Prophylaxis administered per CDC guidelines. Site specific testing (oral, anal, vaginal): generally **NOT** recommended during acute timeframe. Patients with genital s/s of infection: management per ED physician.

*HIV – ½ antigen/antibody combo immunoassay (4th generation) testing preferred. Ab= antibody. sAg= Surface Antigen, sAb= Surface Antibody, cAb= Core Antibody

**These tests should be recommended due to potential health consequences, even if the patient initially declines STI testing. A positive HIV test may change the antiviral treatment regimen. A patient with a positive Hepatitis B testing may have a Hepatitis B reactivation after completing HIV prophylaxis and should be monitored.
