Report, water quality data and/or from other sources of information. DEP has not verified the accuracy of the information submitted with the report.

## Recommendations for your Well

All public water systems with groundwater sources should ensure that only activities necessary for the operation and maintenance of the drinking water system occur within the well's Zone I.

### Specific Recommendations:

- ✓ inspect the Zone I and IWPA regularly;
- ✓ work with the Board of Health and other local officials to make sure your well(s) are included in local regulations and inspection efforts;
- ✓ restrict access to the well and post the area with *Drinking Water Protection Area* signs;
- ✓ make certain that a proper sanitary seal is in place for the well (grouted casing and concrete pad);
- ✓ remove oil/hazardous materials storage tanks, and hazardous materials use or storage from the Zone I;
- ✓ do not use pesticides, fertilizers or road salt within the Zone I;
- ✓ address septic system issues in Zone I; remove septic system, relocate well or pursue upgrading options;
- ✓ water systems not meeting DEP Zone I requirements must get DEP approval and address Zone I issues prior to increasing water use or modifying system.

### Need More Information?

Additional information or sources of information can be obtained by calling Catherine Skiba at (413) 755-2119 or visiting DEP's Drinking Water Web site at <http://www.state.ma.us/dep/brp/dws>.

### Glossary

- Best Management Practices (BMPs) are operational procedures used to prevent or reduce pollution.
- Public Water System is a system for the provision to the public of piped water for human consumption, if such system has at least 15 service connections or regularly serves an average of at least 25 individuals daily at least 60 days of the year.
