The Scrap Recycling Industry:
Scrap Textiles

The textile segment of the recycling industry processes billions of pounds of cotton, wool, synthetic and synthetic-blend products each year. These scrap materials come from a number of sources, ranging from apparel and home furnishing manufacturers to textile mills and consumers.

Each year, 1.1 million tons of textiles recovered from individuals (post-consumer) and manufacturers (pre-consumer) are recycled as new raw materials for the automotive, furniture, mattress, coarse yarn, home furnishings, paper and other industries. This translates to about eight lbs. of textiles per person in the United States in 2010.

Used clothing collected from households is graded into a number of categories. Garments in good condition are exported for resale in parts of the world where new clothing is not affordable for many. This trade provides employment not only among the exporting nations, but also in the importing countries.
