PESI Health Care LLC

September 2007 – present

ADHD

For the practicing mental health clinician, this seminar increases the clinician's ability to rapidly identify processing disorders and make targeted treatment recommendations. This seminar provides the opportunity for the clinician to gain a wide range of concrete skills including assessment of processing and organizational deficits from multiple perspectives, and managing symptom overlap among related disorders.

Risk Assessment and Mental Status Exam Seminar:

The seminar is focused on the practical day to day application of mental health theory and research. It gives the learner both the tools and skills needed to conduct a thorough Mental Status Exam and Risk Assessment of high risk clients and situations and recognize known risk factors for violence and suicide.

Mastering the Clinical Interview

Mastery of the clinical interview decreases client dropout rates, improves treatment outcomes, and expands the clinician's confidence with case formulation and treatment planning. This interactive workshop sharpens the clinician's ability to quickly establish rapport and gather the most important information in the first session. It teaches a wide range of concrete skills including how to elicit and describe client symptoms, how to manage cultural and neuropsychological factors in the intake interview, and how to write powerful notes and observations.

Teleseminars

Dementia: What You Need To Know for Effective Assessment and Treatment - CE Only

Traumatic Brain Injury: Effectively Identify and Treat - CE Only
